the other. Neither Kumārila nor Bhartṛhari solve the question of how words convey meaning on purely logical grounds. Both take recourse to non-logical argument. For Kumārila it is the postulation of *apūrva*, based on the revelation of the Veda, that is found to be necessary for words to convey meaning. For Bhartṛhari it is the postulation of the *sphoṭa*, based on the intuitive experience of the speaker and hearer, that is found to be necessary for words to convey meaning. Both Kumārila and Bhartṛhari ground themselves upon the Vedas and argue that their respective schools provide the true understanding and prescription for life offered by the Vedic revelation." (pp. 218-219, a note omitted)

9. Das, Nilanjan. 2022. "Pratibhā, Intuition, and Practical Knowledge." *British Journal for the History of Philosophy*:1-27.

   First online 9 June 2022.

   Abstract: "In Sanskrit philosophy, the closest analogue of intuition is pratibhā. Here, I will focus on the theory of pratibhā offered by the Sanskrit grammarian Bhartṛhari (fifth century CE). On this account, states of pratibhā play two distinct psychological roles. First, they serve as sources of linguistic understanding. They are the states by means of which linguistically competent agents effortlessly understand the meaning of novel sentences. Second, states of pratibhā serve as

sources of practical knowledge. On the basis of such states, both human and non-human agents unreflectively know which actions they should perform under which circumstances. Given these two roles of pratibhā, modern commentators have often claimed that states of pratibhā, as understood by Bhartṛhari, are intuitions. In this article, I will reconstruct Bhartṛhari's view and to explore its consequences, I will argue that, if Bhartṛhari's theory of pratibhā is right, then a form of human exceptionalism – which makes rationality a unique trait of human beings – becomes difficult to maintain."

10. Dash, Narendra Kumar. 1998. Bhartṛhari's Critism [sic] in Jain Logic: a study. 1-9.

    Available on at Jain Quantum.

    "The grammarian-philosopher Bhartṛhari opines that *Sabda* is the substratum of the world of appearance and thus he accepts the theory of *Sabdāvaita*. However this key-stone of the Grammarians' system of Metaphysics has elaborately been controverted by the rival schools. Here we propose to record the dialectics of the Jains Philosophers, one of the rival schools of Metaphysics.

    This theory of Bhartṛhari has been subjected to severe criticism by the Naiyayikas, Mimamsajas, Buddhists and Jains. Now, for our practical purpose we discuss the view of the Jaina logicians like Vidyanandi (9th century A.D.), Abhayadev Suri (11th century A.D.), Prabhacandra (1st half 12th Century A.D.), Vadideva Suri (later half of 12th Century, A.D.) and Shree Yasovijaya jee (18th Century A.D.)." (p. 1)

11. Davis, Lawrence Ward. 1978. *Studies in Bhartrhari's Vakyapadiya*, University of Massachusetts.

    Doctoral dissertation.

    Absract: "Bhartṛhari's *Vākyapadīya* was the work in which the speculations of the Indian Grammarians found their fullest expression. In this dissertation three topics treated in the *Vākyapadīya* are explicated: ākānksā, sphoṭa, and sabda-brahman. A Montague-style categorial grammar for a fragment

of Sanskrit is given to provide an explication of the term ākānksā. The semantics of that fragment is discussed in connection with the concept sphota and it is argued that Bhartrhari's theory of sphota was not the one currently attributed to him by scholars of his work. The concept of sabdabrahman is discussed with reference to two questions: Why did Bhartṛhari think that the study of Grammar leads to salvation, and how can a monistic position be consistently asserted? The formal machinery of the earlier chapters is employed in these discussions. Another concept—that of metalanguage hierarchies—is discussed but the intent is to demonstrate that such hierarchies need not be employed in a formal treatment of Bhartṛhari's work and a different system is given within which such hierarchies may be accommodated without recourse to a different language."

12. Deshpande, Madhav. 1992. "Bhartṛhari (ca. 450—510)." In *Sprachphilosophie / Philosophy of Language / La philosophie du langage. Vol. 1*, edited by Dascal, Marcelo, Gerhardus, Dietfried, Lorenz, Kuno and Meggle, Georg, 269-278. Berlin: Walter de Gruyter.

    1. Introduction 269; 2. Summary of the *Vākyapadīya* 271; 3. Assessment of Bhartṛhari’s contribution to

    philosophy of language 277; 4. Selected references 278.

    "We know from the tradition that a work called *Saṅgraha* by Vyāḍi was the first known massive work devoted to general issues such as the eternal or non-eternal nature of language, and whether a word denoted a universal or a particular. However, this work which existed before Patañjali’s time was soon lost. Among available texts, Bhartṛhari’s *Vākyapadīya* is the very first devoted to a systematic investigation of issues relating to language.

    While many such discussions are scattered in the works of Kātyāyana, Patañjali, Jaimini etc., Bhartṛhari deals with them in a systematic fashion. While he explains hundreds of different theories, there are some theories for which he is particularly well known. Among these, we must include his notion of

Brahman, the ultimate reality, as a language-principle, the evolution of the material world from the *Brahman* being likened to the manifestation of meanings by words.

While this notion existed in a rudimentary form before Bhartṛhari, he presents it in a decisive shape. The second significant contribution of Bhartṛhari is the notion of *sphoṭa*, ›real word‹, being without parts and sequence, and yet being manifested by sounds which appear in a particular sequence. A related notion is that of a sentence being indivisible and its meaning also being indivisible. If the sentence-meaning is indivisible, then it is certainly not understood as a sequence of the constituent word-meanings. Bhartṛhari's notion is that the sentence-meaning is understood in a flash of understanding (*pratibhā*).

While granting this unitary character of a sentence, its meaning etc., Bhartṛhari also admits that subsequent analysis allows us to isolate components of sentences and words, as well as those of sentence-meanings and word-meanings. Such an analytical understanding is valued for theoretical purposes, but one is warned that in the actual linguistic communication in the real world, such analysed entities do not occur." (p. 277)

13. ———. 1998. "Evolution of the Notion of Authority (*Prāmāṇya*) in the Pāṇinian Tradition." *Histoire Épistémologie Langage* no. 20:5-28.

    Abstract: "The Paninian tradition assumes a special structure of authority for the three founding grammarians, i.e. Pânini, Kâtyâyana, and Patanjali. It is assumed that among these founding grammarians, Patanjali has the highest authority. Then comes Kâtyâyana, and then comes Pânini himself. It is also assumed that these three grammarians are sages (*muni*) and hold a special status, while the tradition after Patanjali is believed to fall into decline and does not command the same high authority. This paper traces the historical evolution of these notions. It first points out that Pânini had not deified (or rather muni-fied) the grammarians who are cited in his grammar. Similarly, Pânini himself was not muni-fied by Kâtyâyana and Patanjali. However, they ascribe some special

respect for him, and treat his grammar as being like the Vedas, the scriptures of the Hindus. It is in Bhartrhari's works (500 A.D.) that we see the first signs of muni-fication of the early grammarians and a feeling that contemporary scholars do not have a native command of Sanskrit. In Kaiyata, we have the full statement of authority of the three early grammarians, with indications of Patanjali being considered an incarnation of the snake divinity Sesa. In the works of Nâgesabhatta, we have the full development of these conceptions, with the inspiration for the grammar of Pânini being attributed to Shiva and his grammar acquiring the status of Veda."

14. Desnitskaya, Evgeniya. 2006. "Antinomy of One and Many in Bhartṛhari's Vākyapadīya." *Acta Orientalia Vilnensia* no. 7:209-221.

    Abstract: "Bhartṛhari's *Vākyapadīya* (VP) is notorious for the multiplicity of the mutually exclusive doctrines expounded there, without any final solution. This paper aims to demonstrate that in the case of every controversial question discussed in VP, the variety of views on it can be reduced to a basic antinomy which serves as a kind of proposition for the problem under consideration. These antinomies are sometimes expressed explicitly but very often they are hidden in the text of VP. The fundamental dichotomy is the opposition between pluralism and monism, the origin of which in turn can be traced in the contradiction between the grammatical background and ontological trends of Bhartṛhari's philosophy.

    The way in which Bhartṛhari integrates these extremities into a total system is analyzed in this paper on the basis of some passages, dealing with a certain semantic problem, from the 1st and the 3rd *kāndas* of VP. Attention is focused on the concept of activity and its role in Bhartṛhari's philosophical discourse."

15. ———. 2016. "*Paśyantī, Pratibhā, Sphoţa and Jāti*: Ontology and Epistemology in the Vākyapadīya." *Journal of Indian Philosophy* no. 44:325-335.

    Abstract: "Eli Franco has recently suggested to distinguish the two main periods in the history of Indian philosophy, i.e. the

older ontological and the new epistemological.

In the Vākyapadīya, however, ontology and epistemology are evidently intertwined and interrelated. In this paper ontological and epistemological features of the concepts of *paśyantī, pratibhā, sphoţa* and *jāti* are analyzed in order to demonstrate that all these concepts, while being ontologically different, are engaged in similar epistemological processes, i.e. the cognition of a verbal utterance. Thus the identification of *sphoţa* and *jāti* as well as of *paśyantī* and *pratibhā* met with in some passages of VP and the commentaries implies not the absolute identity of these concepts, but only their overlapping in the sphere of epistemology. Considering concepts of different origin in one epistemological perspective enables to escape controversies in interpretation and provides a kind of consistency in a bit but amorphous work of Bhartṛhari."

16. ———. 2018. "Bhartrhari's Perspectivism as a Philosophical Strategy: Its Origins and Possible Interpretations." *Advances in Social Science, Education and Humanities Research* no. 233:9-11.

Abstract: "The 'Vakyapadiya' of Bhartṛhari, the famous Indian linguistic philosopher (5th CE), presents many different, often mutually exclusive, views on language and its relationship with cognitive processes and extra-linguistic relation. Modern scholars designate this methodological approach as perspectivism. This paper provides the analysis of perspectivism as a philosophical strategy. Two general features of Bhartṛhari's perspectivism have been identified, namely the functional attitude and the idea of the relative incompleteness of every single doctrine. The origin of both features has been

traced in the works of the ancient grammarians as well as in the earlier Brahmanic texts."

17. ———. 2018. "Language and Extra-linguistic Reality in Bhartṛhari's Vākyapadīya." *Sophia* no. 57:643-659.

    Abstract: "Relation between language and extra-linguistic reality is an important problem of Bhartṛhari's linguistic philosophy. In the 'Vākyapadīya,' [VP] this problem is discussed several times, but in accordance with the general perspectivist trend of Bhartṛhari's philosophy each time it is framed through different concepts and different solutions are provided. In this essay, an attempt is undertaken to summarize the variety of different and mutually exclusive views on language and extra-linguistic reality in VP and to formulate the hidden presuppositions on which the actual viewpoints expressed in the *kārikās* are based. As a result, the following approaches are formulated: (A1) Language is coextensive with external reality. (A2a) Language, designated as *kalpanā/vikalpa,* is distinct from reality. (A2b) Language refers to the secondary/metaphorical reality (*upacārasattā/aupacārikī sattā*). (A3) Language and reality somehow correlate, because otherwise, practical/linguistic activity (*vyavahāra*) would be impossible. The origin of these approaches and their affinities with different schools of Indian philosophy (Nyāya-Vaiśeṣika and Buddhist Pramāṇavāda) are examined. Approach (A3), according to which correlation between language and reality is functional and not ontological, seems very close to Dharmakīrti's concept of *arthakriyā*. This approach accords with Bhartṛhari's perspectivist philosophical strategy. It enabled him to explain how effective linguistic activity is possible, capturing language in its dynamic aspect, without limitative static ontological constructions."

18. ———. 2021. "Atman as Substance in the *Vākyapadīya* and Beyond." *Philosophy East & West*:287-308.

    "The "Dravyasamuddeśa" is a chapter of Bhartṛhari's *Vākyapadīya* (VP) that considers substance (*dravya*) to be the referent of all words and the ultimate essence of all phenomena. In the first *kārikā* of this chapter (VP 3.2.1)

Bhartṛhari lists several synonyms of *dravya*, with *Ātman* being the first among them. It follows from Helārāja's commentary that each member of this list is the central concept of some philosophical tradition—*Ātma*n in particular belongs to the Advaitavādins. Being a traditional commentator, Helārāja could not have cared less for the chronology, but approaching his explanation critically one may wonder what particular form of Advaita he might have in mind and whether Bhartṛhari, who flourished circa the fifth century C.E., could have been familiar with this teaching. Moreover, there is another question that may arise with respect to this *kārikā* and Helārāja's explanation: what generally is the reason to identify *Ātman* with substance?"

(...)

"The present essay attempts to clarify the meaning of this doctrine and the possible reasons for it to appear. An attempt is also made to trace possible origins of this doctrine in the tradition prior to Bhartṛhari. In what follows, I will dwell, first, on the immediate context of *kārikā* 3.2.1. Second, I will focus attention on the concepts of *dravya* and *Ātman* as they appear in the VP and in some earlier works, namely in the *Mahābhāṣya*, in the Upaniṣads, and in some other works. Finally, I will analyze possible reasons for *dravya* and *Ātman* to be equated, arguing that the clay or gold analogy widely used in different texts can be considered a clue to this equation." 19. Devi, Shantipriya. 2020. "Transmission of Language in the Metaphysical Framework of Bhartṛhari." *International Journal of Trend in Scientific Research and Development (IJTSRD)* no. 4:386-387.

Abstract: "As the traditional texts have shown many lights on the theory of language, the Vedas have shown the path to a large extent. The people started communicating with each other and it became the medium of expression. When language started then systematization started slowly and grammatical treatises became possible and were made available through transmission. In the grammatical tradition Bhartṛhari became

the champion in analyzing the metaphysical framework of it in detail. The paper discusses that very aspect here."

20. Dobre, Florina. 2007. "The Sphoṭa Theory of the Indian Grammarians and Structural Linguistics Theories." In *Proceedings of the International symposium, University of Valahia, Targoviste, 3-4 november 2006*, 1-9. Targoviste: Valhai University Press.

    "The sphoṭa theory is a rather wide topic of discussion among the Indian linguistics theories given its role on both the phonetic as well as the semantic plan of language. In this paper, I do not plan to take care of all aspects of the theory but rather focus on certain similarities and disagreements between the Indian grammarians' theories on sphoṭa and some interpretations of the linguistic sign as envisaged by the structural linguistics schools of Saussure and Hjelmslev.

    The sphoṭa doctrine is generally considered as one of the most important contributions of the old Indian grammarians to the central problem of general linguistic as well as philosophy of language(1). According to it, the word or the sentence when taken as an indivisible meaning-unit is the sphoṭa. It's not certain whether Pāṇini knew the term in its full complexity, but in the sūtra 6.1.123 "avaṅ sphoṭāyanasya”(2) of the *Aṣṭādhyāyī* he refers an early grammarian called Sphoṭāyana. The later grammarians such as the 10th century Harādātta or the 16th century Nāgeśa Bhaṭṭa are of the opinion that this Sphoṭāyana fathered the doctrine. On the other hand, Yāska(3) who is generally placed one century earlier than Pāṇini holds that another grammarian Audumbarāyaṇa is the forerunner of the sphoṭa theory." (p. 1)

    Chapter IX: *The Grammarian's view of word and meaning*, pp. 209-263.

    "The Grammarian has made significant contribution to the study of word and meaning. Our discussion of the Grammarian's view would be based mainly on Bhartṛhari's Vākyapadīya and the commentaries thereon by the author himself, Puṇyāraja and Helārāja. It is necessary to state at the very outset that the philosophical standpoint of the Grammarian is absolutistic. The ultimate reality (Brahman), as Bhartṛhari describes it, is of the nature of the word; it is without beginning or end, it is the cause of the manifested phonemes, it is what appears as the objects, and it is from which the creation of the world proceeds. The word-Absolute

    is said to have dual aspects of unity (vydiā) and diversity (avydiā), but, of these, the former alone is real, while the latter is merely apparent. In itself the Word-Absolute is undifferentiated, but due to the power of *nescience* it appears as diverse.

    Thus, the world of objects, according to the Grammarian, is nothing but the appearance of the Absolute Word." (p. 209, note omitted)

22. Dwivedi, Prabha Shankar. 2016. "Signification and Resolution of Absolute in a Textual Structure: A Study in Relation to Bhartṛhari and Jacques Lacan." *Journal of Comparative Literature and Aesthetics* no. 39:123-133.

    Abstract: "This paper intends to explore affinity and interface between Indian and Western concepts of the signification and configuration of meaning in conceptual forms by focusing the attention on Bhartṛhari (Indian Grammarian, Linguist and Philosopher of c. 5th Century A.D.) and Jacques Lacan (A French psychoanalyst and early Poststructuralist critic). This comparative study of historically and culturally wide apart

Indian and Western epistemology and linguistics aims to provide exegesis to those unearthed concepts, which could only be explained in relation to each other. Both, Bhartṛhari and Lacan confer the ultimate eminence to language, according to them the governing power of the whole world is contained in language/word/*śabda*. Bhartṛhari concedes śabda to be a seed of the entire universe, everything evolves from it. It is this śabda that expresses itself in all the forms; all the three states of *bhoktā* (enjoyer), bokta (enjoyed) and *bhoga* (enjoyment) are its varied manifestations. As per Bhartṛhari, who considers it Brahman, it is this śabda Brahman that prevails everywhere. It simultaneously is the cause of reality and illusion in one and the same thing. Lacan, like Bhartṛhari, has full faith over the power of language which in itself sufficiently deals with all the transactions of the world and proffers it its immediate existence which particularly by human beings is viewed as organized, systematic, coherent and to a large extent real.

(...)

The paper concludes as Bhartṛharian ideas/expositions present in the *Vākyapadīyam*, unequivocally, have the universal appeal and extant acceptance irrespective of physical limitations, spatial contexts and temporal boundaries; that is why his stand in respect of language studies precedes all the major theoreticians in the field regardless of cultural and historical variations."

23. ———. 2017. "Thinking Dialectically on Indian Tradition of Knowledge and Western Knowledge System with Special Reference to Bhartrhari and Saussure." *Litterit*:133-143.

    Abstract: "This paper aims at the dialectical study of Indian and Western traditions of knowledge with special reference to Bhartṛharian philosophy of language and Saussure's conception of linguistics. Philosophico-linguistic study of both the systems of knowledge leads the researcher to a point where postulation of one is clearly perceived to be corresponding with the other. Opinions of the scholars in language study won"t be divided on the fact that Saussure's theory of language and meaning was much influenced with his study of Sanskrit grammar and

linguistic philosophy propounded and taken forward by Pāṇinian school and particulaly by Bhartṛhari, which the present paper supports with textual evidences. Both Bhartṛhari and Saussure consider meaning to be the result of the interplay of relations among individual linguistic units in a structure of the system of language.

This paper also uncovers the conceptual growth of the idea establishing the structural notion of language in respect of configuration of meaning through constitutive linguistic units. Bhartṛhari in his *Vākyapadīyam* deals with many ground-breaking linguistic facts in which the idea of language as structure is centrally located. Both, Bhartṛhari and Saussure consider meaning to be the result of the interplay of relations among individual linguistic units in a structure of the system of language. The paper also gives a detailed account of how Saussure's thought the founding-stone of structuralism, pre-figure in those of Bhartṛhari"s pronouncements in his monumental treatise, the *Vākyapadīyam*."

24. ———. 2019. *Bhartṛhari, Structuralism and Poststructuralism*. Delhi: Motilal Banarsidass.

Contents: Preface VII; 1. Vâkyapadîya and (Post)Structuralism 1; 2. Bhartṛhari and Saussure 33; 3. Bhartṛhari and Derrida 77; 4. Bhartṛhari and Lacan 117; 5. Conclusion 149; Appendix 169; Bibliography 175; Index 185-188.

"The convergence of content into being is actually the consequence of the contextual value inscription, which supposedly commences after the valid permutations, authorised by the existing rules and laws of the language in the construction of a textual structure. In a textual form, value is not generated; instead it is configured for having been due upon varied contextual conditions, as in different contexts and relational associations, a linguistic unit hardly stands for the same meaning. That is why, Ferdinand de Saussure observes it to be arbitrary, and Bhartṛhari considers smaller units as 'unreal' before the structure obtained by the authorized permutations of the contents, which for the similar reasons is

viewed as 'erratic' and 'unreal' by Jacques Derrida and Jacques Lacan. But these poststructuralist theoreticians vary from Bhartṛhari in the final resolution of this semantic event, where for Bhartṛhari the forms/structures consecutively emerged bear meanings, and if the event continues, the finally obtained value would be considered 'real' against the forms obtained at different steps. This state, which in Bhartṛhari, is being addressed as final, never arrives in Derrida, and even for that matter in Lacan. Both the theoreticians view the whole process as a chain of endless signification, where each content is constitutive of some other content, and thus, the process attains a state of infinity. Here, the value obtained, being aberration leads to another value, which further directs to some other, and in this way a constant event of perpetual postponement of meaning begins, not to be resolved at any point, while structuralism, like Bhartṛhari, always procures a meaning that can be considered to be final by the authority of the logos, where the process of signification may end for the given conceptual form. In the subsequent pages of the present book, an effort has been made to comprehend the nature of meaning as it is obtained in the views expressed by Bhartṛhari, and European structuralist and poststructuralist theorists so as to establish the nature of affinity between discursive formation inherent upon Indian and Western traditions of thought." (from the *Preface*)

25. Ferrante, Marco. 2013. "Vṛṣabhadeva's Sphuṭākṣarā on Bhartṛhari's Metaphysics: Commentarial Strategy and New Interpretations." *Journal of Indian Philosophy* no. 41:133-149.

    Abstract: "Although somewhat neglected in the scholarly debate, Vṛṣabhadeva's commentary (known as *Sphuṭākṣarā* or *Paddhati,* possibly 8th c. CE) on Vākyapadīya's first chapter, offers a remarkable analysis of Bhartṛhari's views on metaphysics and philosophy of language. Vākyapadīya's first four *kārikās* deal with ontological issues, defining the key elements of Bhartṛhari's non-dualistic edifice such as the properties of the unitary principle, its powers, the role of time and the ontological status of worldly objects. Vṛṣabhadeva's

interpretation of the *kārikās* in question is intriguing and seems to be guided by the urgency to find a solution to the riddle which every non-dualistic theory has to face: how is it possible to postulate a unitary principle of reality when reality is cognized as multiple? In accomplishing the task Vṛṣabhadeva proposes various solutions (some of them based on concepts which are hardly detectable in Vākyapadīya and appear close to the ones propounded in certain trends of Advaita Vedānta), finally suggesting an explanation which, focusing on the pragmatic aspect of language, is altogether consistent with Bhartṛhari's theoretical picture."

26. ———. 2014. "How ro Obtain Salvation Through Language? Bhartṛhari on *śabdapūrvayoga*." *Rivista di Studi Orientali* no. 87 - Supplemento n* 2:161-176.

    Abstract: "Bhartṛhari's *Vākyapadīya* (5th century AD) is a seminal work in the history of Sanskrit grammatical tradition. It offers an original blending of linguistic and philosophical ideas that will have a strong impact in the ensuing history of Indian speculation. Among other issues, the work endorses the idea that language is capable to bring about spiritual consequences that goes far beyond the boundaries of the ordinary experience. In a nutshell, language has a soteriological import. In particular the article deals with a puzzling expression contained in the first chapter of the work — *śabdapūrvayoga* — which seems to embody Bhartṛhari’s peculiar conception of language as a tool for obtaining “salvation”."

27. ———. 2015. "Vṛṣabhadeva on the Status of Ordinary Phenomena: Between Bhartṛhari and Advaita Vedānta." *Journal of Indian Philosophy* no. 43:61-83.

    Abstract: "Vṛṣabhadeva’s *Sphuṭākṣarā,* a commentary on the first chapter of Bhartṛhari's *Vākyapadīya* and its *Vṛtti*, offers a peculiar interpretation of the monistic ideas exposed at the beginning of the *mūla* text. The reflection on the status of ordinary reality and its relation with the unitary metaphysical principle is particularly interesting. Although according to

Bhartṛhari's perspective the entities of the world are real, the *Sphuṭākṣarā* offers a more intricate picture in which different degrees of reality seem involved. Furthermore, the author adopts hermeneutical tools that are unusual in Bhartṛhari's texts, and comparable to those of Advaita Vedānta. In particular, the article will deal with Vṛṣabhadeva's use of the notion of 'inexpressibility' (*anirvacanīyatva*), as well as with other concepts which are typical of the scholastic phase of Advaita. In discussing these affinities the paper will also touch upon the problem of Vṛṣabhadeva's historical collocation."

28. ———. 2017. "Studies on Bhartṛhari and the Pratyabhijñā: The Case of *svasaṃvedana*." *Religions* no. 8:1-25.

    Abstract: "The article addresses a critical problem in the history of South Asian philosophy, namely the nature of the 'knowledge of knowledge' (*svasaṃvedana*). In particular, it investigates how the ´Saiva tantric school of the Pratyabhijñā (10th–11th c. CE) used the notion as an argument against the Buddhists' ideas on the nature of the self. The paper then considers the possibility that the source of the ´Saivas' discussion was the work of the philosopher/grammarian Bhartṛhari (5th c. CE)."

29. ———. 2017. "Bhartṛhari and verbal testimony: a 'hyper-antireductionist' approach?" *Kervan – International Journal of Afro-Asiatic Studies* no. 21:227-246.

    Abstract: "The grammarian and philosopher Bhartṛhari (5th. c. CE) developed a philosophy that is essentially characterized by the prominent role language has in structuring humans' efforts to cope with reality. Within this broader picture, he adopted an epistemological standpoint that was somehow at odds with the standard view of other South Asian thinkers, usually founded on a careful and systematic distinction of the means able to lead to a reliable cognitive event (technically called pramāṇas). Bhartṛhari claimed that such an interpretation is rather artificial, and that a cognition is actually a multifaceted process, whose single components are almost always hard to pinpoint. His main theoretical contribution consists of affirming that

such a multifaceted cognitive act is informed and shaped by language.

The article deals with Bhartṛhari's epistemology by discussing the author's opinion on the nature of testimony. Furthermore, it addresses the question whether pure inference should always be regarded as an accurate way of acquiring knowledge."

30. ———. 2020. "Studies on Bhartṛhari and the Pratyabhijñā: Language, Knowledge and Consciousness." *Journal of Indian Philosophy*:147-159.

    Abstract. "The article examines the impact the grammarian/philosopher Bhartṛhari (460–510) had on the way the 'School of Recognition' (Pratyabhijñā, tenth/eleventh c. CE) elaborated the notion that knowledge and consciousness have a close relationship with language. The paper first lays out Bhartṛhari's ideas, showing that his theses are rationally defensible and philosophically refined. More specifically, it claims that the grammarian is defending a view which is in many respects similar to 'higher-order theories' of consciousness advanced by some contemporary philosophers of mind. In the second part, the paper shows how Utpaladeva and Abhinavagupta adopted Bhartṛhari's scheme without significant alteration."

31. ———. 2020. "The Place of Language in the Philosophy of the Recognition." In *The Bloomsbury Research Handbook of Indian Philosophy of Language*, edited by Graheli, Alessandro, 135-149. New York: Bloomsbury.

    § 4. *The Influence of Bhartṛhari and Pratyabhijñā's Innovations*, p. 142.

    "Bhartṛhari's discussion of the issue [the necessary relationship that obtains between knowledge and language] takes place around a well-known stanza of his Vākyapadīya (VP), the one in which the author claims that language pervades all knowledge. (20) In regard to this, Bhartṛhari holds that the criterion of veridical cognition is causal efficiency.(21)

He maintains that there is no knowledge without a cognitive synthesis that binds together nonconscious cognitions, and that this higher order cognitive synthesis is conceptual and linguistic.(22)" (p. 142, sanskrit in the notes omitted)

(20) 20 VP, 1.131: “In the world there is no cognition without the pervasion of language. All knowledge shines as if pierced by language.”

(21) VP, 1.129: “In the world all that is required to be done is dependent on language. A child too understands it on the basis of the traces of previous births.” See *Vākyapadīya-Vṛtti* on 1.131: “Just like one has a verbal potentiality in a contracted form, similarly no effect is produced by indeterminate knowledge, even if it arises in relation with objects that are [already] known.” And finally VP, 1.135: “Language urges all creatures towards successful activities. If it were to disappear, all this world would appear as unconscious as a piece of wood.”

(22) *Vṛtti* on VP, 1.132: “If knowledge were not by nature linguistic, that very vague cognition that has been produced, being unable to contribute to another cognition, would not function as a means to accomplish the action of knowing. In fact, once there is a cognition of a bare object, whose different parts are not functional to each other and are mutually independent, immediately after comes a unification, a synthesis, the production of a unitary content, that is, the grasping of conjoined capacities as undifferentiated; all this is connected to the linguistic nature of knowledge.”

32. Gajjam, Jayashree Aanand, Kanojia, Diptesh, and Kulkarni, Malhar. 2018. New Vistas to study Bhartṛhari: Cognitive NLP. *World Sanskrit Conference (WSC 2018)*: 1-19.

    Abstract: "The Sanskrit grammatical tradition which has commenced with Pāṇini’s *Aṣṭādhyāyī* mostly as a *Padaśāstra* has culminated as a *Vākyaśāstra,* at the hands of *Bhartṛhari*. The grammarian-philosopher *Bhartṛhari* and his authoritative work ‘Vākyapadīya’ have been a matter of study for modern scholars, at least for more than 50 years, since Ashok Aklujkar submitted his Ph.D. dissertation at Harvard University.[*] The

notions of a sentence and a word as a meaningful linguistic unit in the language have been a subject matter for the discussion in many works that followed later on. While some scholars have applied philological techniques to critically establish the text of the works of *Bhartṛhari,* some others have devoted themselves to exploring philosophical insights from them. Some others have studied his works from the point of view of modern linguistics, and psychology.

Few others have tried to justify the views by logical discussions.

In this paper, we present a fresh view to study *Bhartṛhari,* and his works, especially the 'Vākyapadīya'. This view is from the field of Natural Language Processing (NLP), more specifically, what is called as Cognitive NLP. We have studied the definitions of a sentence given by Bhartṛhari at the beginning of the second chapter of 'Vākyapadīya'. We have researched one of these definitions by conducting an experiment and following the methodology of silent-reading of Sanskrit paragraphs. We collect the Gaze-behavior data of participants and analyze it to understand the underlying comprehension procedure in the human mind and present our results. We evaluate the statistical significance of our results using T-test, and discuss the caveats of our work. We also present some general remarks on this experiment and usefulness of this method for gaining more insights in the work of *Bhartṛhari*."

33. Gajjam, Jayashree Aanand, and Kulkarni, Malhar. 2019. A Novel Outlook for Studying 'Vakyapadiya': A point of Departure. In *Proceedings of Academics World 106th International Conference, Pune, India, 24th - 25th November, 2018*.

    Abstract: "The 'Vākyapadīya' written by ancient Indian grammarian-philosopher Bhartṛhari in the fifth century CE ranks among the principal authoritative works in Sanskrit Grammar. This phenomenal text has been the topic of research for various grammarians, philosophers, philologists, and

linguists since then. While various modern scholars have applied different methods to critically examine the theories stated in the ‘Vākyapadīya’, we propose a novel approach to study them i.e. psycholinguistics perspective. We present the theoretical discussion of the sentence-definitions given in the ‘Vākyapadīya’ along with the experimental design for each of them to analyze them from a cognitive point of view. This preliminary work is the first of its kind of work in Sanskrit grammar and can be considered as a bridge which brings two disciplines together i.e. Sanskrit grammar and the psycholinguistics. The approach in this paper is to provide a point of departure for the researchers working in these two fields. We also present guidelines for the experimental procedure and the methodology that is to be followed. We discuss the caveats of this work and suggest possible future work."

34. Ganguli, Hemanta Kuma. 1963. *Philosophy of Logical Construction: An Examination of Logical Atomism and Logical Positivism in the Light of the Philosophies of Bhartṛhari, Dharmakīrti and Prajñākaragupta*. Calcutta: Sanskrit Pustak Bhandar.

    "The author of the present treatise has tried to view the matter from a new angle of vision. It is perhaps the first attempt of its kind to examine some fundamental tenets of modern positivism in the light of some systems of ancient Indian Philosophy. Bhartṛhari was the greatest theoretician of Nominalistic Idealism as it is understood in Indian Philosophy, and Dharmakīrti the most formidable figure of Yogacara Buddhism, along with his most competent commentator Prajñākaragupta, was perhaps more enthusiastic about the status of the 'pure given' than many among the modern positivists.

    Without entertaining any mission for murdering metaphysics, but with an unsurpassed zeal for hair-splitting analysis, they discussed some basic problems which are still plaguing the minds of the modern positivists, such as, the relation between language and reality, the role of language in shaping human

knowledge, the nature of logical fictions, the status of meaning, the essence of the 'given' and the possibility of its representation in language, and lastly, the problem of verification and contradiction.

They reached their respective conclusions which received from them a full-throated declaration, but which might have also been announced by the modern positivists had they been less afraid of being called metaphysicians or subjective idealists. These ancient philosophers might have been right or wrong, but they were at least more consistent than most of the modern positivists. This is the matter in the main that I have attempted to show in this book." (*Introduction*, pp. IV-V)

35. Haag-Bernede, Pascale. 2001. "Conflicting Views in the Interpretation of Bhartṛhari? The Case of *Madhyamapurusa* in the *Vākyapadīya*." *Annals of the Bhandarkar Oriental Research Institute* no. 82:233-242.

"This paper aims to draw attention to a problem of interpretation in the *Purusasamuddeśa* (PS), which is the 10th chapter of the *Praklrnakanda*, the third part of the Vākyapadīya (VP). This *samuddeśa* is one of the shortest chapters of the whole work, as it contains only nine *kãrikãs*. The PS can be divided into three parts: the first three *kãrikãs* deal with the meanings of the three persons (*prathama*, *madhyama* and *uttamapuruṣa*). The first *kãrikã* establishes that *uttamapuruṣa* expresses the state of *pratyañc*, that is to say, according to Helārāja's commentary, the ego-sense, or the individual soul. *Madhyamapuruṣa* expresses the state of being different from that *pratyañc* (*parabhāva*). The second and third *kãrikãs* state that these two persons alone are able to convey the meaning of *caitanya*, "consciousness", whereas *prathamapuruṣa* in the remaining cases (i.e. when the meaning of *caitanya* by the verbal-ending). The second part is devoted to one special feature of the second person: some hold that the sense of (*sambodhana*) is always understood when the verbal-is used. This question is discussed in three *kãrikãs* (be dealt with in the present paper. The third part of the last three *kãrikãs*, does not actually concern the but constitutes a general

statement about the interpretation rules. The above mentioned problem lies in the last *kãrikã* section, which I find difficult to interpret: it appears the quotation of another view by Bhartṛhari, or his refutation view." (pp. 233-234, notes omitted)

    "The apoha-theory which aroused much controversy concerning the meaning of the word among the Indian philosophers in the classical period was first expounded by Dignāga in his Pramāṇasamuccaya. The fifth chapter of this comprehensive work, which is devoted to the elucidation of the apoha theory, begins with the following verse [*Sanskrit omitted*]:(1)

    That [means of cognition] which is based on word is not an [independent] means of cognition other than inference. Because [the word as the basis of] it expresses its own object through the exclusion of the other [things], just as [the inferential mark] '*krtakatva*' or the like [establishes the object to be proved through the exclusion of what is not a possessor of that inferential mark].

    As is clear in this verse, the function of a word is recognized by Dignāga as identical with the function of a *linga* (inferential mark) in the process of inference." (p. 61)

    (...)

"It is to be noted that pratibhd is recognized in this statement as the meaning of the sentence. The concept of pratibhd is of great importance in the philosophy of word and meaning of the grammarian-philosopher Bhartṛhari.

In the Vākyakāṇḍa of the Vākyapadīya, Bhartṛhari sets forth his doctrine of pratibhā in some verses, beginning with: [*Sanskrit omitted*](8)

When the meanings [of the words in a sentence] are understood by separating [the words from the sentence], there arises pratibhā which is different [from the meanings of the words]' That [pratibhā] effected by the meanings of the words is called the meaning of the sentence." (p. 63)

Reprinted in Roy W. Perrett (ed.), *Indian Philosophy. A Collection of Readings: Vol. 2. Logic and Philosophy of Language*, New York: Routledge 2001, pp. 311-327.

"Assuming that many things in our experience and in the world can be named, one may consider whether there are any limits to this process, and whether there are any things which cannot be named. This was a standing question in traditional Indian philosophy, with some schools of thought affirming that everything could be named while others denied it. The

affirmative position was especially characteristic of the Nyaya-Vai§esika school:(1)

"Naiyāyikās are fond of a saying, which is sometimes found at the head of their works: whatever is, is knowable and nameable".

The negative position was characteristic of the Buddhist philosophers and may have been held by others as well. In its most general terms it may be formulated by an existential statement:

Unnameability Thesis: There are some things which are unnameable.

While it may be surprising and to some extent counter to commonsense, this unnameability thesis belongs to the theory of language and should be subject to rational inquiry. But perplexities arise as soon as one tries to verify it by positive instances, for any positive instance of the unnameability thesis seems bound to name that which it declares to be unnameable. This is the problem we call "Bhartṛhari's paradox", after the fifth century grammarian and philosopher of language, who clearly enunciated it in his *Vākyapadīya*." (p. 311 of the reprint)

(1) See K. Potter, 1977, p. 48. Further discussion is to be found in K. Potter, 1968, which also describes a contradiction having some affinity with Bhartṛhari's paradox, but arising within a rather different philosophical context.

39. Herzberger, Radhika. 1986. *Bhartṛhari and the Buddhists: An Essay in the Development of Fifth and Sixth Century Indian*

Thought. Dordrecht: Reidel.

"The Vākyapadīya of Bhartṛhari and the Pramāṇasamuccaya of Dignāga(*) are seminal texts in the history of ancient Indian philosophy. One text deals with grammar, the other with logic, both are the work of committed metaphysicians. Written within a span of less than a hundred years, between the fifth and the sixth centuries A.D., these texts have generally been treated separately, as representing independent schools of thought.

This essay attempts to interpret these texts jointly, as a dialogue between a grammarian and a logician. This way of approaching these texts highlights unexpected facets of Bhartṛhari and Dignāga's theories of language and is intended to identify the individual achievements of each. Above all, this treatment is an exercise in writing the intellectual history of a period in time, rather than a history of a school of philosophy.

The prevailing view of Bhartṛhari holds that his linguistic techniques are not intrinsic to his metaphysics. The conclusions reached in the present essay are that Bhartṛhari's metaphysics underlie his linguistic techniques and articulate their presuppositions.

The prevailing view of Dignāga maintains that for him language deals with illusory entities and must falsify what is real. The conclusions reached in the present essay are that Dignāga's logical rules are designed to ensure that in using language one is not committed to a belief in fictional entities." (from the *Preface,* p. IX)

(*) *Note*: I follow the current practice of spelling the logician's name Dignāga rather than Dinnāga.

40. ———. 1986. "Apoha and Śimśapāvrksa." In *Buddhist Logic and Epistemology: Studies in the Buddhist Analysis of Inference and Language*, edited by Matilal, Bimal Krishna and Evans, Robert D., 143-169. Dordrecht: Reidel.

"... I shall try in the course of this paper to identify the philosophical problems that Dinnaga's *apoha* doctrines were designed to solve, and to locate the problem so identified within

a historical frame of reference; a part of my overall concern will be to articulate the relevant philosophical issues in universally recognizable terms.

The major theories regarding names can be identified as predating Dinnaga's writings on *apoha*: the first can be traced to Bhartṛhari, a philosophical grammarian belonging to the fifth century A.D. whose name ancient tradition associated with that of a celebrated poet: the second is attributed to Katyāyana, a grammarian who belonged to the second or third century B.C. My attempt in this paper will be to find a place for Dinnaga's *apoha* doctrines within the tensions arising between Bhartṛhar's and Katyāyana's theories." (p. 143)

41. Ho, Chien-hsing. 2006. "Saying the Unsayable." *Philosophy East and West* no. 56:409-427.

    Abstract: "A number of traditional philosophers and religious thinkers advocated an ineffability thesis to the effect that the ultimate reality cannot be expressed as it truly is by human concepts and words. However, if X is ineffable, the question arises as to how words can be used to gesture toward it. We can't even say that X is unsayable, because in doing so, we would have made it sayable. In this article, I examine the solution offered by the fifth-century Indian grammarian-philosopher Bhartrhari and develop it into a linguistic strategy based on the imposition-cum-negation method. The purpose is to show how we can non-contradictorily say, or rather indicate, the unsayable."

42. Ho, Cheh-hsing. 2014. "Meaning, Understanding, and Knowing-what: An Indian Grammarian Notion of Intuition (*Pratibhā*)." *Philosophy East and West* no. 64:404-424.

    "For Bhartṛhari, a fifth-century philosopher of the Indian Grammarian (Vaiyākaraṇika) school, all conscious beings — beasts, birds and humans — are capable of what he called *pratibhā*, a flash of indescribable intuitive understanding such that one knows what the present object “means” and what to do with it. Contemporary scholars writing on pratibhā generally translate the Sanskrit term as “intuition,” not in the sense

understood by many analytical philosophers as an a priori judgment appealed to in thought experiments to test philosophical hypotheses, but in the sense of a spontaneously arising awareness that is immediate, reliable, indescribable, and pregnant with meaning. Significantly, our instantaneous understanding of a sentence or complete utterance already counts as an instance of pratibhā. Given that to understand a sentence is to know its meaning, such an understanding, if correct, amounts to a mode of knowing that may best be termed knowing-what, to distinguish it from both knowing-that and knowing-how.

This essay attempts to expound Bhartṛhari's conception of pratibhā in relation to the notions of meaning, understanding, and knowing laid out in his magnum opus, the Vākyapadīya (henceforth VP).(1) The conception is philosophically intriguing and contemporarily relevant. Yet, it has not hitherto been subjected to a systematic analytical philosophical treatment.(2) Here, I hope to fill this lacuna." (p. 404)

(1) For a critical edition of the Sanskrit text of the *Vākyapadīya*, see Rau 1977. Verse numbers in the present article are given according to that edition.

(29 Bhartṛhari's presentation of the topic is laconic and requires hermeneutic elucidation, for which one may refer to Subramania Iyer 1982, Tola and Dragonetti 1990, and Akamatsu 1994. However, the approach of these works is more philological than philosophical. Readers may also consult Coward and Raja 1990 for discussions of the relevant issues in the Grammarian school.

"Bhartrhari, a grammarian-philosopher, is well known as the upholder of the view that a sentence is an indivisible unit (*akhandavākyavāda*).

According to him, it is not the word (*pada*) but the sentence (*vākya*) that really conveys the meaning in our verbal communication; the meaning of the sentence (*vākyārtha*) is pratibhā. The word pratibhā is usually rendered as 'intuition', 'flash of insight', 'flash of understanding', 'instinct' and so on. These renderings are not able to give us an accurate understanding of pratibhā; rather, they are very misleading. The pratibhā Bhartrhari considers to be the sentence-meaning is properly the cognition by which all its constituent word-meanings are unified into an integrated whole and in which they are connected with one another through the qualificand-qualifier relation (*viśesanaviśeyabhāva*)." Bibliography (Studies in English) Hou-Oet

1. Houben, Jan E. M. 1990. "The Sequencelessness of the Signifier in Bhartṛhari's Theory of Language." *Indologica Taurinensia: Official Organ of the International Association of Sanskrit Studies* no. 15-16:119-129.

   "Since J. Brough's article *Theories of General Linguistics in the Sanskrit Grammarians*, TPS, 1951, pp. 27-46 and K. Kunjunni Raja's, *Indian Theories of Meaning*, Madras, 1963, it is habitual in the study and interpretation of the concept of śabda in Bhartṛhari's Vākyapadīya (short: VP) or Trikāṇḍī(1) to refer to de Saussure's theory of the sign, or to use a saussurean terminology(2). But what we still miss is a systematic comparison between the two philosophies of language. In this paper I want to give a small contribution to such a comparison.

   A systematic comparison of Bhartṛhari with especially de Saussure is useful, because de Saussure expresses by way of the *Cours de Linguistique Générale* (Course in General Linguistics) many ideas that still form to a considerable extent the methodological basis of modern linguistics." (p. 119)

2. ———. 1992. "Bhartṛhari's *Samaya* / Helārāja *Samketa*: A Contribution to the Reconstruction of the Grammarians' Discussion with the Vaiśeṣikas on the Relation between 'śabda' and 'artha'." *Journal of Indian Philosophy* no. 20:219-242.

"In the Saṃbandhasamuddeśa (VP book 3, chapter 3) Bhartṛhari uses the word *samaya* in a discussion of the relation between *śabda* (word) and *artha* (meaning or object)(1) (VP 3.3.31cd). It is used by the Vaiśeṣikas and Naiyāyikas to explain that an *artha* is understood from a *śabda*, and it may usually be translated as 'convention'. The relevant sūtra of the Vaiśeṣikas(2) is *sāmayikaḥ śabdād arthapratyayaḥ* according to two of the three main recensions of the *Vaiśeṣika Sūtra* (VS (1) 7.2.24 and (3) 7.2.20) corresponding to *sāmayikaḥ śabdārthapratyayaḥ* in the other recension (VS (2) 7.2.24). Both versions of the sūtra may be translated as: "The

understanding of an *artha* from a *śabda* is based on *samaya*, 'convention'."

(1) The fact that *artha* may mean 'linguistic meaning' as well as 'concrete object' makes it impossible to adopt a single translation for this word. In general, Bhartṛhari and the grammarians would tend to accept *artha* in the first place as 'linguistic meaning' and the Vaiśeṣikas in the first place as a 'concrete object' or 'really existing entity', but for both groups the other meaning cannot be neglected. Similarly, it is not without importance that *śabda* is for the Vaiśeṣikas also 'sound' in general, thought of mainly as a *guna* 'quality' of *ākāśa* 'space' (at least since the classical period inaugurated by Praśastapāda). In the context of language *śabda* may refer to a sentence, a word, or a phoneme. Since the third book of the VP is devoted to problems relating to words and their meanings, the translation 'word' for *śabda* is here quite appropriate.

(2) In the course of this article several ideas will be attributed to the Vaiśeṣikas on the basis of some of their sūtras. Because the origins of the Vaiśeṣika-system and its sūtras are so much shrouded in darkness (e.g. Matilal, 1977: 53—62), this should imply no more than that the Vaiśeṣikas (or some of them) apparently supported these ideas at some stage in their evolution, but in any case at the time of Bhartṛhari's literary activity. It should be noted, however, that the sūtras referred to here do not seem to belong to the oldest kernel of the *Vaiśeṣika Sūtra*. They belong to a passage (sūtras 7.2.14—20 in VS (3)) which looks very much like an insertion, as was already noted by Faddegon, 1918: 29. Faddegon (*loc. cit.*) described the passage as: "Polemics on the relation between word and meaning against the Mīmāṃsākas," and added that "this passage is inserted, in a forced way . . ." Finally, the date of Bhartṛhari ("Bhartṛhari lived no later than the fifth century A.D.", Cardona, 1976: 299) makes it very likely that several important old Vaiśeṣika-texts of which we know only the names (cf. Matilal, 1977: 59—62) were still available to him.

3. ———. 1993. "Bhartṛhari's Perspectivism (3): on the structure of the third Kāṇḍa of the Vâkyapadîya." *Sambodhi*:1-32.

Abstract: "The present article is part 3 in a series on “perspectivism” in the philosophy of language of the grammarian-philosopher Bhartṛhari (India, early fifth century C.E.). It is part 3 in the sequence in which the series is meant to be read, although it is the one which was published before all others, in 1993, in volume XVIII of the journal *Sambodhi* of the L.D. Institute of Indology, Ahmedabad (edited by J.B. Shah and N.M.Kansara) pertaining to 1992-1993. The discussion in this article is parallel to pp. 81-122 and pp. 132-134 ofThe *Saṁbandha-samuddeśa* (chapter on relation) and Bhartṛhari's philosophy of language (Houben 1995b). Parallel means: the discussion in this article contains less and more, it is more compact and more focused on“perspectivism” as the guiding principle in the structuring of the Third Kāṇḍa of the Vākyapadīya, esp. regarding the 13 Samuddeśas preceding the final Vṛtti-samuddeśa (on the structure of which see pp. 123-131 in Houben 1995b). Other articles in the series of studies on “perspectivism” in the philosopy of language of Bhartṛhari appeared in 1994, 1995 and 1997."

4. ———. 1994. "[Bhartṛhari's Perspectivism (4):] Bhartṛhari's familiarity with Jainism." *Annals of the Bhandarkar Oriental Research Institute* no. 75:1-24.

"In comparison with many authors of Indian philosophical texts, is remarkably non-polemic. His attitude, both in the Mahābhāṣya-Dipikā and in the Vākyapadīya, may be described

not only as 'encyclopedic' in the sense that he seems to be eager to discuss all important views on a certain subject, but also as 'perspectivistic' in the sense that he seems to acknowledge that each view represents a possible and in its own theoretical context valid perspective.(1) Different views are enumerated and contrasted, and sometimes positively or negatively reassessed, but hardly ever fully rejected.(2) Bhartṛhari refers to the different views in a very concise way, and for modern students of his works the precise identity of those who held the views remains often unclear. Of those (apart from grammarians, and authors of Šikṣā and Nirukta) whose views Bhartrhari frequently takes up for discussion, K. A. Subramania Iyer has mentioned Vaiśeṣikas, Mīmāṃsākas, Sāṃkhyas and Buddhists (Iyer, 1969 : 72). Iyer has not mentioned the Jainas, and one may wonder whether they remained outside the scope of Bhartṛhari's encyclopedic approach. This, however, is not the case. Bhartṛhari is aware of Jaina philosophers and refers to them explicitly in at least one place ia the Mahãbhãsya-Dípikã. Other passages in the Mahãbhãsya-Dípikã and Vākyapadīya are remarkably well compatible with Jaina ideas. They may have been intended as references to their views, although their name is not explicitly mentioned." (pp. 1-2)

(...)

"In this paper, without aiming completeness, I will discuss a few indications and possible indications of Bhartṛhari's familiarity with Jainism in the Mahābhāṣya-Dipikā (MBhD) and Vākyapadīya (VP), including two places in VP Kāṇḍa 2 which seem to refer to a technicality in Jainendra-vyākaraṇa. This would show that Bhartṛhari was not only familiar with the Jaina doctrines, but also with their literature in the field of grammar. Finally, in the concluding section I will mention some possible implications of Bhartṛhari's familiarity with Jainism for our understanding of Bhartṛhari's perspectivism and his philosophy of language."

1 See my article, "Bhartṛhari's Perspectivism (1) : The Vṛtti and Bhartṛhari's Perspectivism in the first Kãnja of the

Vākyapadīya" for a provisionary discussion of Bhartṛhari's perspectivism. I hope to discuss it in a philosophically more comprehensive way in a future article.

2 Cf. Houben, 1992 : 23-24. K. A. S. Iyer speaks of Bhartrhari's "spirit of accommodation "(K. A. S. Iyer, *Bhartṛhari, a Study of the Vākyapadīya in the light of the ancient commentaries*, Poona, 1969; 75-82).

5. ———. 1994. "Early Indian Authors and Linguistic Change (Postscript ot Bhartrhari's Familiarity With Jainism)." *Annals of the Bhandarkar Oriental Research Institute* no. 75:255-279.

   "I am very gratrful to Professor A. Wezler (Hamburg) and Dr. Ch. Werba (Vienna) to have pointed out to me that the problems discussed in sections 1. 2. 1 - 1. 2. 6 of my article " Bhartrhari's perspectivism (4) ; Bhartrhari's familiarity with Jainism " have also been addressed, in a different context, by Eivind Kahrs in an article entitled "What is a *tadbhava* word?" (*Indo-Iranian Journal* 35 (1992 : 225-249). The passages cited by me in these sections are also cited by Kahrs. It is Kahrs' purpose to find out what the term *tadbhava* (usually referring to Prakrit words derived from Sanskrit words, as opposed to those similar to them, *tatsama*, and regional or deśī words) must have originally meant in the context of Indian thought about language." (p. 255)

6. ———. 1995. "Bhartṛhari's Solution to the Liar and Some Other Paradoxes." *Journal of Indian Philosophy* no. 23:381-401.

   "Fully aware of these modern developments and inspired Bhartṛhari's treatment of paradoxes in Bhartṛhari's Vākyapadīya (VP), especially in the Saṁbandha-samuddeśa,(2) Hans and Herzberger have presented a lucid exposition of what "Bhartṛhari's paradox' (Herzberger and Herzberger, 1981), special kind of paradox involving self-reference. But the under discussion contains also (see kārikā 25) nothing than the classical 'Liar paradox' ("everything I am saying otherwise known as the paradox of Epimenides the Cretan "All Cretans are liars"). In our view, what is of special the Saṁbandha-samuddeśa, passage, is not so much that adds a new member to

a well-known family of paradoxes, he provides us with the key to an interesting and elegant to them. It would probably prove worthwhile to go deeper implications for modern treatments of these paradoxes, place we will focus on the interpretation of the relevant their own context. Before turning to the kārikās themselves, review some discussions and interpretations of the passage previous works and articles.(3)" (p. 382, a note omitted)

(2) The Saṁbandha-samuddeśa is the third Samuddeśa of the third Kānda of Bhartrhari's Vàkyapadïya (short: VP). I will refer mainly to Wilhelm Rau's edition for the kārikās (Rau, 1977), and to Iyer's edition for Helâràja's commen tary Prakïrnaka-Prakâsa (Iyer, 1963).

7. ———. 1995. *The Sambandha-samuddeśa (Chapter on Relation) and Bhartṛhari's Philosophy of Language*. Groningen: Egbert Forsten.

"The themes of the Sambandha-samuddeśa pervade the entire third Kāṇḍa and even the whole of the VP. Because of Bhartṛhari's perspectivism, and his awareness of the limits of philosophical and theoretical discourse (cf. above, section 2), it is of the utmost importance never to lose sight of the place a certain passage occupies in a larger argumentative complex. To provide material for this, much more is needed than just a translation of the kārikās with Helārāja's commentary. Moreover, a very critical attitude towards Helārāja's commentary is indispensible. By taking other parts of the VP into account, it is to some extent possible to check Helārāja's interpretations. Usually this leads to a justitication of Helārāja's views, occasionally they turn out to be questionable.

The approach sketched above determines the form of the present work.

After this Introduction about Bhartṛhari and the Vākyapadīya, the body of the work is formed by three parts: (1) A discussion of *sambandha* in some early Indian traditions and in Bhartṛhari's philosophy of language; (2) A discussion of the third Kāṇḍa and the immediate context of the Sambandha-

samuddeśa; (3) The Sambandha-samuddeśa, translation and discussion of the kārikās. Finally, in an appendix, Helārāja's commentary on the Sambandha-samuddeśa will be given in translation. (In this organisation of the work it was unavoidable that the kārikās of the Sambandha-samuddeśa be given (at least) twice: once in part 3 with my own discussion, once in the appendix with Helārāja's comments.)" (p. 27)

8. ———. 1995. "Bhartṛhari's Perspectivism (2): Bhartṛhari on the Primary Unit of Language." In *History and Rationality: the Skoevde Papers in the Historiography of Linguistics*, edited by Dutz, Klaus D. and Forsgren, Kjell-Åke, 29-62. Münster: Nodus Publikationen.

   "As for its subject matter, the present article is to be studied in tandem with the conceptual and theoretical Introduction to the Sanskrit tradition of linguistic and semantic thought in J.E.M. Houben, "The Sanskrit Tradition," in: *The Emergence of Semantics in Four Linguistic Traditions* (by W. van Bekkum, J.E.M. Houben, I. Sluiter, and K. Versteegh): 49-145. Amsterdam: John Benjamins, 1997, esp. section 2 "Terminology" (pp. 56-61)." Additional note (30 January 2018).

   "According to Saussure, "the linguistic entity is not accurately defined until it is delimited, i.e. separated from everything that surrounds it on the phonic chain" (Saussure 1916: 145 [103]). However, what are the units to be isolated? The question is important, pragmatically, for anyone trying to learn an entirely new language from the speakers of that language. And it is of crucial theoretical importance for anyone setting out to describe, analyse and study a language." (pp. 29-30)

   (...)

   "The view of the grammarian-philosopher Bhartrhari (India, ca. 5th century C.E.) on this problem has been described in 1951 by John Brough in a pioneering article as follows: "In Bhartrhari's view, then, the primary linguistic fact is the undivided sentence-sphoṭa. Just as a bare root has no meaning in the world, so also the meanings of individual words are merely hints or stepping stones to the meaning of the sentence." (Brough 1951: 45-46)." (p. 30)

(...)

"Unfortunately for the lovers of pure and simple, well-defined ideas, and fortunately for the lovers of major intellectual challenges, the Vākyapadīya is a difficult work with an extremely complex argumentative structure."

(...)

Those who expect on the basis of the indications by Punyaraja, Brough, Robins, Siderits and others to find in the *VP* a straightforward exposition and defence of the idea that the sentence is the indivisible unit of language will be somewhat surprised when they are confronted with the text of the *VP*." (p. 32)

(...)

"Yet, there is perhaps another way to make Bhartṛhari's exposition more perspicuous and I will attempt to follow this way in the present paper. I will focus not on the details of the exposition and description of theories in the sequence in which we find them in the text, but I will try to see what arguments Bhartṛhari uses to evaluate different theories on the sentence and the word. We will see that the types of argument used are very limited in number and by focusing on these we can perceive, in spite of all difficulties, a comparatively clear plan at the basis of the extremely complex exposition in the second book of the *VP*." (p. 33)

9. ———. 1996. "Socio-linguistic Attitudes Reflected in the Work of Bhartṛhari and later Grammarians." In *Ideology and Status of Sanskrit: Contributions to the History of the Sanskrit Language*, edited by Houben, Jan E. M., 157-193. Leiden: Brill.

"In this paper I will first discuss some aspects of the sociolinguistic context in which the Sanskrit grammarians, and especially Bhartṛhari, the grammarian-philosopher of ca. the 5th century C.E., were working, and

next study in the light of this context the statements Bhartṛhari and some of his interpreters made regarding Sanskrit and its relation to non-Sanskrit. Although, as someone with a philological training, I believe

that one should let the texts speak for themselves as much as possible, I also agree with Popper that all knowledge is theory-impregnated.(1)

At some point it is always necessary to reflect on the scope and limits ofthe theories with which we approach a text. Acts and utterances to which our texts refer are understood in a social and sociolinguistic

context. This context is to be reconstructed on the basis of (1) the incomplete and often problematic data available for the period; and (2) unavoidably, either intuitively or methodicaly, some theories and concepts

are brought in to organize the data and to predict aspects of the situation about which no direct information is available." (pp. 157-158)

(1) Popper [*Objective Knowledge. An Evolutionary Approach*. London: Oxford University Press] 1972:104-105: "Since all knowledge is theory-impregnated, it is all built on sand; but its foundations can be improved by critically digging deeper; and by not taking any alleged 'data' for granted."

Halbfass on Indian and Cross-cultural Studies*, edited by Preisendanz, Karl and Franco, Eli, 317-358. Amsterdam: Rodopi.

[*Bhartṛhari's Perspectivism* (6) is in French].

"The present article is part 1 in a series on "perspectivism" in the philosophy of language of the grammarian-philosopher Bhartṛhari (India, early fifth century C.E.). It is part 1 in the sequence in which the series is meant to be read, although it appeared later than the other articles which appeared in 1995, 1993 and 1994.

These articles are to be studied in tandem with another series of articles, on "Bhartṛhari's Vākyapadīya and the Ancient Vṛtti", of which three parts appeared between 1997 and 1999.! Additional note (22 December 2017)."

"There is a simple principle which pervades the whole of the Vākyapadīya (short: VP, which will usually mean in this article: the *Vākyapadīya-kārlkās*, or VP-*kārlkās*).1t is reflected in its structure from beginning to end, and finds sometimes more explicit expression in specific *kārlkās*s, The principle is that, in a very fundamental way, the validity of different perspectives is accepted. Throughout the Vakyapadiya, different viewpoints are discussed in their mutual opposition and complementariness. Sometimes the viewpoints are simply enumerated.

Sometimes Bhartṛhari adds a statement of what would be acceptable from two opposed points of view. Sometimes he has an undeniable preference for one view or the other. And sometimes he seems to develop his own view by integrating the opposed views of other thinkers. But even if he prefers one view or develops a new synthesis, others are not totally discarded. His preferences are generally pronounced against the background of a relativizing attitude. With this approach Bhartrhari differs from the familiar, more openly polemic approach in Indian philosophical works in which other systems are unequivocally refuted and one's own system is defended." (pp. 317-318, notes omitted)

11. ———. 1997. "Bhartṛhari's Vākyapadīya and the Ancient Vṛtti (2): The Vedic background of the author of the Vākyapadīya-Vṛtti " *Studien zur Indologie und Iranistik* no. 21:71-77.

12. ———. 1997. "Bhartṛhari's Vākyapadīya and the Ancient Vṛtti (3): On syntactic and stylistic evidence regarding the authorship of the Vākyapadīya-Vṛtti " *Wiener Zeitschrift für die Kunde Südasiens* no. 43:167-197.

"With Iyer (1965 and 1969) and Aklujkar (1972 and 1993b) arguing for the identity of the Vākyapadīya (VP)-Kārikā-author and the Vṝtti-author (the 'single authorship thesis'), and Biardeau (1964) and Bronkhorst (1988 and 1991a) for différent authors (the 'separate authorship thesis'), the issue of the authorship of the VP-Vṝtti can be considered to be still open. (1)" (p. 167)

(...)

"In what follows we will discuss first (sections 2-4) the arguments brought forward by A. Aklujkar in 1972 and refer to Bronkhorsts criticism and Aklujkar's answers. Next, we will discuss a few other stylistic arguments which have played a rôle in the discussion so far, and draw attention to some aspects and additional points which have been largely neglected so far. These may give a décisive turn to our final judgment." (p. 169)

(...)

"While the argument developed in this article is greatly the discussions in the main studies referred to, we had to reject especially some of the conclusions of Aklujkar 1972. In a future article in this séries, I hope to demonstrate that this study was nevertheless right in rejecting the great différence in time and doctrine Biardeau 1964 suspected to exist between the VP-*kārikās* (even if there are indeed some diverging trends in these two works; cf. Houben 1996 and 1997a). Without claiming that it can be proven beyond any doubt, I contend that all this suits perfectly and naturally the historical hypothesis (HH) which has been formulated in the first article of this series,(45 but which may be repeated here for the convenience of the reader:

HH The Vṝtti on the first two Kārikās was written by a close follower of Bhartṛhari (author of BhD [Mahābhāṣya-Dīpikā] and VP-kārikās), e.g. a direct pupil of his, who finalized his

commentary not long after Bhartṛhari finished the VP-kārikās (three Kārikās), and who explained Bhartṛhari quite honestly and faithfully, although hedoes have his own intellectual character which shows in a few diverging trends in the Vṝtti as compared to the kārikās (and MBhD)." (p. 192)

(1) Cf. Torella 1994: XXV n. 36, who "provisionally accept[s] the thesis of identity". The most important early formulation of the VP-Vṝtti-authorship issue can be found in Shastri 1934: Introduction (cf. also id. 1930).

9: Bhartṛhari’s discussion of linguistic and semantic theories: major issues and parameters, pp. 110-119.

"Bhartṛhari, who became famous with his Vākyapadīya, has also been credited with another work, viz. the *Mahābhāṣya-Dīpikā* or “light on the Mahābhāṣya”. It is a subcommentary on Patañjali’s Mahābhāṣya (Great Commentary) on Pāṇini’s grammar. Because it is the earliest commentary (partly) available on Patañjali’s *Mahābhāṣya* which has greatly influenced later major exponents of the Pāṇninian tradition like Kaiyaṭa and Nāgeśa, this text is of considerable importance. Unfortunately, the work is available only in a single, incomplete manuscript." (p. 110)

14. ———. 1998. "Bhartṛhari's Vākyapadīya and the Ancient Vṛtti (1): The Vṛtti and Vṛṣabhadeva's Paddhati on Vākyapadīya 1.46a *atmabhedam / atmabhedas ...*" *Annals of the Bhandarkar Oriental Research Institute* no. 78:177-198.

"I first started to doubt siagle authorship of kãrikãs and Vṛtti in 1987, when I discovered a passage in the Vṛtti which rather clearly refers to two different versions of the kãrikã (VP. 1. 46a *ãtmabhedam / ãtmabhedah*). For Charudeva Shartri, a strong argument to accept the Vṛtti as the work of Bhartṛhari in spite of some difficulties was that there would be no mention of different readings of the kãrikãs. As other commentaries which are known to stem from a later period frequently do mention different readings, a mention of a different reading would have been a strong indication that the Vṛtti was indeed written after the kãrikãs and by a different author.(6) Because two recent references to this small but important Vṛtti-passage have not yet taken into account all relevant material (Vṛṣabhadeva, for instance, has been largely neglected(7)), and because the evaluation of the passage was quite divergent - Bronkhorst (1988) accepted it as an argument for the 'separate authorship' thesis(8) ; Aklujkar (1993) has sought to explain according to the "single authorship" thesis(9) - it deserves to be studied here in some detail.

This should form the beginning of a series of articles, in which I plan to discuss all main arguments used so far in support of either one of the two theses." (p. 179)

(6) Charudeva Shastri in the Introduction (*Upodghātah*) to his edition of the first Kāṇḍa of the Vākyapadīya and Vṛtti: *etasmin vrttigranthe naikam apt kārikāsu pāthāntaram upāttam / tad api nāma balīyah pramānaṁ tasya ca kārikānāṁ ca samānakartṛkatāyām* // (*Upodghātah*h P. 17). Biardeau (1964:4) accepts Charudeva Shastri's statement that the Vṛtti does not refer to different readings for the kãrikãs but does not consider it a sufficiently strong argument to accept 'single authorship' Iyer 1969 : 19 mentions the point again as an argument in support of 'single authorship'.

(7) Only Aklujkar 1993 : 49 note 9 briefly refers to this subcommentator on kārikās and Vṛtti of Kāṇḍa 1.

[= Bhartṛhari's Vākyapadīya and the Ancient Vṛtti (4) = Vākyapadīya's Perspectivism (5)].

"The (Vâkyapadïya) VP, as well as the other important work by Bhartṛhari (ca. 5th cent. C.E.), the MBhD (Mahãbhãsya-

Dlpikã), testify to a rich and mature tradition of reflection on language, meaning and grammar. The same can said of the ancient commentary on the first two books of the VP, the Vṛtti, which is very close to both the VP and the MBhD in the treatment of its subject. The MBhD, the VP, as well as the Vṛtti, frequently refer to the views of different thinkers or groups of thinkers with regard to the numerous issues that are taken up for discussion. Scholars generally agree on the monumental importance Bhartrhari as a grammarian and philosopher. However, it is possible to estimate his real place in Indian philosophy of grammar and language, his own contributions and possibly the developments in his thought, only against the background of his contemporaries, near contemporaries and immediate predecessors. Not only the grammarians are to be taken into account, but also the representatives of different schools of thought in Bhartrhari's time, such as Vaiśeṣika (cfr. Bronkhorst 1993, Houben 1992), Mīmāṁsā (cfr. Bronkhorst 1989), the Jainas (cfr. Houben 1994), and Buddhist schools (cfr. Ruegg 1959:57-93, Lindtner 1993).

Unfortunately, it is often very difficult to decide precisely which persons and texts precede Bhartṛhari and which follow. Some important texts which we know existed and were probably known to Bhartrhari are now irretrievably lost. In the present article, the focus will be on Bhartrhari's predecessors and contemporaries among the grammarians, especially on one «respectable grammarian» to whom Bhartrhari sometimes refers. For information about this respectable grammarian and his colleagues we depend largely on Bhartrhari's own works, and on the Vṛtti." (pp. 101-102, two notes omitted)

§ 5. Bhartṛhari on language and thought, pp. 149-150.

"Thus, in numerous philosophical schools (not only Buddhist, but also Jaina and Brahminical), problems concerning language and thought posed themselves, but the first extensive treatise in which language and its relation with thought is not a side issue but a major one, can be found not earlier than in the Vākyapadīya , the mature and comprehensive work on semantics, linguistics, and philosophy of language, of the Brahminical grammarian-philosopher Bhartṛhari (5th century CE).

Bhartṛhari’s work can be seen as a systematic investigation of the presuppositions and basic notions and categories of the

grammar composed by Pāṇini (ca. 4th century BCE) and amended and annotated by later grammarians, notably Patanjali (ca. 2nd century BCE). In his investigation, Bhartṛhari takesa grammatical category, for instance ‘time’, ‘gender’, ‘number’ etc., and confronts it with the diverging conceptions of time etc. in the major philosophical schools with which he was familiar. Bhartṛhari’s attitude to the various views is generally non-committal: we find him often engaged in demonstrations of the compatibility of Pāṇinian notions, categories and presuppositions with those of quite diverging philosophical schools and systems.

At the same time, we do see arise certain ‘own’ philosophical positions, or at least preferences, from Bhartṛhari’s careful discussions of the views of different schools." (p. 149)

17. ———. 2007. "Ṛgveda 1.164.23-24 and Bhartṛhari's Philosophy of Language." In *Expanding and Merging Horizons: Contributions to South Asian and Cross-Cultural Studies in Commemoration of Wilhelm Halbfass*, edited by Preisendanz, Karl, 711-719. Wien: Verlag der Österreichischen Akademie der Wissenschaften.

"In a rich and insightful paragraph on Bhartṛhari and the Veda, Wilhelm Halbfass remarked that "Bhartṛhari oes not draw a strict border between the uncreated Veda and the traditions of human thought and exegesis" (Halbfass 1991:37). Nevertheless, we find that there is a significant contrast between the way the grammarian and philosopher Bhartṛhari deals with these two types of texts. He frequently supports his discussion with precise references to the traditions of human thought and exegesis – first of all the Pāṇinian grammatical tradition, but also various philosophical schools in his time (Mīmāṁsā, Vaiśeṣika, buddhist schools). However, it is only to exemplify grammatical points and not on account of the thoughts expressed that he gives quotations from Vedic texts.(1) Bhartṛhari's own work, as is well known, has a direct exegetical relationship with the Pāṇinian tradition: his Mahābhāṣya-Dīpikā (MBhD), to the extent it is available, is a running

commentary on Patañjali's Vyākaraṇa-Mahābhāṣya, while his magnum opus the Vākyapadīya (VP) is a topical commentary on major philosophical issues in the same text of Patañjali. Apart from the occasions where the Veda is a transcendent "entity" nearly identical with Brahman,(2) and apart from Vedic expressions cited only by way of grammatical example or illustration, are there any direct links with Vedic texts, and especially with the oldest and in several respects most important Vedic text, the Ṛgveda?"

(1) That is, Vedic texts in the strict sense: the Saṁhiās and Brāhmaṇas of the various Śākhās (cf. the dictum *mantra-brāhmaṇayor veda-nāmadheyam*, ĀpŚs 24.1.31, and *mantrāś ca brāhmaṇaṁ ca vedaḥ*, Śabara on Mīmāṁsā-Sūtra 2.1.33). Such quotations are predominantly from Yajurvedic texts, and among these especially from the Maitrāyaṇīya-Saṁhitā: cf. Rau 1980 and Bronkhorst 1981, 1987.

(2) VPā1.5ab: *prāptyupāyo 'nukāraś ca tasya* (viz., *brahmaṇaḥ*) *vedo* ... "Of this (Brahman) the Veda is the means of attainment and the image"; VP 1.172ab *anādim anavacchinnāṁ śrutim āhur akartṛkām* "It is said that the authorless Śruti (revealed text, i.e., the Veda) is beginningless and uninterrupted"; cf. also VP 1.173 *avibhāgād virṛttānām abhikhyā svapnavac chrutau* "Those evolved from the undivided (i.e., the primeval *ṛṣis* evolved from *brahman*), (had) a perception with regard to the Śruti as in a dream." See further Houben 1997: 331-336 and cf. Aklujkar 1991.

"The 5th century Sanskrit grammarian and philosopher Bhartṛhari has often been seen as the one who elaborates language-philosophical speculations hinted at in Patañjali's commentary on the grammar (Aṣṭādhyāyī) of Pāṇini.

In such a view Bhartṛhari would carry us away from grammar to philosophy, and he would be introducing his own peculiar viewpoints, for instance the view that the sentence is the main unit in language. Is it possible that Bhartṛhari is in fact all the time focusing on the actual starting points and presuppositions of Panini's Aṣṭādhyāyī, taking into account Patañjali's commentary? Can we see Bhartṛhari as an author offering a very convincing interpretation and exposition of the basic axioms and procedures of Pāṇini's Aṣṭādhyāyī? Can it be that a

simple point has been overlooked by most scholars of Pāṇini's Astadhyayi, namely, that there too the starting point and final aim of the user of grammar has always been the sentence and never a word in isolation, that the starting point is a preliminary sentence that needs to be checked or that needs some little extra refinement? If the latter applies, a fresh look is required, at Bhartṛhari's work, at the Aṣṭādhyāyī, and also at our ideas of what a good grammar should be. At present I start with Bhartṛhari - elsewhere I addressed the Aṣṭādhyāyī and its context, purpose and formal structure (Houben 1999). At crucial points [will have to refer to the Aṣṭādhyāyī, its basic features and current interpretations and representations." (pp. 523-524, a note omitted)

    Updated version of *Bhartṛhari's familiarity with Jainism* (1994).

    "Bhartṛhari refers to the different views in a very concise way, and for modern students of his works the precise identity of those who held the views often remains unclear. Of those (apart from grammarians, and authors of Śikṣā-texts and the Nirukta) whose views Bhartṛhari frequently takes up for discussion, K.A. Subramania Iyer has mentioned Vaiśeṣikas,(3) Mīmāṃsākas, (4) Sāṃkhyas(5) and Buddhists(6) (Iyer 1969: 72). Iyer has not mentioned the Jainas, and one may wonder whether they remained outside the scope of Bhartṛhari's encyclopedic approach. This, however, is not the case. Bhartṛhari is very well aware of Jaina authors and refers to them explicitly in at least one place in the Mahābhāṣya Dīpikā. Other passages in the Mahābhāṣya Dīpikā and Vakyapadiya are remarkably well

compatible with Jaina ideas. These passages were no doubt intended as references to their views, although their name is not explicitly mentioned." (p. 384)

20. Hyung, Yi Jae. 2009. "Bhartṛhari on the Action Referred to the Present (*vartamānakriyā*)." *Journal of Indian and Buddhist*

Studies no. 57:1172-1176.

"In his Mahābhāṣya on P3.2.123, Patañjali cites the following verse to answer the argumentsagainst accepting present time:

Ślokavārttika on P3.2.123: kriyāpravṛttau yo hetus tadarthaṃ yad viceṣṭitam / tat samikṣya prayuñjīta

gacchatīty avicāyaran //

"There is a thing which serves as a reason (*hetu*) for which one enters into an action (*kriyāpravṛttau*). One performs an activity (*viceṣṭita*) for the purpose of attaining such a thing. Having in view (*samīkṣya*) such an activity, one should use the finite verb form *gacchati* ' ... is going' without considering (*avicārayan*) something about what one says."

The point to be noted here is that this verse says that one should use the verb form *gacchati* (3rd sg. pres.) without considering something about what one says. The verb form *gacchati*, which is in the present tense (*vartamāna*), signifies the action of going currently taking place. Consequently, it follows that the statement intends to imply that once the action signified by a verb form in the present tense is considered, there occur difficulties in accounting for the use of such a verb form. In VP 3.9.85-90 Bhartṛhari discusses the difficulties.

The aim of this paper is to show how he deals with them in the discussion." (p. 1172)

Part II: *Bhartṛhari. Speech and the World: Creation or Expression?*, pp. 69-87.

"As it was already said, Bhartṛhari's principal work is his metrical treatise *Vākyapadīya*, that is, "[The Treatise] on theSaying and the Word." It is composed of three chapters (*kaṇḍa*); hence another name by which it became known, *Trikāṇḍī* ("[The Work] in Three Chapters"). The first chapter, "The Chapter on Brahman" ("Brahma-kaṇḍa"), is devoted to

the philosophical investigation of the nature of Brahman and the universe. The second chapter ("Vākya-kaṇḍa," or "The Chapter on the Sentence") deals with the sentences that manifest the meaning of a statement, while the third chapter ("Pada-kaṇḍa, or "The Chapter on the Word") deals with the separate words that are brought together to form the sentence. Besides treating purely linguistical matters, the second and the third chapters include discussions on the nature of time, space, the function and origin of general categories, and so forth. Most of the present essay is based on the material of the first chapter of *Vākyapadīya*, which offers the most concentrated exposition of Bhartṛhari's main ideas." (p. 77)

22. Jha, Vashishtha Narayan. 1985. "Problem of Error: the views of the Grammarians." *Annals of the Bhandarkar Oriental Research Institute*:231-238.

    Reprinted in V. N. Jha, *Studies in Language, Logic, and Epistemology,* Delhi: Pratibha Prakashan, 1986, pp. 92-100.

    "Long before Mādhavācārya (1350 - 75 A. D.)(1) put the label of *darśana* on Pāṇinian System there was, it sems, a conscious effort to establish a philosophy of Grammar(2) till it got established at the hands of Bhartṛhari.(3) Once it was agreed upon that any *śāstra* leads a man to achieve the final aim of his life (*niḥśreyasa*), how is it that the *Vyākaraṇaśāstra* should remain behind? This seems to be the logic behind such an attempt. attempt. But ancient Indian Philosophers cannot close their eyes to such an activity. Thus we find Somānandanātha in his *Śivadṛṣṭi*(4) questioning the propriety on the part of Bhartṛhari to dabble with philosophy. He asks : "You are a grammarian and your job is already defined. Why should you give up that and hunt for *vijñāna* which does not come under your sphere of analysis?" (p. 231)

    (...)

    "To me it seems that Somānanda is not cent per cent correct in holding such a view. Because so far as the description of a language is concerned it is true that a grammarian need not dabble in the question of *yathārthajñāna* and

ayathārthajñāna, which will settle reality and non-reality respectively. But if a grammarian is interested in knowing the relation between language and worldly behaviour and in searching out the truth in it on the background of logic, ontology and metaphysics, one can hardly question his propriety of discussing the question of *pramā* (correct cognition) and *apramā* (erroneous cognition). It is in this light that we should look at the *Pāṇinīyadarśana* literature from Bhartṛhari onwards upto Nāgeśa." (p. 232)

(1) *Sarvadarśanasamgraha* includes the Philosophy of grammar under the name of *Pāṇinīyadarśanam*.

(2) There must have been a long tradition. Today some of the works are known only by name like *Saṁgraha* etc. which are lost.

23. Joshi, Narayan R. 2007. "Sphota Doctrine in Sanskrit Semantics Demystified." *Annals of the Bhandarkar Oriental Research Institute* no. 88:183-197.

Abstract: "From the time of the great grammarian Pāṇini (about 400 B. C.E.) to this day, Indian Sanskrit scholars are preoccupied with language on one hand and with philosophy on the other. In the past 2500 years of known history Indian linguists are discussing the semantics of Sanskrit. In this discussion on the philosophy of word and meaning all schools of thought belonging to Vedic, Buddhist and Jain-traditions have participated. The problem of meaning in Indian linguistic philosophy revolves around the ancient *Sphoṭa* doctrine discussed by Patañjali. Different authors have interpreted *Sphoṭa* in various ways from the high level mystic concept down to the physical property of articulated sounds. In this paper the ancient *Sphoṭa* doctrine in Sanskrit semantics is revisited and demystified by using Physics of sound. This step leads us next to the study of *Varnavāda* freeing us from

confusion generated by unnecessary mysticism associated with *Sphoṭa* doctrine."

(...)

"Bhartṛhari on *Sphoṭa*

According to the observations of Dr. S.D. Joshi(4), *Bhartrhari* has used the term *Sphoṭa* only nine times in Vākyapadīya and that too occurs in the first chapter of it. Like Patañjali, Bhartrhari has also invariably used the term *Sphoṭa* in its relation with the *Dhvani*. Without referring to *Dhvanis,* he has nowhere used the term *Sphota*. Bhartṛhari has nowhere clearly stated in his work Vākyapadīya that *Sphoṭa* is over and above the sounds, it is indivisible and without any inner sequence, and it is meaning bearing unit of language' . He stated that *Sphoṭa* did not involve the difference in the speed of utterance (*vṛttibheda*). Bhartṛhari differentiated between the 'form' of the word and its 'object'. According to him it is the 'form' of the word which changes, while its object remains the same. And this unity of 'object' is carried by the Buddhist concept of *Śabda*, which is mentally retained 'self' of the word." (p. 189)

24. Kahrs, Eivind. 2012. "Bhartṛhari and the Tradition: *karmapravacanīya*." In *Devadattīyam. Johannes Bronkhorst Felicitation Volume*, edited by Voegeli, François, Eltschinger, Vincent, Feller, Danielle, Candotti, Maria Piera, Diaconescu, Bogdan and Kulkarni, Malhar, 107-122. Bern: Peter Lang.

"The statement *nāmākhyātayos tu karmopasaṃyogadyotakā bhavanti,* then, I take to mean: “But they indicate (*dyotakā bhavanti*) that a noun or a verb has a specific connection with an action.” If we are talking about *upasargas* that indicate a specific connection with an action, it seems to me possible to put forward the hypothesis that what Śākaṭāyana and Yāska are talking about in the Nirukta is precisely what the Pāṇinīan tradition calls *karmapravacanīya,* and that it is this link back to Śākaṭāyana and Yāska that is reflected in the *Vākyapadīya* and its surrounding literature. This also goes some way to illustrate how and why the *Vākyapadīya* puts forward certain views only to discard them later on. The text serves as a kind of

reference point or origo reflecting the earlier grammatical tradition, bridging over into the works of later authors as if through a looking glass." (p. 120)

25. Kapoor, Kapil. 2000. "Reality and Its Representation: The Verbal Image in Indian Thought and Bhartrhari." In *Signs and Signification. Vol. II*, edited by Gill, Harjeet Singh and Manetti, Giovanni, 9-28. New Delhi: Bahri Publications.

26. Kelkar, Ashok R. 1999. "What Has Bhartṛhari Got to Say on Language?" In *The Yearbook of South Asian Languages and Linguistics*, edited by Singh, Rajendra, 37-52. London: Sage Publications.

    Abstract: "Bhartṛhari has not received due attention for a variety of reasons. After a word about Bhartṛhari and his works, a sketch of the Indian intellectual tradition in which to place him is presented in terms of its key questions, the resulting affiliations, and broad periodization. The difficulties in presenting Bhartṛhari to the modern reader need to be overcome. Thus, no citations; Sanskrit terms are parenthesized; the risk of tidying up his thought is taken.

    A conspectus of Bhartṛhari's thought on language is best presented under three headings in a certain order. Language as communication: Bhartrhari's conceptual framework and ideas of related causal dependencies are touched upon. Language as human practice: For Bhartṛhari it is human practice that sustains speech power and its acquisition and the power of the speech bond.

    Language as cognition: All cognition, even seemingly non-linguistic cognition, is sustained by specific and generalized language competence. Bhartṛhari's position on the interpretative element and on the presence of chains of signation was well-motivated.

    Bhartṛhari's thought on language is considered in the perspective of Indian and Western thought on language."

27. Li, Chalres. 2018. "Sounding out Différance: Derrida, Saussure, and Bhartṛhari." *Philosophy East and West* no. 68:447-459.

"Saussure's explication of the arbitrary and differential nature of the sign, that it articulates its own category rather than naming an independently existing concept,(14) is almost identical to Bhartṛhari's, except that it is not grounded in his non-dual metaphysics.

The overarching thesis in Bhartṛhari's *Vākyapadīya* is structured by his concept of *śabdādvaita*, or word non-dualism, which posits a monistic, eternal, and undifferentiated Reality from which all differences — all words — issue forth. Change is an illusion due to the power of *śabdatattva*, the linguistic potential that prefigures language, to organize the phenomenal world in terms of space (*dik*) and time (*kāla*).(15)

Bhartṛhari's non-dualism is intimately related to one of the main tenets of the grammarians: the eternality or ahistoricity of the Sanskrit language. The grammarians understood Sanskrit as the eternal, divine language, not subject to change, and thus their method of studying the language was purely ahistorical, or synchronic.

Bhartṛhari neatly intertwines this notion with that of an unchanging, underlying Reality at the very beginning of the *Vākyapadīya*, where he qualifies brahman as both *śabdatattva* and *akṣara*, which is an adjective meaning "imperishable" as well as a noun meaning a "syllable" or a "sound."(16) For him, the eternality of the Sanskrit language is equivalent to the eternality of non-dual Reality. (p. 449)

    "There is, as will be recalled, a good tradition (Punyarāja and Siṃhasūri) to the effect that Vasurāta was at one time the guru of Bhartṛhari.

    According to another source (Paramārtha), the Bauddha teacher Vasubandhu was attacked by Vasurāta, the grammarian, i.e. Bhartṛhari's teacher.(1)

    On the basis of these pieces of independent external evidence only, it would be natural to conclude that Bhartṛhari cannot have been absolutely ignorant about at least some of the writings of "the master of 1000 *śāstra*-s", as the Chinese sources occasionally speak of Vasubandhu (thus, probably, not implying more than that Vasubandhu was an extremely prolific author). When I here speak of Vasubandhu, I am, to be sure, speaking of the author of *Abhidharmakośa, Karmasiddhi, Pañcaskandhaka, Vimśatikā, Triṃśikā, Vyākhyāyukti*, etc. - to mention only the most important of his authentic works.

    Naturally, the question then arises, whether we can detect any palpable pieces of influence from Vasubandhu in Bhartṛhari's magnum opus, the *Vākyapadīya* (VP). We might then find ourselves in a position to understand what I-ching had in mind when he reported that Bhartṛhari was "intimately acquainted with the doctrine of vijnaptimätratä (Chinese: *weishih*)"?" (p. 195, two notesd omitted)

29. Loundo, Dilip. 2015. "Bhartṛhari’s Linguistic Ontology and the Semantics of Ātmanepada." *Sophia* no. 54:165-180.

Abstract: "The distinct function of *ātmanepada* in Sanskrit language remains a sort of linguist mystery in Sanskrit studies. In this article, I analyze the larger implications and subliminal meaning of *ātmanepada* by moving beyond the realm of linguistics, which has been the dominant approach, and entering the territory of philosophy and, more specifically, the purportful approach of traditional Indian philosophy of language represented by Bhartṛhari's *Vākyapadīya*. Bhartṛhari's analytical procedure seeks to unveil the ontological interdependence that binds together the constituent elements of linguistic sentences, understood as modal appearances of the ever present foundational ground of the world/word—Brahman as *Vāc*. This is our referential guide to the semantic reconstruction of *ātmanepada*'s teleology."

30. Matilal, Bimal Krishna. 1992. "The Sphota doctrine of the Indian Grammarians." In *Sprachphilosophie / Philosophy of Language / La philosophie du langage. Vol. 1*, edited by Dascal, Marcelo, Gerhardus, Dietfried, Lorenz, Kuno and Meggle, Georg, 609-620. Berlin: Walter de Gruyter.

    3. *Bhartṛhari view*, pp. 612-616.

    "Bhartṛhari's philosophy of language is ultimately grounded in a monistic and idealistic metaphysical theory. He speaks of a transcendental word-essence (śabdatattva) as the first principle of the universe. His sphoṭa doctrine is finally aligned with the ultimate reality called 'śabda-brahman'. A self-realized person attains unity with the word-principle — a man of perfect knowledge. There is no thought without language, no knowledge without word in it. Consciousness vibrates through words, and such vibrating consciousness or a particular cognitive mode motivates us to act and obtain results. Hence language offers the substratum upon which human activity is based. Language and meaning are not two separate realities such that one conveys the other. They are in essence the two sides of the same coin. The ›sphoṭa‹ is this unitary principle where the symbol and what is signified are one. To understand each other's speech and to communicate, we do separate the inseparable, the sound and its sense.

This is only instrumental to our mutual understanding.

At the ultimate level, they are one. Bhartṛhari talks about three kinds of ›sphoṭa‹: sound-sphoṭa (letter), word-sphoṭa and sentence-sphoṭa, but his primary interest lies with the sentence-sphoṭa. He underlines the importance and primacy of sentence (s. art. 63) in the language analysis, in the second kāṇḍa of *Vākyapadīya*." (p. 616)

31. ———. 2002. "What Bhartrhari Would Have Said about Quine's Indeterminacy Thesis." In *The Collected Essays of Bimal Krishna Matilal: Mind, Language and World*, edited by Ganeri, Jonardon, 333-342. New Delhi: Oxford University Press.

    "Since Quine's thesis of indeterminacy of translation was formulated and defended in his *Word and Object* (1960) about twenty-five years ago, it has generated various sorts of reactions and responses from philosophers." (p. 333)

    "I wish to describe here an old theory of language prevalent in classical Indian writing, which from a slightly different point of view and on different grounds found the notion of meanings as separate and distinct entities unsuitable and superfluous. On the same theory one could have conceded the possibility of the indeterminacy of translation, not on the ground that even when everything is taken into account alternative ways of translating the native's sentence remain open, but on the ground that each translator's linguistic disposition is stimulated in some unique way and one need not match with the other. This theory was championed by Bhartṛhari in AD sixth-century India. In giving an outline of this theory of language and meaning, I shall try to show how this can be seen as a critique of Quine's theory by emphasizing that the elimination of the separate and distinct meaning-entities can be achieved even from a different set of hypotheses.

    There are many ways to skin a cat or a rabbit or a *Gavagai*." (p. 334)

32. Mishra, K. K. . 1986. "Bhartṛhari's Theory of Sphoṭa." *Indologica Taurinensia: Official Organ of the International*

Association of Sanskrit Studies no. 13:115-121.

"The theory of sphoṭa is one of the important contributions of Indian grammarians to the problem of Semantics in General Linguistics.

Its first mention has been traced as early as *Mahābhāṣya* of Patañjali (2nd Cent. B.C.), though the word sphoṭa has been referred to by earlier grammarians like Pāṇini in his pioneer work *Aṣṭādhyāyī*.(1) But it is the *Vākyapadīya* of the great grammarian Bhartṛhari (5th Cent. A.D.) where we get a fully developed and systematized description of the *sphoṭa*-doctrine." (p. 114)

33. Murti, Srimannarayana. 1997. *Bhartrhari, the Grammarian*. New Delhi: Sahitya Akademi.

Contents: Date and Works of Bhartṛhari; Language, Grammar and Culture; Scope and Scheme of the Vākyapadīya; Communicative and Analytic Language; Sentence; Indivisibility of Sentence; Theory of Sphota; Sentence Sense Pratibha Word; Intention of the Speaker; Referent of the Word; Substance and Universal; The Qualifier and the Qualificant; Basal and Contextual Referents; Negative Particle; Yugapadadhikaranavacana; Abhedaikatvasamkhya; Time Sabdadvaita Philosophy; Epilogue; Bibliography.

"Bhartṛhari, the celebrated grammarian philosopher, is believed to have lived in the 5th century. This monograph presents the linguistic and philosophical theories connecting the analysis of the sentence with the ultimate reality-Sabdabrahman. The linguistic principles dealt with here are applicable not only to Sanskrit but to any language. His magnum opus the Vākyapadīya, even though partly incomplete, is the only extant work comprehensively dealing with the linguistic features of the Sanskrit language and the philosophy of grammar. It contains three kandas-Brahma-kanda or Agama-kanda, Vakya-Kanda and Prakirna-Kanda. The first two kandas together consist of 635 slokas, and deal with the

Sabdabrahman, the creation of the world, jiva, world and language. The Prakirna-kanda running into 1300 slokas, divided into 14 sections called samuddesas, deals with the linguistic categories and semantic speculations prevalent in the Indian grammatical tradition. The other extant works of Bhartṛhari are his fragmentary commentary of the Mahabhasya of Patanjali and auto-commentary on the kandas I and II of the Vākyapadīya."

34. Nakamura, Hajime. 1955. "Tibetan Citations of Bhartṛhari's Verses and the Problem of His Date." In *Studies in Indology and Buddhology presented in Honour of Professor Susumu Yamaguchi on the Occasion of his Sixtieth Birthday*, edited by Nagao, Gajin, 122-136. Kyōto: Hozokan.

    "About twenty years ago, the illustrious scholar to whom we are dedicating this commemoration volume pointed out the fact that some verses of a Vedantin called Bhadrahari (?) is mentioned in the Tibetan version of some philosophical works of later Mahayana Buddhism. The author of the present article wants to elaborate on the problem, gathering Tibetan verses ascribed to him, and collating some of them with Sanskrit originals which have been identified by the author." (p. 122)

35. ———. 1960. "Bhartṛhari the Scholar." *Indo-Iranian Journal* no. 4:282-305.

    "Bhartrhari declared himself to be a grammarian, and contemporary scholars of India looked upon him as one. But the study of grammar originated in the interpretation of the Vedas; orthodox Brahmanic scholars had included grammar in the six *angas* which were supplementary to the Vedas, and from ancient times it had held an important and revered place. Bhartṛhari was also held in high esteem as a Vedänta philosopher and since this philosophy was founded on various orthodox Brahmanic sacred books, the Upanisad in particular, it clearly follows that Bhar trhari, in addition to being a grammarian and a Vedänta philosopher, was also a believer in those sacred books. The question arises as to whether he really believed in the authority of those sacred books. The historical fact that grammar originally developed out of the Vedāngas,

prejudiced his thinking, so that he was obliged to declare that the grammar which he taught was based on the Vedas and that he himself was a follower of the Vedic lore." (p. 282)

Bhartṛhari, pp. 228-230.

"We can shed more light on the question of the reality or unreality of the world by returning to Bhartṛhari's conception of Word (*śabda*), the essence of Brahman, and its intimate involvement with the process of creation. Word is the energy (*kratu*) that exists within Brahman, just as the yolk exists within the peacock's egg. In its latent state, Word is undifferentiated, just as the yolk is a uniform color (VP 1.51). Yet the yolk contains within itself all of the variegated colors of the peacock, just as Word contains within itself all sentences and words. For Bhartṛhari, as for other grammarians concerned with Vedic exegesis, words and their meanings are eternal (VP 1.23).

The relations between words and their meanings are also eternal, not arbitrary and variable as taught by Saussurean linguistics (as well as Buddhist linguistic philosophy).

According to Bhartṛhari's ontology of Word, Word in its absolute state is the ground of all words, meanings, and indeed all knowledge: "There is no cognition in the world n which Word does not figure. All knowledge is, as it were, intertwined with Word" (VP 1.123).(12)" (p. 229)

38. Oetke, Claus. 2013. "Inconsistency, Paradox and Linguistic Content. Did Bhartṛhari offer a solution for Truth-Paradoxes?" *Revista de Filosofía de la Universidad de Costa Rica* no. 52:9-39.

    Abstract: "The article attempts to clarify the nature of truth-paradoxes by demonstrating why it cannot be maintained that a particular philosophical treatise offers a way to their solution. In the light of objective qualities of statements leading to paradoxes of truth it emerges that the question of the nature of the content to which properties of (absolute) truth can be ascribed possesses critical relevance. This supports the dismissal of a claim made by some scholars with respect to the pertinent text."

39. ———. 2016. "Is the section of verses 1-29 in Vākyapadīya III.3 based on a sound theoretical motivation?" *Revista Científica Guillermo de Ockham* no. 14:2-21.

    Abstract: "The present article attempts to establish the following propositions: The remarks to be found in the initial segment of the so-called Saṃbandha-Samuddeśa of Bhartṛharti's Vākyapadīya, or Trikāṇḍī, can be interpreted in a way which permits to regard them as the expression of a valid theoretical view. It is important to investigate the possible existence of a sound theoretical motivation in philosophical treatises not only under the perspective of philosophical analysis but even in the framework of traditional textual exegesis irrespective of whether the textual sources represent a Western or a non-Western tradition of thought."

40. Ogawa, Hideyo. 1999. "Bhartṛhari on *Śakti:* the Vaiśeṣika Categories as *Śaktis*." *Journal of Indian and Buddhist Studies* no. 47:15-26.

    Abstract: "According to Bhartṛhari, the phenomenal world is a manifold appearance of *śaktis* which *Śabdabrahman,* the seed of all (sarvabija), is assumed to have and which in themselves are not susceptible of modification (*aparināminī).* In his Vākyapadīya [VP] Bhartrhari describes *śaktis* in the framework

where the Vaiśeṣika categories (*padārtha*) are taken up and equated with them. The aim of this paper is to present, by examining VP III, *sādhana, kk,* 9(-)l 5 where s·uch a framework is observed, a few aspects of the *śakti* Bhartṛhari conceives of. The ontological status of the *śakti* in relation to the ultimately real, that is, its unreality (*asatyatā*) the equivalents for which are *avicāritaramanīyatā*) iyatii ('the state of being beloved without having been well-considered') and *bhedavicārānarhatā* ('the incapability of predicating the difference and non-difference'), shall be kept aside in this paper."

41. ———. 1999. Bhartṛhari on the Non-distinction between Reality and Unreality.

    Paper read at the XIIth conference of the International Association of Buddhist Studies, Lausanne, August 26th, 1999.

    "In view of Bhartṛhari's fundamental thesis that the ultimate reality, the undelimited, appears as delimited, we have to say that the one permanent reality appears as being of the nature of existence and non-existence and not that what is of the nature of existence and non-existence appears as something. For Bhartṛhari, the ultimate reality Brahman is beyond relativization and cannot involve a contradiction in it. Therefore, against the interpretations by Iyer and Houben who understand that Bhartrhari considers Brahman to have the two aspects of *sat* and ā2 I would like to argue that taking *sadasadātmaka* as qualifying the appearances of Brahman (*bahurūpa*) is more consistent with Bhartrhari's thesis. As will be seen later, Helārāja interprets it in that manner. We must give his views careful consideration. To my understanding, his interpretation faithfully reflects the core of Bhartṛhari's linguistic thought.

    The question of the *sadasadātmaka*-interpretation is related to the questions of the verbalization of Brahman, the relativism holding in the domain of the things in the phenomenal world, and the capacities of Brahman underlying its verbalizations.

In this paper, examining these questions, I shall propose a new interpretation of the kārikāunder consideration." (pp. 6-7)

42. ———. 1999. "Bhartṛhari on Representation (buddhyākāra)." In *Dharmakīrti's thought and Its impact on Indian and Tibetan Philosophy: Proceedings of the Third International Dharmakīrti Conference, Hiroshima, November 4-6, 1997*, 267-286. Wien: Verlag der Österreichischen Akademie der Wissenschaften.

"As is well known, Buddhist epistemologists posited as the *śabdārtha* a conceptual representation (*buddhyākāra*) from the viewpoint of appearance (pratibhāsa), an external individual (*svalakṣaṇa*) from the viewpoint of reification or judgement (*adhyavasāya*), and the exclusion of others (*anyāpoha*), where others are either other conceptual representations or other external individuals. This is succinctly summed up by Jñānaśrīmita in his *Apohaprakaraṇa* as follows:

[sanskrit text omitted]

"First of all, an object (*artha*) is primarily conveyed by the word. In that case, *apoha* (‚exclusion'), being subordinate to it [i.e., the object] (*tadguṇatvena*), is to be understood. And the object [is twofold]: One is posited as a denotatum (*vācya*) from the viewpoint of reification or judgement (*adhyāsa = adhyavasya*) and the other from the viewpoint of appearance (*bhāsa = pratibhāsa*).

[But] in reality (*tattvataḥ*) neither [of them] are [the denotatum of the word]." (p. 267)

(...)

"In this paper I shall demonstrate that Bhartṛhari posits a *buddhyākāra* and an external individual as *śabdārthas* from the same points of view as Jñānaśrīmita mentions. Such a semantic position of Bhartṛhari is taken for granted by later Pāṇinīyas like Kaiyaṭa, Helārāja and Puṇyarāja but has not yet been traced back to Bhartṛhari's words themselves so far. As is well known, Dignāga, who is believed to have first advocated

the *apoha* theory, is well acquainted with Bhartṛhari's linguistic thought. And moreover, he is a representationalist, as is shown by his theory of 'appearance' (*ābhāsa*). Naturally, Dignāga did know that the conceptual representation and the external individual were involved in verbal behavior. It is certain, therefore, that clearing up the situation in which Dignāga had to propound the apoha theory will give a new perspective of the so-called historical development of the *apoha* theory and stimulate Buddhists scholars to re-examine it." (p. 269)

43. ———. 2001. "Bhartṛhari on A.1.1.68." *Journal of Indian Philosophy* no. 29:531-543.

    "Bhartr.hari's interpretation of A.1.1.68 in VP 1.60–68 leads to the following conclusion:

    A.1.1.68 is the general rule from which a particular definitional rule such as *agner agniḥ saṃjñā bhavati* is deduced. By this rule, the item in use whose form is equal to that of the item which is uttered in the sūtra is brought in and the relationship of name and the named is established between their own forms. In other words, the rule provides that the form which is understood from the item uttered in the sūtra refers to the form which is differentiated from the item in use when the latter is uttered.

    (...)

    In addition, if we accept that whatever item is uttered has its own form differentiated from it and denotes the form, it will make no sense to say that when a linguistic item is mentioned, its own form is to be understood from it. A.1.1.68 never describes the self-referring nature of the linguistic item, which nature is not determined without the conceptual discrimination between a linguistic item and its form; rather, it makes use of such a nature for building a bridge between the grammar and the practical use of the linguistic item." (p. 536, notes omitted)

44. ———. 2012. "Patañjali's View of a Sentence Meaning and Its Acceptance by Bhartṛhari." In *Devadattīyam. Johannes Bronkhorst Felicitation Volume*, edited by Voegeli, François, Eltschinger, Vincent, Feller, Danielle, Candotti, Maria Piera,

Diaconeswcu, Bogdan and Kulkarni, Malhar, 159-188. Bern: Peter Lang.

"In his Bhāṣya on A 1.2.45, Patañjali advances his view of a sentence meaning as follows:

MBh on A 1.2.45 (I.218.10) *eteṣāṃ padānāṃ sāmānye vartamānānāṃ yadviśeṣe 'vasthānaṃ sa vākyārthaḥ.*

A particular meaning (*viśeṣa*), as a conveyer of which these words conveying a general meaning (*sāmānya*) are established, is a sentence meaning.(1)

In this Bhāṣya Patañjali intends to say that a sentence meaning is a qualifier-qualificand relation (*viśeṣaṇaviśeṣyabhāva*) among the meanings of words in a sentence. Here Patañjali assumes that a sentence is a composite of independently meaningful words and that a sentence is an independent unit which has a sentential meaning separate from word meanings. This is natural, considering that grammarians operate with words as constituents of sentences. Studies of Bhartṛhari's philosophy of language, however, reveal that Bhartṛhari maintains that an impartite sentence is the real unit of actual communication and that he still accepts that through analysis one can and should abstract words and word meanings. It is interesting in this regard to consider how Bhartṛhari deals with Patañjali's view of a sentence meaning in the Bhāṣya. The Bhāṣya is quoted and discussed in the Vṛtti on VP 2.15, 246, 441 and in Helārāja's commentary on VP 3.1.74." (p. 159)

(1) See Ogawa (2004–5). In short, according to this Bhāṣya, the meaning of a sentence is the particular meaning which the words of the sentence, denoting general meanings, convey.

45. ———. 2013. "Bhartṛhari on Three Types of Linguistic Unit-meaning Relations." In *Vyākarana Across the Ages:*

Prtoceedings of the 15th World Sanskrit Conference. Vol. II, edited by Cardona, George, 217-279. New Delhi: Rashtriya Sanskrit Sansthan.

"To summarize the main points Bhartṛhari makes about the relation of 'this-is-that' between a linguistic unit and a meaning:

First, this relation is taught and learned through an utterance of the type so '*yam* 'this-is-that'. Secondly, the relation is established by the identification of the linguistic unit and the meaning. Once the relation is established, the linguistic unit and the meaning appear respectively as identical with the meaning and the linguistic unit.

Thirdly, the identification comes to the restriction on the linguistic units and meanings which can be related to each other.

All this gives the answer to the second question mentioned earlier in §0. Therefore we may be justified in arguing that Helārāja's understanding of the relation between linguistic unit and meaning is thoroughly founded on Bhartṛhari's theory on it." (p. 274)

46. ———. 2016. "Bhartṛhari on Unnameable Things." In *Logic and Belief in Indian Philosophy*, edited by Balcerowicz, Piotr, 415-430. Warsaw: Indological Studies.

"In his *Mahā-bhāṣya* Patañjali declares that for grammarians what words express is their authority. Later Pāṇinîyas from Bhartṛhari onwards illustrate this principle by stating that grammarians are not concerned with things as they are (*vastv-artha*) but as they are spoken of *(śabdārtha*). It is interesting that they recognise that there are things which are unnameable, beyond verbalisation. In his Vṛtti on the Vākyapadīya Bhartṛhari calls them *asaṁvijñāna-padas*—'those which have not words to convey themselves'. In this paper I shall show how Bhartṛhari accounts for the existence of a thing defined as asaôvijñâna-pada and what philosophical significance he

attaches to the issue of whether a certain thing has a word defined as *saṁvijñāna-pada*." (p. 415, a note omitted)

47. ———. 2016. "Bhartrhari on A 3.2.60 *tyadādisu dṛśo 'nālocane kan ca*." In *Vyākaraṇaparipṛcchā: Proceedings of the Vyākaraṇa Section of the 16th World Sanskrit Conference*, edited by Cardona, George and Ogawa, Hideyo, 237-264. New Delhi: DK Publishers.

    Abstract: "In his Bhāṣya on A 3.2.60 Patañjali proposes that in an upapada compound such as *tāḍṛś* 'such-like' the kt affix to be introduced after the verb dṝs 'see' be taken to denote an agent-object (*karmakartṛ*). In VP 3.7.64 Bhartṛhari observes that some Pāṇiniyas try to explain the agent-object construction proposed by Patañjali, on the basis of a logical construction (*parikalpana*) that would attribute to this verb as a meaning the act of becoming the object of seeing (*viṣayatāpatti*). According to Bhartṛhari, however, the logical construction has undesirable consequences in Pāṇini's derivational system. The present paper shows how Pāṇiniyas, accepting that a meaning (*artha*) serves as a cause (*nimitta*) of the explanation (*anvākhyāna*) of a correct speech form, put a limit on semantics.

    For Pāṇiniyas, the meaning which serves as such a cause must be the meaning to convey which a linguistic item is found to be used in actual usage, since their fundamental position is that the denotation of meanings by linguistic items (*abhidhāna*) is a natural thing (*svābhāvika*)."

48. ———. 2019. "Two Truths Theory: What is *vyavahāra*? Language as a Pointer to the Truth." *Journal of Indian Philosophy* no. 47:613-633.

    Abstract: "Mādhyamikas argue that ultimate reality, which is without any delimitation and hence cannot be verbalized in itself (*anakṣara*), can be expressed in words on the basis of the attribution o rsuperimposition (*samāropa*) of the basis for the application of the word (*pravṛttinimitta*). The denotation theory of ultimate reality Bhartṛhari advances in the

Dravyasamuddeśa of his Vākyapadīya convincingly explains that, insofar as ultimate reality is spoken of, we must say that it is denoted by the word; ultimate reality is said to be ineffable only in the sense that it is far from what is conveyed as somethingby the word; language is a pointer to the ultimate reality. The point that the application of a word to ultimate reality depends on the attribution of the basis for the application of the word to it naturally leads to an idea that one should not hypostatize the basis, although without resorting to it any word cannot be used to convey the ultimate reality; otherwise, it would have to be said that the ultimate reality to which the word isapplied has in essence the property which serves asthe basis. Such a property is precisely what theMādhyamikas consider to be the *svabhāva* 'intrinsic nature'. What they understand by the term *śūnyatā* is precisely that everything has no real basis for the application of the word to it."

Bibliography on Bhartrhari, grammarian-philosopher (Fourth part)

Bibliography (Studies in English) Par-Z

1. Parsons, Terence. 2001. "Bhartṛhari on What Cannot Be Said." *Philosophy East and West* no. 51 (4):525-534.

   "Bhartṛhari claims that certain things cannot be signified -- for example, the signification relation itself. Hans and Radhika Herzberger assert that Bhartṛhari's claim about signification can be validated by an appeal to twentieth-century results in set theory. This appeal is unpersuasive in establishing this view, but arguments akin to the semantic paradoxes (such as the "liar" paradox) come much closer. Unfortunately, these arguments are equally telling against another of his views: that the thatness of the signification relation can be signified. Bhartṛhari also claims that the relation of inherence cannot be signified -- a quite different view that is not borne out by twentieth-century results. Finally, further research is needed to investigate what Bhartṛhari's own reasons might have been for these views."

4. R., Pathiraj. 1995. "The Sphota doctrine of Bhartṛhari." *Indian Philosophical Quarterly* no. 22:67-74.

   "The lingustic theory of *sphota* is chiefly associated with the grammarian Bhartṛhari, although he is not the propounder of the doctrine. He gave sphota a metaphysical significance and defended it against its critics.

   One can trace the use of the word '*sphota*' in the ancient writings, around the time of Pāṇini. It is doubted as to whether Pāṇini himself knew of such a thing as *sphota*, though the words '*sphotāyana*' appears once in his work, Aṣṭādhyāyī (6.1.123). Anyway we don't know the propunder of the doctrine. It was Patanjali who, (in his *Mahābhāshya*), for the first time, made a distinction between *sphota* and *dhvan*i. The sound that is produced when the word is uttered he called *dhvani*. It is ephemeral. The permanent element in the word, which is not affected by the peculiarities of the individual speaker, he called *sphota*. The *sphota*, in Patanjali's system, is an unchanging unit of sound. It may be an isolated letter (*Varnasphota*), having a normal and fixed size or a series of such letters (*Padasphota*). (1) Thls is quite diffferent from Bhartṛhari's concept of *sphota*.

   The claim of Bhartṛhari is that "a sentence is to be considered not a concatentaion made up of different sound-units arranged in a particular order but mainly as a single meaningful symbol." (2)

   (2) *Ibid*., p. 97

5. Raja, K. Kunjunni. 1969. *Indian Theories of Meaning*. Madras: Adyar Library and Research Centre.

   Second edition; first edition 1963.

   "To Bhartṛhari the linguistic theory of sphoṭa is part of his monistic and idealistic metaphysical theory according to which

the transcendental speech-essence. (*śabda-tattva*)is the First Principle of the universe." (p. 146)

(...)

"According to Bhartṛhari the speech-principle has three stages in the course of its manifestation, namely *paśyantī, madhyamā* and *vaikharī*.(1) *Paśyantī* is the supreme Reality, Śabdabrahman, and has been identified with *pratibhā*, the flash of insight or the principle of consiousness.) The Pratyabhijñā school of philosophy accepted four different stages in the manifestation of the Śabdabrahman, adding a fourth stage called *parā* which is identical with the *paśyantī,* stage in Bhartṛhari's system." (p. 147, two notes omitted)

6. ———. 1990. "Chapter on Bhartṛhari's Tīkā on Patañjali's Mahābhsāya." In *Encyclopedia of Indian Philosophies. Vol. 5: The Philosophy of the Grammarians*, edited by Coward, Harold G. and Raja, Kuniunni, 172-174. Delhi: Motilal Banarsidass.

"Ṭikā on Patañjali's *Mahābhāṣya*.

Bhartrhari's philosophical ideas are found in their fully developed form in the *Vākyapadīya*, which is his magnum opus; but the germs of his theories may be found in his commentary on the *Mahābhāṣya*, of which a fragmentary manuscript alone is now available. It has been establish ed that this fragmentary manuscript forms a genuine part of Bhartrhari's *Mahābhāṣyaṭikā*. Th.is work was mentioned by ltsing in the seventh century and by Kaiyaṭa as a source book for his *Pradipa* commentary on the *Mahābhāṣya*.

The Ṭikā is not a regular word-for-word commentary on the *Mahābhāṣya*. It contains observations and comments on select words and points raised in them. Some of the ideas that were developed later into a cogent system are found scattered here and there in the commentary on the *Mahābhāṣya*.

In some cases Bhartrhari's comments in the Ṭikā help us to understand his basic standpoint in the *Vākyapadīya*."

7. ———. 1990. "Chapter on Helārāja." In *Encyclopedia of Indian Philosophies. Vol. 5: The Philosophy of the Grammarians*, edited by Coward, Harold G. and Raja, Kuniunni, 193-197. Delhi: Motilal Banarsidass.

   "Helārāja

   This important commentator on Bhartṛhari tells us that he is the son of Bhūtirāja and a descendant of a minister named Lakṣaṇa, or King Muktāpīda of Kashmir. Abhinavagupta, who flourished in 1014, appears to have studied with Bhūtirāja as well as with a son of Bhūtirāja whom Abhinavagupta calls " Indurāja." It 'is clear that Abhinavagupta is referring to Helārāja in some passages, as he is credited with having written a grammatical work called *Prakīrṇakavivaraṇa*, which may have been a commentary on Helārāja's *Prakīrṇakaprakāśa*—at least the title strongly suggests Abhinavagupta's awareness of Helārāja's work. Thus we may place Helārāja's date about A.D. 980.

   Regarding his commentary on Bhartṛhari's *Trikāṇḍi*, it seems clear that such a work was written covering the entire three chapters. There is some doubt about which portions of the work are available to us now. The commentary on book 3 is available in print. Aklujkar argues that its proper title is *Prakīrṇakaprakāśa*, and that Helārāja's commentary on book I was called *Śabdaprabhā*, while that on book 2 was *Vākyakāṇḍaṭikā* or *Vākyapradipa*. Aklujkar further argues that the Tikā on book 2, which is available in print and credited to Punyarāja, is in fact Helārāja's work instead." (p. 193, notes omitted)

8. ———. 1997. "Bhartrhari's Philosophy of Language, *Sphotavada* and *Sabdabrahmavada*: Are they Interrelated?" In *India and Beyond: Aspects of Literature, Meaning, Ritual and Thought: Essays in Honour of Frits Staal*, edited by van der Meij, Dick, 405-407. London: Kegan Paul International.

   "Bhartṛhari, who flourished in the beginning of the fifth century, was an eminent Sanskrit grammarian and a deep and original philosopher of language. He is well known for

enunciating two theories: the *Sphoṭavāda* and the *Śabdabrahmavāda*. They created a storm among thinkers; orthodox schools attacked them severely; modern thinkers of the present century are attracted by the novelty and significance of Bhartṛhari and are trying to understand these views in their proper perspective. Some scholars, like Biardeau, believed that the two theories are interrelated and cannot be explained in isolation. In my book *Indian Theories of Meaning,* l held that even if they are interrelated, each can be studied individually also. I shall try to give a brief summary of the two theories." (p. 405)

10. Ratié, Isabella. 2018. "On the Ṣaḍdhātusamīkṣā, a Lost Work Attributed to Bhartṛhari: An Examination of Testimonies and a List of Fragments." *Journal of the American Oriental Society* no. 138:709-741.

    Abstract: "The fifth-century grammarian-philosopher Bhartṛhari has long attracted scholarly attention, and deservedly so: his magnum opus, the *Vākyapadīya*, had a profound impact on later Indian schools of thought, Brahmanical as well as Buddhist. The *Vākyapadīya* is not, however, the only grammatical and/or philosophical work ascribed to Bhartṛhari in addition to a commentary on Patañjali's *Mahābhāṣya*: according to several sources dating back at least to the tenth century, the same author also composed a *Śabdadhātusamīkṣā* or *Ṣaḍdhātusamīkṣāi*, which, unfortunately, has not come down to us, and which is still shrouded in mystery, as its main topic, and even title and attribution, are considered uncertain to date. The goal of this article is to examine the available fragments and testimonies and to establish on their basis that the work, the original title of which must have been the *Ṣaḍdhātusamīkṣā*, endeavored to show that the whole phenomenal world is made of six elements (earth, fire, water, air, ether, and consciousness) while ultimately defending a nondualistic point of view. Verses

quoted by later authors as belonging to the *Ṣaḍdhātusamīkṣā* are gathered and translated in an appendix to the article."

11. Rukmani, T. S. 1987. "Patañjali's 'Prajñā' and Bhartṛhari's Pratibā. A Comparative Study." *Indian Philosophical Quarterly* no. 14:81-90.

    In this paper I intend to undertake a comparative study of Patañjali's concept of Prajñā and Bhartṛhari's concept of Pratibhā and bring out some of their implications.

    The word *prajñā* occurs in 3 *sūtras*(1) in the 1st *pāda*, in one *sūtra*(2) in the 2nd *pāda*, in one *sūtra* 3 in the 3rd *pāda* and in no *sūtra* in the 4th *pāda* of the *Yogasūtras*. This means that Patañjjali has used the word prajñā in only five *sūtras* in the entire work of about 195 *sūtras*. If one were to deduce the importance of *prajñā* from the number of times the word is used in the *sūtras* then of course the answer is obvious. But the answer is also not correct because the entire system of *Rājayoga* hinges on the concept of *prajñā*." (p. 81)

    (...)

    "lf we now turn to the concept of *pratibhā* in Patañjali's *Yogasūtras*, we find that it occurs for the first time in the *Vibhūtipāda*, *sūtra* 33.(19) Even here it is mainly used to describe the knowledge (*jñāna*) which arises from *pratibhā*. The *sūtra* mentions that 'Due to *pratibhājñāna* the *yogi* knows all'.

    Vyāsa states this is prior to the dawn of *viveka* or discriminate discernment between the '*sattva* intellect' and *Puruṣa*.(20) Thus,*pratibhā* 1s not the highest state of *prajñā* which gives rise to *kaivalya* later." (p. 84)

    (...)

    "In the *Vākyapadīya* Bhartṛhari uses the expression *pratibhā* in a comprehensive manner equating it to istinctive nature at one end of the scale and to the special insight of divine knowledge of *ṛṣis* and sages at the other end.(27) In all, Bhartṛhari has mentioned six kinds of *pratibhā*. What is common to all of them is a flash of understanding and the

difficulty in analysing this process of understanding." (p. 86, sme notes omitted)

12. Saito, Akane. 2017. "Internalization of Speech: Pronunciation and Perception of the Word." *Journal of World Philosophies* no. 2:109-120.

    Abstract: "There are various philosophers who have discussed the role of language in ancient India. Among them, Bhartṛhari considered the relation between the superficial appearance of speech and its essential nature. In actual life, we pronounce and perceive the word. He held that there must be some link between ideal logic and worldly truth. His focus in the *Brahmakāṇḍa* of the *Vākyapadīya*, is on the process of communication, the process of the internalization of speech. He differentiates the perspective of the speaker and the hearer, and explains the movement of sounds. The sphoṭa theory addresses both how to pronounce the word and how to perceive it. Traces of his discussion are found in the works of his follower Maṇḍanamiśra in his book, *Sphoṭasiddhi*."

13. ———. 2020. "Mīmāṃsāsūtra 6.5.54 on bādha in Maṇḍanamiśra's Brahmasiddhi." *Journal of Indian Philosophy* no. 48:915-944.

    Abstract: "This paper will show how the philosopher Maṇḍanamiśra discusses in his Brahmasiddhi the cancellation (bādha) of a former element by a latter, which is prescribed in Mīmāṃsāsūtra 6.5.54. We do not have yet a clear idea of what the value of this text holds for him. I would emphasize that probably more than we had expected, it forms an essential part of Maṇḍana's philosophy. Its authority is sometimes stated explicitly and sometimes not; and we easily overlook the fact that his argument is highly dependent on the Mīmāṃsā scheme. This rule, 6.5.54, was originally purely concerned with the performance of the sacrifice, but Maṇḍana applies it to his epistemic analysis, i.e. his discussion on the relative strength of

the valid means of knowledge, giving this rule the status of basic testimony. Furthermore, he interprets therule in his own unique way, or at least differently from Kumārilabhaṭṭa, integrating it with the argument by his famous predecessor Bhartṛhari.

The mutual relationship among Maṇḍana, Kumārila, and Bhartṛhari, will be illuminated by focusing on what Mīmāṃsāsūtra 6.5.54 really means."

14. ———. 2020. "The Theory of the Sphoṭa." In *The Bloomsbury Research Handbook of Indian Philosophy of Language*, edited by Graheli, Alessandro, 76-107. New York: Bloomsbury.

§ 3. *Bhartṛhari on the Sphoṭa*, pp. 79-82.

"The investigation of the word's phonetic form is found in the Vākyapadīya of Bhartṛhari, one of the greatest Grammarians and philosopher, who had a huge influence on the later history of Indian philosophy. Bhartṛhari refined the few remarks on sphoṭa left by Patañjali into an elaborate philosophical theory. His sphoṭa has three characteristics:

1. Phonemes *(varṇa*), sounds (*dhvani*), and bodily resonance (*nāda*) are differentiated.

2. Sphoṭa is the indivisible sound-form manifested in both the utterance and the hearing perception of a word, which are both discussed by Bhartṛhari.

3. Various views on sound, the nature of sphoṭa, and the relation between them, are discussed by Bhartṛhari as alternatives." (p. 79)

15. Sastri, Gaurinath. 1959. *The Philosophy of Word and Meaning: Some Indian approaches with special reference to the philosophy of Bhartṛhari*. Calcutta: Calcutta Sanskrit College Research Series.

"It was Bhartṛhari, author of the *Vākyapadīya*, who was the first grammarian to take upon himself the task of evolving a school of philosophy which is known by the name of Verbal

Monism, *Śabdādvaita* or *Śabdābrahmavāda*. Monism in Indian thought is said to have found expression in three ways -- the *Brahmādvaita* or *Bhāvādvaita* of the Vedāntist, the *Vijñanādvaita* of the Buddhist, and the *Śabdādvaita* of the grammarian. The term *Śabdābrahman* is no new coinage of Bhartṛhari's, for there are texts in the Upaniṣads where we are told that there are two *Brahmans, Para* and *Apara*, and while the *Parabrahman* means the Higher Brahman, i.e., the Transcendental Absolute, the *Aparabrahman* means the Lower Brahman or the *Śabdābrahman*, the realization of which leads one to the attainment of the other. But we must be careful not to identify the *Śabdābrahman* of the grammarian with the *Śabdābrahman* of the Upaniṣads, for according to Bhartṛhari *Śabdābrahman* is identical with the Transcendent Reality.

The present work starts with an attempt to describe the Transcendental Reality of the grammarian, which, though a unitary principle in essence, is yet inseparably associated with *Śaktis* or Powers which lie therein, and of which the most important is the *Kālaśakti* or the Time Power. It is on the eve of creation that these Powers are sundered from the *Śabdābrahman*, as it were, and the cosmic process runs in two directions, viz, that of word (*śabda*) and that of meaning (*artha*). In the first four chapters of the book I have discussed the nature of the *Sabdabrahman* and of *Kālaśakti* and other Powers and have not only examined the cosmic process as presented by the grammarian-philosopher but compared it with parallel schemes in other systems of philosophy as well.

From this I have proceeded to the study of the empiric realities on the *śabda* side, letters, words and sentences, and I have shown that the grammarian understands *sphoṭa*, the indivisible word, as *śabda qua* denoter." (*Introduction*, pp. XXIV-XXV, a note omitted)

16. ———. 1980. *A Study in the Dialectics of Sphota*. Delhi: Motilal Banarsidass.

"To discuss the nature of 'word' or more precisely, 'significany word' (*upādāna śabda*) is a problem that has arrested the attention of Indian philosophers for centuries. Words are used

convey meanings. Now, a word in common parlance is not anything but the sum-total of a few letters and a sentence, which usually held to be the unit of our thoughts and expressions, is an aggregate of a few words. On a careful and scientific analysis, however, it appears that a combination of letters forming a word and, likewise, a combination of words forming a sentence is never possible. Life of letters is only of short duration as they die out the next moment after they are pronounced. And, as combination of objects is possible only in the case of their co-existence, it is not understood how an aggregate of a few lettersmaking up a word or that of some words forming a sentence is obtainable. !f it, however, be presumed that letters are not short-lived entities but are endowed with permanent existence, a combination of letter, constituting a word may be conceivable but the manner in which such combination is to be achieved for purposes of expression of meaning remains to be studied in detail. The Naiyāyikas who believe in the evanescent character of letters and the Mimāṁsakas who are advocates of their etemal character have in their own ways attempted to return suitable answers to the objections that at times seem to have been baffling. But, it is worthy of notice that the grammarians do not find them suitable for acceptance. They adumbrate a theory strikingly original to claim that both word and meaning are indivisible units. The indivisible unit of expression is called *sphoṭa* and the indivisible unit of meaning is also called *sphoṭa* or *pratibhā*. The grammarians do not believe that a word is divisible into letters or a sentence is divisible into words. Likewise. they do not believe that the meaning of a sentence is the sum-total of the meaning of words which are ordinarily described as its parts." (*Preface*, p. IX)

(...)

We have stated that Bhartṛhari has elaborated the Vedic tradition when he describes the Absolute as brahman and *śabdatattva*.

But, may we go a step further to point out that he introduces it as *akṣara* too. Usually, the expression *akṣara* means that

which does not change or perish, i.e., unchanging or imperishable.

The Transcendent is viewed as the prius of the universe that comes out of it but it remains constant in spite of those transformations.

But, as it has been noticed before that the word may be derived from *vaś*, to pervade, meaning thereby 'what is pervasive and ubiquitous'. In this way the identity between brahman and *akṣara* may be understood. And, If brahman and *śabdativā* are conterminous, it is understandable how the Indescribable One is described as *brahman*, *śabdativā* and *akṣara*." (*Preface*, p. XI)

17. Seneviratne, Rohana. 2019. "Bhartṛhari and Wittgenstein on Grammar: A Few Observations." *IRA: International Journal of Education and Multidisciplinary Studies* no. 15:129-140.

Abstract: "Irrespective of spatiotemporal limitations of the world's intellectual history, discussions on the language have attracted considerable attention of philosophers, linguists, and even the public.

The topics of such discussions have also included the meaning, nature or function/s, and necessity of grammar while diverse arguments have been raised both in support and against even its ontic presence. Among the philosophers from all ages who attempted to analyze the foundation of those arguments, i.e. the common notion that grammar is prescriptive and fruit of pedagogical instructions, Bhartṛhari (c. 450 - 510 C.E.) stands significant because of the richness and legitimacy of his arguments at such an early age of history. More than a millennium later, Ludwig Wittgenstein as a highly influential philosopher from the last century shows some relationship with Bhartṛhari in (re)confirming that our common construal of grammar cannot be valid because of its non-prescriptive nature. While attempting to examine the ways in which Bhartṛhari and Wittgenstein have interpreted grammar, this paper succinctly investigates each philosopher approaches towards the language in use."

18. ———. 2019. "Unity of Sentential Meaning: Bhartṛhari's Approach to the Indivisibility Thesis." *Asian Journal of Multidisciplinary Studies (AJMS)* no. 7:18-26.

    Abstract: "A doyen of profound discussions on the Indian philosophy of language, Bhartṛhari (fl. 500 – 700 CE) introduced in the light of the Advaita Vedanta system of philosophy a major theory known as the indivisibility thesis (*akhaṇḍapakṣavāda*) of meaning. His expertise in Sanskrit grammar rooted in the time-honored tradition bolstered with applied approach to the language in use enabled him to establish firmly this theory. Some later grammarians in the mainstream Pāṇinian grammatical tradition and Vedantic philosophers modelled their theories on Bhartṛhari's approach to sentential meaning, while some others criticized him for misusing the Advaita Vedantic theology and its standard line of arguments in order to justify the indivisibility of meaning, whereas primacy of words cannot be ascertained in any context of language use. This paper examines the background of Bhartṛhari's arguments for the legitimacy of his claim that sentence meaning is the primary entity, which is divisible neither syntactically nor semantically. It also seeks to justify that his approach to the indivisibility thesis deserves a significant position among the early thoughts on the derivation of meaning and its composition."

    "The interest in studies of Bhartṛhari's scientific and philosophical heritage increased immensely within the last decades. It especially concerns *Vākyapadīya*.

    Many editions of the text itself as a whole or in parts appeared and we should like to remind about the critical text of the *Vakyapadiya* prepared and published by our highly esteemed colleague S. K. Iyer. The net result of all researches concerning

this tract of Bhartṛhari is given in S. K. Iyer's fundamental monograph "*Vākyapadīya* in the Light of Ancient Commentaries".(6) It is worth to note that the *Vākyapadīya* is widely used by scholars dealing particularly with the theory of meaning. It involved some ontological and epistemological problems and brought to attempts to define the place of Bhartṛhari in the ideological field of his time." (pp. 664-665)

(6) K. A. Subramania Iyer, *Bhartṛhari, A Study of Vākyapadīya in the Light of the Ancient Commentaries,* Poona 1969.

20. Shastri, Gaurinath Bhattacharyya. 1991. *The Philosophy of Bhartṛhari.* Delhi: Bharatiya Vidya Prakashan.

    "We propose to review in this monograph the cardinal ·points of this unique system of thought which, in our opinion, brings out Bhartṛhari's stature as one of the most outstanding intellectuals and dialecticians of all times. It is most unfortunate, however, that he could not become the fountain-head of a school like Dharmakirti or Śaṅkarācārya who had a continuous band of eminent writers to develop the central thesis of their original promulgators. Nevertheless, his sparkling originality of thought coupled with an amazingly compelling power of logic secured for him a position of great eminence with a host of outstanding philosophers belonging to rival schools of thought." (p. 1)

    (...)

    "To sum up: Io the opinion of the grammarian, Śabda means both the perishable sound and the Imperishable Word.

    When the Absolute is described as *a-śabda*, śabda means ·'sound'. The grammarian adumbrates that the Absolute is Śabda. In the absence of a suitable expression in the English language, the Absolute in the system of the grammarian is called Word (*Śabda*) or the Eternal Verbum." (p. 7)

21. Shukla, Ved Mitra. 2021. *Meaning in Bhartrhari's Vakyapadiya*. New Delhi: D. K Printworld.

22. Shulman, David. 2008. "Illumination, Imagination, Creativity: Rājasekhara, Kuntaka, and Jagannātha on *Pratibhā*." *Journal of Indian Philosophy* no. 36:481-505.

    Abstract: "Sanskrit poeticians make the visionary faculty of *pratibhā* necessary part of the professional poet's make-up. The term has a pre-history in Bhartṛhari's linguistic metaphysics, where it is used to explain the unitary perception of meaning.

    This essay examines the relation between *pratibhā* and possible theories of the imagination, with a focus on three unusual theoreticians—Rājasekhara, Kuntaka, and Jagannāthaita. Rājasekhara offers an analysis of *pratibhā* that is heavily interactive, requiring the discerning presence of the bhāvaka listener or critic; he also positions *pratibhā* in relation to Bildung (*vyutpatti*) and practice. For Kuntaka, *pratibhā*, never an ex nihilo creation by a poet, serves as the basis for the peculiar forms of intensified insight and experience that constitute poetry; these may also involve the creative scrambling and re-articulation of the object in terms of its systemic composition. At times, Kuntaka's *pratibhā* comes close to a strong notion of imaginative process. But the full-fledged thematization of the imagination, and of *pratibhā* as its support and mechanism, is best seen in the seventeenth-century debates preserved for us by Jagannātha. A link is suggested between the discourse of poetic imagination in Jagannātha and similar themes that turn up in Indo-Persian poets such as Bedil."

23. Subramania Iyer, K. A. 1969. *Bhartṛhari: A Study of Vâkyapadîya in the Light of Ancient Commentaries*. Poona: Deccan College Postgraduate Research Institute.

    "To put it briefly, an attempt has been made in this work, after giving a brief account of the problems relating to the text of Bhartrhari's work, including his commentary on the Mahabhashya of Patañjali and to the commentaries on the Vākyapadīya, to expound briefly the philosophical ideas and the notions pertaining to General Linguistics and those underlying the forms of the Sanskrit language, found mainly in the

Vākyapadīya and to a certain extent, in the commentary on the Mahabhashya. As the whole of even the available fragment of the latter work has not yet been published, it has not been possible to bring out all the linguistic notion lying embedded in it.

But I have taken note of some of the notions found in the published portion and they are found to confirm what one can gather from the Vākyapadīya. The present work is chiefly a study of the Vākyapadīya on the basis of the four available ancient commentaries. It does not claim to expound everything that the Vākyapadīya contains. It deals only with the basic notions found in its three *kāṇḍas*. The last section of the third *kāṇḍa*, the one relating to complex formations (*Vrtti*) is particularly rich in linguistic notions and some of them have been briefly explained here. The rest have not been dealt with, not only because they have been left for later treatment elsewhere, but also because some of them pertain particularly to the Sanskrit language whereas I have been anxious to bring out those notions like that of *sphoṭa* which concern language in general and not any particular language. The reason is that I look upon Bhartrhari as one who has, in a philosophical background, made a contribution to General Linguistics. He may be said to have given a definite shape to the contribution of ancient India to General Linguistics, though his ideas go back to Patañjali in the grammatical and linguistic tradition and to the Vedas themselves as far as the philosophical side is concerned. As I have indicated briefly what I have tried to do here in the section entitled 'Problems of Interpretation', it is not necessary to say anything more here." (*Preface*, pp. IX-X)

24. ———. 1982. *The Vākyapadīya: Some Problems*. Poona: Bhandarkar Oriental Research Institute.

Contents: Lecture I: Some Aspects of Bhartṛhari's Śabdādvaita 1-11; Lecture II: Bhartṛhari on Sphoṭa 12-50; Lecture III: the Vākyapadīya and the Pramāṇas 51-69.

"In *Vāk*. I. 44, according to tradition, Bhartṛhari begins his treatment of two kinds of words, included among the eight

topics declared by himself to form the subject matter of the Vākyapadīya.

There he tells us that in connection with the expressive word, one has to distinguish between two things: (1) that element which is the cause of the manifestation, (2) that element which, when manifested, conveys the meaning. Of these, the latter is the real word, the *vācaka* and the former is what manifests it. It is through the former that the indivisible expressive word is manifested and transferred to the hearer. Patañjali, in his Mahābhāṣya also makes a distinction between that which conveys the object, the meaning and that which is mere sound (*dhvani*); but he does not say anywhere clearly that the latter manifests the former. That element which, when manifested conveys the meaning is the real indivisible word, the *vācaka*.

It already exists in the speaker and the hearer but it has to be awakened or mianifested before it can convey the meaning. That which awakens it is called the *nimitta*. These two aspects exist only in the case of words which are expressive (upādānaśabda) ·and are therefore used for communication. The sounds which are uttered by the speaker awaken or manifest the expressive word, primarily the sentence, which already exists in the hearer.

The manifesting sounds are, therefore, the *nimitta*, the immediate cause of the awakening. It is not they which convey the meaning. That is done by the indivisible, sequenceless word which is manifested because it is eternally associated with it. It always carries, as it were, the reflection of the object and that reflection is the meaning. The main purpose is to convey it." (pp. 18-19)

25. Timalsina, Stfianeshwar. 2009. "Bharṭrhari and Maṇdaṇa on *Avidyā*." *Journal of Indian Philosophy* no. 37:367-382.

Abstract: "The concept of *avidyā* is one of the central categories in the Advaita of Sankara and Maṇdaṇa. Shifting the focus from *māyā*, interpreted either as illusion or as the divine power, this concept brings ignorance to the forefront in describing duality and bondage. Although all Advaitins accept avidyā as a

category, its scope and nature is interpreted in multiple ways. Key elements in Maṇḍana's philosophy include the plurality of avidyā, individual selves as its substrate and the Brahman as its field (*visaya*), and the distinction in *avidyā* between non-apprehension and misapprehension. A closer investigation shows that Maṇḍana is directly influenced by Bhartṛhari's linguistic non-dualism in developing the concept of Bhartṛhari. This study also compares other key constituents such as *vivartta* and *parināma* that are relevant to the analysis of *avidyā*. As the concept of counter-image (*pratibimba*) emerges as a distinct stream of Advaita subsequent to Maṇḍana, this study also compares the application of *pratibimba* in the writings of Bhartṛhari and Maṇḍana."

26. ———. 2009. "The Brahman and the Word Principle (*Śabda*). Influence of the Philosophy of Bhartrhari on Maṇḍana's *Brahmasiddhi*." *Journal of Indian Philosophy* no. 37:189-206.

    Abstract: "The literature of Bhartrhari and Maṇḍana have drawn significant attention in contemporary times. The writings of the prominent linguistic philosopher and grammarian Bhartrhari and of Maṇḍana, an encyclopedic scholar of later seventh century and most likely a senior contemporary of Sankara, shape Indian philosophical thinking to a great extent. On this premise, this study of the influence of Bhartrhari on Maṇḍana's literature, the scope of this essay, allows us to explore the significance of Bhartrhari's writings, not only to comprehend the philosophy of language, but also to understand the contribution of linguistic philosophy in shaping Advaita philosophy in subsequent times. This comparison is not to question originality on the part of Maṇḍana, but rather to explore the interrelationship between linguistic philosophy and the monistic philosophy of the Upaṇisadic tradition. Besides excavating the role of Bhartrhari's writings on the texts of Maṇḍana, this analysis will reveal the interrelatedness of the Advaita school of Sankara, often addressed as 'pure non-dualism' (*Kevalādvaita*) and the Advaita of Bhartrhari, identified as 'non-dualism of the word-principle' (*Śabdādvaita*)."

27. ———. 2014. "Semantics of Nothingness: Bhartṛhari's Philosophy of Negation." In *Nothingness in Asian Philosophy*, edited by Liu, JeeLoo and Berge, Douglas R., 25-43. New York: Routledge.

"Conclusion

This discussion of Sanskrit semantics has multiple philosophical implications.

Bhartṛharii's treatment of negation as ultimately grounded on being, and his assertion that there is no absolute negation of speech, removes it from the paradox that underlies negating something. This speech, or *vāc*, of Bhartṛhari is not just a means of communication though. When speech is identified with the absolute, the Brahman, the consequence is that no negation of the foundational being is possible, a rejection of the Nāgārjunian approach.

Bhartṛhari's treatment of sentence negation and word negation further illuminate other issues. It has been discussed above that negation in a sentence relates to the verb and negation in compounds relate to the second word. The consequence is that word negations do not simply negate something. Bhartṛhari's logic rests on three-tiered negation:

~ P = Q

~ P = ~

~ = P'

(Where P' stands for something that is neither identical to P nor is absolutely different from it, in the sense that P' shares many of the constituents of P but not all.) While Bhartṛhari rejects the position that ~ P = Q , this is only in the context of the compound terms. His analysis of three-tiered negation (which stems from Patañjali's analysis) still has relevance in understanding negation in the issues outside of semantics.

The consequence of Bhartṛhari's conclusion is that ~ P = P' leaves negation as affirming something existing. For the Advaitins, 'ignorance' (*avidyā*) is of the essential character of

being (*bhāvarūpa*). This understanding of ignorance as something phenomenal (while not having its own intrinsic being) would be semantically impossible had not the philosophy of language allowed such interpretation. Along the same lines, the Svātantrika-Prāsangika discourse on negation also stems from the semantic issue of whether the negative terms simply negate being or affirm something else.

The discourse on language is therefore pivotal to understanding a wide range of philosophical issues that originated in classical India. Although I have restricted myself to the philosophy of Bhartṛhari, his answers to the issues regarding negation are relevant for a wider discourse not only on language but also epistemology." (pp. 40-41)

28. ———. 2018. "Bhartṛhari and the Daoists on Paradoxical Statements." *Journal of Indian Philosophy and Religion*:5-24.

    Abstract: "Rather than considering paradox in a literal sense to be unresolvable, both Bhartṛhari and the Daoists develop a distinctive hermeneutics to decipher them, always exploring an overarching meaning where the fundamental differences are contained within. The conversation on paradox escapes the boundary of paradox then, as it relates to interpreting negation, and above all, the philosophy of semantics. Being and non-being, one and many, or something being both true and false at the same time are examples found from their texts. Just as the static and dynamic domains of the Dao remain a key to address paradox in Chinese literature, the stratification of speech, wherein deeper layers of speech are capable of resolving the apparent tension found at the surface level, seems central to Bhartṛhari’s approach."

29. Tiwari, Devendra Nath. 1997. "Bhartṛhari on the Indivisibility of Single-Word Expressions and Subordinate Sentences." *Indian Philosophical Quarterly* no. 24:197-216.

    "The aim of Bhartṛhari' s Philosophy of language is to explain the cognition accomplished by expressions in usual communication. By the term 'expression' Bhartṛhari means the unit of language which illuminates itself (its real nature) and

the meaning as well on the basis of which communications are accomplished.

It as such is a unit of communication comprising utterances, signs, symbols, gestures etc. as instrumental in the manifestation of real language (sphoṭa) and the sphoṭa as well which when manifested by them reveals itself and the meaning as well. Expression is not confined to tokens we utter, write or read because communication is accomplished by it. It is the differences of tokens used that the vitality or otherwise of an expression is decided; though Vaiyākaraṇas give importance to the tokens popularly used in ordinary usages. An expression is expressed in the mind of a speaker before communicating through utterances and reveals meaning when it is revealed in the mind of the audience through hearing and mainfesting sphoṭa. The utterances/tokens by proxy are called expressions. According to his philosophy there is no cognition without śabda (language) and all cognition. is congition shot through and through by *sabda*.(1)" (p. 197)

30. ———. 2008. *The Central Problems of Bhartrhari 's Philosophy*. New Delhi: Indian Council of Philosophical Research.

Contents: Notes on Transliteration of Sanskrit Alphabets VI; Abbreviations VII; Acknowledgements IX; Preface XI-XIX; Chapter I: Philosophical Problems of *Vākyapadīya* 1; Chapter II: Concept of Speech-Element (*Vāk-tattva*) 75; Chapter III: The Concept of Sentence (*Vākya*) 143; Chapter IV: The Concept of Sentential-Meaning (*Vākyārtha*) 176; Chapter V: The Concept of Word (*Pada*) 257; Chapter VI: The Concept of Word-Meaning (*Padārtha*) 285; Chapter VII: Concept of Grammatical Analysis (*Apoddhāra*) 360; Chapter VIII: Relation betweern Language and Meaning 377; Chapter IX: Critical Estimate 404; Index 420-434.

"The present work is a cognitive approach that views Bhartrhari's philosophy in accordance with his goal of

analyzing and interpreting cognition as revealed by language in usual communication. It views even the metaphysical concepts, as they are revealed in the mind by language. Philosophy cannot excel, or there is no possibility of any philosophy, if it is taken to engage with transcendental, non-cognitive and incommunicable things beyond the reach of language. Philosophy is a cognitive activity par excellence in the sense that it is concerned with and is confined to the beings that are awareness in character, and the world of awareness, for a Bhartṛharian, comprises the being of language and that of the meaning revealed non-differently by it in the mind. The language expresses/reveals those beings independently of things in-themselves - empirical or transcendental - and of our allegiances to them. Such beings, as are revealed by language, are alone intelligible and, hence, philosophical beings.

Language (*śabda*) for Bhartṛhari is not confined to what we speak, read or write. It is the light, the unit of awareness, a conscious force, different in character and in function from other lights, viz. sun, lamp, etc. which serve as tools in perception. Unlike other lights, it is awareness and, hence, foundational in character. It functions as the expresser of both itself and its meaning. Lights, other than language, illuminate external things caught in their compass, while language reveals all light, non-light, consciousness, unconsciousness and self-awareness as well. As a lamp illuminates many things falling within its compass, but the thing desired or expected, specifically, is taken primarily as illuminated by it, language (*śabda*) is expressive of all meanings (*sarve sarvārtha vācākāḥ*), but the meaning popularly expected is primarily taken to be known by it and other meanings are known on its basis either by implication or by closeness to the primary meaning. The present work observes that any oversight of the importance of expressive or primary meaning may cause confusion in understanding philosophical excellence of *Vākyapadīya*, because it is the primary meaning on the basis of which secondary and tertiary meanings of the word/language are known by imposition and nearness to it." (*Preface*, p. XIII)

(....)

"In order to impart to the book a pattern of organic unity, it is symmetrically arranged into nine chapters. The presentation contains investigations into the problem of different theories of language, meaning and the relation between the two from the point of view of analysis of cognition as revealed by language in communication. It deals with almost all the major arguments of the Naiyyikas, Bauddhas and the Mīmāṃsakas on the various issues of philosophical semantics and syntactics and answers them persuasively from the point of view of Bhartrhari's philosophy. Attempt has been made to present a philosophical exposition of the concepts without leaving any important verse of *Vākyapadīya* untouched. That is why, it has become a useful monograph not only for scholars, but also for general readers interested in the central philosophy of *Vākyapadīya*. The author is well aware of his limitations. It is up to wise readers to correct him for an improved next edition." (*Preface*, p. XIX)

31. Todeschini, Alberto. 2010. "Bhartṛhari's view of the *pramāṇas* in the Vākyapadīya." *Asian Philosophy: An International Journal of the Philosophical Traditions of the East*:97-109.

Abstract: "This paper is a study of Bhartṛhari's understanding of the *pramāṇas,* i.e. the means whereby knowledge is acquired, as can be evinced from his Vākyapadīya and the corresponding commentary (Vākyapadīya Vṛtti). Both Bhartṛhari's general attitude towards pramāṇas as well as his specific understanding of the individual means of knowledge are analyzed. In particular, it is established that Bhartṛhari accepts exactly three pramāṇas: perception (pratyakṣa), inferential reasoning (anumāna) and tradition (āgama). However, the status of the three is unequal: perception and inferential reasoning are fallible and hence cannot provide reliable guidance with regard to Dharma. These two pramāṇas do have their place and according to Bhartṛhari should not be discarded entirely. As for āgama, it is clear that Bhartṛhari accords it primacy in matters related to Dharma. But again, Bhartṛhari does not discard anumāna and pratyakṣa entirely.

Rather, he seems to suggest that they have to be supplemented by āgama, which is the unimpeacheable judge of tradition."

32. Tola, Fernando, and Dragonetti, Carmen. 1990. "Some Remarks on Bhartṛhari's Concept of Pratibhā." *Journal of Indian Philosophy* no. 18:95-112.

    "Among the meanings which the word *pratibhā* possesses in Bhartṛhari three interest us:

    (1) *Pratibhā* as the meaning of the word (*pāda*) and of the sentence (*vākyārtha*).

    (2) *Pratibhā* as an act of intuitive knowledge, whose object is the meaning of the word and of the sentence. Both aspects of *pratibhā* as the meaning of the word and of the sentence and as an intuitive knowledge are indissolubly connected. This relation is expressed by Punyarāja when he says, ad kārikā II, 13, that *artha*, the meaning is *pratibhārūpa* and, ad kārikā II, 31, that it is *pratibhātmaka*. Bhartṛhari himself affirms that the śabda(2) and the artha are not separated (II, 31, *sabdārthāv apṛthakslhitau*). It is only the conceptual analysis that can separate the meaning of the sentence (*artha*) from its cognition {*pratibhā*)(3)

    (3) *Pratibhā* as an act of intuitive knowledge whose object is not the meaning of the word or of the sentence, but the 'meaning of an action', 'the meaning of a situation', and other objects of diverse kinds. With this third value the semantic sphere covered by the word *pratibhā* becomes much broader. The second and third meanings differ only in relation to the object to which the act of intuition applies. So in what follows we shall treat them together." (pp. 95-96)

    (2) The word śabda comprises words (*pāda*) and sentences (*vākya*).

    (3) This remark on the indissoluble unity of the meaning of the sentence and its cognition is also valid for any other object of *pratibhā*.

33. Unebe, Toshiya. 2000. "Jñānaśrībhadra's Interpretation of Bhartrhari as Found in the *Lankāvatāravrtti* ('*Phags pa*

Langkar gshegs pa'i 'grel pa)." *Journal of Indian Philosophy* no. 28:329-360.

"The *Lankāvatārasūtra* (LAS) is one of the most important scriptures of Mahāyāna Buddhism. It was translated into Chinese four times. Three translations are still extant. Many commentaries on those Chinese versions were written in China, as well as in Japan,(1) whereas only two commentaries on the Sanskrit version have come down to us in the form of Tibetan translations. Jñānaśrībhadra (*Ye shes dpal bzang po*), who is thought to have been active in the eleventh century in Kashmir, wrote one of them: the Ārya-Lankāvatāravrtti (’Phags pa Langkar gshegs pa’i ’grel pa = LAV)." p. 329)

(...)

"In his LAV Jñānaśrībhadra frequently refers to the positions of Bhartṛhari, the Grammarians (vaiyākaraṇa/lung ston pa rnams), or the Śabdabrahmavādin (sgra tshangs par smra ba rnams) holders of the theory of Brahman as language). As far as I am aware, under these names, forty-six verses are directly quoted from the *Vākyapadīya* (VP), the magnum opus of Bhartṛhari. Given the fact that Śāntarakṣita in his *Tattvasaṅgraha*, cited Bhartṛhari’s verses in many places, and even devoted one chapter to refuting his Vedāntic philosophical thought, Buddhists could not ignore Bhartṛhari’s philosophy and linguistic theory.

In this paper I will deal with some of the verses cited by JJñānaśrībhadra and his comments on them to illustrate how this Buddhist scholar understood Bhartṛhari's thought. The paper will also offer some interpretations of LAS passages in the light of the commentary of Indian origin; in addition it will provide material to understand the world of thought of eleventh century Kashmir from a Buddhist perspective." (p. 330, a note omitted)

(1) For this tradition, based on the Chinese versions of the LAS, see Suzuki (1930: 3–11, 51–65).

34. ———. 2004. "The "Grammarian Objection" in Sthiramati's *Triṃśikābhāṣya* and Bhartṛhari's Argument on the Secondary

Application of Words." In *Three Mountains and Seven Rivers: Prof. Musashi Tachikawa's Felicitation Volume*, edited by Hino, Shoun and Wada, Toshihiro, 135-152. Delhi: Motilal Banarsidass.

"My attempt in this paper is only to show that the connection between the objection recorded in the Sthiramati's commentary and the grammatical literature, especially, Bhartṛhari's Vākyapadīya. Using these earlier studies, we shall discuss it further in detail." (p. 136)

(...)

"In conclusion, let us summarize our discussion briefly. As we have examined, the close ideas to the "Grammarian's objection" presented in Sthiramati's *Triṃśikābhāṣya* are recorded in Bhartṛhari's Vākyapadīya. But it is doubtful that he intends to make an objection to the Vijnanavadins per se, as he seems to introduce just various views with reference to the secondary application or secondary meanings of words. Among the various views taken up by Bhartrhari, the one particular to him is that a word primarily refers only to its form (svarupa), a ·particular pattern of phonemes; whatever else the word may refer to is secondary. In spite of Sthiramati's rejection of this view, we can see some kind of affinity between Bhartrhari and the Vijnanavadins on this point, since it is the Vijñānāvadins who assert that whatever a word may refer to is secondary." (p. 146)

35. ———. 2010. "Bhartṛhari on Text and Context." In *Indian Philosophy and Text Science*, edited by Wada, Toshihiro, 115-131. Delhi: Motilal Banarsidass.

"... in this paper, I would like to introduce the ancient Indian counterpart of modern contextualism by presenting how the fifth-century Indian grammarian/philosopher Bhartṛhari treats context in his linguistic theory, widely known as the theory of the indivisible sentence (*akhaṇda-vākya-vāda*). Scholars have clarified that Bhartṛhari considers a sentence (*vākya*) as the indivisible unit of speech and meaning of a sentence (*vakyārtha*) as something indivisibly and instantaneously

perceived as a flash of understanding (*pratibhā*) by the listener of the speech. However; the role of context in his theory has not been sufficiently explained thus far.

As the title of his magnum opus, the *Vākyapadīya* (VP), indicates, Bhartṛhari mainly argues about a sentence (*vākya*) in contrast with a word *(pada*). Therefore, he focuses on the significance of a sentence vis-a-vis the words that constitute it. Thus, there seems to be no independent section in Bhartṛhari's *Vākyapadīya* where he solely explains context. However, this still does not imply that he considers the issue to be an insignificant one. l hope that the idea of this ancient Indian grammarian will prove to be relevant even for the present *Text Science*." (p. 116, a note omitted)

36. ———. 2011. "“*Apūrva*,” “*Devata¯*,” and “*Svarga*”: Arguments on Words Denoting Imperceptible Objects." *Journal of Indian Philosophy* no. 39:535-552.

    Abstract: "We cannot directly perceive and experience objects of words such as “apūrva” “devata¯ ,” and “svarga,” while objects of words such as “cow” and “horse” are perceptible. Therefore in the Indian linguistic context, some assert that there are two categories of words. However, a grammarian philosopher Bhartṛhari (450 CE) in the second book of his Vākyapadīya, introduces a verse stating that there is no difference between them. Other Indian thinkers as well deal with this issue in various contexts. This paper aims at exploring the ideas expressed in Bhartṛhari’s verse and the related arguments found in other treatises of different schools. It consists of discussions of the following: (1) Bhartṛhari's Vākyapadīya 2.119 and its commentarial texts; (2) Kumārila’s Criticism; (3) The Nyāya context; (4) The Sāmkhya and the Buddhist context; (5) Related grammatical passages and the background of the Vākyapadīya 2.119; and (6) Conclusion."

38. ———. 2018. "Cognition and Language: Buddhist Criticism of Bhartṛhari' Thesis." In *History of Indian Philosophy*, edited by Bilimoria, Purushottama, 446-455. New York: Routledge.

"This chapter is primarily concerned with the fifth-century (c. 450– 510 CE) Indian grammarian and philosopher Bhartṛhari. Bhartṛhari's thesis on the relation between cognition and language is frequently visited by various thinkers from other schools. We will examine arguments in a few Buddhist logico-epistemological compendia, in which certain authors criticized Bhartṛhari for neglecting non- conceptual (*avikalpa/ nirvikalpa*) perception.

Bhartṛhari proclaims his thesis in the first book of his magnum opus, the *Vākyapadīya* (V) as follows:

[Sanskrit omitted]

(VP 1.131; VPwr, p. 49; VPI, p. 188)

In the world there is no notion (*pratyaya*) without conforming to/ accompaniment of language. All cognition *(jñāna*) appears as if penetrated by language.

As it reads, Bhartṛhari asserts that all cognition is closely related to language. The relationship between language and cognition intrigued ancient Indian scholars, and Bhartṛhari's theory generated arguments among them. Quoting this verse, many thinkers argue for and against his thesis.(2)" (p. 446)

39. Vergiani, Vincenzo. 2004. "Two Parallel Passages in the Mahabhayasyatika and the Vakyapadiya of Bhartrhari." *Rivista degli Studi Orientali* no. 77.

"THE six *kāraka* categories are, as is known, a pivotal feature of Pāṇini's grammar. This explains why they have repeatedly drawn the attention of both ancient Grammarians and modern Indologists, stimulating considerable debate on the subject. Despite minor criticisms and modifications, the Pāṇiniyas have basically accepted the *kāraka* system as expounded in the *Aṣṭādhyāyī*, making a clear distinction between *kāraka* and non-*kāraka* syntactic relations.

It is all the more disconcerting, therefore, to come across the mention of «seven *kārakas*» in one of the best-known and most authoritative commentaries on Patañjali's *Mahābhāṣyaṣyaṭīkā*,(1) the *Mahābhāṣyapradīpa*(2) of Kaiyaṭa, even though this occurs within the context of what appears to be an alternative view, which the author rejects.

In all likelihood Kaiyaṭa is inspired by a remark made by Bhartṛhari in his *Mahābhāṣyaṣyaṭīkā*(3) the most ancient extant commentary on the MBh.(4) In Bhartṛhari's *ṭīkā* on the *Paspasāhnika*, in fact, there is a puzzling statement, which is made more difficult to comprehend by the fact that in one place the manuscript has a barely legible akṣara (...). Here I would like to suggest a new interpretation of Bhartṛhari's words(5) by drawing a parallel with v. 44 of the Sādhanasamuddesa,(6) the

chapter on the factors of action in the third *kāṇḍa* of the *Vākyapadīya*.(7) My interpretation is based on a reading of the passage that differs from the one found in the 1987 BORI critical edition of this section of the MBhT by Bronkhorst." (p. 86)

(1) Henceforth, MBh.

(2) Henceforth, MPr.

(3) Henceforth, MBhT.

(4) As is known, the MBhT is preserved in only one incomplete and often corrupt manuscript, the facsimile of which has been published by the Bhandarkar Oriental Research Institute of Pune.

(5) And, consequently, of Kaiyaṭa's.

(6) Henceforth, SaS. Unfortunately, for the understanding of this verse we cannot rely on Helārāja's help, because one of the two gaps occurring in the *Prakīrṇaprakāśa* (henceforth, PrPr) includes the

commentary on this section of the SaS. The gaps are filled in the manuscripts with the text of an otherwise unknown author called Phullarāja.

(7) Henceforth, VP.

40. ———. 2009. "A Quotation from the Mahābhāṣyadīpikā of Bhartṛhari in the Pratyāhāra Section of the Kāśikāvṛtti." In *Studies in the Kasikavrtti. The Section on Pratyaharas Critical Edition, Translation and Other Contributions*, edited by Haag, Pascale and Vergiani, Vincenzo, 161-189. London: Anthem Press.

"In the *Kāśikāvṛtti* (henceforth, KV) on psū. 5, *ha ya va ra ṬT*, a passage occurs that is present in a very similar form in two earlier texts, the *Mahābhāṣyadīpikā* (henceforth, MD) of Bhartṛhari and the Cāndravṛtti (henceforth, CV) on the Cāndravyākaraña (henceforth, C.) of Candragomin. A second passage elaborating on the first is found in almost identical

form in the CV and the KV. Although many scholars, from Kielhorn (1886) onwards, have drawn attentionto the numerous similarities that exist between the C., and especially its commentary, the CV, and the KV, even in the *pratyāhāra* section, these particular passages seem to have gone virtually unnoticed. However, as I will try to show in the following pages, they represent one piece of direct evidence that can help to establish on a more reliable basis the still controversial relative chronology of the authors and texts mentioned above, as well as their relationships to each other. Before examining the passages in question, I will present the terms of the ongoing debate, thus situating their interpretation in a historical perspective." (pp. 161-162, notes omitted)

Goodness of Sanskrit: Studies in Honour of Professor Ashok Aklujkar*, edited by Watanabe, Chikafuma, Desmarais, Michele M. and Honda, Yoshichika, 331-349. New Delhi: D. K. Printworld.

"Even sensations and impressions that have hardly been consciously recorded at the time of their occurrence can often be retrieved to some extent by an effort of recollection and therefore verbalised. Thus, a question arises about their status after the sense-object interaction takes place: should they be regarded as unformed perceptions that already possess cognitive value, namely, that are already somewhat imbued with linguistic categories? And is it possible that Bhartṛhari uses the phrase *avikalpa jñāna* to refer to such liminal states of cognition, when one’s attention is either unfocussed or, on the contrary, deeply absorbed in what one is doing whilst generally alert to one’s surroundings?

In order to answer these questions, I will first briefly present Bhartṛhari's views on the physical and physiological aspects of perception, for I think these have a bearing on the topic of this article." (pp. 332-333, a note omitted)

42. ———. 2013. "The Adoption of Bhartṛhari's Classification of the grammatical object in Cēṉāvaraiyar's commentary on the Tolkāppiyam." In *Bilingualism and Cross-cultural Fertilisation: Sanskrit and Tamil in Medieval India*, edited by Cox, Whitney and Vergiani, Vincenzo, 161-197. Pondichéry: Publications de l'Institut Français de Pondichéry.

    "In this article I will look at one episode in the long history of the interaction between the Sanskrit and Tamil grammatical traditions and draw from it some — largely tentative — conclusions in the hope that they may help to cast some light on larger processes at work.

    The episode in question is quite a clear-cut case of conceptual borrowing.

    It consists in the adoption of a semantic classiication of the grammatical object, irst formulated by the Sanskrit author Bhartṛhari (probably 5th century CE), at the hands of Cēṉāvaraiyar (13th–14th century CE), a mediaeval Tamil commentator of the Collatikāram (TC) of the Tolkāppiyam (T.). In order to assess the full significance and the wider implications of this borrowing, I will first have to situate both authors within their respective scholastic traditions. In particular, their views on the grammatical object will need to be seen in the broader context of each school's treatment of cases. his is a vast, complex and a highly technical topic, and even more so in an inter-linguistic perspective like the one attempted here. I will therefore have to be content with providing an inevitably sketchy outline of the two systems before narrowing my focus down to the grammatical object, and with that focus in mind I will also briely discuss other broadly coeval texts and traditions, in the hope that even a simple presentation of textual data will give a sense of the complexity of the underlying socio-cultural dynamics." (pp. 161-162, a note omitted)

43. ———. 2014. "The concept of *prayoktṛdharma* in the *Vākyapadīya* and some later works: The expression of feelings through words: a linguistic and philosophical outlook." *Bulletin d'Études Indiennes* no. 32:267-291.

"It is not uncommon for an utterance in the context of ordinary communication not only to predicate something about a given state of affairs but also to convey something about the speaker's emotional disposition towards the particular situation he/she is talking about. Clearly, any utterance reflects the uniquely subjective point of view of a certain speaker, which depends on the motivation behind his/her speech act as well as on what can be broadly defined as the context in which the communication takes place – and the context itself can be further described or analysed in terms of a number of variables such as the time and place, the level of formality/informality of the exchange, the nature of the relation between the people involved, and so on.

(...)

In an article published in 1991 Saroja Bhate draws attention to this remarkable feature of Pāṇini's work, one more token of his linguistic genius. "In his Aṣṭādhyāyī", she writes, "he showed in at least two hundred rules that a number of emotive and attitudinal meanings were relevant to the form of language" (Bhate 1991: 59).(2)

(...)

In the Pāṇinian tradition, the concept of *vyañjanā* was adopted by one of its greatest later exponents, Nāgeśa, in the 17th century (Bhate 1991: 56), to designate meanings that are not directly expressed but rather suggested or implied. However, long before Nāgeśa, the grammatical tradition, and in particular Bhartṛhari (5th c. CE), had speculated on this elusive aspect of semantics from a linguistic and philosophical point of view, coming up with different insights of great theoretical interest. In this paper I will focus on one such insight – the notion of *prayoktṛdharma* "property of the speaker" – found in the third *kāṇḍa* of the *Vākyapadīya* (VP), Bhartṛhari's major

treatise on philosophical semantics, and look at the use some of the later Pāṇinīyas made of it in their works."

(2) A systematic survey of these rules in the A. is still a desideratum. I intend to carry it out in the future.

Abstract: "Examining the function and style of the references to grammatical literature found in a substantial section of Helārāja’s Prakīrṇaprakāśa on Bhartṛhari's third book of the Vākyapadīya, the article argues that the likely ideological motive of this commentary was to establish its *mūla* work firmly within the Brahmanical canon and should therefore be seen in the context of the appropriation of Bhartṛhari's ideas on the part of the roughly contemporary Pratyabhijñā philosophers of Kashmir. Incidentally, it also touches upon the making of the Pāṇinian tradition and the relation between Helārāja and Kaiyaṭa, the Kashmiri commentator of Mahābhāṣya."

45. ———. 2016. "Bhartṛhari on Language, Perception, and Consciousness." In *The Oxford Handbook of Indian Philosophy*, edited by Ganeri, Jonardon, 231-252. New York: Oxford University Press.

"Among the followers of the three sages (*munis*)—Pāṇini, Kātyāyana, and Patañjali—Bhartṛhari is the first whose works are extant. But rather than focusing primarily on the technical side of grammar, in his magnum opus, the Vākyapadīya, Bhartṛhari develops the reflection on semantics initiated by

Patañjali. This reflection is elaborated within the framework of his unique metaphysical vision according to which the very essence of brahman , the Absolute, is language (*śabda*), the ordering principle that is the fountainhead of the light of consciousness shining inside all living beings as well as the ultimate source of the physical world.

If the language principle (śabda-tattva) is the stuff the universe is made of, it follows that its sentient manifestations, and in particular human beings, are never divorced from language, for their capacity for knowledge (in fact their very consciousness and self-awareness, as will be argued below) is innately infused with language. The epistemological counterpart of Bhartṛhari's ontological monism is epitomized in this much-quoted verse from the first book of the VP: "In ordinary experience there is no cognition that does not conform to language. All knowledge appears as if it were transfixed by language." This position certainly has metaphysical underpinnings, as I have mentioned, but at the same time it is rooted—like all of the Grammarians' statements on language and epistemology—in the insightful observation of the actual linguistic practices and mental processes at play in everyday experience. And yet, the content of this particular statement may seem counterintuitive, because we are not normally aware of language playing any evident role in the sensory apprehension of physical objects. For Bhartṛhari's epistemology, it is of crucial importance, then, to show how language operates in a subtle but pervasive way even in perception, the most immediate mode of cognition." (p. 233, notes omitted)

In *Studies in Logic: A Dialogue between the East and the West: Homage to Bimal Krishna Matilal*, edited by Mitra, Madhabendra Nath, Chakraborty, Mihir Kumar and Sarukkai, Sundar, 115-141. New Delhi: Munshiram Manoharlal.

"For the Indian Grammarians, including Bhartṛhari, a statement represents the speaker's intention.(7) Accordingly, the hearer should not assume in advance that the speaker is

telling a lie or what he is saying is false, as otherwise it would not be possible to establish communication between the speaker and the hearer.

However, when a speaker utters the sentence "all I say is lies" (*sarvaṃ mithyā bravīmi*), if the word "all" refers to the statement itself, then the statement itself would be refuted and the speaker's intention to convey what he has in mind would not be accomplished. In order to prevent this self-refutation, the meaning of the quantifier "all" must be restricted. As a result, the meaning of the statement is understood as "all I say is lies except for this statement."

In this sense, it might be said that Bhartṛhari employs the theory of meta-language as devised from the semantic point of view. But the crucial point in his manner of evading self-reference is his Introduction of the notion of the speaker's intention and his emphasis on the purpose of speech acts. This point is more intimately related to pragmatics than to semantics. It is to be noted that A.P. Martinich tries to solve the liar paradox from the pragmatic point of view. According to him, a statement must fulfill an "essential condition." He explains this technical term as follows:

The essential condition for making a statement is that the speaker intends that the audience will take his utterance as representing how things are. (10)

In the light of this "essential condition" for making a statement, a paradoxical sentence such as "this statement is false" cannot be accepted as an adequate statement, because the hearer of this statement cannot ascertain its truth. It can be said that this "essential condition" for making a statement is considered a means for preventing self-reference, ancl thus, this idea is quite similar to Bhartṛhari's theory described above.

As is this "essential condition," Bhartṛhari 's notion of the speaker's intention is related to the purpose of speech acts, and it confines a speaker to saying something he considers to be true when he makes an utterance. Through such a

presupposition, he precludes self-reference from arising." (pp. 119-120, two notes omitted)

   Summary: "The article takes up anew the question of the authorship of the Vṛtti on the first two kāṇḍas of the

Vākyapadīya. Section 1 reviews the most important relevant passages from classical Sanskrit authors; they are unanimous in ascribing the Vṛtti to the author of the Vākyapadīya. Section 2 shows that there are, on the other hand, very strong internal arguments to show that the Vṛtti and the Vākyapadīya had different authors; the most important of these arguments have not yet been brought forward, or evaluated properly in the literature on this question. Section 3 then deals with the question of the weight which must be given to the unanimity of tradition, and to the other arguments that have been used to prove identity of authorship. Most of these can be shown to be without value, because they can be explained by a stylistic feature of many commentaries from that period which have not been taken into account or even noticed previously. Only one important argument remains at this point, the argument according to which some verses of the Vākyapadīya are incomplete without words added by the Vṛtti; this argument too loses its value once it is seen that these verses remain incomplete even after the words from the Vṛtti have been added. The conclusion is drawn that the Vṛtti and the Vākyapadīya have different authors. Section 4 deals with the text-critical question of how to distinguish verses belonging to the Vākyapadīya from verses cited in the Vṛtti from elsewhere. Section 5 addresses the question of whether the author of the Vākyapadīya or the author of the Vṛtti, if either, wrote the Mahābhāṣya Dīpikā. Some arguments support the view that it was the former. Section 6 reviews some early quotations from the Vṛtti, which indicate that this commentary may be old, even perhaps older than Dignāga."

1. Bansat-Boudon, Lyne. 2011. "Une lecture *Śaiva* de Bhartṛhari. Enquete sur une citation corrompue de l' *Abhinavabhāratī* ." *Indologica Taurinensia* no. 37:37-74.

   "La question de savoir si la *Vṛtti* , le commentaire le plus ancien du *Vākyapadīya* , est l' oeuvre de Bhartṛhari ou celle de Harivṛṣabha a été longuement et anciennement débattue. Pour une grande partie de la tradition indienne, il est incontestable que Bhartṛhari est l'unique auteur du *Vākyapadīya* et de sa *Vṛtt* i. Telle est, en tout cas, nous le verrons, la position d' Abhinavagupta (et, sans doute, d'Utpaladeva), et c'est ce qui justifie le titre du présent article.

   Donnée deux fois, dans deux de ses gloses, par Abhinavagupta, la strophe, retrouvée dans la *Vrtti* , que j'examine ici, est explicitement attribuée à Bhartṛhari dans l'une au moins de ses occurrences, à savoir la *Vivṛtivimarśinī*. En sorte que l'interprétation inédite qu'en propose, à cet endroit, Abhinavagupta constitue bien une «lecture *śaiva* de Bhartṛhari»." (p. 38)

"En gros, les spéculations brahmaniques sur la connaissance se distribueront selon les deux directions ainsi indiquées par la Mïmāmsā et le Nyāya. Cependant, elles seront aussi partiellement influencées par une troisième doctrine qu'elles rejetteront pour l'essentiel et qui, elle aussi, se trouve liée à une discipline particulière : la grammaire.

Il s'agit cette fois, non plus d'une école proprement dite, quoique ce soit la tradition grammaticale issue de Pānini qui en fournisse l'occasion, mais d'une oeuvre attribuée à un auteur plus individualisé : Bhartṛhari.

(...)

Son Vākyapadīya n'a pas fait école, quoiqu'il ait été utilisé de maintes façons, et la moindre raison n'en est pas, sans doute, le fait qu'il a bouleversé la problématique de la Mïmāmsā et du Nyāya. La grammaire est une des « sciences annexes » - *anga* - du Veda, considérée comme nécessaire à l'exacte transmission du texte dans sa matérialité.

Les grammairiens n'ont cependant pas attendu Bhartṛhari pour soulever les problèmes philosophiques liés au langage. Au contraire, ce dernier est placé devant un riche faisceau de spéculations traditionnelles, acceptées par le monde orthodoxe, et qu'il intègre à sa propre réflexion. Pourquoi la Grammaire de Bhartṛhari n'a-t-elle pas été finalement retenue au nombre des darśana, des « points de vue » sur la vérité considérés comme

orthodoxes ? C'est une question à laquelle il faudra essayer de répondre." (pp. 24-25, une note omise)

3. Bronkhorst, Johannes. 1988. "Études sur Bhartṛhari, 1: L'auteur et la date de la Vṛtti." *Bulletin d'Études Indiennes* no. 6:105-143.

   Summary: "The article takes up anew the question of the authorship of the Vṛtti on the first two kāṇḍas of the Vākyapadīya. 4. ———. 1992. "Études sur Bhartṛhari, 4: L'absolu dans le Vākyapadiya et son lien avec le Madhyamaka." *Asiatische Studien = Études Asiatiques* no. 46:56-80.

   "Pour la compréhension de la philosophie de Bhartṛhari telle qu'elle apparaît dans son Vākyapadīya, le concept du Brahman, c'est-à-dire de l'absolu, joue un rôle central.

   Bhartṛhari l'introduit au début même de son ouvrage, et cela indique déjà qu'il serait incorrect d'ignorer cet aspect de sa pensée.

   La strophe initiale du Vākyapadīya décrit le Brahman comme étant *śabdatattvam* .

   L'ambiguïté de ce composé permet deux interprétations tout à fait différentes; toutes les deux ont été acceptées par des chercheurs différents." (p. 56)

   (...)

   "On voit que les deux interprétations du Brahman de Bhartṛhari proposées par la recherche récente ne conviennent pas. La question se pose donc de nouveau: quel était le concept du Brahman de Bhartṛhari?

   Il existe une troisième conception du Brahman qui pourtant, pour autant que je sache, n'a jamais été mentionnée dans le contexte de Bhartṛhari. C'est celle de la totalité de tout ce qui existe, conception qui se trouve dans certaines upaniṣad, et ailleurs, comme par exemple dans la Bhagavad Gitā (où elle porte, naturellement, sur Vāsudeva: 7.19; 11.40). Est-il possible que Bhartṛhari accepte ce concept du Brahman?

   Pour répondre à cette question, il est nécessaire d'étudier d'abord le concept du tout trouvé dans le Vākyapadīya. Pour Bhartṛhari le tout est réel, tandis que ses parties ne le sont pas." (p. 59)

   (...)

   "Pourquoi Bhartṛhari a-t-il élaboré une telle conception du monde? L'idée du Brahman comme totalité existait déjà avant

lui, bien sûr. Mais Bhartṛhari n'a pas simplement emprunté cette idée aux textes antérieurs. Il l'a développée, encadrée dans une vision extraordinaire, vision qui attribue une réalité supérieure à chaque totalité, en comparaison avec ses parties.

Notons d'abord la ressemblance de cette vision avec une autre, cependant opposée à celle-ci. Selon la position adoptée par une grande partie des bouddhistes indiens, aucune totalité n'existe vraiment. Voici l'autre extrême, presque aussi radical que celui de Bhartṛhari. On ne peut guère s'imaginer que les deux extrêmes sont indépendants l'un de l'autre, et il semble donc tout à fait plausible que la position de Bhartṛhari soit une réaction contre celle des bouddhistes.

Il est vrai que Bhartṛhari n'admet nulle part qu'il ait subi l'influence du bouddhisme. Par contre, il se réfère à sa propre tradition, où il essaie de prouver la justesse de sa position par argumentation. La nature de son argumentation nous ramène pourtant au domaine du bouddhisme.

La position de Bhartṛhari n'est pas seulement un extrême opposé à celui des bouddhistes, elle est aussi une défense contre l'attaque lancée par les bouddhistes de l'école Madhyamaka contre tout point de vue possible." (pp. 63-64, note omises)

5. Candiotti, Maria Pia. 1997. "Lieux de réflexion métathéorique : Le langage de la science chez Bhartṛhari." *Asiatische Studien = Études Asiatiques* no. 51:1087-1094.

   "Les données textuelles des pages qui suivent font partie d'un corpus qui a été recueilli en vue d'un travail consacré au concept de langage scientifique dans l'œuvre de Bhartṛhari (B). But de cette brève exposition est d'essayer une première systématisation du matériel, afin d'en déceler des lignes de foi, utiles pour l'interprétation d'un sujet qui a, jusqu'ici, reçu peu d'attention dans la littérature secondaire."

6. ———. 2006. *Interprétations du discours métalinguistique. La fortune du sütra A 1 1 68 chez Patañjali et Bhartṛhari* . Firenze: Firenze Univesity Press.

"Comme il est aisé de le voir, l'ouvrage se structure nettement en trois parties qui sont indépendantes mais fonctionnelles l'une à l'autre :

Sans les conventions qui régissent le langage académique, la première section, intitulée 'Esquisse d'analyse lexicale', aurait tout aussi bien pu s'appeler 'Les mots pour le dire'. Á l'origine de la recherche décrite dans ces chapitres il y a eu la conviction que, si une réflexion métalinguistique s'était développée de façon cohérente dans la tradition grammaticale indienne, cette réflexion avait sans nul doute laissé des traces au niveau lexical. Car on a toujours besoin de 'mots pour le dire', tout spécialement quand il s'agit d'explorer des domaines nouveaux. L'attention se portera donc sur les mots par lesquels les grammairiens pouvaient faire référence aux noms métalinguistiques, en premier lieu sur le mot *saṁjñā* et sur le réseau linguistique qui s'est construit autour de ce terme(14).

La deuxième et la troisième section sont consacrées aux deux outils métalinguistiques principaux : la nomination, ou le fait d'appeler les formes linguistiques par des noms(15) et la citation, ou le fait de les nommer directement par leur forme(16). Plus spécifiquement, la deuxième section est consacrée à la nomination.

Bien que la langue commune possède aussi des noms métalinguistiques, ceux-ci sont une des caractéristiques saillantes de la langue de la grammaire. L'instauration des noms dans la grammaire se fait par le biais d'un acte volontaire de modification du rapport entre une forme linguistique et son sens : c'est un aspect du langage technique en général qui n'a pas manqué d'éveiller l'attention des grammairiens, en particulier de Bhartṛhari.

La troisième section porte sur la citation autonymique, lue comme un cas particulier de la nomination, où 'forme qui signifie' et 'forme signifiée' sont identiques. Réfléchir sur le pouvoir des noms de faire connaître leur forme, dans le domaine de la grammaire sanscrite, signifie avant tout, comme nous l'avons déjà souligné, réfléchir sur le sens du sūtra A 1. 1. 68. C'est dans cette dernière section que deviendra plus

évidente la qualité novatrice de la réflexion de Bhartṛhari, le penseur qui travaille le plus en profondeur sur les deux mécanismes (nomination / citation), sur leurs différences spécifiques et sur les différents niveaux de langue qu'ils impliquent." (pp. 17-18)

(14) Un 'réseau linguistique' identifie l'ensemble des termes liés à un terme donné par des rapports de subordination, d'opposition et ainsi de suite. Cette analyse lexicale a été conduite avec les instruments traditionnels de l'analyse lexicale par champs sémantiques, tout en utilisant parfois des méthodes onomasiologiques davantage liées à l'analyse des champs cognitifs. Cette façon de procéder semblait en effet respecter le statut un peu spécial du métalangage grammatical, un langage qui n'est pas artificiel et technique à tous les effets (et n'est donc pas analysable exclusivement à travers une approche onomasiologique) mais qui est certes en bonne partie de formation consciente et volontaire (et par conséquent différent des systèmes lexicaux de la langue commune).

(15) Quand on nomme la forme linguistique jamais comme un 'adverbe'.

(16) Quand on cite la forme linguistique jamais par le mot autonyme 'jamais'.

[sūtra A 1. 1. 68: *svaṁ rūpaṁ śabdasya åśabdasaṁjñā* = A word other than one whicvh is a technical term (*saṁjñā*) of the grmmar denotes its form only. (Rama Nath Sharma, *The Aṣṭādhyāyī of Pāṇini* , New Delhi: Munshiram Manoharlal 1990, Volume II p. 68)

7. Houben, Jan E. M. 2001. "Paradoxe et perspectivisme dans la philosophie de langage de Bhartṛhari : langage, pensée et réalité." *Bulletin d'Études Indiennes* no. 19:173-199.

[Bhartṛhari's Perspectivism (6)].

"Le grammairien-philosophe Bhartṛhari, qui vivait et travaillait en Inde au v• siècle de noire ère, traite de certains paradoxes auxquels il est confronté quand il discute de problèmes grnmmaticaux, linguistiques et philosophiques. Tandis qu'il est

possible de comparer les déclarations de Bhartṛhari sur les paradoxes plus ou moins directement avec les premières assertions connues dans la tradition européenne - c'est-à-dire dans l'Antiquité -, son approche et celle des philosophes el logiciens modernes semblent deux mondes à part. Néanmoins, Bhartṛhari fournit des suggestions stimulantes et audacieuses aux penseurs modernes traitant des paradoxes. Dans l'oeuvre de Bhartṛhari aussi bien que dans les discussions de la tradition occidentale, les problèmes posés par les paradoxes concernent la relation entre le langage, la pensée et la realité." (p. 173)

8. Montaut, Annie. 1990. "La tradition des grammairiens philosophes indiens : la notion d'objet dans la Grammaire de Bhartṛhari." *Linx* no. 23:19-38.

   "Le langage et la réflexion sur le langage a toujours été un sujet fondamental dans la philosophie indienne, elle-même ancrée dans son origine sur le rituel religieux : elle est le fondement notamment des écoles hindouistes de la *mīmāṁsā* (règles prescriptives relatives à l'interprétation du Veda) et du *nyāya* (logique), mais aussi un thème important de la réflexion philosophique du *vedānla* (littéralement "achèvement du Veda", avec le non dualisme de Śankara au VIlle siècle de notre ère) et de certains développements du boudhisme. Les histoires classiques de la philosophie indienne lui font donc la part belle, et plus récemment des travaux importants ont privilégié la réflexion proprement linguistique, sans la dissocier de la philosophie générale(1). La grammaire est une des sciences annexes du Veda (littéralement "un de ses membres" : *vedāṅga*), et il arrive qu'on en fasse l'un des *darśana* ou "points de vue" ou écoles philosophiques classiques (c.a.d. hindouistes)." (p. 19)

   (1) David Seyford Ruegg, *Contributions à l'histoire de la philosophie linguistique indienne* , De Boccard, Paris, 1959, Kunjunni Raja, *Indian Theories of Meaning* , 1963, The Adyar Library and Research Center, Madras, Madeleine Biardeau, *Théorie de la connaissance et philosophie de la parole dans le brahmanisme classique* , Mouton, la Haye, 1964, (traductrice également du chapitre 1 de la grammaire de Bhartṛhari en

français, De Boccard, 1964), et surtout K.A. Subramania Lyer, éditeur et traducteur de tous les volumes de la Grammaire de Bhartṛhari (I, II, III-2 chez Motilal Banarsidass, Delhi, III-l au Deccan College, Poona), et auteur de plusieurs études critiques, dont *A Study of the Vâkyapadiya in the light of the ancient commentaries* , Deccan College, Poona, 1969, et *The Vākyapadīya : some problems* , Bhandarkar Oriental Institute, Poona, Inde, 1982. Le récent livre de J.P. Staal, *Universals : Studies in indian Logic and Linguistics,* The University of Chicago Press, 1988, surtout la seconde partie, articule magistralement les problèmes spécifiques de la description et de la théorie linguistique chez Pāṇini surtout, la logique indienne classique, et la mise en perspective sur la version occidentale de semblables débats. Parmi les articles les plus synthétiques, indiquons "Sanscrit Philosophy of Language", J.F. Staal, C *urrent trends in Linguistics,* 5 Mouton, 1969, "La Grammaire sanscrite de Pāṇini", Pierre-Sylvain Filliozat (pp. 171-194), et 'Théories du langage en Inde", Madeleine Biardeau (pp. 1 13-144), dans *La Traversée des signes* , Seuil, Paris, 1975.

6. Beaulieu, Jack. 2021. "Gaṅgeśa on Absence in Retrospect." *Journal of Indian Philosophy* no. 49:1-37.

   Abstract: "Cases of past absence (*prāṁâstitāsthala*) involve agents noticing in retrospect that an object or property was absent, such as when one notices later that a colleague was not at a talk. In Sanskrit philosophy, such cases are introduced by Kumārila as counterexamples to the claim that knowledge of absence (*abhāva*) is perceptual (*pratyakṣa*), but further take on a life of their own as a topic of inquiry among Kumārila's commentators and their Nyāya interlocutors. In this essay, I examine the Nyāya philosopher Gaṅgeśa's epistemology of past absence, according to which agents learn that a recollectable (*smaraṇârha*) object or property was absent by inferring its past absence from failing to recall (*asmaraṇa*) that object or property. Gaṅgeśa's account is best appreciated against the backdrop of earlier theories and their shortcomings, and I begin by presenting historical views leading up to his. I identify two groups of views about the epistemology of past absence: recollection views, according to which cases of past absence involve agents recalling negative information; and recollection failure views, according to which cases of past absence involve agents failing to recall positive information. I reconstruct two early recollection views: a Bhāṭṭa view belonging to Uṃveka, and a competing Nyāya view belonging to Jayanta and Bhāsarvajña. I then examine Śālikanātha and Sucarita's

critiques of recollection views, following which I reconstruct a Bhāṭṭa recollection failure view belonging to Pārthasārathi. I then examine Gaṅgeśa's critiques of Pārthasārathi's account and the recollection failure view he constructs out of its shortcomings."

    "This paper aims at presenting a critical analysis of the *Samavāyavāda*(1) of Gaṅgeśa with a view to bring out his significant contribution to the problem of relations in general and the relation of inHerence in particular. It may be mentioned here that Gaṅgeśa's

    contribution to the problem of Inherence should mainly be viewed in the light of (1) his refutation of the view of the opponent(= opp.) and the objector to the opp. (= ob-opp.), who, in most cases, is either a Buddhist or a Vedāntin or a Mimāsaka, and (2) strengthening the Nyāya position on inherence. One of the prime concern of this paper has been to identify these opp., along with their arguments by quoting

suitable extracts from their texts along with the text of Gaṅgeśa."

(1) For the first time a critical analysis of the *Samavāyavāda* of *Tattvacintāmaṇi* is presented here. MM. Satis Chandra Vidyābhūsaṇa has pn:senttd a summary of it wbich hardly presents the analysis as such. Vide *A History of Indian Logic*, Delhi, Motilal Banarsidass, 1971, pp. 414 f.

23. ———. 2021. "Gaṅgeśa on Epistemic Luck." *Journal of Indian Philosophy* no. 49:153-202.

    Abstract: "This essay explores a problem for Nyāya epistemologists. It concerns the notion of *pramā*. Roughly speaking, a *pramā* is a conscious mental event of knowledge-acquisition, i.e., a conscious experience or thought in undergoing which an agent learns or comes to know something. Call any event of this sort a *knowledge-event*. The problem is this. On the one hand, many Naiyāyikas accept what I will call the *Nyāya Definition of Knowledge*, the view that a conscious experience or thought is a knowledge-event just in case it is true and non-recollective. On the other hand, they are also committed to what I shall call Nyāya *Infallibilism*, the thesis that every knowledge-event is produced by causes that couldn't have given rise to an error. These two commitments seem to conflict with each other in cases of epistemic luck, i.e., cases where an agent arrives a true judgement accidentally or as a matter of luck. While the *Nyāya Definition of Knowledge* seems to predict that these judgements are knowledge-events, Nyāya *Infallibilism* seems to entail that they aren't. In this essay, I show that Gaṅgeśa Upādhyāya, the 14th century Naiyāyika, solves this problem by adopting what I call epistemic localism, the view that upstream causal factors play no epistemically significant role in the production of knowledge."

    "The article is an exposition of the Vyaptigrahopaya (means for the ascertainment of invariable concomitance) section of the Tattvacintamani, the famous NavyaNyaya work of Gangesa. The Sanskrit original, given in transliteration, is divided into nineteen short texts. Texts 1-15 give the Prabhakara position: invariable concomitance is not ascertained through 'repeated observation', but through 'single observation'. texts 16-18 give Gangesa's refutation of the Prabhakara. Text 19 gives Gangesa's

own position: the cause for the ascertainment of invariable concomitance is the perception of the coexistence of the probans with the probandum along with the absence of cognition concerning the irregularity of the probans."

    "Classical Indian theory of perceptual illusion is refined by Gangesa (c. 1325) in this translation (with explanation) of an important section of his masterwork, "Jewel of reflection on the truth (about epistemology)". Illusion is a single cognition of an entity as qualified by a qualifier that is fused by memory into current perception. This view is challenged by various adversaries (mainly Mimansaka but also Buddhist and Vedantic). Examples agreed to are of people making false statements on the basis of perceptual evidence, e.g., "this is silver," when an object in front is really mother-of-pearl. One rival camp sees the unsuccessful effort to pick up silver as flowing from a failure to cognize of a certain sort, not from a perceptual misrepresentation. Gangesa devotes (successful) effort to refuting this and other views, his overall strategy being that though his view faces difficulties they are much less severe than those faced by the alternatives."

Buddhist Logic and Ontology. A Survey of Contemporary Studies

Introduction

"In the non-Buddhist traditions of Indian philosophical thought, and perhaps also in early Buddhist thought, there appears to be a tacit acceptance of the possibility of acquiring knowledge of reality. However, Nâgârjuna (about AD 250), a later Buddhist dialectical thinker, raised serious doubts about the possibility of acquiring knowledge by pointing out the self-contradictory character of all means of acquiring knowledge, Nâgârjuna's objections stimulated and compelled all subsequent philosophers provide a solid foundation to epistemology and logic before proceeding with the formulations of their philosophical positions.

In Buddhist circles Asanga (about AD 405) and Vasubandhu (about AD 410) made pioneering attempts to construct epistemology and logic on the Buddhist pattern. However it was Dignâga (about AD 450) who put Buddhist epistemology and logic on a solid footing and gave them a distinctive character. He is, therefore, rightly regarded as the father of Buddhist epistemology and logic, and also of medieval Indian epistemology and logic in general, for he not only gave a precise formulation to Buddhist epistemology and logic but also imparted a new direction to Indian epistemology and logic by way of composing independent treatises on epistemology and logic and interspersing the treatment of metaphysical problems within them, a style which was later on followed by Gangesa (about the twelfth century AD), the founder of the school of Navya-Nyāya. Buddhist literature prior to Dignaga deals with the problem of knowledge and the means of knowing either very casually or not at all. There seems to be no work devoted to the problem. But Dignaga felt the necessity for a distinct treatise on epistemology and logic to establish the Buddhist doctrines in a logical manner. He explicitly mentions in the Pramâna-samuccaya that its composition was led by the need to establish the means of valid cognition.

The task initiated by Dignaga was brilliantly continued by Dharmakirti (about 635), a doyen of Buddhist epistemology and logic. His Pramâna-vârtika, Pramânaviniscaya and Nyāya-bindu are masterpieces of Buddhist epistemology and logic. When Dignaga undertook an examination of the logical tenets of other philosophical schools in his treatise there were reactions from the latter. For instance, Uddyotakara and Kumarila (about AD 500) tried to controvert the views of Dignaga. Dharmakirti therefore defended and modified the views of Dignaga, thereby strengthening the foundations of Buddhist epistemology and logic. However, his exposition, which was ended to explain and defend the views of Dignaga, superseded and eclipsed the original by its superior merit. This tradition of Dharmakirti was carried forward by Darmottara (about AD 847) and subsequently by, amongst others, Jnanasrimitra about AD 1040)." (pp. 414-415)

From: S. R. Bhatt, "Logic and Language in Buddhism" in: Brian Carr, Indira Mahalingam (eds.), *Companion Encyclopedia of Asian philosophy*, London-New York: Routledge 1997.

"(...) from the origin of Buddhism in the 6th century b.C. to its expansion into four philosophical schools in the 4th century A.D., there were no systematic Buddhist works on Logic, but only a few stray references to that science in the works on philosophy and religion. Nagàrjuna, about 300 A.D., wrote a tract on Logic which was a mere review of the common topics of the Ancient School of Brahmanic Logic. During 400-500 A.D., Maitreya, Asanga and Vasubandhu handled Logic, but their treatment of it was merely incidental, being mixed up with the problems of the Yogacara and Vaibhasika schools of philosophy. Vasubandhu's three works on Pure Logic mentioned by Hwen-thsang are now lost and consequently their merits cannot be judged. With 450 A.D. began a period when Logic was completely differentiated from general philosophy, and a large number of Buddhist writers gave their undivided attention to that branch of learning. The works brought out by these. writers, along with those brought out by the Jainas, constitute the Mediaeval School of Indian Logic. Dignaga is the earliest known writer of this school." (p. 270)

2. Aviv, Eyal. 2015. "A Well-Reasoned Dharma: Buddhist Logic in Republican China." *Journal of Chinese Buddhist Studies* no. 28:189-234.

   Abstract: "The rediscovery of Buddhist logic (Sanskrit *hetuvidyā, yinming*) in early 20th century China was a key

element in the Chinese Buddhist response to modernity. I argue that while Buddhist intellectuals used Buddhist logic for different purposes, their shared goal was to demonstrate that Buddhism was not only modern but also that it was and is indispensable for the modern project. The article addresses two reasons for the renewed interest in Buddhist logic. Firstly, the revival should be understood in the context of logic's newly gained authority and significance in the early part of the 20th century in China.

Secondly, the rise of Buddhist logic was a product of doctrinal debates within Buddhism. With globalization and growing foreign influence, Chinese Buddhists revisited Buddhist teachings that were in the margins for centuries.

These teachings, primarily from the Yogācāra schools, challenged ubiquitous views in Chinese Buddhism. Buddhist logic was not only one of the doctrines that was rediscovered, but it was also one of the most effective tools in anskritdebating the nature and future of Buddhism in modern China."

3. Bandyopadhyay, Nandita. 1979. "The Buddhist Theory of Relation between Pramā and Pramāna." *Journal of Indian Philosophy* no. 7:43-78.

   "The article seeks to introduce Dharmakīrti's theory of identity between Prama and Pramana, i.e., valid knowledge and its means. Knowing is nothing but feeling an object-shape stamped upon knowledge. This cognitive object-stamp is the immediate means to knowledge, being the direct measure of its object and as such is not really different from the structure of knowledge itself. The difference is thus only an analytical abstraction having no causal import. Many other systems, even Kumarila Mimansa, on close examination, are reduced to the same position, barring the Nyaya which firmly holds the difference."

    Abstract: "From the origin of Buddhism in the sixth century BC to its expansion into four schools, logic was not looked upon as an independent branch of study within philosophy, though scattered uses of logical concepts and arguments were not rare in early Buddhist literature. Since the middle of fifth century AD, Buddhist logic developed into an independent area of study. This was possible because of the contributions of some great Buddhist thinkers who tried to develop logic not only as an independent study but also as a formal system where one can validly infer an unapprehended phenomenon on the basis

of an apprehended phenomenon. Rules were also developed for turning debate into a rational enterprise. Pioneering works in the field of logic were done by Dignāga, who was considered to be the father of Buddhist logic, and Dharmakīrti. Later Buddhist thinkers were more or less engaged in the discussion of logical issues dealt by these two great thinkers and tried to defend the Buddhist position against the attacks of the opponents, both of Brāhmaṇical and non-Brāhmaṇical schools. It is in course of such counterattacks and defenses that Buddhist logic developed to have a position of its own in Indian philosophy."

29. Dorfman, Michael. 2014. "Putting the Madhyamaka Trick in Context: A Contextualist Reading of Huntington's Interpretation of Madhyamaka." *Buddhist Studies Review* no. 3:91-124.

    Abstract: "In a series of works published over a period of twenty-five years, C.W. Huntington, Jr. has developed a provocative and radical reading of Madhyamaka (particularly Early Indian Madhyamaka) inspired by 'the insights of post-Wittgensteinian ragmatism and deconstruction' (1993, 9). This article examines the body of Huntington's work through the filter of his seminal 2007 publication, 'The Nature of the Mādhyamika Trick', a polemic aimed at a quartet of other recent commentators on Madhyamaka (Robinson, Hayes,

Tillemans and Garfield) who attempt ‘to read Nāgārjuna through the lens of modern symbolic logic’ (2007, 103), a project which is the ‘end result of a long and complex scholastic enterprise … [which] can be traced backwards from contemporary academic discourse to fifteenth century Tibet, and from there into India’ (2007, 111) and which Huntington sees as distorting the Madhyamaka project which was not aimed at ‘command[ing] assent to a set of rationally grounded doctrines, tenets, or true conclusions’ (2007, 129), This article begins by explicating some disparate strands found in Huntington’s work, which I connect under a radicalized notion of ‘context’. These strands consist of a contextualist/pragmatic theory of truth (as opposed to a correspondence theory of truth), a contextualist epistemology (as opposed to one relying on foundationalist epistemic warrants), and a contextualist ontology where entities are viewed as necessarily relational (as opposed to possessing a context-independent essence.) I then use these linked theories to find fault with Huntington’s own readings of Candrakīrti and Nāgārjuna, arguing that Huntington misreads the semantic context of certain key terms (tarka, dṛṣṭi, pakṣa and pratijñā) and fails to follow the implications of Nāgārjuna and Candrakīrti’s reliance on the role of the pramāṇas in constituting conventional reality. Thus, I find that Huntington’s imputation of a rejection of logic and rational argumentation to Nāgārjuna and Candrakīrti is unwarranted. Finally, I offer alternate readings of the four contemporary commentators selected by Huntington, using the conceptual apparatus developed earlier to dismiss Robinson’s and Hayes’s view of Nāgārjuna as a charlatan relying on logical fallacies, and to find common ground between Huntington’s project and the view of Nāgārjuna developed by Tillemans and Garfield as a thinker committed using reason to reach, through rational analysis, ‘the limits of thought.’"

    "In this paper we should like to argue that the "Prasajya" negation of the Madhyamaka school of Buddhist philosophy is not the same as that of the non-Madhyamaka schools (that is, that the distinction between "Prasajya" and "Paryudasa"

negation is not drawn in the same way). We should also like to argue that the terms and concepts of elementary set theory, employed in conjunction with the elementary predicate calculus, are useful in the explication of the laws of the excluded middle and of contradiction and also in the clarification of the "Catuskoti". Finally we shall defend the Madhyamika Nāgārjuna against two charges that have been laid against him to the effect that he has been guilty of certain errors of reasoning."

    "Negative facts have perplexed Western philosophers ever since the time of Plato.' But the philosophers of Europe and America have not been the only philosophers to have been perplexed by them; classical Indian philosophers too have pondered their nature. My interest here is to explore how the reflections of these classical Indian philosophers, transposed into the contemporary philosophical idiom, might enrich current metaphysical thinking about negative facts; and what I shall conclude is that at least one of these philosophers has a view of negative facts and knowledge of them, which, when so transposed, is very plausible indeed.

    I shall begin by asking the fundamental ontological question of whether or not negative facts exist and then sketch various replies which European and American philosophers have given to it. Since these replies have not led to any decisive answer to the question, I shall then ask two other questions: the more specific ontological question of whether or not absences-surely paradigmatic examples of negative facts-exist; and the related epistemological question of what is known when the absence of something is said to be known. Answers to these questions comprise an important part of classical Indian philosophy; and I shall outline their answers to them, concluding that the most plausible answers to these questions are those of Jayanta

Bhatta, who maintained that absences do indeed exist and that they are known not only by inference but also by perception."

39. Gokhale, Pradeep P. 2022. "Buddhist Logic: Sample Texts." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-20. Dordrecht: Delhi.

    Abstract: "In this chapter, three sections from three different texts are chosen which discuss some of the core doctrines in Buddhist logic.

    The first section, namely, *Nyāyapraveśakasūtram* discusses Diṅnāga's theory of inference which includes his theory of "inference for oneself" and "inference for others" and fallacies of inference including those of the thesis, reason, and instance.

    The second section chosen from Dharmakīrti's *Nyāyabindu* deals with "Inference for oneself." Dharmakīrti here tries to construct a comprehensive and tight framework of inference. Accordingly, *hetu* can be only of three kinds: s*vabhāva, kārya,* and *anupalabdhi.* Dharmakīrti in this chapter also explains the 11-fold classification of *anupalabdhi-hetu.*

    The third section selected from Dharmakīrti's *Hetubindu* discusses formal logical issues concerning the inference for others. Here Dharmakīrti contends that the statements of *pakṣadharmatā* and *vyāpti* are the only logically necessary and sufficient premises and that the statements of positive and negative concomitance entail each other such that only one of the two needs to be stated. This gives rise to two basic forms of inference which resemble Modus Ponuns and Modus Tollens."

Abstract: "The chapter deals with some important issues related to the Buddhist logic.

Since Nyāya logic is treated as the mainstream Indian logic by many scholars, the true nature and the real contribution of Buddhist logic are many a time overshadowed by the studies in Nyāya logic. The first issue discussed in the chapter, therefore, is the differences between the Buddhist and Nyāya logic.

Within the Buddhist logic, the contributions of Diṅnāga and Dharmakīrti are many times studied in a combined (and confused) way. How one can distinguish between the two is the second issue.

Dharmakīrti is known for his view that probans-probandum relation should be a necessary relation, and this necessity can be derived from identity or causality. Some questions are raised such as whether identity leads to “internal pervasion” and how causal necessity can be ascertained. They are discussed in the third section.

The fourth issue is concerned with the logical consistency in prasaṅga method which was used as the core method of Mādhyamika Buddhism.

The last issue is concerned with the doctrine of apoha, which, though primarily concerned with word-world relation, is also concerned with the theory of inference in an indirect way."

47. Herzberger, Hans G. 1975. "Double Negation in Buddhist Logic." *Journal of Indian Philosophy* no. 3:3-16.

    "The Apoha doctrine of Dignāga and his followers, presents a fascinating logical puzzle. While rejecting the classical law of double negation, it nevertheless requires a partial semantic equivalence between expression and their double negations. None of the principal nonstandard concepts of negation (classical, intuitionistic, three-valued) can do justice to this complex position. this paper undertakes a semantic reconstruction of the Apoha doctrine, using methods derived from Emil Post's work on the foundations of many-valued logic, especially the notion of a "two-fold" proposition."

48. Herzberger, Radikha, and Herzberger, Hans G. 1997. "Two Truths, or One?" In *Relativism, Suffering and Beyond. Essays in Memory of Bimal K. Matilal*, edited by Bilimoria, Purusottama and Mohanty, Jitendra Nath, 278-300. New Delhi: Oxford University Press.

    "Thomas Mann begins his essay on Schopenhauer by telling us that the pleasures of metaphysics are mainly aesthetic.

    Without sharing that high degree of philosophical detachment, we acknowledge that the present essay was motivated by aesthetic as well as historical concerns. Because it is part of an effort to understand Indian philosophers as particular individuals with distinctive problem situations and doctrines it is properly classified as historical. Because it aims to locate particular doctrines within larger philosophical, visions, it might also be classified as aesthetic. Our essay develop's a long perspective going back to the early origins *of pramâna* theory. Drawing the reader back in time puts us in a better position to trace historical sources for certain important ideas of

Dharmakīrti and Dinnaga, and to contrast the treatment of those ideas in their respective philosophical systems."

    Abstract: "Jizang 吉藏(549–623 CE), the key philosophical exponent of the Sanlun 三論 school of Chinese Buddhism, based his philosophy considerably on his reading of the works of Nāgārjuna (c. 150–250 CE), the founder of the Indian Madhyamaka school. However, there are salient features in his thought on language that are notably absent from the works. In this article, I present a philosophical analysis of Jizang's views of the relationship between speech and silence and compare them with those of Nāgārjuna. It is shown that while Nāgārjuna leans toward affirming a clear-cut distinction between speech and ineffable quiescence, Jizang endorses the nonduality of conventional speech and sacred silence."

51. ———. 2013. "Ontic Indeterminacy and Paradoxical Language: A Philosophical Analysis of Sengzhao's Linguistic Thought." *Dao. A Journal of Comparative Philosophy* no. 12:505-522.

    Abstract: "For Sengzhao 僧肇(374–414 CE), a leading Sanlun 三論 philosopher of Chinese Buddhism, things in the world are ontologically indeterminate in that they are devoid of any determinate form or nature. In his view, we should understand and use words provisionally, so that they are not taken to connote the determinacy of their referents. To echo the notion of ontic indeterminacy and indicate the provisionality of language, his main work, the Zhaolun 肇論, abounds in paradoxical expressions. In this essay, I offer a philosophical analysis and rational reconstruction of Sengzhao's linguistic thought, with a view to exploring the rationale for and purpose of his use of paradoxical language."

Abstract: "This paper examines a passage of the eleventh chapter of the *Rigs gter* of Sa skya Pand˙ita (1182–1251) on the division of arguments by consequence (*thal 'gyur*) of the form "Because S is P, it follows that it is Q" with respect to the type of relation between P and Q. This passage appears in quite different versions in several available recensions of the Rigs gter, all of which are problematic to some extent.

The different interpretations of the commentators can be shown to derive from their reliance on different versions of the text, which they strove to make sense of through two distinct strategies. Following up on the examination of a division of arguments

by consequence along the same line in the works of Sa skya Pandita's Tibetan predecessors, in particular Phya pa Chos kyi seng ge (1109–1169) and mTshur stongZhon nu seng ge (ca. 1150–1210) (see Hugon, in Journal of Indian Philosophy 44(5):883–938,

2016b), I evaluate the diverging versions of the Rigs gter against a coherent logical scenario founded on Sa skya Pand˙ita's discussion pertaining to the types of logical reasons in inference in the tenth chapter of his work and comparison with the classification by Phya pa. I offer a hypothesis regarding the genesis of the problematic versions of the passage on the classification of consequences in the Rigs gter based on the comparison with the classification found in mTshur ston's epistemological work. I propose that the composition of this portion of the Rigs gter might have involved a textual reuse of

mTshur ston's classification, even though mTshurston and Sa skya Pand˙ita disagree on background issues. This very disagreement imposed changes to the reused text that led to problematic readings."

Journal of the Philosophical Traditions of the East no. 20:283-307.

Abstract: "'Right words are like the reverse' is the concluding remark of chap. 78 in the Daoist classic *Daodejing*. Quoted in treatises composed by Seng Zhao (374–414), it designates the linguistic strategy used to unfold the Buddhist *Madhyamaka* meaning of 'emptiness' and 'ultimate truth'. In his treatise *Things Do not Move*, Seng Zhao demonstrates that 'motion and stillness' are not really contradictory, performing the deconstructive meaning of Buddhist 'emptiness' via the corresponding linguistic strategy. Though the topic of the discussion and the rhetoric are borrowed from Daoist sources, the point of view is rooted in the Buddhist understanding. The first section of this paper deals with the issue of exegetical methods in early Chinese Buddhism; the subsequent part explains both the Daoist background and the topics modified in Seng Zhao's discussions; the third part analyzes Seng Zhao's linguistic strategy and expounds its particular philosophical significance"

    Abstract: "Abhinavagupta (fl.c. 975–1025 CE) is a tantric philosopher whose rigorous epistemological discussions are deeply rooted in his Śaiva metaphysics. In order to strongly withhold the Trika doctrinal principle of non-duality, Abhinavagupta, like his predecessor Utpaladeva (fl.c. 925–975

CE), is struggling to interpret the philosophical question of causality that rests in the analysis of cause and effect or subject and object duality. In this chapter, a short example from his *magnum opus* tantric manual, the *Tantrāloka* (9.1–44), and its elaborate commentary titled *-viveka* by Jayaratha (fl.c. 1225–1275 CE) is discussed while also contextualizing the process of philosophical rationalization in the history of Trika Śaivism. The champions of the theory of causality (*kāryakāraṇabhāva*), the Buddhists, are precisely targeted, and following rational enquiry, Abhinavagupta and Jayaratha want to prove that Śiva alone is the supreme agent (*kartā*) or cause (*kāraṇa*) and He indeed is also the effect (*kārya*) since both cause and effect are the manifestation of and in a single consciousness. Even though the *Tantrāloka* is based on the revealed knowledge from early scriptures like the *Mālinīvijayottaratantra*, yet at every step, compelling efforts are being made to justify the revealed (*āgama*) knowledge with reason (*yukti*)."

    "This paper presents a survey and an annotated translation (from Tibetan and Sanskrit) of the main Buddhist documents from II-X century a. D. dealing with the 'two truths', or two degrees of reality: a relative and an absolute. The former is the empirical world known to us through the senses and the usage of language. Submitted to sustained critical analysis it proves to be devoid of logical and ontological foundation. Enlightened individuals realizing that there is thus in fact only one truth -- the absolute -- nevertheless avail themselves of the convention of language in order to indicate what cannot be communicated but only 'personally intuited.' Thus the relative truth is pedagogically indispensable."

70. Liu, Ming-Wood. 1993. "A Chinese Madhyamaka Theory of Truth: The Case of Chi-tsang." *Philosophy East and West* no. 43:649-673.

    "Chi-tsang (549-623) was the key figure in the revival of Chinese Madhyamaka in the late sixth century, and his teaching is commonly acknowledged to be the apex of the development of Madhyamaka thought in China. This essay attempts to examine the conception of truth underlying a number of ideas generally considered as central to Chi-tsang's thought, including "refutation of falsehood", "revelation of truth" and "two truths"."

71. Matilal, Bimal Krishna. 1970. "Reference and Existence in Nyāya and Buddhist Logic." *Journal of Indian Philosophy* no. 1:83-108.

    "This Nyaya-Buddhist controversy over the empty subject term may well recall to a modern mind the Meinong-Russell controversy about 'existence' and 'denotation'. The Nyaya and the Buddhist logicians worried over the logical and the epistemological problem connected with the issue. The Nyaya interpreted "the rabbit's horn" not as a singular term but as a predicate complex attributing 'hornness' to something that

belonged to the rabbit. "The rabbit's horn does not exist" ascribes the absence of hornness to something belonging to a rabbit, and is true. This analysis is closer to Russell's theory of description. The Buddhist, on the other hand, is prepared to allow some sort of 'fictional existence' to "the rabbit's horn" which is perhaps not very different from Meinong's 'theory of objects'. In epistemology the Nyaya believed that any object of cognition (which is expressible in words) must be either real or analyzable into constituents which are ultimately identifiable with some real entity or other. Only a complex object can be fictional. The Buddhists, however, hold that the objects of erroneous cognition are fictional."

"For the first time in recent history, seventeen scholars from all over the world (India, Japan, Europe, the United Kingdom, Canada and the United States) collaborated here to produce a volume containing an in-depth study of Buddhist logical theory in the background of Buddhist epistemology. The Tibetan tradition identifies this important chapter in the history of Buddhist philosophy as the *pramāṇa* school. It owes its origin to the writings of the great Buddhist master, Dinnāga (circa A.D. 480-540), whose influence was to spread far beyond India, as well as to his celebrated interpreter of seventh century A. D., Dharmakīrti, whose texts presented the standard version of the school for the later Buddhist and non-Buddhist authors for a long time.

The history of Buddhist and Indian logical and epistemological theories constitutes an interesting study not only for the Buddhist scholars but also for philosophers as well as historians of philosophy in general. Each author of this anthology combines historical and philological scholarship with philosophical acumen and linguistic insight. Each of them uses original textual (Tibetan or Sanskirt) material to resolve logical issues and philosophical questions. Attention has been focused upon two crucial philosophical concepts: *trairūpya* (the "triple" character of evidence) and *apoha* (meaning as "exclusion"). Broadly the issues are concerned with the problems of inductive logic and the problem of meaning and universals. Besides, some authors address themselves to the general question: why and in what sense does logical theory become relevant to Buddhism, especially to the philosophical soteriology such as Madhyamika?" (From the Preface)

    Abstract: "The Principles of Excluded Middle and Non-Contradiction are highly orthodox in Western philosophy. They are much less so in Indian philosophy. Indeed, there are logical/metaphysical positions that clearly violate them. One of these is the Buddhist *catuṣkoṭi*; another is the Jain *saptabhaṇgī*. Contemporary Western logicians have, however, investigated systems of "non-classical" logic in which these principles fail, and some of these bear important relationships to the *catuṣkoṭi* and the *saptabhaṇgī*. In this essay, we will look at these two principles and see how these may inform and be informed by those systems."

    "The purpose of this paper is to explain the Buddhists' conception of empty term, which is linked up with their conception of Sunyata, and to answer some of the questions raised by certain contemporary writers on Nyaya and Buddhism. Moreover, the aim is to show an important function of language which is embedded in the Buddhist philosophy as a whole. A comparison between Russell and the Nyaya has been drawn, and some of the questions raised by Quine have been discussed in this context."

100. ———. 1978. "Negation and the Buddhist Theory of Meaning." *Journal of Indian Philosophy* no. 6:59-77.

"The aim of this paper is to explain and reconstruct the Buddhist theory of meaning which is formulated in terms of double negation. The Buddhist theory of meaning requires two types of negation for expressing the meaning of an expression. This discussion leads us to an investigation of the different senses of negation used in Indian logic. The first section deals with the different classifications of negation. The second section deals with professor Herzberger's explication of the Buddhist theory of meaning. According to our positive thesis the theory of meaning can be reconstructed in terms of two senses of negation."

121. Tuske, Joerg. 2022. "General Introduction to Buddhist Logic." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-21. Dordrecht: Delhi.

    Abstract: "This chapter discusses some key concepts of Buddhist logic from different traditions. The first part deals with Nāgārjuna’s prasaṅga technique and his claim that reality is empty (*śūnya*). The idea that the claim that everything is empty, if true, might be regarded as empty itself is discussed. The second part provides an overview of Diṅnāga’s view on inference and his theory of the three conditions of an

inferential sign (*hetu*). This theory is compared to the Nyāya view on inference and the question whether the second of Diṅnāga's conditions is redundant is raised. The third part explores Dharmakīrti's developments of Diṅnāga's view on inference, particularly his Introduction of the particle eva and the three types of *hetu*. The final part of this chapter presents an outline of Diṅnāga's apoha (exclusion) theory of the meaning and function of concepts and words."

124. Walser, Joseph. 1998. "On the Formal Arguments of the Akutobhaya." *Journal of Indian Philosophy* no. 26:189-232.

"Though the Madhyamika school of Buddhism begins with Nāgārjuna's Mula Madhyamakakarika, modern scholar's interpretations of this work rely heavily on the commentaries of Buddhapalita, Bhavaviveka and Candrakirti. These commentaries each reflect the so-called "Svatantrika-vs-Prasangika" debate, which became a Madhyamika preoccupation in later times. There are, however, two earlier commentaries which have been largely ignored. This article will demonstrate that one of these commentaries, theAkutobhaya, gives us a rendering of Nāgārjuna's logic that is perhaps closer to Nāgārjuna's own milieu than post-Dignāga commentaries, such as those of Candrakirti and Bhavaviveka. In this article, I show the ways that the formal argumentation of the Akutobhaya differs from the post-Dignāga logic and seems to conform more closely to an earlier standard set by the early Nyaya and Samkhya schools of logic. The result of this difference in logical methodology is subtle, but nevertheless has ramifications for Madhyamika doctrine."

   "The article purports to examine the philosophical speculations of Dinnaga, a Buddhist logician who lived in India during the Fifth century A.D. After a brief historical Introduction describing the development of the idealistic school of Buddhism, the teachings of Dinnaga are compared with those of Vasubandhu and the points of difference noted. The arguments adduced by Dinnaga in refutation of the realist theory of perception are then compared with those of the

Western philosopher, Berkeley. This has lead to the conclusion that Dinnaga presented a theory of immaterialism comparable to that propounded by Berkeley."

    "The Buddhist Dharmakirti (c. 650) is one of the great minds of classical Indian thought, but his main works, apparently lost, were rediscovered only in the Nineteen-Thirties. Much scholarship has been devoted since the rediscovery to the interpretation of his complex positions and subtle arguments. The principal merit of this paper is that it shows how various dimensions of his philosophy -- the logical, epistemological, ontological, and soteriological, fit together as one comprehensive world view. The precise senses in which Dharmakirti's views may be said to be both "pragmatist" and "idealist" are specified, and his arguments for such main tenets as "momentariness" and the "Apoha" logic of concepts are scrutinized, along with his views on sensation and "causal efficiency" as the criterion of the real."

Ancient Islamic (Arabic and Persian) Logic

Logic in Medieval Islam

"It has long been recognized by historians of logic that the medieval Muslim philosophers and philosophical theologians (*Mutakallimún*: rendered variously as rationalist theologians, dialectical theologians, the "scholastics" of Islam) made some interesting contributions to the history of logic. When the Greek logical works were handed to the Muslim scholars in translation in and after the 9th century A.D., they studied them thoroughly and critically and wrote commentaries upon them. Prantl, (1) the 19th-century writer on the history of logic in the West, noted that Arabic literature on logic was one of the main sources for the terminist logic (i.e., the logic of terms) of the medieval Western logicians - a view upheld by 20th century scholars on medieval philosophy. (2) William and Martha Kneale (3) and David Knowles (4) have also noted the origin in Avicenna (Ibn Sina, d. A.D. 1037) of the doctrine of intentio, a doctrine which was of great importance in both Arabic and medieval Western philosophical logic. The *secundae intentiones* constituted the subject matter of logic. (I have shown elsewhere, however, that in Arabic logic itself the doctrine of the "intentions" is traceable to al-Farabi, d. A.D. 950). (5)Bochenski (6) was also aware that "Arabian logicians certainly exercised some influence" on medieval scholastic logic.

However, for a complete knowledge of the contributions to logic made by the Muslim philosophers we have to wait until a great number of the logical works in Arabic have been edited and studied. But we know so far that modal logic, the branch of logic which deals with the concepts of poibility and neceity, because of its relevance to the problem of determinism and divine foreknowledge, was of great concern to them; that the relationship between logic and grammar interested them; that conditional syllogisms, the problem of universals, the analysis of the concept of existence and predication, the theory of categorical propositions were some of the logical or logico-philosophical questions which the Muslims philosophers treated in interesting ways." (pp. 1-2)

Whereas the study of medieval Western logic is now an established field of research, contributing both to modern philosophy of logic and to the intellectual history of the Middle Ages, the study of logic in the precolonial Islamic world is still barely in its infancy. That fact alone makes it difficult to write an introductory chapter on the field:we are as yet unclear what contributions of the logicians writing in Arabic are particularly noteworthy or novel. It is also a dangerous temptation in this state of relative underdevelopment to cast an eye too readily on the work of the Latin medievalist, and to import the methods, aumptions, and even the historical template that have worked so well in the cognate Western field.

This temptation must be resisted at all costs. There are many important differences between the scholarly ideals and options of the Latin West and the Muslim East; there are, also, many differences between the various fortunes encountered by rigorous logical activity in the two realms over the centuries. A glance at the historiographical preliminaries of Bochenski's *History of Formal Logic* prompts the following observations.(1) First and foremost, Aristotle ceases by the end of the twelfth century to be a significant

coordinate for logicians writing in Arabic - that place is filled by Avicenna. The centrality of Avicenna's idiosyncratic system in post-Avicennian logical writings and the absence of Aristotelian logic in a narrowly textual sense meant that Arabic texts dealing with Avicenna's system were left to one side by the medieval Latin translators. Instead, other, le influential texts by Averroes and al-Fârâbi were translated because they did concentrate on Aristotle and spoke to thirteenth-century Western logical concerns. Even at the outset, then, the insignificance of Aristotle's logical system in the Avicennian tradition worked to distort Western appreciation of the relative importance of particular logicians writing in Arabic.

A second difference is that the whole range of Aristotelian logical texts were available in Arabic by about 900, and so the broad periodization of medieval Latin logic into *logica vetus* and *logica nova* is inappropriate as a way of periodizing logic written in Arabic; by the time serious logical work began, the complete Organon was available. Avicenna's work marks the watershed for any helpful periodization. Thirdly, Bochenski's analysis of what preconceptions and historical meanderings clutter the way to the proper study of medieval Western logic (the collapse of acute logical study with the demise of scholasticism, the ahistorical reductivism of post-Kantian logic, the institutionalization of a psychologistic logic in neoscholasticism) do not apply to the study of the logic of medieval Muslim scholars - even in the early twentieth century, it is clear that at least some scholars were still in contact with the acute work of the thirteenth century. There had been far le of a rupture in logical activity over the intervening centuries. On the other hand, there have been postcolonial efforts to find later Western logical achievements foreshadowed in early Arabic logic, and this has damaged the prospects for appraisal of the work by leading to a disproportionate focus on minor traditions.

Finally, only some of the characteristics Bochenski finds which distinguish medieval Western logic from the logic of late antiquity apply to the logic being written in Arabic at roughly the same time It too is highly formal and metalogical in its treatment, and pedagogically central; but no doctrine like supposition was developed, and there seems to have been far le concern with antinomies. One may say - nervously, given the current state of

research - that Arabic logic is somewhat closer to the logic of late antiquity in its concerns and methods than medieval Latin logic. That said, one must guard against an obvious alternative aumption, which is that Arabic logic is by and large just one or other of the systems of late antiquity.9 We already have enough control over Avicenna's logic to know that is false." (pp. 248-249)

Ontology in Medieval Islam

"The problem of expreing the Greek concept of being in Arabic did not escape claical Islamic writers. But the discuion of this problem as an instance of the general question of the influence of grammar on the formation of philosophical concepts is to be found among some recent writers on Islam, although unfortunately there is hardly anything approaching a sustained treatment from this perspective.

A few quotations from two recent writers will bring into focus those distinctive features of the Arabic language which are said to be problem-causing, and at the same time they will provide our analysis with a point of departure.

In his useful book Philosophical Terminology in Arabic and Persian, Soheil Afnan identifies the problem for the Arabic translator of Greek metaphysics in these words: "the translator can easily find himself helple." (1) This is generalized to all semitic languages, which are said to be "still unable to expre the thought adequately." (2) Afnan attributes this to what he calls "the complete absence of the copula." (3) Another writer, the linguist Angus Graham, in a stimulating article, (4) singles out another, but related, feature of Arabic, the sharp separation of the existential and predicative functions, a feature notably lacking in claical Greek. (5) These two features, the absence of the copula and the existential-predicative

separation, are supposed to have stood in the way of expreing the Greek concept of being adequately or accurately. And what is meant by this, in the words of Afnan, is the failure to expre "the precise concept of being as distinct from existence." (6) Graham puts it this way: "Because of the structure of the language, they [the Arabic translations of Aristotle] transform him at one stroke into a philosopher who talks sometimes about existence, sometimes about quiddity, never about being.(7)" (pp. 29-30)

3. Abed, Shukri B. 1996. "Language." In *History of Islamic Philosophy: Volume II*, edited by Nasr, Seyyed Hossein and Leaman, Oliver, 1602–1655. London: Routledge.

   "The purpose of this chapter is to characterize the debates concerning the development of the Arabic language (*al-'arabiyyah*) and to identify the specific mechanisms through which linguistic accommodations have been (and are being) made in the Arabic language to adapt to evolving circumstances. The first section will deal with the reaction of Arab intellectuals to the introduction of Greek, Indian and Persian philosophy and science into the Islamic world beginning in the second/eighth century. This reaction was mirrored in a series of debates concerning the relative merits of (Greek) logic and (Arabic) grammar. These culminated in a particularly important debate, documented toward the middle of the fourth/tenth century, which will serve as a focus for discussion in the first section of the chapter. The second and third sections will address the impact of the two external cultural confrontations cited above on the Arabic language, during the classical and the modern periods of Islam,

respectively. The fourth and final section will briefly summarize contemporary debates concerning the future of the Arabic language.(2)" (pp. 1602-1603)

(2) Owing to space limitations, other important linguistic issues, such as the discussion of the nature and the origin of language (i.e., whether it is conventional or inspired) cannot be dealt with here. A summary of various views on these subjects in the writings of medieval Islamic intellectuals may be found in J. al-Dln al-Suyuti (n.d.): 7ff. For the origin of the term *lughah* (language), consult the *Encyclopaedia of Islam*, new edition, s.v. “Lughah”, contributed by A. Hadj-Salah.

4. Adamson, Peter, and Key, Alexander. 2015. "Philosophy of Language in the Medieval Arabic Tradition." In *Linguistic Content: New Essays on the History of Philosophy of Language*, edited by Cameron, Margaret and Stainton, Robert J., 74–99. New York: Oxford University Press.

   "Our analysis will show that the distinction between Hellenic philosophy and the autochthonous Arabic disciplines was not the result of any prima facie incompatibility between the two epistemologies. In fact, once the sensitivities of politics and culture had died down, the tripartite and bipartite theories of meaning that each tradition brought to the table proved perfectly compatible and mutually productive.

   But, before that point was reached in the eleventh century, the two sides in our debate needed to work through their political and cultural differences. The polemical context drove them to make exaggerated claims for their respective disciplines: either logic was the only way to think, or it was grammar.

   The self-evidently false nature of that dichotomy contributed to its abandonment, but not before casting a long shadow on the philosophy of language in the medieval Arabic tradition. Our chapter will, through its analysis of the debate, provide a clarification of the autochthonous Arabic position, which has received less attention than the philhellenic discourse. There was a pre-existing theory of meaning in Arabic before Hellenic philosophy appeared, and we will show how that bipartite Arabic theory of meaning, consisting solely of vocal form and mental content, provided the terminology and epistemological architecture for a whole series of ideas about how the mental content could, and should, be turned into linguistic content." (pp. 74-75)

5. Afnan, Soheil M. 1964. *Philosophical Terminology in Arabic and Persian*. Leiden: Brill.

   Chapter Five: pp. 35-50.

   "The logic of the *Falāsifah* just like that of their Greek and Hellenistic predecessors was a subject-predicate(1) logic. And their metaphysics was a substance-accident(2), and universal-particular(3) metaphysics. Hence the insights of modern schools of philosophy could hardly be expected of them. It has been maintained that for the employment of the subject-predicate principle in language and logic there is "a sound pragmatic defence. But in metaphysics the concept is sheer error(4)". Perhaps for that reason it is easier to pick at their metaphysics than at their logic; though that may have been superceded also. In any case the methods of linguistic analysis as developed in modern times, and the form in which correct logical statements or philosophical questions need to be couched, cannot be applied to the works of the *Falasifah* with justice.

   Language and thought have been progressively changing in the Occident for centuries. They have been stagnant in the Orient for almost the same period. "Philosophy must ... involve the exercise of systematic restatement(5)"; not the tedious repetitions practiced in the East for so long." (pp. 34-35)

   (...)

"In view of the above considerations the logic propounded by the Arabs and Persians can be more easily equated with the Greek texts than their metaphysics. The terms were more definite even when literally translated whether through some happy equivalent or sheer improvisation. But such terms did not always convey to the *Falāsifah* exactly the same meanings. In metaphysics where the terminology is much more abstract it becomes extremely risky to equate the terms with the original Greek in spite of the apparent semblance. Furthermore they were as a rule unaware that certain terms were of Peripatetic origin, others came from the Stoics and still others from the Neoplatonists. They knew for instance that entelechy was a word coined by Aristotle, but that was only a rare case." (p. 39)

6. Ahmed, Asaq Q. 2008. "The Jiha/Tropos-Mādda/Hūlē Distinction in Arabic Logic and its Significance for Avicenna's Modals." In *The Unity of Science in the Arabic Tradition: Science, Logic, Epistemology and their Interactions*, edited by Rahman, Shahid, Street, Tony and Tahiri, Hassan, 229–254. Dordrecht: Springer.

   Abstract: "The word *tropos,* translated in Arabic as *jiha*, is understood in the field of logic as mode. Though investigations of modals in the medieval Arabo-Islamic logical tradition trace their lineage back to Aristotle, the Greek word designating this concept was never used in this manner by the Stagirite. The closest word that the Arabic *jiha* translates from Greek is *tropos,* which was a technical term that gradually developed with Aristotle's commentators. The word came to be understood as part of a dichotomy, *tropos-hūlē*, which was inherited by the Arabs as *jiha-mādda*. This dichotomy seems to have become a determining factor for conversion rules of modal propositions and thus for modal syllogistic. After an investigation outlining the evolution of the term *tropos* and the development of the dichotomy *tropos-hūlē* in the Commentary tradition of modal logic, the article presents philological evidence for their influence on Avicenna. It then briefly discuss the ramifications of this influence for his modal conversion rules and syllogistic. In sum, the article argues that the *jiha-mādd*a (*tropos-hūlē*) division was part of a larger dichotomy

that allowed Avicenna to construe propositions in various ways. How he understood a given proposition determined the validity of its conversion and so of its place in his modal syllogistic."

8. Ahmed, Asaq Q. 2011. "Systematic growth in sustained error: a case study in the dynamism of post-classical Islamic scholarship." In *The Islamic Scholarly Tradition: Studies in History, Law, and Thought in Honor of Professor Michael Allan Cook*, edited by Ahmed, Asaq Q., Sadeghi, Behnam and Bonner, Michael, 343–378. Leiden: Brill.

   Contain the edition and translation of Āmidī, “On the Conflict between Avicenna and Fārābī on the Description of the Subject", pp. 363-371 (translation), pp. 372-377 (arabic text).

   "The details of my study are addressed to historians of medieval logic, philosophy, and theology, but what they tell us about transformations—and the mechanisms underlying the transformations—within the discipline of logic should interest Islamicists more generally. I therefore summarize the global picture in the next two sections. In section IV, I hope to have offered an explanation of the specialist details by way of some examples. The rest of the article, starting in section V, is the extended technical proof of the more general observations and conclusions.

   Thus, the reader not specializing in the fields of Arabic theology, philosophy, and logic should have no difficulty with sections II and III; and she may also wish to work through section IV for a non-formal sample presentation of the argument. Section V, however, assumes some knowledge of medieval logic in general and Arabo-Islamic logic in particular." (pp. 345-346)

9. ———. 2013. "Logic in the Khayrābādī School of India: A Preliminary Exploration." In *Law and Tradition in Classical Islamic Thought: Studies in Honor of Professor Hossein*

Modarressi, edited by Cock, Michael, Haider, Najam, Rabb, Intisar and Sayeed, Asma, 227–243. New York: Palgrave Macmillan.

Abstract: "This chapter presents, in an exploratory fashion, the history of Arabo-Islamic logic in India between the tenth/sixteenth and fourteenth/twentieth centuries, with special focus on the formation of the Khayrābādī School in this discipline. Given its exploratory nature, the chapter does not promote any thesis that elaborates on the causes behind historical developments; however, it does point out that the study of logic passed through India in four distinct stages via Multān, Delhi, Lahore, the Awadh (generally), and Tonk. The aim of the chapter is simply to chart the trajectory of the scholars and works associated with logical studies in the specified period and region, so as to lay the groundwork for further technical research in Arabo-Islamic logical texts of the subcontinent."

10. ———. 2022. *Palimpsests of Themselves: Logic and Commentary in Postclassical Muslim South Asia*. Oakland, CA: University of California Press.

"This book is a study of the *Sullam al-ʿulūm* (*The Ladder of the Sciences*) of Muḥibballāh al-Bihārī (d. 1119/1707), long considered to be the most advanced logic textbook in the Indian(1) Niẓāmī curriculum.(2) It also engages the vast commentarial tradition that its composition elicited and offers a theory of commentaries.

The culminating South Asian articulation of discourses on logic issuing after the close of the classical period (ca. 200/800–600/1200), the Sullam is uniquely positioned to give scholars of Arabic logic a vantage point from which to reflect on the postclassical (ca. 600/1200–1300/1900) career of the discipline: as we will witness below, it was the South Asian heir to a continuous tradition that passed sequentially from Avicenna to Marāgha to Shīrāz to North India. The *Sullam* also allows one to reflect on the development of logic in the local Indian environment: its commentarial tradition was either internally self-referential or it reverted to the prehistory of the

hypotext; contemporary developments outside the Subcontinent are practically never cited by the *Sullam*'s hypertexts. In other words, although the *Sullam* was the product of a protracted transregional affair, its commentarial tradition was locally responsive."

(1) I do not use the expression "Indian" to refer to nation-state boundaries. I use it interchangeably for South Asia and as a shorthand for those domains that were under direct or indirect Mughal suzerainty at some point in the history of the region. This, too, should not be interpreted as a connotative concession to contested categories, but only as a way to set up a vague regional referent.

(2) The so-called Niẓāmī curriculum was, properly speaking, a method of scholarly training. I do not use the expression to indicate a rigid set of texts or classes. For further discussion, see Ahmed, "Dars."

"The article's anchor is the presentation of the negative-predicate proposition in the *Sullam al-ʿulūm* of Muḥibballāh al-Bihārī (d. 1119/1707).(2) I focus on this late reception and engagement with the topic via some of the commentaries on this work. Insofar as the *Sullam* was part of a continuous dialectical tradition, I also explore discussions of this topic in three works of logic that played an influential role in the South Asian tradition.(3) Thus, the article is divided in the following manner. In the first part, I highlight the relevant principles whose common validity produced the problems that motivated the invention of the new kind of proposition; here I rely mostly

on the tradition of the *Sullam*. In the second part, I present discussions of the negative-predicate proposition in Quṭb ad-Dīn at-Taḥtānī's (d. 766/1365) *Sharḥ al-Maṭāliʿ* of Sirāj ad-Dīn al-Urmawī (d. 682/1283), As-Sayyid ash-Sharīf al-Jurjānī's (d. 816/143) supercommentary on the *Shamsiyya* of Najm ad-Dīn al-Kātibī (d. 675/1276), and Jalāl ad-Dīn ad-Dawānī's (d. 908/1502/3) commentary on the *Tahdhīb al-Manṭiq* of Saʿd ad-Dīn at-Taftāzānī (d. 793/1390). These three texts constituted the textual *Sitz im Leben* of the discussion in the Sullam tradition. In the third and final part, I summarize the discussion of this topic in the *Sullam* tradition mainly via the commentary of Mullā Mubīn (d. 1225/1810)." (pp. 427-428)

13. Ahsan, Abbas, and Karima, Marzuqa. 2022. "Torn Between the Contours of Logic: Exploring Logical Normativity in Islamic Philosophical Theology." *European Journal of Analytic Philosophy* no. 18.

    Abstract: "Western contemporary logic has been used to advance the field of Islamic philosophical theology, which historically utilised Aristotelian-Avicennian logic, on grounds of there being an inherent normativity in logic. This is in spite of the surrounding controversy on the status of logic in the Islamic theological tradition. The normative authority of logic means that it influences the content of what we ought to believe and how we ought to revise those beliefs. This paper seeks to demonstrate that, notwithstanding the incompatible differences between the two systems, the underlying feature of both Western contemporary logic and Aristotelian-Avicennian logic is logical normativity. It then argues that an inherent

normativity of logic in the Islamic theological/philosophical tradition is unmotivated. Instead, it proposes to reinstate logic as anti-exceptional within the Islamic theological/philosophical tradition as a viable alternative."

14. Akgunduz, Ahmed. 2011. "Sa'īd Nūrsī's Approach to the Principles of Reasoning Vis-à-vis Analogical Inductive Reasoning." *Journal of Islam in Asia* no. 8:157–179.

    Abstract: "Analogical inductive reasoning (al-qiyās al-tamthīlī) is to some scholars a controversial issue related to Islamic law and logic. It is argued that this kind of qiyās can only afford non-certain knowledge in Islamic law. Bedi'uzamān Said Nūrsī (1876-1960) however, evaluated this kind of qiyās and argued that there also exists al-qiyās al-tamthīlī which affords certain knowledge. This problem may not be appreciated unless information regarding the proofs (al-'adillah wa al-Íujaj) and the ways of inference (isÏinbāt) and argumentation (istidlāl) in logic and Islamic law is discussed. For that matter stand of great scholars like Ibn Taymiyyah (d. 728) and Ibn al-Qayyim (d. 751) have been shared in. They have actually gone the same way with different nuances."

15. Akrami, Musa. 2017. "From Logic in Islam to Islamic Logic." *Logica Universalis* no. 11:61–83.

    Abstract: "Speaking of relations between logic and religion in Islamic world may refer to logic in two respects: (1) logic in religious texts, from doctrinal sacred texts such as *Qur'an* and sayings of the Prophet (as well as *Imāms*, in *Sh'ıism*) to the *Qur'anic* commentaries and the texts related to the principles and fundamentals of jurisprudence, all of which make use of some reasoning to persuade the audiences or to infer the rules and prescripts for religious behavior of the members of religious community; and (2) logic as a discipline that is studied and applied both independently and as a tool for reasoning in (a) schools of Islamic theology (from *Ash'arīs* to *Mu'tazilīs* and *Shī'īs*), (b) systems of Islamic philosophy (from Peripatetics to Illuminationists), and (c) other types of knowledge in medieval Islamic world, all being strongly influenced by religious doctrines of Islam. Accordingly, this

paper speaks of (i) the different manifestations of using logical reasoning, particularly analogy, in *Qur'anic* arguments, e.g. for the existence of God and resurrection after death; (ii) some contradictions or paradoxes reported by different opponents in the verses of *Qur'an*; (iii) the place of logic in the classification of disciplines and the courses taught at the schools and seminaries; (iv) the influence of the attitudes of different religious sects on logic; (v) the instrumental role of logic for both religious and secular reasonings; (vi) the relation between reason and dogmatic religious doctrines, and, finally, (vii) the reflection of this relation on progress or recession of logic in medieval Islamic world."

16. ———. 2020. "Logic in Islam and Islamic Logic." In *Beyond Faith and Rationality: Essays on Logic, Religion and Philosophy*, edited by Silvestre, Ricardo Sousa, Göcke, Benedikt Paul, Béziau, Jean-Yves and Bilimoria, Purushottama, 276–300. Cham (Switzerland): Springer.

    "Due to its appealing potential and possibilities, the Greek heritage in logic was broadly translated into other languages (for Arabic translation of Aristotle's writings see (Walzer 1962)). The leading role of logic gave rise to studying, learning, and teaching it in various religious and philosophical circles. In spite of some antiphilosophical trends, it is not surprising that the translation of Greek works in logic was welcomed by most scholars with their own strong Islamic religious and theological attitudes. Such an attitude led to the emergence of important logicians and extension of Greek logic in the Islamic world.

    This chapter is arranged in three main sections to show the place of

    1. reason and reasoning in Islam as a religion,

    2. logic in Islam as a religion, and

    3. the well-known "Islamic logic", a tradition in the history of logic that was developed in the Islamic world largely by Muslim logicians, in relation to logic in Islam as a religion that has its own sacred texts, on the one hand, and the theoretical and

practical issues that possibly makes using logic necessary, on the other hand." (pp. 277-278)

18. Ali, Mufti. 2002. " The image of the history of opposition against kalam and logic reflected in modern literature." *Al Qalam* no. 19:117–137.

    Abstract: "The attitudes of Islamic scholars toward Greek *kalam*, logic, and philosophy, which they generally refer to as '*ulum al-awa'il*, are divided into two orientations: the Traditional orientation, which emphasizes that Islamic reason should be focused on understanding and applying revelation, away from philosophical activities, and the Rational orientation, which states that the Greek tradition does not contradict Islamic doctrine. This Traditional orientation has not received sufficient attention from modern writers. Through a review of modern literature by I. Goldziher, G. Maksidi, G.H.A. Juynboll, J. Pavlin, and P.Sj. van Koningsveld, which explicitly and elaborately outlines the schools, figures, opinions, and arguments of these "opponents," this study reveals that the stance of supporting or rejecting kalam and logic is not the monopoly of a particular religious school. Scholars who are considered representatives of the extreme Traditional school can be the main defenders of *kalam* and logic and make very significant contributions to the advancement of the two sciences, and vice versa. This study also reveals that the five modern authors did not refer to *Shawn AI-Manthiq Wa Al-Kalam Min Fannay Al-Manthiq Wa Al-Kalam* by Al Suyuthi, a text that is very rich in this theme."

    Abstract: "On the basis of my analysis of four works composed by al-Suyūṭi, I argue that hostility to logic was a predominant feature of Sunni scholarship, especially during the 13th, 14th, and 15th centuries. Logic was condemned by distinguished Sunni scholars in Valencia, Fez, Aleppo, Iraq, and Mecca, but especially in Egypt and Syria. This conlusion confirms Goldziher's argument that resistance to logic started already in the 2nd/8th century and increased in the 13th and 14th centuries; and disconfirms al-Rouayheb s argument that opposition to logic was never predominant among Muslim Sunni scholars."

    Abstract: "Al-Radd ʻala ʾl-Mantiqiyyin (an alternative title for Nasihat Ahl al-Iman) is a work composed by Ibn Taymiyya to demolish each principle of logic as well as to unravel the depravity of their foundation. Probably due to Ibn Taymiyya’s

being genius, when he destroys those principles, he could not avoid himself to discuss digressively irrelevant topics dealing with theological as well as metaphysical issues. In a number of passages in al-Radd, he could not even hinder himself to make a good deal of repetitions. Therefore, al-Radd ‘ala’l-Mantiqiyyin is complex and difficult to use. The coherence of arguments that Ibn Taymiyya formulated is not solid and comprehensive. His criticism of logic is not penetrating as well. On the basis of my analysis of al-Suyuti’s method of abridgement of Ibn Taymiyya’s al-Radd, I argue that al-Suyuti succeeded in rendering Ibn Taymiyya’s sequence of ideas superior to that found in the original work of the latter. The result of this study confirms Hallaq’s argument that the overall result of al-Suyuti’s abridgement of Ibn Taymiyya’s al-Radd is ‘a more effective critique of logic than that originally formulated by Ibn Taymiyya."

    "In marked contrast to the abundance of modern literature on the history of theology and logic in Islam, we can only find a few works dealing with the history of the Muslim opposition to logic and theology. Usually, these works mainly focus either on the opposition to logic or on the opposition to theology." (p. 14)

    (...)

    "Our understanding of the Muslim opposition to logic and theology may be furthered by the study of the four works on these subjects written by Jalal al-Din al-Suyūṭī." (p. 30)

    "4. The Scope of the Present work

    The purpose of the present work is to deal with the following research-question:

    What can we learn from al-Suyūṭī’s four works against logic and theology about the history of Islamic thought concerning the

condemnation of logic and theology, in addition to the light shed on this subject by modern scholars quoted earlier?

In dealing with this research-question, I will discuss in the first chapter al-Suyūṭī's earliest contribution to the history of the opposition to logic, entitled *al-Qawl al-Muhriq fī Taḥrīm al-Ishtigāl bi 'Ilm al-Manṭiq*, written by him when he was still a student of 18 years old. I will deal with the manuscripts and the edition of QM (1.1), the date and purpose of its composition (1.2), as well as with an analysis of its contents (1.3). In my conclusion, I shall evaluate this work as a source for the history of Muslim opposition to logic (1.4).

In chapter two, I will discuss al-Suyuti's abridgement of IT's *Naṣīḥa*, entitled, *Jahd al-Qarīha fī Tajrīd al-Naṣīḥa*, a work composed when his knowledge of logic was doubted by some of his contemporaries. I will deal with the date (2.1) and purpose of his abridgement (2.2). I will also assess the contribution made by al-Suyūṭī in rendering IT's *Naṣīḥa* more comprehensible. Elements of IT's religious viewpoints against logic and theology in JQ will also be discussed (2.3). Some pages are devoted to deal with the question how al-Suyūṭī selected IT's viewpoints against logic in his JQ (2.4). In the conclusion, I shall analyse the rationale of al-Suyūṭī's selection of IT's arguments in it (2.5).

Chapter three will discuss al-Suyūṭī's work that was composed twenty years after QM, when his call for *ijtihād* was refused by some of his contemporaries who doubted his ability to comply with an alleged precondition for *ijtihād*, i.e., the knowledge of logic. I will deal, first of all, with the manuscript and the edition of SM (3.1), with the date (3.2) and the purpose of the composition of this work, i.e. *Ṣawn al-Manṭiq* (3.3). An analysis will also be given of the content of this work (3.4). In my conclusion, I shall again evaluate this work as a source for the history of Muslim opposition to logic and theology (3.5).

In chapter four, I will discuss al-Suyūṭī's *Fatwā* against logic. In so doing, first of all, I will deal with its manuscript (4.1). I will give an analysis of the content of this *Fatwā* (4.2) and evaluate

this sources on which al-Suyūṭī relies when issuing this *Fatwā* (4.3).

In the conclusion, I will try to answer the research-question formulated above by synthesizing the last paragraphs of each of the four chapters of this study."

Abbreviations

IT = Ibn Taymiyya

JQ = *Jahdal-Qarīha fī Tajrīd al-Naṣīḥa*

QM = *l-Qawl al-Muhriq fī Taḥrīm al-Ishtigāl bi 'Ilm al-Manṭiq*

SM = *Ṣawn al-Manṭiq wa 'l-Kalām 'an Fannay al-Manṭiq wa 'l-Kalām*

23. ———. 2008. "How did Al-Suyūtī abridge Ibn Taymyya's Naṣīḥat ahl al-Ĩmān fī al-Radd 'alā Manṭiq al-Yūnān?" *Al-Jami'ah* no. 46:279–301.

Abstract: "*Al-Radd ‘ala ’l-Manṭiqiyyīn* (an alternative title for *Naṣīḥat Ahl al-Ĩmān*) is a work composed by Ibn Taymiyya to demolish each principle of logic as well as to unravel the depravity of their foundation. Probably due to Ibn Taymiyya’s being genius, when he destroys those principles, he could not avoid himself to discuss digressively irrelevant topics dealing with theological as well as metaphysical issues. In a number of passages in *al-Radd*, he could not even hinder himself to make a good deal of repetitions.

Therefore, *l-Radd ‘ala ’l-Manṭiqiyyīn* is complex and difficult to use.

The coherence of arguments that Ibn Taymiyya formulated is not solid and comprehensive. His criticism of logic is not penetrating as well. On the basis of my analysis of al-Suyūṭi’s method of abridgement of Ibn Taymiyya’s *al-Radd*, I argue that al-Suyūṭi succeeded in rendering Ibn Taymiyya’s sequence of ideas superior to that found in the original work of the latter. The result of this study confirms Hallaq’s argument that the overall result of al-Suyūṭi abridgement of Ibn Taymiyya’s *al-*

Radd is ‘a more effective critique of logic than that originally formulated by Ibn Taymiyya."

24. ———. 2009. "Al-Suyūṭī's al-Qawl al-Mushriq against logic." *Bibliotheca Orientalis* no. 66:40–70.

"Of four works against logic by al-Suyūṭī(1) *al-Qawl al-Mushriq fi Taḥrim al-Ishtighal bi-¨Ilm al-Manṭiq* (hereinafter: QM) can be said to have been the first to be composed, i.e. in 867 or 868/1465 or 1466. This is clearly indicated in the introduction of another work by al-Suyuṭi (born in 849/1445), i.e. *Ṣawn al-Manṭiq*, which says: “Long ago, in the year 867 or 868 [H] I composed a book on the prohibition of being occupied by the art of logic, which I named “al-Qawl al-Mushriq” into which I included the statements of the learned men of Islam to condemn and prohibit it.”(2)

In this work al-Suyūṭī has discussed either explicitly or incidentally the opposition of more than 40 leading scholars of various law schools against logic by referring to more than 26 works which deal either explicitly or incidentally with the same issue.

In this paper, I will deal with (1) the manuscript and the edition of QM, (2) the date and purpose of its composition, as well as with (3) an analysis of its contents. In (4), the Conclusion, I shall evaluate this work as a source for the history of Muslim opposition to logic." (pp. 40-41)

(1) Al-Suyūṭī’s discussion of the Muslim opposition to logic and theology is found in four works which were composed by him within different literary contexts and times: *Al-Qawl al-Mushriq fi Taḥrim al-Ishtighāl bi-'Ilm al-Manṭiq* (QM), *Jahd al-Qarīḥa fi Tajrīd al-Naṣīḥ*a (ed. al-Nashshar, 1947), *Ṣawn al-Manṭiq wa-ˆl-Kalām 'an 'īFannay al-Manṭiq wa-'l-Kalām* (published and edited twice: first together with *Jahd*; second: Cairo: Dār al-Naṣr li-'-Ṭibā'a 1970, ed. Su'āda 'Abd al-Raziq), and al-Suyūṭī’s *Fatwā* against Logic (hereinafter: *Fatwā*). As far as the chronological discussion of these four works is concerned, QM was written the first, followed respectively by *Jahd*, *Ṣawn*, and concluded by the *Fatwā*.

(2) See *Ṣawn* (1970), p. 33.

25. ———. 2021. "Imām Suyūṭī's original thought on the opposition to (Greek) logic and theology in *Sawn al-Manṭiq wa'l'Kalām 'an Fannay al-Manṭiq wa 'l-Kalām*." *Hamdard Islamicus: Quarterly Journal of Studies and Research in Islam* no. 40:7–43.

    Abstract: "The transmission of Greek philosophy and sciences to the Islamic world through the translation movement in the eighth and ninth centuries played a major role in accelerating the Hellenizing process of that world. The emergence of scholastic theology (kalÉm) and Islamic Aristotelianism and Neo-Platonism (falsafah) in the Islamic world is considered, in Madjid's opinions, as the direct cultural influence of it."

26. Alper, Ömer Mahir 2015. "Intellecting the Intellected: An Examination on the Interpretation of "the Second Intelligibles" in Islamic Tradition of Logic and its Reception during the Ottoman Period." *Nazariyat: Journal for the History of Islamic Philosophy and Sciences* no. 1:35–68.

    Abstract: "The interpretation of the "second intelligibles" (*al-maʿqūlāt al-thāniya/al-maʿqūlāt al-thawānī)*, as a term which is highly sophisticated and closely related to many philosophical disciplines, began with al-Fārābī and continued to expand its content especially in the literature of logic until the modern times. In this process, following al-Fārābī several philosophers such as Ibn Sīnā, ʿUmar al-§āwī, Fakhr al-dīn al-Rāzī, ʿUmar al-Kātibī, Shams al-dīn al-Samarqandī, Qutb al-dīn al-Rāzī and Sayyid Sharīf Jurjānī became salient igures in interpreting the second intelligibles. he accumulated tradition including various approaches and transformations on the subject was transmitted directly to the Ottoman period, during which the second intelligibles were widely discussed with new concepts and issues. As it had been before, these interpretations and discussions found place in the literature of logic during the Ottoman period. In this article, I will examine the interpretations on the second intelligibles from al-Arabi to Jurjānī while marking moments of change and development. hen I will examine how Ottoman philosophers and logicians

approached the second intelligibles by comparing the commentaries of Burhān al-dīn Bulgārī, Kul Ahmed (Ahmed b. Muhammad b. Khıdr), §adr al-dīn-zāda Mehmed Emin Shirwānī and Kara Khalil b. Hasan al-Tirawī on Mullā Fanārī's famous book on logic, *al-Fawā'id al-Fanāriyya*."

27. Altunya, Hülya. 2020. "A Study of al-Galanbawī's Work Titled *Commentary on al-Īsāghūjī* in the Context of Signification and Definition Issues." *Eskiyeni* no. 41:571–598.

    Abstract: "Ismail al-Galanbawī (1730-1791) is known for his works in the fields of logic, *al-munazara* (Islamic disputation theory), mathematics, astronomy, *tasawwuf* (mysticism) and theology. al-Galanbawī, who followed the tradition of al-Fārābī - Avicenna which is a continuation of logic of Aristotle (322 B.C.), compiled a work on logic in the last period of the Ottomans. His work titled *Burhān* is considered to be the last compiled work written in logic in the Ottoman scien-tific world. In addition, he wrote a commentary text on *Isāghūjī* by Athīr al-Dīn al-Abharī (d. 1265), although he has other logical studies. There are many commentaries and *hawashī* (margin notes) on *Isāghūjī* text, which has a remarkable position in the history of Islamic logic. The advantage of *Isāghūjī* as a text of logic, regarding the texts in other branches of science, is its delineating a formal issue with a clear style. However, it is an ever changing historical need to revise its style simply because its potential readers are not the same in a different historical context. Islamic logicians wrote these commentaries in accordance with the level of understanding of the students in their own period. Here, al-Galanbawī aims to explain the incomprehensible issues in this treatise for the students of his period with the commentary on Isāghūjī. Even if we can witness similar contents in the texts after written 13th century, al-Galanbawī's commentary attracts attention in terms of its delineating different viewpoints with some anal-ysis. In the introductory section of his text, al-Galanbawī establishes the close relation between logic and linguistic and religious disciplines. From this perspective, it puts a logical emphasis on the idea that a student of religious sciences cannot get a deep insight into religious sciences, like *tafsīr* (science of Qur'ānic

commentary), *kalām* (theology), without learning logic. He discusses dialectically some theological problems with taking kalām tradition into consideration. His chief aim is to demonstrate that logic is a basic method for all Islamic sciences. Then al-Galanbawī posits some meaning and definition of logic. In this level, he employs the term *cihat al-wahda* (*jihat al-wahda*) which was used by Mollā Fanārī before him. It is understood that this term indicates his the unity in the theory of existence to the theory of knowledge and his mystical tendency in this issue.

The logician, who called science of logic as *'ilm al-mīzān* (science of measurement), tries to highlight the applicable dimension of logic in its commentary. Since logic is the tool of religious sciences and therefore logic has a big duty to ensure the robustness and accuracy of all kinds of evidence. For this, while commentary on *Isāghūjī* has been explaining the rules of the science of logic together with logical explanations, at the same time, it investigates the meaning of the most of words from linguistic and grammatical perspectives. In this article, the introduction section of Galanbawī's commentary on *Isāghūjī*, and the subjects of signification (*dalālā*) and definition in its conceptualizations *(tasawwurāt)* section are examined in terms of logical and linguistic. al-Galanbawī discusses in detail the matter of literal and non-literal aspects of signification, which was discussed by classical Muslim logicians. Each of this distinction has subdivisions such as natural (*tabi'ī*), rational (*'aklī*), and conventional (*waz'ī*). Logicians focus mostly on literal conventional signification (*lafzī waz'ī*). As from Avicenna, this literal conventional signification is considered *mutabaqat* (correspondence), *tazammun* (consequence), *iltizām* (concomitance). al-Galanbawī discusses these three elements in detail by displaying different perspectives in conflict and a possible solution for them. He passes his views on many disputed definitions and gives some responses to them. Thus he attempts to re-establish the discipline of logic in terms of Islamic disciplines with the aim of demonstrating that logic is a basic method. In addition, logicians who have influence on

Ottoman logic, such as Mollā Fanārī and Dāwūd al-Qārisī, will be evaluated together with their the commentaries on *Isāghūjī*. Moreover, it will be tried to determine his place, importance and contributions by this work in Islamic logic tradition."

28. Alwishah, Ahmed, and Sanson, David. 2009. "The Early Arabic Liar: The Liar Paradox in the Islamic World from the Mid-Ninth to the Mid-Thirteenth Centuries CE." *Vivarium* no. 47:97–127.

    Abstract: "We describe the earliest occurrences of the Liar Paradox in the Arabic tradition. The early Mutakallimùn claim the Liar Sentence is both true and false; they also associate the Liar with problems concerning plural subjects, which is somewhat puzzling. Abhari (1200-1265) ascribes an unsatisfiable truth condition to the Liar Sentence - as he puts it, its being true is the conjunction of its being true and false - and so concludes that the sentence is not true. Tūsī (1201-1274) argues that self-referential sentences, like the Liar, are not truth-apt, and defends this claim by appealing to a correspondence theory of truth. Translations of the texts are provided as an appendix."

29. ———. 2016. "Al-Taftāzānī on the Liar Paradox." *Oxford Studies in Medieval Philosophy* no. 4:100–124.

    "Saʿad al-Dīn Masʿūd ibn ʿUmar ibn ʿAbd Allāh al-Taftāzānī (1322–1390) was a Persian polymath who wrote on a wide range of subjects—grammar, logic, theology (*kalām*), jurisprudence (*fiqh*), and literature.

    Here we translate and discuss his remarks on the Liar Paradox, in which he (a) presents the first example of a Liar Cycle or Deferred Liar in the tradition, (b) gives the paradox a puzzling name—the fallacy of the “irrational root” (*al-jadhr al-aṣamm*) —which became the standard name for the paradox in the tradition, and (c) suggests a connection between the paradox and what it tells us about the nature of truth and falsehood, and related puzzles concerning reason and the nature of goodness and badness." (p. 100)

30. Aoude, Safia. 2011. "Classical logic in Islamic philosophy: Creating dichotomy or catalyst?" *Tidsskrift om Islam & Kristendom* no. 14:29–38.

    "Introduction

    Using classical Greek logic to explain the concept of a metaphor to his readers, the famous Islamic scholar Ibn Sina wrote in his book “Qiyâs”:

    “So and so is beautiful. Everything beautiful is a moon. Therefore so and so is a moon.”

    On the other hand, the equally famous Islamic scholar Imam al-Shafi'i is quoted to have said:

    "People did not become ignorant, nor differed except after their abandonment of the Arabic language and their inclination to the language of Aristoteles!"

    The words of Ibn Sina and Imam al-Shafi´i present each two opposites; one is using the methodology of classical Aristotelian logic to elaborate a metaphysical Islamic concept, the other one is claiming Aristotelian logic has ruined the basics of Islamic creed by the limitation of its semantics. Obviously, classical logic did play an important role in the development of philosophical ideas among Muslim scholars and philosophers, but there seems to be a dichotomous difference in approach.

    The aim of my paper is to look into the views of some of the well known thinkers in Islamic philosophy, extracting their specific opinions towards Aristotelian classical logic. What use did Muslim philosophers have for Aristotelian logic in the development of their own ideas?" (p. 29)

31. Ardeshir, Mohammad, and Nabavi, Fatemeh. 2022. "A Logical Framework for the Islamic Law." In *New Developments in Legal Reasoning and Logic: From Ancient Law to Modern Legal Systems*, edited by Rahman, Shahid, Armgardt, Matthias and Kvernenes, Hans Christian Nordtveit, 53–81. Cham (Switzerland): Springer.

Abstract: "We introduce a new aspect of the notion of obligation inspired from the Islamic legal system.We then construct a dynamic deontic logic to model this notion of obligation. A semantics for this logic is introduced, and then its soundness and completeness theorems with respect to this semantics are proved."

"To find out the logical system of the Islamic legal reasoning, we follow the following plan in this paper.

In Sect. 3.2, we introduce a general outline of the method of reasoning in the Islamic legal system in Shī'ī style, which is discussed in the methodology of fiqh [Islamic jurisprudence].

Then in Sect. 3.3, we look for a meaning of obligation inspired from the principles of figh and fix it as our base in formalizing of the logic of the Islamic legal system.

In Sect. 3.4, we argue that the dynamic approach is the most suitable one for the deontic notions we derive from the principles of figh in Sect. 3.3.

Then in Sect. 3.5, we formalize some concepts according to the dynamic approach, which are based on the notion of action. We introduce our logical system, including syntax and its semantics in Sect. 3.6. In this section, we prove that our logic is sound and complete with respect to the proposed semantics. We have put the proofs of these theorems in the appendix to preserve smoothness for readers who want to have a general idea of our work.

In Sect. 3.7, we briefly compare our system with some related works, and the final section includes our concluding remarks and possible extensions of our logic." (p. 54)

32. Arif, Syamsuddin. 2020. "The Art of Debate in Islam: Textual Analysis and Translation of Tasköprüzade's *Ādāb al-Baḥth wa al-Munāẓarah*." *Afkar* no. 22:187–216.

    Abstract: "This article presents an analysis of a short treatise entitled *Ādāb al-Baḥth wa al-Munāẓarah* (The art of discussion and disputation) by the celebrated Ottoman scholar Abu al-Khayr 'Iṣām al-Dīn Aḥmad ibn Muṣṭafā ibn Khalīl

Ṭāshkubrīzādah or Ṭaşköprüzade (d. 968 AH/ 1561 CE). An overview of the nomenclature and a brief introduction about the author and his work will be presented along with an annotated English translation of the text in order to highlight Ṭaşköprüzade's contribution to this nearly forgotten discipline."

33. Arnaldez, Roger. 1991. "Mantik [Logic]." In *Encyclopaedia of Islam, 2nd edition*, 442–452. Leiden: Brill.

2. Definition of logic (*'ilm al-mantik*).

Al-TahanawT, in his *Dictionary of technical terms*, comments that this is also called the science of balance (*'ilm al-mizdn*), "because this is a means of weighing arguments (*huajadi*) and demonstrative proofs (*bardhir*i)". Ibn Slna calls it "the servant of the sciences" (*khādim al-'ulurn*), "because it is not a science in its own right, but a means (*wasīla*) of acquiring sciences". But al-Fārābī called it the "mistress" (*ra'isa*) of sciences "on account of its efficacity (*nafādh*) in the practice of them". This science, al-TahanawT continues, "was called *mantik* because the root *nutk* (action of speaking, elocution) applies in a general fashion to statement (*lafz*), to the perception of universals (*idrāk al-kulliyyāt*) and to the reasonable soul (*al-nafs al-nāṭika*); since this art reinforces the first of these concepts, through the second it follows the path of rectitude (*sadād*), and by its means the perfection of the soul is realised, a word has been derived from this root to designate it, sc. the word *mantik*. It is the science of rules (kawānīn) which explains the methods for passing from that which is known to that which is unknown, and the conditions that they pose (*sharā'it*) so that error (*ghalaṭ*) will not survive in thought (*fikr*}. The known extends to the necessary truths of intuition (*ḍarūriyyāt)* and to speculative truths". It may be noted that this distinction corresponds to that made by Aristotle (*Anal. Pr*. i, 10, 76b 10) between "common axioms" and "entirely demonstrated conclusions".

    Abstract: "This paper tries to outline a history of development of informal logic in Semitic languages and especially in Arabic. It tries to explain how the first definite formulation of rules of this logic appeared at āl-Śāfiʿy' Risāla, a work on *'uswl āl-fiqh* or methodology of law. It attempts also to provide new theories and hypotheses about the translation movement in the Arabic and Islamic medieval world."

35. Bäck, Allan. 2008. "*Islamic* Logic?" In *The Unity of Science in the Arabic Tradition: Science, Logic, Epistemology and their Interactions*, edited by Rahman, Shahid, Street, Tony and Tahiri, Hassan, 255–279. Dordrecht: Springer.

    Abstract: "A current ideology has it that different cultural traditions have privileged sources of insight and ways of knowing. Prizing one tradition over another would reek of cultural imperialism. In this vein we have those pushing for a unique status for Islamic philosophy—and no doubt alongside Chinese philosophy, Indian philosophy, African philosophy.... I begin by examining what could be meant by 'Islamic philosophy'. I argue that embracing a multiculturalism that makes the philosophic enterprise relative to particular cultural traditions ignores a quite important part of the Islamic philosophical tradition itself: the quest for a transcultural, universal objectivity. The major Islamic philosophers embraced this ideal: al-Fārābī and Ibn Sīnā (Avicenna), for instance. They held that some cultures are better than others at attaining philosophical wisdom, and some languages better than others at expressing it. They advocated selecting critically features from the different cultures for constructing a general theory. I illustrate their method by considering their treatment of

paronymy and the copula. I end by advocating a return to this Islamic tradition."

36. ———. 2016. "Demostration and Dialectic in Islamic Philosophy " In *The Routledge Companion to Islamic Philosophy*, edited by Taylor, Richard C. and López-Farjeat, Luis Xavier, 93–104. New York: Routledge.

    "Introduction

    Plato had seen in dialectic a way to justify the first principles of philosophy, from which the demonstration of universal truths could proceed (e.g. *Republic* VI). Likewise, Aristotle uses dialectic to arrive at an intuitive grasp of the first principles on which demonstrative syllogisms are based (e.g. *Metaphysics* IV). Islamic philosophers inherited and developed these doctrines on demonstration and dialectic from the Greeks. In what follows I will sketch the Greek background and then examine some important developments in the Islamic context, in particular how dialectic became more removed from demonstration in the thought of Ibn Sīnā, if not in Islamic philosophy as a whole. I conclude by considering how intuition grew in importance and why this view deserves serious consideration even in philosophy today." (p. 93)

37. ———. 2016. "Aristotelian Protocol Languages." In *Formal Approaches and Natural Language in Medieval Logic: Proceedings of the XIXth European symposium of medieval logic and semantics, Geneva, 12-16 June 2012*, edited by Cesalli, Laurent, Goubier, Frédéric, de Libera, Alain and Isaac, Manuel Gustavo, 343–371. Barcelona - Rome: Fédération Internationale des Instituts d'Études Médiévales.

    "An alternative approach to the history of philosophy –one that takes the aim of opening up the discipline seriously– would treat both Western and non-Western philosophy as the regional inflections of a global phenomenon(1). In what follows I shall illustrate this approach by showing how Islamic and Latin Aristotelians inherited the same project, of constructing an ideal, protocol language but focused on developing different aspects of it.

(...)

I shall look briefly at how Aristotle develops an ideal protocol language, an artificial language isomorphic with the world and its structure. His project has two main stages: subtraction and addition.

First, starting from natural language and its common ways of speaking, as he is wont to do in his endoxic method, he prunes away those ways of talking that he finds erroneous and misleading, as he does with unnatural predication. Second, after observing the phenomena and developing his theory, he adds terms to the pruned vocabulary, as he does for items in the categories.

(...)

Islamic philosophers like Al-Fārābī and Avicenna did likewise. Yet they also tended to worry much more explicitly than their Latin counterparts over the translation of Aristotle's texts: how to express the same philosophical concepts in Greek and in Arabic, especially on account of how much Arabic differs from Greek grammatically. They did so by using in Arabic the verbal infinitive, the *maṣdar*, to make the language of paronymy reflect the reality more clearly. They also did so in their treatments of the statement, by modifying how ordinary Arabic expresses the copula and the quantifiers.

How philosophically interesting are these issues? I shall end by comparing them to some current doctrines." (pp. 343-344)

38. Baffioni, Carmela. 1991. "Probable Syriac influences in the Ikhwān al-Ṣafā"s logical epistles?" *Aram Periodical* no. 3:7–22.

39. ———. 2013. "Logic in Islam." In *Encyclopedia of Sciences and Religions*, edited by Runehov, Anne L. C., Oviedo, Lluis and Azari, Nina P., 1174–1180. Dordrecht: Springer.

"Logic developed through the Syriac language during the reign of the 'Abbasid Caliph al-Ma'mūn (813–833), though a version

of the *Topics* may have been made at the time of the third ‘Abbasid Caliph al-Mahdī (775–785).

The translation movement focused on Porphyry (d. 304)’s *Isagoge,* Aristotle’s *Categories*, *De interpretatione* and *Prior Analytics*, Galen (d. 200)’s *Introduction to logic*, and on works by Aristotle’s commentators such as Theophrastus (d. 287 B.C.), Alexander of Aphrodisias (d. 222), Themistius (d. 387), Ammonius (d. 520), and John Philoponus (d. ca. 580).

In line with the Alexandrian school and Syriac tradition, the *Rhetoric* and *Poetics* were also considered parts of Aristotle’s collected logical writings known as the *Organon* (instrument of reasoning); Porphyry’s *Isagoge* was placed at the beginning as an introduction (Inati 1996, pp. 802-803; Street (2008)).

One of the first systems of logic was that of the tenth-century Ikhwān al-Safā’ (the Brethren of Purity), which appears in their encyclopedia of sciences at the end of the first section on the propaedeutical sciences. They paraphrase with some originality the *Isagoge*, *Categories, De interpretatione*, and the *Prior* and *Posterior Analytics* (Baffioni 2008, p. 105)." (pp. 1174-1175)

42. Beidokhti, Hanif Amin. 2018. "Suhrawardî on Division of Aristotelian Categories." In *Islamic Philosophy from the 12th to the 14th Century*, edited by Al Ghouz, Abdelkader, 377–408. Bonn: V&R unipress.

    "Suhrawardī's discussion of the categories covers almost all aspects of the Peripatetic doctrine including the deduction method for attaining the final list of the categories. This paper will discuss Suhrawardī's critical point of view on the Aristotelian list of the categories. For this purpose, I shall first discuss a long lasting debate on the subject matter of the *Categories* and the proper science for studying its topics and the way it relates to Suhrawardī's treatment of the categories.

    Then, I shall discuss briefly the historical route of arguments for establishing the tenfold list of the categories probably available to Suhrawardī; after that, I shall introduce Suhrawardī's own reductionist division, as well as the level of certainty that he associates with his fivefold division. This might provide us with a clue for ordering Suhrawardī's works and depict the development of his discussion." (p. 379)

43. Belhaj, Abdessamad. 2016. "*Ādāb al-Baḥth wa-al-Munāẓara*: The neglected art of disputation in later medieval Islam." *Arabic Sciences and Philosophy* no. 26:291–307.

    Abstract: "Is it possible to invent a science that sets the rules for an ethical, logical and effective debate? Shams al-Dīn al-Samarqandī (died in the first half of the 14th century), a logician and Ḥanafī jurist thought it possible. He undertook the task of developing a general theory of scientific discussion that had a tremendous success and impact on Muslim scholarship. *Ādāb al-baḥth wa-al-munāẓara*, as he called it, is a set of ethical and logical principles, taken from Aristotelian logic and Islamic law. His major treatise *Risālat Ādāb al-baḥth*, initiated

a new discipline in which dozens of treatises, commentaries and glosses were written. In my contribution, I will shed light on this neglected science, describe its structure, expose its functions and highlight its significance for the development of debates and intellectual dialogues in the later medieval Islam."

44. Bellosta, Hélène. 1991. "Ibrāhīm Ibn Sinān: On Analysis ansd Synthesis." *Arabic Sciences and Philosophy* no. 1:211–232.

"The leading role the problem of analysis and synthesis played until the 19th century is well known; yet ancient and mediaeval works bearing on it are extremely rare. That is why the text dealing with analysis and synthesis in geometrical demonstrations by Ibrahim Ibn Sinan, a tenth century mathematician,(1)

is of special importance. It is the first theoretical treatise, strictly speaking, devoted to the subject in the whole history of mathematics. Ibn Sinan also treats, in connection with analysis, the closely related question of classification of problems.

Before Ibn Sinan, the only authors to tackle the problem of analysis and synthesis (apart from Aristotle and Plato, who alludes to it briefly)(2) are Pappus in his preface to Book VII of the *Collection*, the most elaborate Greek statement on the subject,(3) Proclus in the second Prologue to his *Commentary on Euclid,* Book 7,4 and the Pseudo-Euclid in a short passage. Ibn Sinan's text invites two immediate questions: is it only a repetition, albeit more detailed and precise, of what can already be found in the earlier Greek texts, or does it offer a modification of the terms in which the problem is stated, and consequently present us with the emergence of new problematics? More directly, what impact did this text have on later mathematicians?" (pp. 211-212, a note omitted)

(1) 1 Ibrahim Ibn Sinan Ibn Tabit Ibn Qurra (296/909-335/946), son of Sinan, physician and encyclopaedist, friend and companion of the caliph al-RadJ (934-940), grandson of Tabit Ibn Qurra, translator and mathematician of genius. Ibn Sinan's family comes from the town of Harran, on the Upper-Euphrates, crossroads of caravan routes and cultures, and religious centre of the Sabean sect. He was the heir to a

prestigious scientific tradition and an intimate of the Caliphal court.

47. ———. 1990. *Logic and Aristotle's Rhetoric and Poetics in Medieval Arabic Philosophy*. Leiden: Brill.

"This book examines a widespread, and often misunderstood, doctrine within the medieval Aristotelian tradition, namely, the inclusion of Aristotle's *Rhetoric* and *Poetics* within the scope of the *Organon*. Throughout I have attempted to argue that this tradition is not a bizarre anomaly of medieval philosophy, but rather, provides the focal point for a considerable body of sophisticated speculation on the nature of human knowledge, human language, and human society. This does not mean that the Arabic philosophers' developments of this doctrine are entirely without blemish; but it does mean that, like all important figures in the history of philosophy, the Arabic philosophers offer their readers novel and interesting perspectives on problems that continue to be of interest within contemporary philosophical discussion.

I have confined myself in the present study to the consideration of the Arabic Aristotelian tradition. Originally, it had been my intention to consider the interpretation of the logical character of the *Rhetoric* and *Poetics* in both the Arabic and the Latin traditions within medieval philosophy. But the wealth of material presented by the Arabic authors soon necessitated a full study in its own right. It is my hope that I will be able to return to the developments of this taxonomy amongst Latin authors at some later date, and that the present study will contribute in some measure to the understanding of the epistemological and logical framework shared by both traditions within medieval philosophy.

In considering the Arabic tradition itself, I have confined my study by and large to the writings of the three most prominent Aristotelians of the medieval period, Al-Farabi, Ibn Sina, and Ibn Rushd. Yet even to consider these three philosophers together runs the risk of creating the impression of unanimity and conformity in areas where there is considerable diversity of approach, if not disagreement. This is especially the case in

considering the epistemological and psychological teachings that form the background to the logical problems upon which I have focused, for in these areas the three philosophers I have chosen offer a rich variety of alternative positions. In order to offset this danger, I have tried to give due attention to the positions of all three philosophers, and to note any significant divergences or exceptions to the perspectives that I have focused upon within the study. I hope that I have not, in my efforts to be inclusive, seriously misrepresented or unduly neglected any of my three subjects." (*Preface*, p. IX)

48. ———. 1991. "Aristotle's 'Peri hermeneias' in Medieval Latin and Arabic Philosophy: Logic and the Linguistic Arts." *Canadian Journal of Philosophy* no. Supplementary volume 21:25–83.

    "My aim in the present discussion is to explore a selection of the standard passages in the medieval commentary tradition which give rise to explicit considerations of logic's general status as a linguistic art, and its special relationship to grammar. Amongst the Latin commentators, I have confined my inquiry to authors whose commentaries were written in the thirteenth century, and with the exception of Robert Kilwardby, to commentaries available in printed editions.(2) Amongst Arabic authors, I have considered in the main the writings of Al-Fārābī (ca. 870-950 AD) and Avicenna (Ibn Sīnā, 980-1037 AD).(3) Since the question of Arabic influence on the Latin discussions of these topics is minimal, I propose to begin with the writings of Latin commentators, since the Latin discussions of the issues with which I am concerned are on the whole more thematic and homogeneous, and hence more approachable, than those of the Arabic authors." (pp. 3-4)

    (2) For an overview of the *Peri hermeneias* commentaries prior to the time of Aquinas, see Gauthier, Introduction to the new Leonine edition of Aquinas"s commentary, 64*-75*. On the general subject of the *Peri hermeneias* in the West see J. Isaac, *Le "Peri hermeneias" en occident de Boèce a saint Thomas* (Paris: Vrin 1953).

For the most part, I have confined my remarks on the Latin authors to direct commentaries on the *Peri hermeneias,* and refrained from comparisons with more general logical texts, both by these commentators and by other thirteenth-century authors. I suspect, however, that there are some tensions between the approach to language and logic that is found in the commentary tradition, and that found in independent logical treatises and in works on speculative grammar. But a full investigation of this topic is beyond the scope of the present discussion.

(3) I have omitted Averroes's *Middle Commentary*, even though it is the only Arabic text on the subject that was available in the West, since it is less concerned with the issues under consideration here than are the commentaries of Avicenna and Fārābī.

49. ———. 1998. "Logic in Islamic Philosophy." In *Routledge Encyclopedia of Philosophy*, edited by Craig, Edward, 706–713.

"Islamic logic was inspired primarily by Aristotle's logical corpus, the *Organon* (which according to a late Greek taxonomy also included the *Rhetoric* and *Poetics*). Islamic authors were also familiar with some elements in Stoic logic and linguistic theory, and their logical sources included not only Aristotle's own works but also the works of the late Greek Aristotelian commentators, the *Isagōgē* of Porphyry and the logical writings of Galen. However, most of the logical work of the Islamic philosophers remained squarely within the tradition of Aristotelian logic, and most of their writings in this area were in the form of commentaries on Aristotle.

For the Islamic philosophers, logic included not only the study of formal patterns of inference and their validity but also elements of the philosophy of language and even of epistemology and metaphysics. Because of territorial disputes with the Arabic grammarians, Islamic philosophers were very interested in working out the relationship between logic and language, and they devoted much discussion to the question of the subject matter and aims of logic in relation to reasoning and speech. In the area of formal logical analysis, they

elaborated upon the theory of terms, propositions and syllogisms as formulated in Aristotle's *Categories, De interpretatione* and *Prior Analytics*. In the spirit of Aristotle, they considered the syllogism to be the form to which all rational argumentation could be reduced, and they regarded syllogistic theory as the focal point of logic. Even poetics was considered as a syllogistic art in some fashion by most of the major Islamic Aristotelians.

Since logic was viewed as an organon or instrument by which to acquire knowledge, logic in the Islamic world also incorporated a general theory of argumentation focused upon epistemological aims. This element of Islamic logic centred upon the theory of demonstration found in Aristotle's *Posterior Analytics*, since demonstration was considered the ultimate goal sought by logic. Other elements of the theory of argumentation, such as dialectics and rhetoric, were viewed as secondary to demonstration, since it was held that these argument forms produced cognitive states inferior in certitude and stability to demonstration. The philosopher's aim was ultimately to demonstrate necessary and certain truth; the use of dialectical and rhetorical arguments was accounted for as preparatory to demonstration, as defensive of its conclusions, or as aimed at communicating its results to a broader audience." (p. 706)

50. Brumberg Chaumont, Julie. 2016. "The legacy of ancient logic in the middle ages." In *The Cambridge Companion to Medieval Logic*, edited by Novaes, Catarina Dutilh and Read, Stephen, 19–44. Cambridge: Cambridge University Press.

    "A history of translations and transmissions thus needs to be complemented by a careful study of circulations and appropriations, where the different versions of the *Organon* are identified, taking into account the texts that were considered as a complement to or substitute for Aristotle's texts in the Middle Ages, as well as the various intellectual frameworks and filters through which logical theories were understood.(3)

    As a consequence, we focus on texts that belong properly to what the Middle Ages inherited from Antiquity, in order to

reconstruct the state of logic in Late Antiquity that was actually transmitted to the Middle Ages – what Sten Ebbesen has labelled a 'Logical Late Ancient Standard', to be complemented point by point by a 'Grammatical Late Ancient Standard' (see Ebbesen 2007). A portion of these texts are now lost in their Greek versions, but were directly or indirectly available to medieval logicians. The exegetical context provided, on the one hand, by the Alexandrian school, for the Arabic world (see D'Ancona 2005), and, on the other hand, by Boethius' project (see Ebbesen 1990) played a crucial role here.

In what follows, the five first sections focus on the texts and doctrines indirectly and directly transmitted. A last section traces the stages of circulation of this legacy, as well as the various conceptions of logic related to these successive versions of the logical corpus; this is done by comparing Eastern and Western contexts." (pp. 21-22)

51. Brunschvig, Robert. 1970. "Logic and Law in Classical Islam." In *Logic in Classical Islamic Culture*, edited by von Grunebaum, Gustave E., 9–20. Wiesbaden: Ottto Harassowitz.

"When, speaking of logic one thereby implies rationality. Consideration of a legal system from the standpoint of logic is conducted largely from that of its rationality, but only largely, for the two words are not exactly synonyms: it is not indispensable that the fundamental ideas be rational or present themselves as such for the juridical construction to show a rational character. In classical orthodox doctrine, Muslim Law (*Shari'a*), which is ethico-juridical, is based, in the first place, on sacred texts that need no justification. In the absence of a notion of natural law and in the negation of ethical or rational values that impose themselves upon God, or which God imposes upon Himself, or which may be inherent in Him, the revealed or inspired datum, a divine phenomenon, is a priori exempt from the demands of rationality which rightly manifest themselves with regard to human laws. In this sense, it is therefore permissible to speak of irrationality, it being understood that irrational means here “which is not subject to reason, which does not depend on it in any way” and not “which is contrary to reason.” And this is true to such an extent that a posteriori attempts have not been found lacking, even in the most orthodox circles, to explain as rationally as possible the prescriptions of the religious Law. This secondary justification will appeal more and more to notions of wisdom (*hikma*), goals or aims (*maqasid*) of interest or utility (*masalih*) to human beings; and the task will be made easier by the incontestably realistic and positive character of this law, which does not have recourse to the strange or to the mysterious and each provision of which does not shock human reason in any way at a given stage of society. But from the beginnings of Islam, if the arbitrary decision of God which is beyond all justification is necessarily respected by the Believers, the koranic text itself from time to time gave incipient explanatory considerations. On the other hand, there was certainly needed a principle that would decide between these successive legislative revelations whenever they could be reconciled only with difficulty and even in certain cases when they were apparently contradictory; to this effect the Koran teaches abrogation in the form of replacement of the oldest by the most recent." (p. 9)

52. Burnett, Charles. 2004. "The Translation of Arabic Works on Logic into Latin in the Middle Ages and Renaissance." In *Handbook of the History of Logic, Volume 1: Greek, Indian and Arabic Logic*, edited by Gabbay, Dov M. and Woods, John, 597–606. Amsterdam: Elsevier North-Holland.

    "In the Middle Ages, and again in the Renaissance, several Arabic texts on logic were translated into Latin. These included not only works by Arabic philosophers, Avicenna, Algazel, Alfarabi and Averroes, but also texts originally written in Greek, i.e. the *Organon* or corpus on logic by Aristotle, on which all Medieval and Renaissance texts were ultimately based. (1) While one can understand how Latin translations of Arabic works on mathematics, medicine, astrology and other practical sciences could useful, it is more difficult to imagine how texts on logic written in, and for, a Semitic language could make much sense in a language which is completely unrelated to it. For Aristotelian logic is, of course, very much language based. Moreover, while Latin scholars were lacking scientific texts in mathematics and medicine, they already had good translations and detailed expositions of at least the first half of the *Organon* (Aristotle's corpus of logical writings, with the Introduction--*Isagoge*--of Porphyry), made by Boethius in the early sixth century. And, when they wished to complete the *Organon*, they were able to do so by translating the texts directly from the Greek. In the mid-twelfth century James of Venice is credited with the translating the *Topics*, the *Prior* and *Posterior Analytics* with 'authentic expositions', and we have from the twelfth century, translations from Greek of the *Topics* and the *Posterior Analytics* (twice).

    And yet we find Gerard of Cremona translating the latter work from Arabic in the same century, and in the thirteenth century all Averroes' Middle Commentaries on the *Organon* were translated. Why was there any need to do this? This is the question that shall be addressed in this paper." (p. 597)

In *Words, Texts and Concepts Cruising the Mediterranean Sea: Studies on the sources, contents and influences of Islamic civilization and Arabic philosophy and science. Dedicated to Gerhard Endress on his sixty-fifth birthday*, edited by Amzen, Rüdiger and Thielamann, Jön, 211–222. Leuven: Peeters.

"The title of this essay seeks to capture a problem central to our quest for knowledge, determining the first principles on which reasoning - especially scientific or demonstrative, as opposed to popular or rhetorical and even dialectical - is based. In *Short Commentaries on [Aristotle's] Logic* (*Jawāmi' fi l-Manṭiq*), when explaining how demonstration is to be used, Averroes focuses his attention on this problem. His solution or, more precisely, lack of solution is unprecedented and has the potential of casting the whole scientific enterprise into doubt. Or, if that is too strong a judgment, suffice to say that it renders invalid all of his preceding examples of demonstrations that prove the world cannot be eternal.

Slightly more than twenty-five years ago, a critical edition and English translation of the last three short commentaries was published(1). As explained at length there, these commentaries exist only in two Judaeo-Arabic manuscripts plus a Hebrew and Latin translation. The Arabic text is not extant(2). In the treatise entitled "The Book of Demonstration" (*Kitāb al-Burhān*), the eighth of the nine other treatises in this collection soon to be published as a whole, some - not all, for this is a short commentary - of the subjects treated in Aristotle's *Posterior Analytics* are examined(3). Before turning to an examination of the problem posed there, it might not be amiss to say something more general about the collection itself." (pp. 211-212)

Bibliography

1. Calverley, Edwin E. 1933. "al-Abharī's Īsāghūjī fī-l manṭiq." In *The Macdonald Presentation Volume: A Tribute to Duncan Black Macdonald*, 75–85. Princeton: Princeton University Press.

   "The title of al-Abhari's compendium is the same as that of Porphyry's "Introduction" to Aristotle's *Organon*, but, unlike Porphyry's work, al-Abhari's *Īsāghūjī* is not confined to a presentation of the Five Universals. It deals, although briefly, with all the nine divisions of logic.(4)

   For western scholars the interest of the study of Arabian logic lies in the Muslim acceptance of the science from the Greeks and the adaptation of it to Muslim religious ideas.(5)

   For western students of religion the translation furnishes a brief review of the accepted logical method in Muslim scholasticism. For Arabists the vocabulary provides in English a considerable number of technical terms of logic which have not yet been included in western lexicons of Arabic.(6) The importance of al-Abhari's *Īsāghūjī* is indicated not only by its inclusion in the "Collections of Texts," but also by the immense number of editions, commentaries and supercommentaries it has received.

   Concerning al-Abhari himself Ibn Khallikān has the following notice: "In the year 625 [a.d. 1228] the Shaikh Athlr al-Dln al-Mufaddal al-Abheri, the author of the *Talika fi 'l-Khilaf* [notes on controverted matters], the *Zlj* [astronomical tables], and other well known works, left Mosul and came to Arbela where we were then residing. He took up his lodgings in the Dar al-Hadlth [school for traditions], and I studied under his direction some controverted points of jurisprudence." He then relates

several stories of al-Abhari's regard for his teacher Kamāl al-Dīn ibn Manā.(7)" (pp. 75-76)

2. Çapak, Ibrahim. 2010. "The Formation of Knowledge and Disputation (*Al-Jadal*) in Ghazālî's Logic." *Journal of Islamic Research* no. 3:129–142.

   Abstract: "Ghazâlî attaches great importance to logic and attracts attention to the signi-ficance of logic saying “the knowledge of one who is not acquainted with logic is unreliable”. The word 'logic' calls to minds the notions of conception (*tasawwur*) and assent *(tasdiq*). According to Ghazâlî, the notions of concep-tion and assent are the bases of all sciences. In this sense, the five arts em-phasized by Aristotle and many other logicians as the application areas of syllogism are based on conception and assent. By virtue of their significance in Ghazâlî's logic, this study is going to elaborate on the formation of knowledge and disputation (*jadal*) which is among the five arts."

3. Carter, M. G. 1997. "Analogical and syllogistic reasoning in grammar and law." In *Islam: Essay on Scripture, Thought and Society. A Festschrift in Honour of Anthony H. Johns*, edited by Riddell, Peter G. and Street, Tony, 104–112. Leiden: Brill.

   "It is well known that grammatical and legal reasoning are virtually identical, in that both involve the systematisation of

irrational data predominantly by means of analogical reasoning. This identity has been cogently expounded by Ibn al-Anbari (d. 1181), whose *Luma*^{c} *al-adill*a represents the culmination of a long process of methodological symbiosis between law and grammar.

In looking again at those two disciplines, this paper, which is here dedicated with pleasure to my respected colleague Tony Johns, will concentrate on the two types of reasoning employed, analogical and syllogistic, with special attention to the terms *'illa* and *qyīas*, proceeding from the assumption that not only are analogy and syllogism historically and qualitatively different, but that they also have different applications. Briefly, analogy is a technique for infinitely extending a finite corpus of data to meet new circumstances, while syllogism authenticates the rationality of that technique without itself creating new law or linguistic usage (or indeed anything). The two systems are thus complementary and therefore mutually exclusive, that is, not only does syllogistic reasoning not create new law or language, but analogical reasoning cannot prove its own rationality. These ideas will easily be recognised as derived from the Aristotelian use of logic as the organising principle of all the sciences, which is precisely what

we find in the first classifications of the sciences in Islam, notably those of al-Fārābī and Ibn Sinā." (p. 104)

5. Ceylan, Hadi Ensar. 2010. "Ghazali's Account of Signification." *Journal of Islamic Research* no. 3:98–114.

   "The present study will only attempt to compare "the ways in which meaning is signified by utterances" in logic and methodology based on Ghazali's (d.505/1111) ideas. Our choice of Ghazali could concisely be expressed in a few points. First, Ghazali occupies a prominent place in methodology. His prominence stems from the fact that his work *al-Mustasfā* was a turning point in the systematization of methodology. Although we can talk about an established framework for the books on methodology compiled before Ghazali in general, the framework was not so much organized in itself. This was also a source of complaint for Ghazali, who expressed his criticisms on the point in his introduction of *al-Mustasfā*.(2)

   Ghazali argues that before him, there was a convention in methodology literature of dragging out matters of Islamic theology (*kalam*) by Islamic theologians and matters of jurisprudence (*fiqh*) by jurisprudents. This fact prevented methodology from attaining an organized structure in itself.

   Criticizing his predecessors, Ghazali presents a highly systematized framework in *al-Mustasfâ* when compared to the books written before him. The book consists of an introduction and four chapters. The introduction entirely deals with issues in

logic. Since he considered methodology as a theoretical science, Ghazali gave an outline for logic in his introduction to the book on methodology on account to the fact that logic should be regarded as a foundation for every theoretical science." (pp. 98-99, a note omitted)

6. Chatti, Saloua. 2014. "Syncategoremata in Arabic Logic, al-Fārābī and Avicenna." *History and Philosophy of Logic* no. 35:167–197.

Abstract: "In this paper, I raise the following problem: What terms are considered as syncategoremata in the Arabic logical texts? How are they defined? How do they determine the forms of the propositions and the inferences? To answer these questions, I focus on the analyses provided by al-Fārābī and Avicenna. Both authors apply the grammatical distinction between the particle (the correspondent of the syncategorema), the noun and the verb to logic. They also state the semantic and the syntactic criterions, but their analyses of the particles are different. For al-Fārābī devotes two treatises to the analysis of particles: (1) *al-Alfāz al-mustaʿmalah fī i l-manṭiq*, where he provides a listing of particles that he classifies in the manner of the Greek grammarians and (2) *Kitāb al-Ḥurūf*, where he analyzes some particles used in metaphysics; while Avicenna, despite the considerable amount of his logical corpus, does not devote a special book to the analysis of particles. He does not provide any listing either but characterizes ach logical particle (*ḥarf*) on its own, while analyzing the propositions, their elements and the inferences. In this paper, I argue that this treatment of particles in the two frames shows a significant difference between the two authors with regard to the relation between logic and grammar, and with regard to the characterizations of the logical particles themselves. For vicenna is much less interested than al-Fārābī by the grammatical analysis and focuses much more on the logical particles, which he scrutinizes meticulously. This enriches his

definitions of the logical constants and leads him in the final analysis to different and more various inferences than those hold by al-Fārābī."

7. ———. 2019. *Arabic Logic from al-Fārābī to Averroes: A Study of the Early Arabic Categorical, Modal, and Hypothetical Syllogistics*. Cham (Switzerland): Birkhäuser.

   "This book is the continuation of the works that I have done in the field of Arabic logic since I became interested in it. I feel that the analysis and the precise study of Arabic logic is highly indispensable to all scholars interested in the history of logic in general, since it is still not well known, in the western world as well as in the Arabic one, despite the seminal contributions of Prof. Nicholas Rescher whose work helped discover and analyze the writings of many logicians of that tradition.

   He was followed by many contemporary researchers who were interested in its various aspects. I myself focused a lot on categorical and modal logics and presented some conferences on these topics on many occasions. But in this tutorial, I wished to give a more complete image of a tradition which lasted several centuries.

   This is why I presented in the tutorial three different parts of these systems, which are the categorical logic, the modal logic, and the hypothetical logic. My analysis of these different theories focuses mainly on the original Arabic writings, in order to be as faithful as possible to the texts. I translated most of the quotations that I have given in this examination but I also used some good and well-known English translations such as those of Professors Tony Street, Nabil Shehaby, and Wilfrid Hodges, among others." (p. VII)

8. ———. 2022. "The Hypothetical Logic in the Arabic Tradition." In *Women's Contemporary Readings of Medieval (and Modern) Arabic Philosophy*, edited by Chatti, Saloua, 13–50. Cham (Switzerland): Springer.

   Abstract: "In this paper, I will present the hypothetical logics of some authors pertaining to the Arabic tradition, namely al-Fārābī, Avicenna and some later logicians, in particular in

North Africa, but not Averroes, as he gives that system very little importance. The main problems that I raise are the following: what is the hypothetical logic about? How is it viewed by the Arabic logicians, whether in early Medieval times (eighth twelfth centuries) or in later ones (fourteenth fifteenth centuries)? What are the main theories and results provided by these authors? The study of the hypothetical logic, which analyses the propositions containing 'if . . .then' and those containing 'either . . .or' shows that in al-Fārābī's frame, this system is given some importance and developed in various ways. But it is Avicenna who studies these propositions at the greatest length and gives them the most importance, since he introduces quantification in this field and presents several systems of hypothetical logic, having distinct features. In later times, the hypothetical logic is given much importance in particular in the Western (i.e. North-African) Arabic areas with the writings of Ibn 'Arafa and al-Sanūsi, among others, who seem influenced by Avicenna and especially his follower al-Khūnajī.

I will thus present the basic features and rules of these systems, and will show the main differences between these various systems as well as the evolution of this field in the Arabic tradition. I will also analyse the rules provided in the light of the modern classical formalism of propositional and predicate logics."

9. Chejne, Anwar G. 1984. "Ibn Hazm of Cordova on Logic." *Journal of the American Oriental Society* no. 104:57–72.

"Ibn Hazm [994-1064] received a broad education in both the religious and secular sciences, and may be considered one of the most erudite scholars of al-Andalus. He was an enthusiastic defender of the sciences of the Ancients (*'ulum al-awd'il*), which comprised logic, mathematics, astronomy, medicine, and other sciences.

He considered these not only noble and useful, but attempted to reconcile them within the framework of the religious sciences.(4) He also emphasized the value of logic within the context of both the religious and secular sciences, and was its

staunch defender throughout his career, even when he became devoted almost wholly to the study of the religious disciplines. His work on logic, *Facilitating the Understanding of the Rules of Logic* and *Introduction Thereto* (*al-Taqrīb li-ḥudūd al-manṭiq wa-madkhaluh*), was written early in his career, between 1025 and 1029.(5)" (p. 57)

(4) This point is discussed at great length in his *Marātib al-ulūm*. See Chejne, *Ibn Hazm of Cordova and His Conception of the Science*, [Chicago: Kazi Publications 1982]

In his *Taqrīb*, 200, Ibn Hazm states: "We composed this book of ours and many others while we were in exile and far away from homeland, family and offspring." This could not have taken place during his first exile (1013-19). See his *Tawq*, 251. All indications are that he stayed in Cordova until the accession of al-Mustakfī (1023-25), who placed him in jail and caused his expulsion later on. Ibn Hazm appears to have returned to Cordova in about 1029 and remained there until about 1035 when he was exiled for the third time, never to return again.

10. Daiber, Hans. 2018. "*De praedicamento relationis in philosophia arabica et islamica*. The Category of Relation in Arabic-Islamic Philosophy (Extended Version)." *Enrahonar* no. Supplement Issue:431–490.

    Abstract: "The main sources for the discussion of the category “relation” were Aristotle’s *Categories* and *Metaphysics*. Before their translation into Arabic in the 8th and 9th centuries, Christian theologians and in their footsteps Syriac scholars considered Aristotle’s works to be a useful tool in Christological discussions. This article analyzes the category of relation and its development in Arabic-Islamic philosophy in authors such as Kindī and his student Aḥmad Ibn aṭ-Ṭayyib as-Saraḫsī, Fārābī, Ibn Sīnā, Ghazālī, Ibn Rušd, the Sufi Ibn ʿArabī and others."

11. Daşdemir, Yusuf. 2019. "The Problem of Existential Import in Metathetic Propositions: Qutb al-Din al-Tahtani contra Fakhr al-Din al-Razi." *Nazariyat Journal for the History of Islamic Philosophy and Sciences* no. 5:81–118.

Abstract: "This paper addresses discussions in post-Avicennan Arabic logic on various characterizations of metathetic propositions and their status vis-à-vis the existential import condition by focusing on the arguments made by Fakhr al-Dīn al-Rāzī (d. 606/1210) and the counter-arguments by Quṭb al-Dīn al-Rāzī al-Taḥtānī (d. 766/1365), both of whom established their positions in a framework drawn by Avicenna (Ibn Sīnā, d. 428/1037), the most prominent figure in the tradition of classical Arabic logic. In his logic texts, Avicenna thoroughly discusses the problem of the existential import in metathetic propositions (maʿdūla), and seems to have presumed the existential import to be a truth-condition for affirmative propositions, and therefore, for a irmative metathetic propositions as well. For Avicenna, in other words, an affirmative metathetic proposition presumes its subject-terms's possibly existent referent(s). However, the theologian-philosopher Fakhr al-Dīn al-Rāzī, who lived about a century and half after Avicenna, criticized his views on metathetic propositions and their existential import among other things, thereby igniting a wave of debates in the tradition, in which Quṭb al-Dīn al-Taḥtānī participated in the following century. By studying this contained problem, this paper seeks to address a wider scholarly concern regarding the vitality of post-classical Arabic logic, and to establish that this period witnessed the flourishing of philosophical debate among Arabic logicians."

12. ———. 2024. "Propositions with Negative Predicates in Arabic Logic." *History and Philosophy of Logic*:1–19.

    Abstract: "This paper explores a neglected category of propositions in Arabic logic, propositions with negative predicates (sālibat al-maḥ mūl), by addressing two pivotal questions concerning this propositional form: first, whether it is possible to defend it as distinct from metathetic and simple negative propositions and second, whether affirmative instances of these propositions have existential import. The paper argues for the existence of two distinct and conflicting theories of existential import frequently implicit in the views of Arabic logicians: one centered on the copula and the other on the predicate."

13. Di Vincenzo, Silvia. 2018. "Early Exegetical Practice on Avicenna's Śifā': Faḫr al Dīn al Rāzi's *Marginalia to Logic*." *Arabic Sciences and Philosophy* no. 28:31–66.

    Abstract: "Nine manuscripts preserving Avicenna's *Kitāb al-Šifā'* share a set of identical marginal glosses to the section of Logic. One of these manuscripts reports, at the end of each of the glosses, a certificate of transmission ascribing them to the theologian and philosopher Faḫr al-Dīn al-Rāzī (d. 606H/1210), which provides some material evidence of the existence of a flourishing exegetical activity on the *Kitāb al-Šifā'* during the twelfth-thirteenth century, in spite of the apparent lack of commentaries on the text in that period. The present paper provides an edition of the so far unknown *ḥāšiyāt* to Avicenna's *Kitāb al-Šifā'* by al-Rāzī, with an attempt at reconstructing their tradition and contextualizing them within al-Rāzī's exegetical and teaching activity."

14. ———. 2024. "Aristotle's *Categories* in the Arabic Tradition." In *Works of Philosophy and Their Reception*. Berlin: de Gruyter.

    Available on-line.

    Abstract: "Tracing the Arabic reception of Aristotle's *Categories* entails charting the history of a foundational philosophical work across three continents, from Spain to India, over a span of at least ten centuries (9th–19th century). This chapter offers an overview of the most significant phases of this reception. The first section examines the Arabic translations of the *Categories* and related Greek commentaries realized between the 9th and the 10th centuries, drawing on manuscript and bio-bibliographical sources. The second section delves into the development of an Arabic scholarly reflection on the *Categories* between the 9th and 11th centuries and the formation of a philosophical discourse surrounding a selection of key issues that would shape the subsequent reception of the treatise. Central among these key issues is the question of the scope of the *Categories* and its disciplinary classification. The third section presents Avicenna's (d. 1037) novel ontological interpretation of the *Categories* and the resulting repositioning

of the treatise within metaphysics. The fourth section investigates the broader impact of Avicenna's reassessment of the place of the treatise in the post-Avicennian tradition (12th–14th century). Finally, the fifth section presents the 'traditionalist' interpretations of the *Categories* that emerged in response to the mainstream consensus on the ontological reading of the treatise established by the post-Avicennian tradition (12th–18th century)."

15. Druart, Thérèse-Anne. 2016. "Logic and Language." In *The Routledge Companion to Islamic Philosophy*, edited by Taylor, Richard C. and López-Farjeat, Luis Xavier, 69–81. New York: Routledge.

    "Introduction

    In Greek *logos*, word or discourse, gave rise to *logike techne* or craft of reasoning, i.e. logic. Further, the basic type of reasoning studied in logic is called the *syllogismos*, a word deriving from *logos*. These etymologies reveal a link between language and logic, particularly since symbolic logic was not yet invented. Classical Arabic too manifests a link between word or speech and logic as the word for logic *mantiq* derives from *nutq*, which means articulated speech. Yet, logic claims to be universal, whereas there is a great multiplicity of languages. Distinguishing logic from linguistic arts, as well as articulating their relationship, is a complex and difficult endeavor that philosophers in Islamic lands faced in various ways. They had to take into account not only the Greek philosophical tradition but also some theological positions. In the first section I look at logic as essentially an autonomous discipline focusing on syllogisms. In the second I explore how some philosophers either emphasize their relationship or try to articulate better logic's autonomy. The last and final section deals with some of the philosophers' reflections on various aspects of language in general." (p. 69)

16. Ebadi, Ahmad, and Qaramaleki, Ahad Faramarz. 2018. "Singular Proposition (*Al-qaḍiyah al-Shakhṣīyah*) in Logic of the Islamic Period." *The Islamic Quarterly* no. 62:229–246.

Abstract: "Singular proposition (*al-qaḍiyah al-Shakhṣīyah*) is a type of categorical proposition (*al-qaḍiyah* al-ḥamlīyah). Islamic logicians have paid close attention to defining, naming, and analyzing of singular proposition. From the works of logicians of Islamic period, eight features of singular propositions can be derived: constituency relation, unquantifiability, indivisibility into confirmation of the subject and confirmation of the object, indivisibility into factual/extrinsic propositions, inefficiency in categorical syllogism, not being convertible, having no value in *al- 'ulūim al-burhānīyah*, and truth of contradictory propositions in square of opposition."

17. El-Rouahyeb, Khaled. 2009. "Impossible Antecedents and Their Consequences: Some Thirteenth-Century Arabic Discussions." *History and Philosophy of Logic* no. 30:209–225.

    Abstract: "The principle that a necessarily false proposition implies any proposition, and that a necessarily true proposition is implied by any proposition, was apparently first propounded in twelfth century Latin logic, and came to be widely, though not universally, accepted in the fourteenth century. These principles seem never to have been accepted, or even seriously entertained, by Arabic logicians. In the present study, I explore some thirteenth century Arabic discussions of conditionals with impossible antecedents. The Persian-born scholar Afdal al-Dīn al-Khūnajī (d.1248) suggested the novel idea that two contradictory propositions may follow from the same impossible antecedent, and closely related to this point, he suggested that if an antecedent implies a consequent, then it will do so no matter how it is strengthened. These ideas led him, and those who followed him, to reject what has come to be known as ‘Aristotle’s thesis’ that no proposition is implied by its own negation. Even these suggestions were widely resisted. Particularly influential were the counter-arguments of Naṣīr al-Dīn al-Tūṣī (d.1274)."

18. ———. 2020. "Logic in the Arabic and Islamic World." In *Encyclopedia of Medieval Philosophy. Second edition*, edited

by Lagerlund, Henrik, 1074–1083. Dordrecht: Springer.

Abstract: "The Arabic logical tradition emerged from the Graeco-Arabic translation movement from the eighth to the tenth centuries. In its initial stages, it was closely linked to the activity of translating and commenting upon Aristotle's *Organon*. By the early tenth century, a circle of Aristotelian scholars had emerged in Baghdad who saw themselves as a continuation of the Alexandrian tradition. Its most prominent representative was undoubtedly Al-Fārābī (d. 950), who wrote esteemed commentaries on Aristotle's logical works, as well as a number of treatises introducing logic (*manṭiq*) to an environment that often viewed the Greek sciences with suspicion. The influence of the Baghdad circle eventually reached Islamic Spain, where Aristotelian philosophy and logic flourished in the eleventh and twelfth centuries, culminating in the monumental commentaries on Aristotle by Averroes (d. 1198). In other parts of the Islamic world, however, the influence emanating from Avicenna (d. 1037) eventually superseded that of Aristotle. Avicenna was less concerned with getting the interpretation of Aristotle right and more willing to make radical departures from the Aristotelian tradition. By the thirteenth century, his works had replaced those of Aristotle as the point of reference for most logicians writing in Arabic. The prominent theologian Fakhr al-Dīn al-Rāzī (d. 1210) approached the Avicennian tradition with the same irreverence with which Avicenna had himself approached the Aristotelian tradition.

He also decisively reoriented the scope of logic toward a focused study of terms, propositions, and syllogisms, rather than the entirety of topics covered in the Organon. A number of thirteenth-century logicians working in the wake of Avicenna and Fakhr al-Dīn al-Rāzī produced sophisticated and original summas of formal logic. They also produced a number of condensed handbooks that formed the basis of logical studies at colleges throughout the Islamic world until modern times."

19. ———. 2022. "Mixed Conditional-Categorical Syllogisms from Avicenna to Urmawī." *History and Philosophy of Logic* no. 43:232–250.

Abstract: "A number of medieval Arabic logicians discussed inferences that combine the principles of propositional and term logic, for example:

Whenever H is Z then Every J is D

No D is A

Whenever H is Z then Some J is not A

The present paper will be devoted to discussions of the validity of mixed conditional-categorical syllogisms of this form, and purported counterexamples, from Avicenna (d. 1037) to Urmawī (d. 1283). One major problem that was discussed, related to modern discussions of the context-sensitivity of counterfactual conditionals, is that if the antecedent of the conditional premise is incompatible with the categorical premise, then there is no guarantee that the latter will combine syllogistically with the consequent of the conditional premise. Plausible formalizations of the argument reinforce the misgivings expressed by some thirteenth-century Arabic logicians."

20. ———. 2023. "Dawānī (d. 1502) and Dashtakī (d. 1498) on Primary (awwalī) and Familiar (mutaʿāraf) Predication." *Oriens* no. 51:367–392.

    Abstract: "The present article explores the motivations that led Jalāl al-Dīn al-Dawānī (d. 1502) to draw the distinction between what he called “primary predication” (*ḥaml awwalī*) and “familiar predication” (*ḥaml mutaʿāraf or ḥaml shāʾiʿ*). These motivations include allowing for the predication of particulars, such as “This is Zayd” and accounting for apparently true self-negations, such as “The [concept] particular is not a particular.” The article also explores some criticisms of this distinction by Dawānī’s contemporary and rival Ṣadr al-Dīn al-Dashtakī (d. 1498). Despite these criticisms, Dawānī’s distinction was adopted, adapted, and emphasized by the Safavid scholar Mīr Dāmād (d. 1631).

    Mīr Dāmād’s influence, in turn, accounts for the prominence given to the distinction in later centuries among Iranian and

Indo-Muslim logicians."

21. ———. 2025. "A Problem with the Wholly Hypothetical Syllogism: Some 13th-Century Arabic Discussions." In *Logic, Soul, and World: Essays in Arabic Philosophy in Honor of Tony Street*, edited by Ahmed, Asad Q., Zarepour, Mohammad Saleh and Strobino, Riccardo, 300–325. Leiden: Brill.

    "Until the time of Avicenna, it was standard in the Arabic logical tradition to divide syllogisms into categorical (*ḥamlī*) and hypothetical (*sharṭī*). The latter included the following three argument schemes:

    (i) modus ponens:

    If p then q.

    p.

    ∴ q.

    (ii) modus tollens:

    If p then q.

    Not-q.

    ∴ Not-p.

    (iii) disjunctive syllogism:

    p or q.

    Not-p.

    ∴ q.

    Avicenna and the post-Avicennan logical tradition accepted these inference schemes, but also recognized what they termed the “connective-hypothetical syllogisms,” including what in the European logical tradition is called “wholly” or “purely” hypothetical syllogisms:(1)

    If p then q.

    If q then r.

    ∴ If p then r.

The present paper will present some of the worries about this syllogism, expressed already by Avicenna and discussed intensely in the thirteenth century. (pp. 00-301)

(1) Tony Street, “Arabic Logic,” in D.M. Gabbay & J. Woods (eds.), *Handbook of the History of Logic, Vol. 1: Greek, Indian and Arabic Logic* (Amsterdam: Elsevier, 2004): 523–596, at 543–547.

Street’s article is a landmark in the modern study of the history of Arabic logic and remains the indispensable starting point for later research

22. ———. 2025. "Qūshjī (d. 1474) and Dawānī (d. 1502) on Truth and Correspondence." *Journal of the History of Philosophy* no. 63:191–208.

    Abstract: "The present article presents the views of two fifteenth-century Islamic scholars, ʿAlī al-Qüshjī (d. 1474) and Jalāl al-Dīn al-Dawānī (d. 1502), on the following issue: When we make claims about extramental subjects and predicates, it seems plausible to suggest that such claims are true by virtue of corresponding to extramental reality. But what do we make of claims whose subjects and predicates are not extramental existents, such as philosophical claims like ‘An actual infinity is impossible’ or ‘Existence is a second intention’? It seems problematic to suggest that such claims are made true by mental reality, for one can have false philosophical views. Such considerations led some earlier scholars to postulate that the truth of such propositions consists in correspondence with what is in the Active Intellect.

    Qūshjī raised objections to such proposals, and his glossator Dawānī developed another account that distinguished between de facto beliefs and the beliefs that are appropriate to our concepts."

23. El-Rouayheb, Khaled. 2004. "Sunni Muslim Scholars on the Status of Logic, 1500-1800." *Islamic Law and Society* no. 11:213–232.

    Abstract: "In the present article, I discuss Goldziher's contention (echoed in more recent literature) that fromt he

thirteenth and fourteenth centuries, Sunni Muslim scholars ('*ulama'*) became increasingly hostile to rational sciences such as logic. On the basis of discussions and *fatāwā* by Sunni scholars in the sixteenth, seventeenth and eighteenth centuries, I show that this idea is radically mistaken. Mainstream scholars in the Maghrib, Egypt and Turkey considered logic to be not only permissible but actually commendable or even a religious duty incumbent on the Muslim community as a whole (i.e. a *farḍ kifāyah*). Though there were dissenting voices in the period, such as the Qāḍizādelīs, this seems to have been the mainstream opinion of Sunni scholars until the rise of the Salafiyyah movement in the nineteenth and twentieth centuries."

24. ———. 2005. "Was There a Revival of Logical Studies in Eighteenth-Century Egypt?" *Die Welt des Islams* no. 45:1–19.

"It is a common assumption that intellectual life in the Arabic-Islamic world entered a period of stagnation or decline after the 13th or 14th century. The intellectual inertia is supposed to have lasted until the 19th century, when a more dynamic and vital Europe thrust itself upon the region. This overall interpretation of the course of Arabic-Islamic intellectual history seems never to have been the conclusion of careful and dispassionate historical investigation. We simply know too little about the intellectual life of the Arabic-Islamic world between 1400 and 1800 to be able to justify such an unflattering comparison with the earlier, so-called "classical" age of Arabic-Islamic civilisation. In recent decades, the idea that the period

between 1500 and 1800 constituted a period of overall "decline" has been challenged." (p. 1)

(...)

"In the present article, I explore some intriguing evidence suggesting that there was a revival of interest in logic in eighteenth- century Egypt. In particular, one prominent scholar writing in Egypt towards the end of the eighteenth century believed that there had indeed been a resurgence of interest in the discipline starting around two generations earlier and continuing to his own day. I assess this testimony by drawing on other historical sources from the period, primarily the history of 'Abd al-Rahman al-Jabarti (d.1825-6) and the biographical compilation of scholars who died in the Muslim eleventh century (1592-1688 C.E.) by the Damascene scholar Muhammad Amin al-Muhibbi (d.1699). I then discuss how my findings relate to the claims of Gran and Schulze." (p. 2)

25. ———. 2006. "Opening the Gate of Verification: The Forgotten Arab-Islamic Florescence of the 17th Century." *International Journal of Middle East Studies* no. 38:263–281.

"In the present article, I would like to challenge this idea of intellectual apathy and stagnation by drawing attention to some hitherto neglected intellectual developments in the Arabic-speaking parts of the Ottoman Empire in the 17th century. One of these developments was the introduction of a range of new handbooks in the fields of grammar, semantics-rhetoric, logic, and theology, mostly of either Persian or Maghribi origin.

Contemporary witnesses believed thatt his development was significant, because Persian and Maghribi scholars were imbued, or so it was believed, with an ethos of "verification."

Another major development was the spread of originally non-Arabic mystical orders such as the Shattariyya, Naqshbandiyya, and Khalwatiyya in the region. This development appears to have had the effect of strengthening support for monist, pro-Ibn 'Arabi doctrines, which had hitherto been regarded with suspicion by most Arab-Islamic scholars (*ulama*). The two trends were distinct, but at times coalesced, as in the case of two of the intellectual giants of the 17th century, Ibrahim al-Kurani (1616-90) and 'Abd al-Ghani al-Nabulusi (1640-1731)." (p. 264)

26. ———. 2009. "Impossible Antecedents and Their Consequences: Some Thirteenth-Century Arabic Discussions." *History and Philosophy of Logic*:209–225.

    Abstract: "The principle that a necessarily false proposition implies any proposition, and that a necessarily true proposition is implied by any proposition, was apparently first propounded in twelfth century Latin logic, and came to be widely, though not universally, accepted in the fourteenth century. These principles seem never to have been accepted, or even seriously entertained, by Arabic logicians. In the present paper I explore some thirteenth century Arabic discussions of conditionals with impossible antecedents. The Persian-born scholar Afdal al-Dīn al-Khūnajī (d.1248) suggested the novel idea that two contradictory propositions may follow from the same impossible antecedent, and closely related to this point, he suggested that if an antecedent implied a consequent, then it would do so no matter how it was strengthened. These ideas led him, and those who followed him, to reject what has come to be known as ‘Aristotle’s thesis’ that nothing is implied by its own negation. Even these suggestions were widely resisted. Particularly influential were the counter-arguments of Naṣīr al-Dīn al-Tūṣī (d.1274)."

27. ———. 2010. *Relational Syllogisms and the History of Arabic Logic, 900-1900*. Leiden: Brill.

"In the first chapter of the study that follows, I present discussions of the anomaly of relational inferences by logicians writing in Arabic during the 'classical' period from around 900 to 1200: Fārābī (d. 950) and his second-generation student Ibn Zurʿa (d. 1008); Avicenna (d. 1037) and his followers, such as Bahmanyār (d. 1065) and Sāwī (fl. 1145); the more orthodox Aristotelian scholars Abū l-Barakāt al-Baghdādī (d. 1165) and Averroes (d. 1198); and the anti-Peripatetic Platonist philosopher Yaḥyā al-Suhrawardī (d. 1191).

In the second chapter, I survey the discussions of relational inferences that took place between the year 1200 and 1350. The topic received a decisive impetus from its treatment by Fakhr al-Dīn al-Rāzī (d. 1210), who argued that previous attempts at explaining away inferences such as 'the argument from equals' were unsatisfactory and that the stipulation that a categorical syllogism must have three terms, of which one is shared, should be abandoned.

(...)

In chapter three, I present some discussions of the topic between 1350 and 1600. This period has often been dismissed as an age of sterile 'commentaries and glosses.'

(...)

In chapter four, I trace the discussions of the topic in Iranian, Indo-Muslim, North African, and Christian Arabic logical works from 1600 to 1900. By this time, distinct traditions of Arabic logic had crystallized, with different standard handbooks. Hence, it is helpful to survey each major regional tradition separately.

In chapter five, I look at the discussions of the topic in Ottoman works on logic (usually written in Arabic) from 1600 to 1800. By the latter date, relational inferences had been recognized in several Ottoman works as a special type of 'unfamiliar syllogism,' and a number of scholars began to explore the logic of such inferences.

In chapter six, I give a systematic account of the logic of relational syllogisms as presented in a handbook on logic by the Ottoman scholar Ismāʿīl Gelenbevī (d. 1791) and its commentary by Muṣṭafā Sīrōzī (fl. 1808–1839).

(...)

In chapter seven, I survey developments of the theme in nineteenth century Ottoman logic. Ottoman logicians of that century expanded the framework of relational syllogisms and showed a keen interest in using this expanded framework for rendering arguments that they encountered in scholarly works into explicit syllogistic form." (pp. 3-4)

28. ———. 2012. "Post-Avicennan Logicians on the Subject Matter of Logic: Some Thirteenth- and Fourteenth-Century Discussions." *Arabic Sciences and Philosophy* no. 22:69–90.

    Abstract: "In the thirteenth century, the influential logician Afḍal al-Dīn al-Khnajī (d. 1248) departed from the Avicennan view that the subject matter of logic is “second intentions”.

    For al-Khūnajī, the subject matter of logic is “the objects of conception and assent”. His departure elicited intense and sometimes abstruse discussions in the course of subsequent centuries. Prominent supporters of Khūnajī’s view on the subject matter of logic included Kātibī (d. 1277), Ibn Wāṣil (d. 1298) and Taftāzānī (d. 1390). Defenders of Avicenna’s view included Tūsī (d. 1274), Samarqandī (d. 1303) and Quṭb al-Dīn al-Rāzī (d. 1365). This article presents the outline of the development of this discussion down to the end of the fourteenth century and attempts to reconstruct the major arguments of both sides."

29. ———. 2016. "Does a Proposition Have Three Parts or Four? A Debate in Later Arabic Logic." *Oriens* no. 44:301–331.

    Abstract: "!The present article traces the controversy on propositions and their parts, intensively discussed by logicians writing in Arabic in the fourteenth, fifteenth and sixteenth centuries. From the beginning of the Arabic logical tradition to the end of the thirteenth century, the dominant view among

Arabic logicians was that a categorical proposition consists of three parts: subject, predicate and nexus between them indicated (in most languages) by the copula. A number of influential logicians from the fourteenth century suggested that the parts are strictly four: the subject, the predicate, the nexus between them, and the judgment. This thesis was criticized in the late fifteenth century, most influentially by the Persian scholar Dawānī (d.1502). His criticism and the ensuing discussion came to be intertwined with another controversial issue: can some objects of conception (*taṣawwur*) also be objects of assent (*taṣdīq*)?"

30. ———. 2016. "Arabic Logic after Avicenna." In *The Cambridge Companion to Medieval Logic*, edited by Novaes, Catarina Dutilh and Read, Stephen, 67–93. Cambridge: Cambridge University Press.

    "The critical interventions of Rāzī and Khūnajī were in turn modified and carried forward by later generations of like-minded logicians such as Athīr al- Dīn al- Abharī (d. 1265), Najm al- Dīn al- Kātibī (d. 1277), and Sirāj al- Dīn al- Urmawī (d. 1283).These “revisionist Avicennan” logicians (I adopt the phrase from Tony Street) authored lengthy summas of logic as well as shorter handbooks that continued to be studied in Islamic madrasas until the twentieth century: Abharī’s elementary *Īsāghūjī*; Kātibī’s *al-Risālah al-Shamsiyyah*; and Urmawī’s *Maṭāliʿ al- anwār*. These handbooks in turn became the point of departure for later logicians.

    Especially in Persia and India, Avicenna’s logical writings continued to be prized, copied, and quoted (Ahmed 2012), but the state of the field had changed too much in the course of the twelfth and thirteenth centuries for Avicenna’s writings to constitute the state of the art for logicians writing after around 1300. The following section will take a closer look at the logic expounded in the enormously influential thirteenth- century post- Avicennan handbooks (especially Kātibī 1948). The section after that will attempt to outline the development of Arabic logic in the fourteenth and fifteenth centuries." (pp. 68-69)

31. ———. 2016. "Theology and Logic." In *The Oxford Handbook of Islamic Theology*, edited by Schmidtke, Sabine, 408–431. New York: Oxford University Press.

Abstract: "In the ninth and tenth centuries, Arabic ‘logicians’ (*manṭiqiyyūn*) and Islamic ‘theologians’ (*mutakallimūn*) constituted distinct and rival groups. The former advocated the use of Aristotelian and Stoic formal modes of inference, whereas the later had a very different and broadly analogical model of argumentation and disputation. In the course of the eleventh and twelfth centuries, a number of prominent Islamic theologians such as al-Ghazali (d. 1111) and Fakhr al-Din al-Razi (d. 1210) began to adopt Greek-derived formal logic and to concede that the older analogical forms of argumentation were inappropriate to the discipline of theology. Despite an opposition to this process by such figures as Ibn Taymiyyah (d. 1328), this blending of logic and Islamic theology became predominant by the fourteenth and fifteenth centuries. Henceforth, opposition to logic tended to be confined to Islamic religious circles that were also fiercely opposed to the discipline of theology (kalam)."

32. ———. 2018. "*Takmīl al-Manṭiq*: A Sixteenth-Century Arabic Manual on Logic." In *Illuminationist Texts and Textual Studies: Essays in Memory of Hossein Ziai*, edited by Gheissari, Ali, Walbridge, John and Alwishah, Ahmed, 199–256. Leiden: Brill.

"The history of Arabic logic after Avicenna (d.1037) is only just beginning to be explored. Until quite recently, it was widely believed that there would be little point in doing so." (p. 299)

(...)

"More recent scholarship has concluded that this overall interpretation is spectacularly wrong. Thanks especially to the path-breaking research of Nicholas Rescher and Tony Street, we now know that logic continued to be cultivated at an advanced level for centuries after Avicenna." (p. 199)

(...)

"Rescher and Street have both drawn attention to another post-Avicennan logical work: *Sharḥ al-Takmīl fī 'l-manṭiq*, a manuscript of which is extant at the British Library.(3) This work includes, among other things, a detailed analysis of modality propositions and the logical relations, immediate inferences, and syllogisms involving them." (p. 200)

(...)

"As will be seen below, Rescher was quite mistaken about the provenance and date of the work, which does not really fit into his narrative of post-medieval decline. The author of *Takmīl al-manṭiq* was an Iranian-born scholar who was active in the Ottoman Empire in the early- to mid-sixteenth century, and he was not named Shirwānī." (p. 200)

"To sum up the case: The author of *Takmīl al-manṭiq* should be identified with Ḥasan b. Ḥusayn b. Muḥammad al-Amlashī al-ʿAjamī who was active in the Ottoman Empire in the 1530s and 1540s. His Takmīl al-manṭiq was dedicated to a certain Aḥmad Çelebī b. Abū'l-Suʿūd, who is almost certainly the son of the famous Ottoman Grand Mufti Abū'l-Suʿūd. This would place the composition of the work in Istanbul in the middle of the sixteenth century. There are good reasons to think that the author is identical to Ḥasan b. Ḥusayn al-Tālishī al-ʿAjamī (d. 1556 or 57) on whom there is an entry in Ṭāşköprüzāde's classic biographical dictionary of Ottoman scholars *al-Shaqā'iq al-nuʿmāniyya*.

Though the identification is not as water-tight as one could have wished, it is very unlikely that there were two different

scholars from the same distinct Talish-speaking region in Iran, both with the name “Ḥasan b. Ḥusayn”, both active in the Ottoman Empire in the 1530s and 40s, both spending time in Cairo, and both residing in Istanbul in the early years of the 1550s." (p. 210)

33. ———. 2019. *The Development of Arabic Logic (1200–1800)*. Basel: Schwabe Verlag.

"In the Islamic world, there has in recent years been a burgeoning interest in editing premodern works on philosophy and logic." (p. 19)

(…)

"This more recent scholarship has made it possible to offer the present overview of the history of Arabic logic from 1200 to 1800, an overview that is intended to be at once a corrective and a homage to Rescher’s *The Development of Arabic Logic*. Like Rescher’s work, it is in part bio-bibliographic. Each section of what follows has an introductory essay on general developments within a certain period and region, followed by discussions of the lives and works of some major figures. Deciding who was and who was not a “major” figure is of course not always straightforward. This is especially the case for the later centuries, both because more material survives from those centuries and because it is easier, with the benefit of hindsight, to determine who the influential logicians of earlier times were – it is more difficult to do so when dealing with scholars who were writing just before the dramatic disruptions of the nineteenth and twentieth centuries that in many regions brought the Arabic tradition of logic to an end. In general, an attempt has been made to include logicians who appear to have been original, or whose works were widely copied or discussed, or who were noticeably prolific, or illustrate certain significant historical trends. At the present stage of research, our sense of which logicians meet these criteria is of course provisional, and there may be readers who are disappointed that some figure or other has been left out. But in an overview such as this, some difficult choices have to be made. It is simply impossible to

include every single scholar who wrote on logic in Arabic in the six hundred years spanned by the present volume." (pp. 19-20)

34. ———. 2019. "Books on Logic (*manṭiq*) and Dialectics (*jadal*)." In *Treasures of Knowledge: An Inventory of the Ottoman Palace Library (1502/3–1503/4). Volume I*, edited by Necipoğlu, Gülru, Kafadar, Cemal and Fleischer, Cornell H., 891–906. Leiden: Brill.

    "The ordering of subjects in the palace library inventory prepared by ʿAtufi seems to reflect a general sense ofrank. Logic and dialectics appear toward the end of the inventory, suggesting that they were ranked relatively low. Nevertheless, these disciplines were regularly studied in Ottoman colleges (*madrasas*). The cataloguer ʿAtufi himself contributed to them, writing a commentary on *Īsāghūjī* (Introduction), the standard introductory handbook on logic by Athir al-Din al-Abhari (d. 1265).(1) Ottoman palace slaves (the *kapıkulu*) were also taught logic, and it is explicitly for the education of this group that a Turkish work on logic dedicated to Sultan Bayezid II and entitled *Zübdet ül-beyān* (*The Cream of Exposition*) was written. (More on this work below.)

    The inventory features 116 entries in the section devoted to books on logic (*manṭiq*) and dialectics (jadal)." (p. 891)

35. ———. 2020. "Logic in the Arabic and Islamic World." In *Encyclopedia of Medieval Philosophy. Second edition*, edited by Lagerlund, Henrik, 1074–1083. Dordrecht: Springer.

    Abstract: "The Arabic logical tradition emerged from the Graeco-Arabic translation movement from the eighth to the tenth centuries. In its initial stages, it was closely linked to the activity of translating and commenting upon Aristotle's *Organon*. By the early tenth century, a circle of Aristotelian scholars had emerged in Baghdad who saw themselves as a continuation of the Alexandrian tradition. Its most prominent

representative was undoubtedly Al-Fārābī (d. 950), who wrote esteemed commentaries on Aristotle's logical works, as well as a number of treatises introducing logic (*manṭiq*) to an environment that often viewed the Greek sciences with suspicion. The influence of the Baghdad circle eventually reached Islamic Spain, where Aristotelian philosophy and logic flourished in the eleventh and twelfth centuries, culminating in the monumental commentaries on Aristotle by Averroes (d. 1198). In other parts of the Islamic world, however, the influence emanating from Avicenna (d. 1037) eventually superseded that of Aristotle. Avicenna was less concerned with getting the interpretation of Aristotle right and more willing to make radical departures from the Aristotelian tradition. By the thirteenth century, his works had replaced those of Aristotle as the point of reference for most logicians writing in Arabic. The prominent theologian Fakhr al-Dīn al-Rāzī (d. 1210) approached the Avicennian tradition with the same irreverence with which Avicenna had himself approached the Aristotelian tradition.

He also decisively reoriented the scope of logic toward a focused study of terms, propositions, and syllogisms, rather than the entirety of topics covered in the Organon. A number of thirteenth-century logicians working in the wake of Avicenna and Fakhr al-Dīn al-Rāzī produced sophisticated and original summas of formal logic. They also produced a number of condensed handbooks that formed the basis of logical studies at colleges throughout the Islamic world until modern times."

36. ———. 2022. "Mixed Conditional-Categorical Syllogisms from Avicenna to Urmawī." *History and Philosophy of Logic* no. 43:232–250.

Abstract: "A number of medieval Arabic logicians discussed inferences that combine the principles of propositional and term logic, for example:

Whenever H is Z then Every J is D

No D is A

Whenever H is Z then Some J is not A

The present paper will be devoted to discussions of the validity of mixed conditional-categorical syllogisms of this form, and purported counterexamples, from Avicenna (d. 1037) to Urmawī (d. 1283). One major problem that was discussed, related to modern discussions of the context-sensitivity of counterfactual conditionals, is that if the antecedent of the conditional premise is incompatible with the categorical premise, then there is no guarantee that the latter will combine syllogistically with the consequent of the conditional premise. Plausible formalizations of the argument reinforce the misgivings expressed by some thirteenth-century Arabic logicians."

    Abstract: "It is quite common among historians of Arabic logic to attribute MS Aḥmad iii, no. 3401, entitled *Al-Manṭiq al-kabīr* (*Major [book on] logic*), to Fakhr al-Dīn Rāzī. This view is expressed explicitly and forcefully by Franziska Knobel

(2015) and Turgut Akyüz and Elmin Aliyev (2020). In this paper, we try to refute this attribution through textual analysis, thereby exposing new evidence to the contrary. We show that the text has several references to Fakhr al-Dīn Rāzī himself as well as to some later logicians such as Rāzī's pupil Zayn al-Dīn Kashshī and the latter's successor Afd. al al-Dīn Khūnajī. We also show that contrary to some contemporary historians, all references to '*kitābunā al-kabīr*' ('our major book') in Rāzī's *Sharḥ Al-ishārāt* do not refer to*Al-Manṭiq al-kabīr,* but to *Al-mabāhith al-mashriqiyya*."

40. ———. 2023. "Early Arabic logicians on the contraposition of the particular affirmative." *British Journal for the History of Philosophy* no. 31:382–404.

Abstract: "The logical rule of contraposition as applied to a particular affirmative proposition (I-contraposition), despite its rejection in the medieval Latin logic, had a different history in the medieval Arabic logic, varying from common acknowledgement to total dismissal (it was accepted by Avicenna and by all of his followers in the eleventh and twelfth centuries and rejected by all of Arabic logicians in the late thirteenth century onwards). This paper is a narrative of the fate of I-contraposition in the early Arabic logic. I will study Avicenna's, al-Suhrawardī's, al-Rāzī's, al-Kashshī's, and al-Khūnajī's views on this rule. Although Avicenna explicitly acknowledged I-contraposition in a brief note, and in an apparently Meinongian language, the other four figures found I-contraposition problematic and listed some counterexamples to it.

Nonetheless, they all attempted to justify Avicenna's acceptance of the rule by restricting its application conditions. These efforts led to interesting syntactic and semantic analyses but gathered little attention from later medieval logicians. Finally, in the middle Arabic logic, the revised versions of I-contraposition were also declared invalid."

41. ———. 2024. "Burhān al-dīn Nasafī as the Author of *Al-Manṭiq alkabīr* (MS Aḥmad iii, no. 3401)." *History and Philosophy of Logic* no. 45:246–261.

    Abstract: "Recently, in 'An inquiry on Fakhr al-Dīn Rāzī's authorship of *Al-manṭiq al-kabīr* (MS Aḥmad iii, no. 3401)', we refuted the quite common view among historians of Arabic logic as to attribute *Al-manṭiq al-kabīr* (*Major [book on] logic*) to Fakhr a-Dīn Rāzī; however, in that paper, we could not identify the real author of the book. In this paper, we try to show that *Al-manṭiq al-kabīr* was written by Burhān al-dīn Nasafī (1203–1288), who authored another book, *Sharḥ Asās al-kiyāsa* whose logical part is very similar to *Al-manṭiq al-kabīr* in the following significant features: the titles of chapters and sections, the style of writing, some technical as well as some non-technical terms, many sentences word by word. None of these features we find in any other Arabic logical work. So,*Al-manṭiq al-kabīr* and *Sharḥ Asās al-kiyāsa* are so close to each other that we might most possibly identify the authors of the books as the same scholar, i.e. Burhān al-dīn Nasafī.

    Fortunately, this has been verified recently by two manuscripts of a medieval Arabic logical book."

42. Fanani, Ahwan, Syifa, Mohammad , and Widigdo, Amin. 2022. "The Art of Logic in Muslim Scholarship: A Study of *Mantiq* Transmission and Reception in Indonesia." *Afkar* no. 24:241–274.

    Abstract: "Although the Islamic art of logic (*mantiq*) has circulated for more than two centuries in Indonesia, the *mantiq* works and their functions obtain little academic attention. In this regard, the article aims to study how the *mantiq* works entered and spread in Indonesia and what functions they play

in Islamic educational and scholarship settings. This writing employs a qualitative-historical approach by reading critically primary and secondary works of literature related to the study of logics in the Muslim world, especially in Indonesia, in order to analyze how those logical concepts and scholarship spread and are used in Islamic scholarly works in Indonesia. In the end, the article finds that the spread and development of *mantiq* works in Indonesia primarily stem from the international learning networks of Indonesian Muslim scholars (*'ulama'*), centered in Mecca, Madina, and Cairo. The Indonesian *'ulama*, who used to study in the Middle East, brought the *mantiq* to Indonesia. It is instrumental and required knowledge for understanding scientific and scholarly traditions in Islam, such as Islamic law (*fiqh*) and theology (*kalam*). Furthermore, *mantiq* plays a crucial role as an instrument for academic debates among scholars from different religious affiliations on whether religious or non-religious topics."

43. Feldman, Seymour. 1964. "Rescher on Arabic Logic." *Journal of Philosophy* no. 61:724–733.

    "The important facts that emerge from Rescher 's historical sketches can be summarized as follows: Arabic logic had its beginnings when the Syriac Christians translated the first four books of the *Organon* (*Isagogue, Categories, De Interpretatione, Prior Analytics*) from Greek into Syriac. These four were the only books of the *Organon* translated into either Syriac or Arabic before the middle of the ninth century. Translations into Arabic began in the ninth century, and were done by Christians. The center of Arabic logical studies was in the East; Baghdad was the first main place of study, followed by Persia. Although the originators and leaders of the former school were Christians, ultimately the school was led by a Moslem, Al-Farabi (870-950), whose fame as a logician is evidenced by Maimonides' insistence that Al-Farabi alone is worthy of study among the modern logicians (*Letter to Samuel ibn Tibbon*). The chief achievements of the Baghdad school were three: (1) the complete translation of the *Organon* into Arabic; (2) commentaries on various books of the *Organon*,

among which those of Al-Farabi are of especial importance; and (3) the study of extra-Aristotelian logical topics, such as the conditional syllogism and analogical inference. As a result of political and theological harassment, the school died out, and Persia became the center of logical study under the leadership of the famous Moslem philosopher Avicenna (980-1037). Avicenna's approach to logic was less committed to devotion to the text of Aristotle, the study of which was becoming more hazardous in Persia. And the logical tradition in Persia was supplemented by material from Galen and the Stoic logicians, especially the Stoics' work on conditional syllogisms and propositions. Eventually, logical studies spread westward to Arabic-speaking Spain and reached their highest development in Averroes (1126-1198). This tradition, however, also died out as a result of religious-political persecution and of sterile techniques of instruction." (p. 720)

44. Firdaus, Qusthan A. H. 2024. *Demonstration and Burhan: A Logical Investigation*. Singapore: Springer.

    "My intention in this book is simply to ease students in Islamic philosophy in specific and Islamic studies in general to learn logic not only as a mere tool but also a developing academic discipline. This is rather different with, for instance, ethics in which case the Western discourse of ethics draws a strict line between ethics and etiquettes. In contrast, I surmise that *akhlak* (morals and its justifications/ethics) and *adab* (a code of conduct, good manners or etiquettes) in Islam seem to be well connected. This connection has many ornaments most of which I cannot understand well. This apology finds its strength on my dormancy to study Arabic." (p. 4)

    "Aristotle disperses his teaching of logic into several books. The ancient commentators categorise them as *Organon*. Since the first century BC, this *Organon* was openly available in Greek and triggered some commentaries and introductions by the early third century BC.(1) This corpus consists of *Categories* (one book), *De Interpretatione* (one book), *Prior Analytics* (two books), *Posterior Analytics* (two books), *Topics* (eight books), and *Sophistical Refutations* (one book). Alexander of Aphrodias' version of *Organon*, according to Gutas, consists of

three more books, to wit, Aristotle's *Rhetoric* (three books), *Poetics* (one book), and *Eisagoge*(2) in addition to those six books.(3)" (p. 7)

(1) Hodges (2020), p. 9. Al-Farabi was responsible for initiating the notion of *ḥukm* or judgment into the Arabic logic just as he translated Aristotle's accounts of 'denies' and 'affirms' into one, single notion of 'judges.' A further discussion on this issue, please check Hodges (2020), p. 28.

(2) Aristotle did not write this book but it is Porphyry's introduction to Aristotle's *Categories*.

"According to Ibn Jinnī, not only does grammar constitute a complex system, that is, an integral whole – most of his colleagues would agree on this point – but it does so as the result of underlying causes – or rather, ultimately, as the result of a particular, unifying cause: the nature of language itself. It is this deep conviction – the driving force behind his Khaṣāʾiṣ – which compels Ibn Jinnī to oppose the claim made by Jāḥiẓ in the above-mentioned passage, but which in its specific guise simultaneously sets him apart from most *naḥwiyyūn* of his

time. This particular unity underlying the wide range of grammatical features will be at the center of this paper, whose principal aim consists in bringing out Ibn Jinnī's basic ideas about the phenomenon called language." (p. 50)

47. Giolfo, Manuela E. B., and Hodges, Wilfrid. 2016. "The System of the Sciences of the Arabic Language by Sakkākī: Logic as a Complement of Rhetoric." In *Approaches to the History and Dialectology of Arabic in Honor of Pierre Larcher*, edited by Sartori, Manuel, Giolfo, Manuela E.B. and Cassuto, Philippe, 242–266. Leiden: Brill.

    "Al-Sakkākī's Miftāḥ is widely recognized as having made a radical reorganization of the Arabic science of rhetoric, which had been founded by ʿAbd al-Qāhir al-Gˇurgˇānī (d. 471/1078) in *Dalāʾil al-ʾiʿgˇāz* (Gˇurgˇānī Dalāʾil) and *ʾAsrār al-ʿarabiyya* (Gˇurgˇānī ʾAsrār), bringing it to a form that generated textbooks and commentaries right up to present times. Later writers, both Arab and Western, have taken the heart of the book to be its 'Science of meanings' (*ʿilm al-maʿānī*). For example Qazwīnī (d. 739/1338) in his influential two commentaries (Qazwīnī ʾĪḍāḥ; Qazwīnī Šarḥ) restricts himself to this section of the Miftāḥ.

    Happily we have a German translation of the same section of the Miftāḥ by Udo Gerald Simon (1993), taken from his doctoral dissertation.

    It is interesting that Qazwīnī and Simon stop where they do. Al-Sakkākī himself had added to the section on ʿilm al-maʿānī two appendices on logic, one on definition (*al-ḥadd*) and one on syllogism (*al-istidlāl*). Apparently he failed to convince his readers that these appendices had a point.

    (...)

    So it makes sense to look back at the M*iftāḥ* and ask what al-Sakkākī thought he was doing when he added these two appendices.

    The two present authors are a linguist and a logician; we thought we should look at the work together. What we have to

report so far is only preliminary. In broad terms our conclusion is that the commentators were right to separate off the material on logic: Sakkākī seems to us to have failed to make any meaningful connection between syllogistic logic and his main theme of *ʿilm al-maʿānī*.

However, his reactions to logic do raise some interesting points that he seems to have been led to by his linguistic expertise." (pp. 243-243)

48. Goldenberg, Gideon. 2007. "Subject and Predicate in Arab Grammatical Tradition." In *The Early Islamic Grammatical Tradition*, edited by Baalbaki, Ramzi, 301–336. Aldershot: Ashgate.

"The basic notion of predication, common for the diverse sentence-forms, was in Arab grammatical theory, as elsewhere, one of the fundamental ideas. The clear exposition of predicative relation is not really impaired by the different specific terms used for each of the sentence-types, viz. the nominal and the verbal. In Arab grammatical literature, the treatment of 'nexus' as such, in nominal and verbal sentences alike, is by no means marginal, and, except for the most elementary works, has not usually been neglected. The analysis of nexal relation in Arab grammatical tradition, and the technical terms involved, have been expounded afresh in some meticulous studies published recently,(1) but the repeated criticism of the Arab grammarians as being unable to develop the generalized conceptions of subject and predicate may call for some further comments." (p. 301)

(...)

"For better understanding the treatment of predicative relation in medieval Arabic grammar, some evidence will be brought together and examined in the following chapters concerning (1) the terminology of predicative relation, (2) the functional definition of the parts of speech, (3) *kalām* and *gumlah,* (4) the verb as a nexus-complex, and (5) the syntactical exercises of *ixbār." (p. 303)

49. Goldziher, Ignaz. 1981. "The Attitude of Orthodox Islam Toward the “Ancient Sciences”." In *Studies on Islam*, 185–215. Oxford: Oxford University Press.

English translation of Ignáz Goldziher, "Stellung der alten islamischen Orthodoxie zu den antikken Wissenschaften," *Abhandlung der Koniglichen Akademie der Wissenschaften*, 8 (1915): 3-46.

"In contrast to the other disciplines belonging to the ‘*ulūm al-awá’il,* orthodox Islam went much farther in developing a position regarding logic. While orthodoxy expressed its distrust of these other fields of Greek learning simply by showing a certain preventive concern, the battle against logic was an opposition of fundamental importance. It (orthodoxy) maintained that the recognition of Aristotle’s methods of proof was a serious threat to the validity of religious doctrines. The general attitude of the uneducated was expressed in the saying: “He who practices logic becomes a heretic” (man tamanṭaqa tazandaqa).(94)

Al-Fárábi, whose chief contribution were his commentaries on Aristotle’s work on logic, appears to have written a defense of logic (no longer extant) in order to combat this bias. In this

work he collected all those sayings of the Prophet that were useful in setting forth, from a religious point of view, a more favorable judgment regarding logic.(95)

The scholastic theologians (the people of *kalām*) contributed substantially to the religious disparagement of logic. In their rationalistic efforts they ignored the syllogism of demonstrative methods of proof (for which the followers of Aristotle held them in contempt)(96) and believed that for the support of their theses they could manage with premises that were based only on popular acceptance or tendentious biases, without ever having to prove them correct or having to concede them.(97) Mu'tazilite as well as Ash'arite circles produced numerous polemical treatises against Aristotelian philosophy in general and against logic in particular.(98)" (p. 198)

(...)

"Although the *manṭiq*(108) (the specialist in logic) was not one of the favorites of orthodoxy, as we have seen, it is clear, based on studies of the early 'Abbasid period1that the cultivation of logic was favored by the theological authorities and that it was even employed by them in the service of theology." (p. 199)

(...)

"Our literary sources show, however, that the viewpoint of those who condemned logic was not victorious in the educational system of Islamic theology. The position expressed in the commentaries, supercommentaries, and marginal glosses (to mention only the most influential sources), which was championed by the logical works of Abhari (an adaptation of the *Isagoge* of Porphyry), Kātibi (*Shamsīya*), Akhdari(151) and the authors of other compendia of logic in Islamic education offers us proof of the fact that the voices of opposition to logic gradually faded away without any lasting results. Even scholastic theology (kalām) made use of Aristotelian philosophy (especially from the time of Fakhr ad-Dīn ar-Rāzī [d. 606]) as a methodological tool in the establishment and elaboration of itself." (p. 208)

50. ———. 1994. *On the History of Grammar among the Arabs: An Essay in Literary History*. Philadelphia: John Benjamins.

Translated from Hungarian *[A nyelvtudomány történetéröl az araboknál*, 1878] and edited by Kinga Dévényi, Tamás Iványi.

"The original Hungarian version of the present treatise, "On the History of Grammar among the Arabs: An Essay in Literary History", was read and discussed at a session of the Hungarian Academy of Sciences on the 16th April 1877. An abstract was published in the annual bulletin of the Academy {Akadé-miai 1877, 11.111-112), while the whole paper (except for Chapter 6) appeared in print in the following year in the linguistic journal of the Academy 1878, 14.309-375).

Goldziher himself considered it a compendium {*Abriß*, as he called it in his Diary) of a major work that he may have planned to prepare in German. A century and a quarter elapsed since its publication but Goldziher's essay still has not become outdated. It seemed worth to make this work known to the world outside Hungary by translating it to English, especially since no similar work has been published. We wanted to preserve as much of the style of the original as it was possible, e.g., some of its long circumstantial sentences and the stylistic devices of a lecture. This latter fact influenced the text in another substantial way: Goldziher, departing from his usual practice, did not cite original (Arabic) passages in the treatise, either in the text or in the footnotes. Thus we considered our task to provide them in the Appendix. This was felt all the more necessary since the original passages in most cases were not translated, but only summarised or paraphrased by him. An asterisk in the text refers to that the original passage is quoted in the Appendix." (*Preface*, p. IX)

"Arabic linguistics developed further [in the 9/10th □ A.D.], at a time when the influence of Greek philosophical literature, of which the Muslim world became the most assiduous and ardent propagator, exposed Arabic thinking to a completely new field. Philosophy, especially in the Eastern territories of Islam, did not remain isolated for long, but soon infiltrated into all areas of thought, even theology, considered by many the adversary of

philosophical thinking. It is clear that not even linguistics could be left untouched; it could hardly remain so since the philosophical works, whose study and translation at that time preoccupied the Muslim mind, treated in detail those questions which are usually referred to under the name of linguistic philosophy. These discussions had greatly influenced the thinking of Muslim scholars and they felt compelled to set out to incorporate them in their works." (p. 38)

53. Günther, Sebastian. 2025. "Al-Ghazālī on Logic as a Means of Learning. Historical Evidence and Educational Implications." *Al-Abhath*:1–45.

    Abstract: "Renowned for his profound scholarship, the philosophical theologian and mystic Abū Ḥāmid al-Ghazālī (d. 505/1111) has significantly influenced Islamic thought and education for centuries. This article presents a novel approach to studying his body of works. It analyzes six of al-Ghazālī's key works on logic in chronological order, offering a fresh perspective on his views on reasoning.

    Additionally, the study explicitly focuses on al-Ghazālī's concept of "logic as a tool of learning," leading into an exploration of the relevance of his insights for contemporary humanistic education."

54. Gutas, Dimitri. 1993. "Aspects of Literary Form and Genre in Arabic Logical Works." In *Glosses and Commentaries on Aristotelian Logical Texts: the Syriac, Arabic and Medieval Latin Traditions*, edited by Burnett, Charles, 29–76. London: The Warburg Institute.

"My aim in this essay has been to add to the above, in the spirit of the present volume, a study of an aspect of Arabic logic that has received no attention. Apart from Endress's necessarily brief statements in a wider context in the *Grundriss*, the literary form which Arabic logical works took and the genres which Arab logicians developed have never been discussed in any detail. This is what I have attempted to do here without making any claims either to exhaustiveness or to inclusiveness. Not all genres that can be witnessed throughout the history of Arabic logic have been mentioned, let alone discussed, and not all periods have been considered with equal attention. The purpose has been to pave the way for more comprehensive studies by establishing a certain framework with regard to terminology and literary forms, highlighting mainstrean genres and periods, and pointing to areas of neglect and potential research.

It would appear from the present state of the art, briefly described here, that the background may have been prepared for the emancipation of Arabic logic from its surrounding areas and its cultivation as an independent field. The next stage of this endeavour will have to consIst of a senous and comprehensIve study of the tradition of the Arabic *Organon*. Still on the agenda, this time at a higher level of sophistication, are critical editions of the Arabic translations of the remaining books of the *Organon,* critical editions and translations of ArabIc commentanes, and perhaps the most important aspect of the entire enterprise, an appreciation of Arabic logic in itself through an evaluatoon of Its contributIon to the hIstory of logic in particular and to intellectual history in general." (pp. 30-31)

55. Gyekie, Kwame. 1971. "The Terms "Prima intentio" and "Secunda intentio" in Arabic Logic." *Speculum* no. 46:32–48.

"The more passages one examines in the translations from Arabic to Latin and from Arabic to English and other modern

languages, the more mistakes one comes across in the translation of the Arabic expression *alā al-qaṣd al awwal* (or, *'alā al-qaṣd al thānī).* The mistakes stem from the failure to distinguish between two senses of the expression, one an adverb, and the other a famous philosophic concept. Failing to distinguish between the two senses, the translators translated the phrase literally, often with unsatisfactory results. In this paper, I shall indicate a Greek word which was rendered by the Arabic '*la al-qasd al-awwal.* I shall refer to some English translations from the Arabic and show how wrong they are. I shall suggest that in Arabic philosophy itself al-Farabi, rather than Avicenna, may have been the origin of the philosophic concepts of "first and second intentions." I shall point out that although these concepts may have been introduced into Latin scholasticism by Raymond Lull, he could not have derived theni from the Logic of al-Ghazali, as has been alleged." (p. 32)

56. ———. 1972. "The term *Istithnā'* in Arabic Logic." *Journal of the American Oriental Society* no. 27:88–92.

"The term istithnā' is a term used in Arabic logical works which has not, as yet, been given a satisfactory translation. Among the translations of this term which I have come across in modern works are: (a) "exclusion",(1) (b) "exception",)2) (c) "choice", (3) (d) "interpellation",(4) (e) "particular mention",(5) and (f) "disjunction".(6)

While the first two (a and b) are the dictionary meanings of the term which, here, are not helpful towards the understanding of the term as it is used in the logic of propositions, the next three (c, d, e) probably arose out of an attempt to make sense of the passages in which the term occurs and, are, strictly speaking, not translations as such. "Disjunction" does not translate istithnā although we shall find later that istithnā syllogisms included the disjunctive." (p. 88)

57. ———. 1979. *Arabic Logic: Ibn al-Tayyb's Commentary on Porphyry's Eisagoge*. Albany: State University of New York Press.

Contents: Preface IX-X; Introduction 1; Logic in Medieval Islam 1; Porphyry's *Eisagoge*: Its Subject Matter 7; Some Points of Philosophical or Logical Interest in this Book 9; Greek Commentaries on the Eisagoge 13; Syriac Translations and Commentaries on the Eisagoge 16; Arabic Translations and Commentaries on the Eisagoge 17; The Manuscripts 20; The Format of Ibn al-Tayyib's Commentary 22; Its Relation to the Alexandrian Commentaries 23; English Translation of the Arabic Text 25; Commentary 159; Notes 219; Glossary of Arabic-Greek Logical Terms. 231; Bibliography 237; Index of

Proper Names 243; Index of Arabic Terms Referred to in the Introduction and Commentary 245.

"This is a translation and a study of Ibn al-Tayyib's commentary* on the *Eisagoge* of Porphyry. The study takes into account the "Eisagoge" (*al-Madkhal*) of Avicenna (Ibn Sina), a contemporary of Ibn al-Tayyib. Avicenna's work is, strictly speaking, not a commentary in the sense in which Ibn al-Tayyib's is. That is to say, he, unlike Ibn al-Tayyib, does not quote verbatim a passage from Porphyry's work and comment upon it. His "Eisagoge" is rather a restatement or paraphrase of the subject matter of Porphyry in his own way and with his own views on it. The views of the eminent philosopher, al-Farabi, have, where relevant, also been mentioned. Ibn al- Tayyib's own commentary on the *Categories* (as yet unpublished) has been referred to in a handful of places. The study also takes into account the four extant Greek commentaries of Ammonius, Elias, Pseudo-Elias and David. Parallels between the commentaries of Ibn al-Tayyib and these Alexandrian scholars have been pointed out in the Commentary." (*Preface*, p. IX)

* My edition of the Arabic text was published by Dar al-Mashreq (Beirut) in 1975. The translation covers the commentary proper, i.e. excluding Ibn al-Tayyib's own introduction (paragraphs 1-88 of the Arabic text.). Paragraphs 1-347 of the translation thus corresponds to paragraphs 89-437 of the Arabic text.

Bibliography

1. Hallaq, Wael B. 1987. "A Tenth-Eleventh Century Treatise on Juridical Dialectic." *The Muslim World* no. 77:197–206.

   "Abū al-Ḥusayn al-Baṣrī's (d. 4361 1044) *Kitāb al-Qiyās al-Shar'ī*, translated here as the *Book of Juridical Qiyās*, represents one of the earliest extant writings on juridical dialectic (*al-jadal al-fiqh*ī) in Islam. The author's Ḥanafī-Mu'tazili persuasion lends the work further importance, as the combination of these two particular schools of thought seems to have been of rare occurrence among authors of works on juridical dialectic. In this treatise al-Baṣrī draws significantly upon his magum opus *al-Mu'tamad fi Uṣū al-Figh* which was to become a milestone in the later development of legal theory. The subject of the treatise is rather complex and therefore warrants a brief introduction into the nature, form, and methods of juridical dialectic and its relationship to legal theory which provided the premises and points of departure for dialectic." (p. 197, notes omitted)

2. ———. 1990. "Logic, Formal Arguments and Formalization of Arguments in Sunnī Jurisprudence." *Arabica* no. 37:315–358.

   Part I. Logic and Formal Arguments

   Some decades before the translation movement from Greek into Arabic began, a battle over the ultimate source of Law had already been fought and won by Traditionalist Islam, represented by the well-known Ibn Idrīs al-Shāfi'ī (d. 204/820). The triumph of the theory of the divine origins of law compelled Islamic jurisprudence to dissociate itself from all rationalist tendencies involved in philosophical ventures. Chief among these tendencies were the discussions on metaphysics in

which logic served as the guiding spirit of philosophical argumentation. Associated with such heretical enterprises, logic as an organon of philosophy could hardly be distinguished from substantive metaphysical doctrines, and in such an environment Traditionalist jurisprudence kept suspected logic at bay. It was not until the appearance of the Shāfi'ī-Ash'arī intellectual Abū Ḥāmid al-Ghazālī (d. 505/1111) that logic as a method was sifted out of Aristotelian philosophy and thus cleared of its "non-theistic" tenndencies. Ghazālī's endeavor in bringing logic into law, and the persistence of what may be called the Ghazālīan thesis among some of his influential *uṣūlist* successors, will form the subject of this essay. While the following section attempts, in general terms, to analyze Ghazālī 's attitude towards logic in the law, it is not until Part II of this essay that we will encounter, in the form of a translation, what may be described as one of the most revealing statements which Ghazālī made on the logic of legal argument." (p. 315)

3. ———. 1993. *Ibn Taymiyya Against the Greek Logicians*. Oxford: Clarendon Press.

   Translated with an Introduction and notes by Wael B. Hallaq.

   "Ibn Taymiyya could hardly avoid criticizing the logical foundations of speculative mysticism since he categorically rejected the doctrine of the Unity of Existence (wahdat al-wujüd), its logical underpinnings, and its relationship to Platonic philosophy." (*Introduction*, p. XII)

   (...)

   "Even if we were to reduce the objects of Ibn Taymiyya's attacks to the writings of Ibn Slnä and Ibn Arabī, and set aside his scathing and massive criticism of countless other philosophical, mystical, theological, and sectarian doctrines, we would still come to the realization that what Ibn Taymiyya was fighting against amounted to everything that directly or indirectly derived from what was termed 'the ancient sciences' (*ulüm al-awä'il*).(9) Ibn Slnä's cosmology had for its foundation Aristotelian-Ptolemaic doctrines with a Neoplatonic structure in which the emanationist philosophy of being was thoroughly incorporated. His logic was manifestly Aristotelian but not

without Stoic and Neoplatonic influences. Likewise, Ibn 'Arabī made use of the Platonic Ideas, and his cosmology integrated not only the pseudo-Empedoclean doctrines of Ibn Masarra (d. 319/931) but above all Alexandrian elements as found in the doctrines of Ikhwän al-Safä'. Admittedly, the latter were indebted to the teachings of Pythagoras and Nichomachus, particularly in their treatment of the metaphysics of number. They were no less indebted to Jäbir b. Hayyän (d. 160/776), who was in turn influenced by Plato, Pythagoras, and Apollonius as well as by Indian and Hermetic ources.(10)" (*Introduction*, p. XII-XIII)

(9) See e.g. his *Jahd*, 176 (Translation, par. 167, below), where he speaks of the influence the philosophers had over the Süfls and others. See also a*l-Radd*, 186-7.

4. Halper, Yehuda. 2016. "Dialecticians and Dialectics in Averroe's Long Commrntary on Gamma 2 of Aristotle's *Metaphysics*." *Arabic Sciences and Philosophy* no. 26:161–184.

Abstract: "While Averroes' work is often considered to represent the culmination of the method of Aristotelian demonstration in Arabic philosophy, a short passage of his *Long Commentary on Aristotle's Metaphysics* Γ 2 emphasizes the prominence of dialectic and calls for a re-examination of dialectic and demonstration in Averroes' philosophical works. In this passage Averroes describes dialectic as an acceptable form of philosophy and the dialectician as a kind of scientist. In putting dialectic and demonstration on an equal, or nearly equal footing, Averroes seems to go against his own account of the dialectical and demonstrative classes of people in the *Decisive Treatise*. Moreover, this interpretation of *Metaphysics* Γ.2 also contradicts Averroes' explanation of the same passage in the *Middle Commentary on the Metaphysics* as well as Aristotle's own description of dialectic throughout the *Metaphysics*. That is, in the *Long Commentary on the Metaphysics*, Averroes departs from his earlier views, and describes dialectic as a necessary part of metaphysics, even

though the centrality of dialectic argumentation could call into question the entire project of metaphysics and consequently of the sciences whose demonstrations rely on metaphysical ground, i.e., all sciences. Averroes does not emphasize this view, but its presence is nevertheless unambiguous."

5. ———. 2019. "Are there Second Intentions in De Interpretatione 16 a 3-8? The Hebrew Aristotelian Commentary Tradition in the 13th-15th centuries." *Studia graeco-arabica* no. 9:243–260.

   Abstract: "*Aristotle's De Interpretatione* 16 a 3-8 describes the relationship between writing, words, meanings, and things.

   Christian and Jewish interpreters took different approaches to interpreting this passage. Scholastic thinkers tended to examine the differences between meanings and the meaning of meanings, or first-second intentions, and this terminology is even reflected in William of Luna's translation of Averroes' *Middle Commentary* on this passage. The 14th c. Jewish interpreters, who relied on Jacob Anatoli's 13th c. translation of Averroe's *Middle Commentary*, tended not to find the first-second intention distinction in *De Interpretatione* 16 a 3-8, and instead took Averroes' account of meaning at face value. This changed in the 15th c. when Jewish thinkers began to engage more directly and more significantly with Latin scholastic works, and began to interpret Aristotle accordingly."

6. ———. 2021. "Debate by the Book, about the Book, in a Book: Shem Tob Falaquera's *Epistle of the Debate*, Al-Fārābī's *Book of Dialectic*, and Aristotle's *Topics* on Philosophy and the Holy Writings." *Studia graeco-arabica* no. 11:93–106.

   Abstract: "Shem Tov Falaquera's *Epistle of the Debate* describes a debate between a Pietist who is knowledgeable only in Jewish law and religious texts and a Scholar who is well versed in both Jewish and philosophical works about whether according to Scripture studying philosophy is forbidden, permitted, or necessary for the perfection of human beings. I argue that to a large extent the form, style, and much of the content of the arguments in the debate are based on Al-Fārābī's *Book of Dialectic*. Falaquera thus provides an example of a

debate by the book (Al-Fārābī's *Dialectic*), about the Book (Scripture), and in a book (*The Epistle of the Debate*). Moreover, by examining the arguments of the *Epistle* in light of Al-Fārābī's *Dialectic*, we can see how dialectic can provide both training in adversarial debates and an introduction to philosophy and science."

   "In this chapter we discuss, first, how the Arabic logicians up to the end of the tenth century took over Greek material and added to it material of their own and how they reshaped the subject of logic in the process. We have included references to the young Averroes, although he wrote in the twelfth century, inasmuch as he belongs in the tradition of al-Fārābī (d. 950). After this we turn to the formal innovations of Avicenna's in the early eleventh century. Many of the questions that we discuss are treated also in Street (2004)." (p. 45)

9. Hodges, Wilfrid. 2018. "Two early Arabic applications of model-theoretic consequence." *Logica Universalis* no. 12:37–54.

   Abstract: "We trace two logical ideas further back than they have previously been traced. One is the idea of using diagrams to prove that certain logical premises do—or don't—have certain logical consequences. This idea is usually credited to Venn, and before him Euler, and before him Leibniz. We find the idea correctly and vigorously used by Abū al-Barakāt in 12th century Baghdad. The second is the idea that in formal logic, P

logically entails Q if and only if every model of P is a model of Q. This idea is usually credited to Tarski, and before him Bolzano. But again we find Abū al-Barakāt already exploiting the idea for logical calculations.

Abū al-Barakāt's work follows on from related but inchoate research of Ibn Sīnā in eleventh century Persia. We briefly trace the notion of model-theoretical consequence back through Paul the Persian (sixth century) and in some form back to Aristotle himself."

10. ———. 2020. "Medieval Arabic Notions of Algorithm: Some Further Raw Evidence." In *Fields of Logic and Computation III: Essays Dedicated to Yuri Gurevich on the Occasion of His 80th Birthday*, edited by Blass, Andreas, Cégielski, Patrick, Dershowitz, Nachum, Droste, Manfred and Finkbeiner, Bernd, 133–146. Cham (Switzerland): Springer.

    Abstract: "During Yuri Fest 2010 the discovery of a proof search algorithm devised in the 1020s by Ibn Sīnā (Avicenna) was announced.

    A Gurevich abstract state machine was given in evidence that Ibn Sīnā really did intend an algorithm; this was needed because Ibn Sīnā explained the algorithm by a long sequence of exercises, not by a rigorous definition. More recently a radically original logical decision algorithm has come to light in the work of the 12th century Baghdad scholar Abū al-Barakāt. Taking these algorithms alongside the already known algorithms of al-Khwārizmī for solving quadratic equations, and of al-Khalīl for listing finite sequences of letters, we can see that the medieval Arabic scholars uncovered a range of algorithms of various kinds. But it seems that they never brought these algorithms together under a single notion of 'algorithm'; in fact we know of no writer who drew a comparison between any two of these algorithms. A natural question for historical research is to uncover what kinds of entity the medieval Arabic scholars thought these algorithms were. The present paper assembles some raw material that should be relevant to this question, including a not very successful attempt by al-Fārābī to institute a theory of logical procedures."

11. Hodjati, Seyyed Mohammad Ali. 2008. "Kātibī on the Relation of Opposition of Concepts." *History and Philosophy of Logic* no. 29:207–221.

    Abstract: "According to a rule of traditional logic concerning the relation between general (or universal) concepts, if a given concept is more general than a second one, then the opposition (or contradictory) of the first concept is more specific than the opposition (or contradictory) of the second one. Kātibī, one of the Muslim logicians in the 13th century, has raised a question against this rule and, by giving some counterexamples, claims that it results in contradiction. Some Muslim logicians have replied to Kātibī, and in this paper I have examined their replies. Also, by using rules of modern logic, we may easily show that either Kātibī's argumentation is fallacious or it does not result in contradiction; however, it seems that if modern logic rules had been epresented to Muslim logicians, some of those rules would have been rejected by them."

12. Ighbariah, Ahmad. 2012. "Between Logic and Mathematics: Al-Kindī's Approach to the Aristotelian Categories." *Arabic Sciences and Philosophy* no. 22:51–68.

    Abstract: "What is the function of logic in al-Kindī's corpus? What kind of relation does it have with mathematics? This article tackles these questions by examining al-Kindī's theory of categories as itwas presented in his epistle On the Number of Aristotle's Books (*Fī Kammiyyat kutub Aristū*), from which we can learn about his special attitude towards Aristotle theory of categories and his interpretation, as well. Al-Kindī treats the *Categories* as a logical book, but in a manner different from that of the classical Aristotelian tradition. He ascribes a special status to the categories Quantity (*kammiyya*) and Quality (*kayfiyya*), whereas the rest of the categories are thought to be no more than different combinations of these two categories with the category Substance. The discussion will pay special attention to the function of the categories of Quantity and Quality as mediators between logic and mathematics."

13. ———. 2016. "Grammatical features in Ibn al-Muqaffaʿ's C*ategories*." *Jerusalem Studies in Arabic and Islam* no.

43:251–271.
14. Imamoglugil, Halil. 2025. "The Influence of al-Ghazali on the Use of Logic as a Thinking Methodology in Islamic Sciences." *Entelekya. Logico-Metaphysical Review* no. 9:107–124.

    Abstract: "Al-Ghazali (d. 1111) represents one of the most important turning points in the history of logic in the Islamic world. He emphasized logic in particular in his efforts to remedy the shortcomings he observed in the traditions of *Fiqh* (Islamic Jurisprudence and *Kalam* (Islamic Theology) and to make these sciences more systematic. Al-Ghazali's terminology, views, and conceptualizations were influential in the beginning of the use of logic as a methodology of thought in Islamic sciences. Al-Ghazali's work in the field of logic, primarily directed toward practical goals in the religious sciences, presented a comprehensive example of applied logic that had not been seen before. He offered a wide range of suitable examples that could appeal to the minds of those engaged in religious sciences. His emphasis on the importance and value of logic helped spread it throughout the Islamic world and incorporate it into the *madrasa* curriculum. He ended the debates on logic in Islamic philosophy, thereby establishing a legitimate foundation for logic in the Islamic world. Thus, logic became an important part not only of philosophy but also of all religious sciences, especially theology. Many Islamic thinkers, especially theologians, benefited from logic to acquire knowledge."

15. Inati, Shams. 1996. "Logic." In *History of Islamic Philosophy: Volume II*, edited by Nasr, Seyyed Hossein and Leaman, Oliver, 1409–1450. New York: Routledge.

    "The task of this chapter is extremely difficult, not only because it is impossible to cover in one short chapter the long history of the field of Arabic logic and the enormous quantity of material encompassed by it but also because many Arabic logical writings have not reached us. In addition, of those works that have reached us, many are still in manuscript form.

    Thus, it must be stressed at the outset that this is not the full story of Arabic logic or even the recounting of all its important

elements, as a comprehensive study of the field is not possible at this point. Rather, this is a modest attempt to trace the outline of the history of Arabic logic, pointing out within the space allowed some of the essential features of this field which are accessible to us." (p. 802)

(...)

"The relation of logic to philosophy

One of the issues that preoccupied Arabic logicians was whether logic is a part of or an instrument of philosophy. The controversy over this issue emerged in ancient times. The Platonists considered logic both a part and an instrument of philosophy; the Peripatetics considered it only an instrument of philosophy; and the Stoics considered it only a part of philosophy.

The history of Arabic logic is full of references to the idea that logic is an instrument (*dlah*) of philosophy.(89) However, some, such as Ibn Slna, spoke of logic at times as an instrument and at other times as a science, i.e., as a part of philosophy.(90) This is because he finds no conflict in considering logic both as an instrument of and as a part of philosophy.

The conflict, he asserts, arises from using the term philosophy in two different senses. If philosophy is used in the sense of the study of "things inasmuch as they exist and are divided into the two types of existence", meaning the external and the mental, then logic is not "a part of philosophy. But inasmuch as logic is useful for this study, it is an instrument of philosophy." If, on the other hand, philosophy is used in the sense of the study of "every theoretical matter and from every point of view", then logic is "a part of philosophy and an instrument of the other parts of philosophy".(91) According to him, to engage in a dispute over such a matter is to engage in falsehood, because the rwo positions are not contradictory, and in futility, because concerning oneself with such a matter leads to no benefit.(92)" (p. 814)

(89) See, for example, al-Farabi, *al-Alfāẓ*: 107; Ibn Slna, *Remarks*: 47; *Mantiq*: 5, 8 and 10; al-Ghazzalī, *Tahafut*. 45; Alī

ibn Muhammad al-Sharīf al-Jurjānī, Kitāb al-tārīfāt (Beirut, 1969): 351 .

16. Ismail, Mohd Zaidi bin. 1996. "Logic in Al-Ghazali's Theory of Certitude." *Al-Shajarah: Journal of the International Institute of Islamic Thought and Civilization (ISTAC)* no. 1:1–2.

"Although certitude might be considered by many to be very personal, and because of that, too subjective, one needs more than just gallantry to make an outright denial of its importance in life. Perhaps it is precisely because of its being objectively subjective that one cannot do without it.

(..)

Or, to put it differently, is it conceivable that we have certitude concerning a matter which is totally rejected by our reason? This question, for us, is by no means artificial. Rather, it provides the necessary framework for our present discussion.

It is not hard to see why al-Ghazalī, as a scholar who was very much interested in the problem of knowledge and faith, was so involved in the problem of certitude. Since logic is the property of reason, concerns the correct laws of thought, and is highly regarded by al-Ghazalī, he could not but give as well an account of its status in his overall solution to that problem. In the present paper, we will concern ourselves with surveying what al-Ghazalī's answer is and how he provides such a solution. But before that, and since certitude, truth and knowledge are only different aspects of a single item, it is very relevant to see how he perceives truth-reality (*al-ḥaqq*.) (1)

(1) When referring to the word *al-ḥaqq,* we have to combine these two English words, 'truth' and 'reality', for in Arabic such a word connotes both meanings. For further analysis of this term, and how it is related to taṣdīq, see Syed Muhammad Naquib al-Attas, *Islam and the Philosophy of Science* (Kuala

Lumpur: ISTAC, 1989), 17-25; and his *A Commentary on the Ḥujjat al-Ṣiddīq of Nūr al-Dīn al-Rānīrī* (Kuala Lumpur: Ministry of Culture, 1986), 128-129, 149-153, 183,187, and 234.

17. Izutsu, Toshihiko. 1974. "Basic Problems of "Abstract Quiddity"." In *Collected Texts and Papers on Logic and Language*, edited by Mohaghegh, M. and Izutsu, Toshihiko, 1–25. Tehran: Tehran University Press.

    "The concept of "quiddity" (*māhiyah*) plays an exceedingly important role in Islamic philosophy, not only in metaphysics but also in logic. For the *Eisagoge* (Ar. *Ishāgūjī*), which constitutes the First Book of classical Aristotelian logic as it has been accepted by the Muslims, is in its essentials nothing other than an elaborate theory of "quiddity". In the course of history, the concept of "quiddity" has raised in Islamic thought a number of interesting problems. The so-called *i'tibārāt* of "quiddity" is surely of the most irnportant of those problems."

    The word *i'tibārāt* (sg. *i'tibār*) means "(various possible) ways of looking at" a thing. The expression "*i'tibārāt* of quiddity", therefore, refers to various possible ways in which "quiddity" can be viewed at the level of conceptual analysis. It must be noted that the expression in no wise suggests the existence of various kinds of "quiddity". All that it indicates is that every "quiddity" can be rationally approached from a number of different angles, or can be conceived in a number of different dimensions, and that at each of the dimensions "quiddity" discloses different rational characteristics.

    Three *i'tibārāt* have been consecrated by philosophic tradition as being the most fundamental among all the imaginable approaches:

    1) *lā bi-sharṭ* or a non - conditioned".

    2) *bi-sharṭ lā* or "negatively conditioned".

    3) *bi-sharṭ* shay' or "positively conditioned".

    Of these three the most controversial have always been the first and

the second. The present paper will deal with some of the most basic problems

Three i'tibarat have been consecrated by philosophic tradition as being

the most fundamental among all the imaginable approaches:

1) la bi-sharf or a non - conditioned".

2) bi-sharf la or "negatively conditioned".

3) bi-shar/ shay' or "positively conditioned".

Of these three the most controversial have always been the first and the second. The present paper will deal with some of the most basic problems.(1)" (pp. 3-4)

(...)

"We have examined in the foregoing some of the representative views on the nature and structure of "quiddity qua negatively conditioned". In spite of an exceeding importance that has been attached to it --- or, we might say, precisely because of it-- the problem does not seem to have reached any final solution. However this may be, the distinction between the two meanings of "qua negatively conditioned", together with the more general distinction between the two systems of the *i'tibārāt* of "quiddity", have exercised an indelible influence on the development of Islamic philosophy in all its branches including the semantic theory of jurisprudence. But to go further into details about these matters will take us too far beyond the scope of the present paper." (p. 23)

18. Jacobsen Ben Hammed, Nora. 2020. "Meno's Paradox and First Principles in Fakhr al-Dīn al-Rāzī." *Oriens* no. 48:320–344.

Abstract: "This article examines Fakhr al-Dīn al-Rāzī's (d. 606/1210) epistemology and his understanding of syllogistic reasoning through a consideration of *Meno*'s paradox. It focuses on later works, namely, *al-Maṭālib al-ʿāliya, Kitāb al-*

Jabr, and *al-Tafsīr al-kabīr* as well as his treatment of the subject in *al-Mulakhkhaṣ fī l-ḥikma*. Informed by the theories of epistemology developed through the philosophical tradition of Meno's paradox and first principles, Rāzī views all knowledge formed through syllogistic reasoning as dependent on axiomatic truths (*al-badīhiyyāt*), a concept with roots in both the philosophical and theological traditions. These first principles are formed immediately upon the presence of the requisite concepts in the mind, and thus comprise Rāzī's implicit response to the paradox in that all subsequent knowledge does indeed require previous fundamental knowledge that is not sought nor acquired voluntarily. Finally, the article discusses a separate paradox implicit in Rāzī's works, namely that he both asserts in sections treating divine determinism that no knowledge can in fact be acquired whatsoever while elsewhere emphasizing the fundamental importance of knowledge acquisition."

19. Janssens, Jules. 2010. "Al-Ghazālī: The Introduction of Peripatetic Syllogistic in Islamic Law (and Kalām)." *MIDÉO : Mélanges de l'Institut dominicain d'études orientales du Caire* no. 28:219–233.

    "For a better, and hence correct understanding of the proper contents and way of expression of philosophically articulated logic, al-Ghazālī eventually points to his work Mi'yār al-'ilm, *The Standard for Knowledge*(2). As I have tried to show elsewhere, al-Ghazālī, in this latter work, consults a wide range of texts, especially Avicennian (*Najāt, Ishārāt, Dānesh-Nāmeh* (*Maqāṣid*) and *Kitāb al-ḥudūd*) and Farabian (*al-Qiyā aṣ-ṣaghīr* and *al-Maqūlāt)*(3). Very broadly speaking, it is undoubted that the logic of both Ibn Sīnā and al-Fārābī is ultimately Aristotelian inspired, but also is largely based on further developments of the Stagirite's ideas in the "Alexandrian" tradition(4).

    Let me stress that this does not mean that they are just slavish imitators of that tradition, nor that their logical doctrines are identical. It simply shows that there exists a common background, which offers al-Ghazālī the possibility to combine

parts of their works. The very fact that al-Ghazālī's does so, does not in itself prove that he totally identified with their respective logical thoughts. It only indicates that he was aware that some issues were better, or, at least, more completely developed, in one of them." (p. 220)

(2)Al-Ghazālī, *The Incoherence of the Philosophers*, A parallel English-Arabic Text, translated, introduced and annotated by M. E. Marmura (Islamic Translation Series). Provo, Utah, Brigham Young University

Press, 1997 p. 10, 1.

(3) See Janssens J., «Le *Mi'yār al-'ilm fī fann al-manṭiq* d'al-Ghazālī: sources avicenniennes et farabiennes», *Archives d'histoire doctrinale et littéraire du Moyen Age*, 69 (2002), p. 39-66, now reprinted in J. Janssens, *Ibn Sina and his Influence on the Arabic and Latin World* (Variorum Collected Studies Series CS 843). Aldershot, Hampshire, Ashgate, 2006, IX. Note that the designation *Dānesh-Nāmeh* (*Maqāṣid*) implies that al-Ghazālī's wording is in the present work sometimes although not always, closer to that of his own *Maqāṣid*, which is a slightly modified Arabic translation of Ibn Sīnā's Persian work.

(4) For a general survey of Arabic logic, see Street T., «Arabic Logic», in *Handbook of the History of Logic*, ed. Dov M. Gabbay and J. Woods. Amsterdam, Elsevier, 2004, p. 523-96, especially p. 523-60 (where he mainly deals with al-Farābī and Ibn Sīnā, and the precise nature of the relation between their respective logical systems). Street also offers a basic bibliographical list (ibid., p. 586-90)."

20. ———. 2016. "Abu al-Barakat al-Baghdadı and His Use of Ibn Sına's al-Hikma al-'Arudiyya (or another work closely related to it) in the Logical Part of His *Kitab al-Mu'tabar*." *Nazariyat Journal for the History of Islamic Philosophy and Sciences* no. 3:1–22.

Abstract: "The last four sections of the first book of Abū al-Barakāt al-Baghdādī's summa, entitled *Kitāb al-Mu'tabar*, deal with dialectics, sophistical refutations, rhetoric, and poetics in full line with Aristotle's *Organon*. However, they are not so

much based on Aristotle's works, but on a work of the young Ibn Sīnā, namely *al-Hikma al-ʿArūdiyya*. Both texts have much in common not only in their structure, but also in their very wording. The article presents a basic survey of the correspondences for all four sections and also highlights the most significant differences. However, important part of these differences has a counterpart in an (incomplete) logical text, which is present in the manuscript Nuruosmaniye 4894 and which is, in turn, very close to, albeit not identical, with Ibn Sīnā's a*l-Hikma al-ʿArūdiyya* as conserved in the unique manuscript Uppsala 364. Therefore, it is obvious that Abū al-Barakāt takes over many formulations and, at once, many ideas from Ibn Sīnā. However, he adds clearly personal elements that often seem to have been religiously inspired and, on occasion, consciously returns to Aristotle's wording."

21. Kalbarczyk, Nora. 2019. "In the Footsteps of Ibn Sīnā? The Uṣūlī Debate on the *Argumentum e Contrario*." In *Philosophy and Jurisprudence in the Islamic World*, edited by Adamson, Peter, 53–65. Berlin: de Gruyter.

    "From al-Ghazālī (d. 505/1111) onwards we should not expect to see any direct reception of Greek logic – the question is rather in which way *uṣūl al-fiqh* texts were influenced by Avicennian philosophy of language and logic and how the two traditions interacted. In this chapter I intend to show how the debate on the argumentum *e contrario* (*mafhūm al-mukhālafa* or *dalīl al-khiṭāb*) was informed by Avicennian philosophy of language and logic.

    I will start by outlining the controversial aspects of the argumentum *e contrario* in general before turning to Fakhr al-Dīn al-Rāzī's (d. 606/1210) reasoning against it, and then to the modifications of both the Avicennian position and al-Rāzī's critique in the subsequent commentary literature. We will be able to discern a shift in the *madhhab* positions on this issue: even though Fakhr al-Dīn al-Rāzī was a Shāfiʿī scholar, Ḥanafīs standardly use a modified refutation of his criticism of the argumentum *e contrario* against its Shāfiʿī proponents." (pp. 53-54)

22. Karabela, Mehmet Kadri. 2010. *The Development of Dialectic and Argumentation Theory in Post-classical Islamic Intellectual History*, McGill University.

    Available at Academia.edu

    Abstract: "This dissertation is an analysis of the development of dialectic and argumentation theory in post-classical Islamic intellectual history. The central concerns of the thesis are; treatises on the theoretical understanding of the concept of dialectic and argumentation theory, and how, in practice,

    the concept of dialectic, as expressed in the Greek classical tradition, was received and used by five communities in the Islamic intellectual camp. It shows how dialectic as an argumentative discourse diffused into five communities (theologicians, poets, grammarians, philosophers and jurists) and how these local dialectics that the individual communities developed fused into a single system to form a general argumentation theory (*ādāb albaḥth*) applicable to all fields.

    I evaluate a treatise by Shams al-Dīn Samarqandī (d.702/1302), the founder of this general theory, and the treatises that were written after him as a result of his work. I concentrate specifically on work by ʻAd}ud al-Dīn al-Ījī (d.756/1355), Sayyid Sharīf al-Jurjānī (d.816/1413), Taşköprüzâde (d.968/1561), Saçaklızâde (d.1150/1737) and Gelenbevî (d.1205/1791) and analyze how each writer (from Samarqandī to Gelenbevî) altered the shape of argumentative discourse and how later intellectuals in the post-classical Islamic world responded to that discourse bequeathed by their predecessors.

    What is striking about the period that this dissertation investigates (from 1300-1800) is the persistence of what could be called the linguistic turn in argumentation theory. After a centuries-long run, the *jadal*-based dialectic of the classical period was displaced by a new argumentation theory, which was dominantly linguistic in character. This linguistic turn in argumentation dates from the final quarter of the fourteenth century in Ījī's impressively prescient work on *ʻilm al-wadʻ*.

This idea, which finally surfaced in the post-classical period, that argumentation is about definition and that, therefore, defining is the business of language—even perhaps, that language is the only available medium for understanding and being understood—affected the way that argumentation theory was processed throughout most of the period in question.

The argumentative discourse that started with Ibn al-Rāwandī in the third/ninth century left a permanent imprint on Islamic intellectual history, which was then full of concepts, terminology and objectives from this discourse up until the late nineteenth century. From this perspective, Islamic intellectual history can be read as the tension between two languages: the ‚language of dialectic' (*jadal*) and the language of demonstration' (*burhān*), each of which refer not only to a significant feature of that history, but also to a feature that could dramatically alter the interpretation of that history."

23. Karimullah, Kamran I. 2017. "Influence of Late-Antique (ca. 200–800 A.D.) Prolegomena to Aristotle's *Categories* on Arabic Doctrines of the Subject Matter of Logic: Alfarabi (d. ca. 950 A.D.), Baghdad Peripatetics, Avicenna (d. 1037 A.D.)." *Archiv für Geschichte der Philosophie* no. 99:237–299.

    Abstract: "In this article, I explore how Avicenna's (d. 1037) views about the subject matter of logic relate to earlier debates about Aristotle's *Categories* among Aristotle's Platonist commentators and the Baghdad Peripatetics, chief among them being Alfarabi (d. ca. 950). I argue that Alfarabi invents the idea of secondary intelligibles (or "second intentions"). I show, however, that under the influence of the middle and late Platonist commentary tradition on the *Categories*, he insists that primary intelligibles, not secondary intelligibles, are the subject matter of logic. While Avicenna thus takes over the idea of secondary intelligibles from Alfarabi, I show that Avicenna rejects Alfarabi's view that primary intelligibles are the subject matter of logic. I conclude that what motivated Avicenna to hold that secondary intelligibles are the subject matter of logic was his belief that logic is a discipline of philosophy and not merely an instrument of it."

24. Kassem, Omar. 2016\. "Abū Ḥāmid al-Ghazālī on intensional logic, freedom and justice." *Journal of Islamic Philosophy* no. 10:19–61.

    "Aristotelian vs. intensional logic: It was Aristotle who first brought up the three fundamental laws of identity, non-contradiction and the excluded middle, but in Aristotle these are descriptions of reality contained in his *Metaphysics*, in Book Gamma at 1005b19. For Aristotle, logic didn't have the psychological dimension to be intensional, and knowledge was simply the realistic view that knowledge of reality was direct and unmediated. Intensionality arises in Ghazālī, however, from the very first discussion of *Tahāfut*, where the human "will" (*irāda*) is not only something that is apart from the things we find in this world, but is that upon which perception ultimately depends, as in the example of the thirsty man facing two equidistant glasses of water [*Tahāfut*, p. 38:11-41:3]. It is not the nature of a thing which make one incline towards one of two possible contradictories (*nisbat al-dhāt ilā al-ḍiddayn wāḥida*) [*Iqtiṣād* 101:6-7].

    In the European tradition, Antoine Arnauld and Pierre Nicole in *The Port Royal Logic* [*La Logique ou l'art de penser*] (1662) made the first signal advance over the Aristotelian understanding of logic, which in its time it sought to explain in terms of "... the reflections men have made on the four main operations of their mind-conceiving, judging, reasoning, and ordering."(23) But this description of intensionality still presupposed that ideas are prior to judgments, and that the function of judgments is merely to state the combinations of ideas that follow from comparing them(24). Kant goes towards a fuller intensionality in that he doesn't presuppose a plurality of already determined ideas that could be combined into judgments when they are compared at all. What he sees is an indeterminate manifold of representations which the judgment must then bring to one and the same "objective unity of apperception" [CPR B141-2, p. 251].

    It is precisely in this way that the language concerning human judgments in Ghazālī, such as 'affirmation' (*ithbāt*) and

‘negation’ (*nafā* or negated: *nafī*), is determinative of ideas and that, as a consequence, the categories themselves are related to thought processes and are of a different logical order to the Aristotelian categories." (pp.28-29)

25. Kemal, Salim. 1997. "Al-Ghazalī, Metaphor and Logic." In *Across the Mediterranean Frontiers: Trade, Politics and Religion, 650-1450*, edited by Agius, Dionisius A. and Netton, Ian Richard, 205–223. Turnhout: Brepols.

"Any Muslim religious philosopher must account for the status and seriousness of figurative language since it occurs frequently in the Qur'an. Perhaps surprisingly, given his reputation for rejecting philosophy and for a commitment to mysticism, al-Ghazalī (d. 505/1111) finds logic crucial to this explanation. In the space available in this paper my intention is to sketch out al-Ghazalī,'s account of figurative language, to show how he deals with truth, and thereby to identify some of the issues this raises that need further consideration." (p, 205, a note omitted)

(...)

"Further issues

This explanation of al-Ghazalī's conception of metaphor and figurative language leaves a number of issues uncharted. For example, we need to consider in more detail the source and nature of the premises about which we reason and which we can develop in figurative language. Given his mysticism, we may have to accept that some premises occur as intuitions or insights into the nature of reality. This is entirely compatible with the use of logic as a tool of reason, however, in that the insights and premises cannot be self-contradictory if they are to be taken seriously, regardless of whether their expression is precise or relies on figurative language. This comparison also requires us to consider further how al-Ghazalī understands the sources of premises - an issue that is clearly connected with the

nature of essential and other existences and the issue of how fully it is possible to set out the rules and conditions for particular levels of existence. In any case, what I wanted to emphasise in this paper is that reason has an important role to play in al-Ghazalī's work, and it would be unfortunate if we were to reject its place for the sake of ascribing a merely irrational mysticism to this philosopher." (p. 223)

26. Key, Alexander. 2018. *Language between God and the Poets: Maʿnā in the Eleventh Century*. Oakland: University of California Press.

    Chapter 6, *Logic*, pp. 152-195.

    "What is language? How does language work? Scholars writing in Arabic in the eleventh century had good answers to these two questions. Their theories of language, mind, and reality—of words, ideas, and things—appear in books about how to describe God, how to interpret scripture, how to solve logical problems, and how to criticize poetry. They used a conceptual vocabulary very different from the Anglophone or European toolbox that academia provides for us today. This book is a study of their Arabic intellectual world and a translation of their approaches to questions that still concern us a millennium later. It is a book about these scholars' analyses of how their minds worked, and of the role language played when they turned those minds to the world outside.

    My methodological principle in this research has been to follow eleventh-century Arabic scholars' conceptual vocabulary into their areas of concern. This is consequently a book about maʿnā (their word for mental content) and about ḥaqīqah (their word for accuracy). It is very much a work of philology." (p. 1)

    "Ibn Sīnā inherited Greek and Arabic Aristotelianism and turned it into a new synthesis with a new conceptual vocabulary. Translation lay at the heart of this process.

    In the eleventh century, Ibn Sīnā wrote in dialogue with both the philhellenic commentary tradition and the Arabic tradition of thought about language. Where the Baghdad School of

Aristotelian philosophers had claimed that logic enabled them to dispense with Arabic grammar (see my article with Peter Adamson),(1) and al-Fārābī had tended to use calques of Greek words (Zimmermann argues persuasively that he did so deliberately),(2) Ibn Sīnā chose to write Arabic with all the challenges and rewards such a decision entailed. He was faced with Aristotle in Arabic and translation choices made by other scholars. The Arabic conceptual vocabulary he developed gave him the tools to rethink human cognition, logical process, and the role of God." (p. 152)

27. ———. 2021. "Notes around Ambiguity: Ibn Sīnā’s Logic, ʿAbd al-Qāhir al-Jurjānī’s Poetics, Rāghib’s Two-Meanings-at-One-Time, and the Figures of Ibhām, Istikhdām, and Tawriya." In *Philosophy and Language in the Islamic World*, edited by Germann, Nadja and Najafi, Mostafa, 77–99. Berlin: de Gruyter.

"These notes are adapted from the 2018 monograph *Language Between God and the Poets: Maʿnā in the Eleventh Century*, to which an interested reader may turn in search of more detail about logic and poetics, the additional genres of lexicography and theology, and explanations of the methodology and translation strategy adopted here. The adapted sections have been rearranged around the question of ambiguity in logic and poetics, and new material concerning whether a word can have two meanings at the same time has been added, in addition to a

discussion of the rhetorical figures of *ibhām, istikhdām, and tawriya*.

We begin in the eleventh century with Ibn Sīnā's discussions of two Aristotelian questions that speak to language's potential for logical ambiguity: *pros hen* and Aristotelian homonymy. Next, we look at ʿAbd al-Qāhir al-Jurjānī's theory of lexical accuracy (*ḥaqīqa*), which takes the lexicon into the imaginary poetic image. In order to think more about ambiguity itself, we then turn to al-Rāghib al-Iṣfahānī's claim that a word could have two meanings at the same time, and to three figures used by critics over the next few centuries to manage and structure ambiguity: ibhām, istikhdām, and tawriya. In conclusion, we return to Jurjānī and syntax time." (p. 77)

28. King, Daniel. 2013. "Grammar and logic in Syriac (and Arabic)." *Journal of Semitic Studies* no. 58:101–120.

    Abstract: "In order to advance the debate surrounding the origins and background of the Arabic grammatical tradition, we offer an exploration of the Syriac grammatical tradition with a focus on the interdisciplinarity it shared with the study of logic. The essay demonstrates that the essentialist view of grammar adopted by many Greek thinkers led to the working assumption that logic and grammar were virtually the same discipline, and that the Syrians shared this view of things and transmitted it to Arab scholasticism. A number of philosophers and grammarians are explored with a view to demonstrating this point.

    Scholasticism in the Late Antique Near East was a cross-linguistic phenomenon which never respected the boundaries we like to draw between Greek, Syriac, Hebrew, and Arabic worlds. Arabic grammar grew out of this background, while being driven by its own internal genius."

29. ———. 2015. "Logic in the Service of Ancient Eastern Christianity: An Exploration of Motives." *Archiv für Geschichte der Philosophie* no. 97:1–33.

    Abstract: "The present article explores the motives behind the so-called 'appropriation' of Aristotelian logic by the Syriac-

speaking community in the Near East from the sixth to the ninth centuries. While it is often assumed that the Syrians adopted Greek logic for religious, and polemical, ends, we aim to show rather that the underlying reasons given for the study of logic and its propagation through educational institutions were much the same among Syriac as they were for Greek practitioners of philosophy in Late Antiquity. There was a marked continuity between the late ancient Greek centres of learning and the Syriac monasteries.

Syriac theologians rarely, if ever, sought to use Aristotle as a crutch in sectarian religious debates. There are implications for our understanding of how and why the Arabic renaissance in logic came about."

30. Kleven, Terence. 2016. "Rhetoric, Poetics, and the *Organon*." In *The Routledge Companion to Islamic Philosophy*, edited by Taylor, Richard C. and López-Farjeat, Luis Xavier, 82–99. New York: Routledge.

    "As an instrument it was not obviously controversial, if used for the right purposes, and it could be helpful in distinguishing true from false opinions. It was necessary, however, to know what logic was, and there was more than one opinion on the matter. One particular question that emerged in this inquiry of the nature and scope of logic was which books of Aristotle actually constituted his “instrument” of study. Aristotle’s *Rhetoric* and *Poetics* were included as two of the syllogistic arts by some ancient and medieval scholars and excluded by others. Classical Islamic philosophy devoted considerable attention to the place of these two books among the logical arts, and thus the title of this chapter introduces a topic for inquiry that is forcefully present in Islamic philosophy. The purpose of this chapter is to articulate the reasoning on the basis of which two of the finest Arabic philosophers—al-Fārābī and Ibn Rushd (Averroes)—included rhetoric and poetry in the corpus of logical arts in the Islamic world." (pp. 82-83)

31. Klinger, Dustin D. 2019. "A New Take on Semantics, Syntax, and the Copula: Note on Qutb al-Din al-Razi al-Tahtani’s Analysis of Atomic Propositions in the *Lawāmiʿ al-asrār*."

Nazariyat Journal for the History of Islamic Philosophy and Sciences no. 5:59–80.

Abstract: "In logic, Quṭb al-Dīn al-Razī was broadly an orthodox Avicennan. However, in his enormously influential commentary on al-Urmawī's logic handbook *Maṭāli ʿ al-anwā*r, he explicitly criticizes Avicenna and advances a novel analysis of atomic propositions. As a later addition that only survives in two manuscripts shows, Quṭb al-Dīn was troubled by traditional accounts of the syntax and semantics of atomic propositions. For him, the main problem was a confused understanding of the copula. In atomic propositions of the form "A is B," the copula is the word that indicates that B is predicated of A ("is" in English, "esti" in Greek, but not usually expressed in Arabic). Avicenna had maintained, for lack of an Arabic equivalent to Aristotle's "esti," that the Arabic pronoun "huwa" should be used to form complete atomic propositions (e.g., "Jīm huwa bā'"). Quṭb al-Dīn considers this to be mistaken on several levels. To straighten out the mistake, he disambiguates the predicative nexus of a proposition from its judgment, formulates a unified notion of unsaturatedness for predicates, and gives an account of the judgment-nexus. An upshot of this novel analysis is a reinterpretation of the Aristotelian distinction between *secundum adiacens* and *tertium adiacens propositions*."

32. ———. 2024. "Forms of Carroll's Paradox in Post-Classical Arabic Logic." *History and Philosophy of Logic* no. 45:262–277.

Abstract: "Arabic logicians in the thirteenth century discussed a set of arguments raised by the theologian Fakhr al-Dīn al-Rāzī (d. 1210) that in some respects closely resembles Carroll's paradox. Roughly, the paradox states that we can never reach a conclusion from a set of premises without incurring an infinite regress. The present article presents and discusses Rāzī's formulation of the problem with syllogistic deduction, his own solutions to the problem, and the contributions of Afḍal al-Dīn al-Khūnajī (d. 1248) and Najm al-Dīn al-Kātibī (d. 1276). It is argued that the proposed solutions developed by these authors

are best understood as tending in the direction of Gilbert Ryle's distinction between *knowing-that* and *knowing-how*."

33. ———. 2025. "A 12th Century Attack on Peripatetic Logic: Rashīd ad-Dīn al-Waṭwāṭ's (d. 1182) Treatise "A Doubt About reductio ad absurdum" and Its Aftermath." In *Logic, Soul, and World: Essays in Arabic Philosophy in Honor of Tony Street*, edited by Ahmed, Asad Q., Zarepour, Mohammad Saleh and Strobino, Riccardo, 326–365. Leiden: Brill.

    "In this article I argue that a text that has only recently been attributed with certainty to Rashīd ad-Dīn al-Waṭwāṭ (d. 1182), a courtier and literary figure otherwise not associated with logic, sheds new light on the pre-Rāzīan engagement with Avicenna's modal logic, specifically with problems arising for conversion from the profusion of propositional types. After a brief contextualization of Waṭwāṭ, his text, and the history of Arabic logic in 12th century Khwārazm, I propose to read Rashīd ad-Dīn's "A Doubt About *reductio ad absurdum*" as a wholesale attack on the consistency of Avicennan logic (section 2). This attack is based on the following argument: Since *reductio* is needed to prove certain conversions that in turn are needed to prove the validity of all but the four first figure syllogistic moods, *reductio* is indispensable for the entire deductive system.

    However, *reductio* can be used to prove several distinct propositions as conversions of a single proposition. As every proposition only has one converse, some of them must be false. Hence, *reductio* is not an adequate proof strategy for conversion, and, by extension, not for the validity of syllogistic moods. The argument, as I explain in detail in section (3), would not work against Aristotle's assertoric syllogistic, as it capitalizes on the profusion of propositional types. The earliest detailed response, most likely from ar-Rāzī's interlocutor in the Transoxanian Debates(7) Afḍal ad-Dīn Ibn Ghaylān al-Balkhī (d. ca. 1194), was, I argue, eventually not successful (4). Another contemporary, Shihāb ad-Dīn as-Suhrawardī (d. 1191), acquiesced in the insufficiency of reductio proofs, but believed there was no harm for logic overall (5). It was only with ar-Rāzī,

whose toolkit of newly forged logical terms for novel distinctions was richer than al-Waṭwāṭ's, that the attack was forcefully and, it seems, decisively met (6). I conclude with a summary and some broader observations on what this debate may tell us about the history of logic and philosophy in the 12th century (7)." (p. 328)

34. Komath, Muhammed. 2024. "Defeasible Reasoning in Islamic Legal Theory." *Informal Logic* no. 44:431–467.

Abstract: "Logicians commonly understand nonmonotonic types of reasoning can warrant rational acceptance of conclusions. The significance and legitimacy of these forms of arguments, which were long considered fallacious, has been contentious among logicians in the Aristotelian logical tradition. In contrast, Islamic jurisprudence (*fiqh*), has long recognised the importance of non-deductive forms of reasoning, and demonstrated how conventionally understood fallacies are not essentially fallacies. *Qiyās* – generally representing analogical reasoning – is such a case of defeasible reasoning in Islamic legal theories. I show through works of two emblematic medieval Muslim jurist-logicians, al-Juwainī and al-Ghazzālī, that understanding the legitimacy of non-deductive forms of arguments is core to Islamic legal theories (*usūl al-fiqh*), which proposed a dialectical method (*jadal*) of approach."

35. ———. 2025. "Rational Force of Analogy/Qiyās in Law: Logic of Law in Islamic and Contemporary Legal Reasoning." *Informal Logic* no. 45:423–448.

Abstract: "Analogy is an inherently fragile form of argument, as the conclusion is derived from similarity, while overlooking dissimilarities. Yet law necessarily depends upon analogical

reasoning to ensure consistency and predictability in its rulings. This entanglement of fragility and necessity compels the legal traditions, like Islamic and common laws, to formulate a justification of analogy when applied in law. The most successful justification, I argue, is the one that is anchored in logic. This logical grounding is a shared feature among contemporary legal theorist Scott Brewer, the informal logician Douglas Walton, and the 12th-century Muslim jurist-logician al-Ghazzālī, as all three insist that the justification of legal analogy is logical.

This paper aims to trace the thematic contours of their explanation in order to demonstrate, drawing primarily on al-Ghazzālī's two works: *al-Mustaṣfā fī Uṣūl al-Fiq*h and *al-Muntaḥal fī al-Jadal,* that al-Ghazālī's model of analogical reasoning effectively integrates key elements of Brewer's abduction model and Walton's model of defeasible argument."

"Abû l-Walîd Muhammad Ibn Rushd's (the Latin Averroës, d. 1198) commentaries on Aristotle attest to how the Andalusian philosopher and jurisprudent tinkered with the interpretation of his master's thought until the very end of his life. Ibn Rushd's seemingly evergrowing appreciation for the minutiae of Aristotelian lore came coupled with a penchant for formalisation. The long commentaries, the crowning

achievement of a long and distinguished career, are lined with attempts to knock informal arguments into syllogistic shape.(1)

(…)

"The following presentation takes its cue from (I) Ibn Rushd's eighth physical *Question*, which presents a novel interpretation of the argumentative structure of the *Physics* proof for an immaterial First Mover.

(II) An examination of the logical underpinnings of Ibn Rushd's proposed interpretation gives way to (III) a consideration of the theological concerns that fuelled Ibn Rushd's search for a structurally sound reading of Aristotle. (IV) From here, I move to John Buridan's comments on Aristotle's argumentation in natural philosophy, which are explicitly directed against the Commentator and his followers in the Latin world, most notably Thomas Aquinas. Supplementary materials from Nicole Oresme serve to illustrate the difference between the two types of explanation, a difference that is to an extent (V) paralleled by a division among current theorists of philosophical logic." (pp. 447-448)

37. ———. 2010. "Al-Ghazālī on the Signification of Names." *Vivarium* no. 48:55–74.

Abstract: "Al-Ghazālī's most detailed explanation of how signification works occurs in his treatise on *The Beautiful Names of God*. Al-Ghazālī builds squarely on the commentary tradition on Aristotle's *Peri hermeneias:* words signify things by means of concepts and correspondingly, existence is laid out on three levels, linguistic, conceptual, and particular (i.e. extramental). This framework allows al-Ghazālī to put forward what is essentially an Aristotelian reading of what happens when a name successfully picks out a being: when a quiddity is

named by some kind term, its referent in the mind is formally identical to the quiddity of an individual existent which belongs to that natural kind. Al-Ghazālī then proceeds to tease out the implications of this scheme for the special problem of signifying God. It turns out that the Peripatetic theory, which al-Ghazālī appropriates from Ibn Sīnā, is ill equipped for the task as al-Ghazālī envisions it."

38. Kuşlu, Harun. 2024. "Context-Sensitive Terms In Islamic Philosophy of Language: A Study On The Logicalization of Demonstrative Pronoun." *Nazariyat Journal for the History of Islamic Philosophy and Sciences* no. 10:73–104.

    Abstract: "The issue of ambiguous words (*al-mubhamât*), which occupies the core subject of ʻAdud al-Dīn al-Ījī's (d. 756/1355) *al-Risālat al-wadʻiyya*, has blossomed into subject of a serious logical and semantical dispute between two great names of later Islamic thought, Saʻd al-Dīn al-Taftāzānī (d. 792/1390) and Sayyid Sharīf al-Jurjānī (d. 816/1413). The operant traces of the debate can palpably be traced up to the late Ottoman polymath Ismail Gelenbevī (d. 1205/1791) and his commentators. In this paper, I take up the relevant debate with reference to the problem of context-sensitive terms in the contemporary philosophy of language. Throughout the article, I examine both the course of the issue in the philosophy of language tradition by using the literature following al-Ījī's treatise and how al-Taftāzānī has made this topic into a matter of logic by referring to some works of logic. Thus, I intend to show the contributions or criticisms of some philosophers from al-Taftāzānī to Gelenbevī towards the logicalization of context-sensitive terms."

39. Lagerlund, Henrik. 2008. "The Assimilation of Aristotelian and Arabic Logic up to the Later Thirteenth Century." In *Handbook of the History of Logic, Volume 2: Mediaeval and Renaissance Logic*, edited by Gabbay, Dov M. and Woods, John, 281–346. Amsterdam: Elsevier North-Holland.

    "The development of logic from the rediscovery of the complete corpus of Aristotle in the early twelfth century through the thirteenth and fourteenth centuries cannot be characterised as

anything else than remarkable. No other time in history, except the late nineteenth and twentieth centuries, has seen such a development of logic.

In this chapter, I will try to give an account of some of the problems and developments from the late twelfth century into the mid-thirteenth century. My focus will primarily be on the commentary tradition of Aristotle's logical works, that is, the *Categories, De interpretatione, Prior Analytics, Posterior Analytics, Topics,* and *Sophistici Elenchi.*(1) Running parallel to the commentary tradition is a less known and much less studied tradition, namely the history of the Arabic logical works available in Latin at this time. Most scholars are of the opinion that Arabic logic had very little if any influence on Western logic, but, although Arabic logic did not revolutionise western logic as was once thought, it certainly is part of the Western logical tradition and as such it had a not insignificant influence; although not in the way previously thought. I will here highlight some of the more interesting things I have noticed about these works.(2)" (p. 281)

(1) I will not say anything about the commentaries on the *Posterior Analytics*. This tradition is hardly studied and its development seems to be a little bit different than the other works.

Although it is a work on method it is unclear whether thirteenth century logicians saw it as a work in logic. For an overview of this tradition see [Longeway, 2007, 3–79].

(2) For a more detailed study of this tradition and its influence on Western logic I will have to refer the reader to a forthcoming monograph of mine with the title Latin Arabic Logic in the Middle Ages: The Doctrines and Influences of Arabic Works on Logic Translated into Latin in the 12th and 13th Centuries.

40. ———. 2010. "Al-Ghazālī on the form and matter of the syllogisms." *Vivarium* no. 48:193–214.

Abstract: "Al-Ghazālī's *Maqāsid al-falāsifa* [*The Aims of the Philosophers*] [*] is an intelligent reworking of Avicenna's *Dānesh-name* (Book of Science). It was assumed by Latin

scholastics that the *Maqāsid* contained the views of Al-Ghazālī himself. Very well read in Latin translation, it was the basic text from which the Latin authors gained their knowledge of Arabic logic. This article examines the views on the form and matter of the syllogism given in the *Maqāsid* and considers how they would have been viewed by a Latin reader in the thirteenth century."

41. ———. 2020. "Logic, Arabic, in the Latin Middle Ages." In *Encyclopedia of Medieval Philosophy. Second Edition*, edited by Lagerlund, Henrik, 1083–1086. Dordrecht: Springer.

    Abstract: "C. Prantl argued in the mid-nineteenth century that the part of western logic nowadays called *logica modernorum*, that is, the so called theories of the properties of terms, entered into the Latin world from translations of Byzantine and Arabic logical works. This was, as M.L. de Rijk showed in the 1960s, completely wrong. He argued convincingly that this part of medieval logic was partly due to Aristotle's *Sophistici elenchi* but foremost it was due to the creative minds of late twelfth-century logicians.

    His judgment of earlier views was so harsh, however, that Arabic logic in the Latin tradition has hardly been studied at all. Most scholars are of the opinion that Arabic logic had very little, if any, influence on western logic, but although Arabic logic did not revolutionize western logic as was once thought, it certainly is part of the western logical tradition and as such it had quite a significant influence, though not in the way previously thought."

42. Lameer, Joep. 1993. "Aristotelian rhetoric and poetics as logical arts in medieval Islamic philosophy." *Bibliotheca Orientalis* no. 5:563–582.

    Review of Deborah Black, *Logic and Aristotle's Rhetoric and Poetics in Medieval Arabic Philosophy*.

43. ———. 1996. "The Organon of Aristotle in the Medieval Oriental and Occidental Traditions." *Journal of the American Oriental Society* no. 116:90–98.

    Abstract: "In this review article of Charles Burnett's edition of Glosses and Commentaries on Aristotelian Logical Texts: The Syriac, Arabic and Medieval Latin Traditions, the focus will be on the two contributions which concern the medieval Arabic tradition, whereas my comments on the Syriac and medieval Latin sections will be of a more succinct and marginal character. In his "Remarques sur la tradition arabe de L'Organon d'aprés le manuscrit Paris, Bibliothèque Nationale, ar. 2346," Henri Hugonnard-Roche argues, against Richard Walzer, that a significant part of the marginal and interlinear glosses and notes to the Arabic translations of the *Organon* as contained in this famous manuscript are not merely philological, but constitute evidence of a difference in understanding the logic of Aristotle. Challenging though it is in proposing a new perspective, the majority of the examples given by Hugonnard-Roche do not support this thesis, as I will venture to show. My comments on Dimitri Gutas' "Aspects of Literary Form and Genre in Arabic Logical Works" are of a more complementary character, with a special emphasis on al-Farabi. A complete listing of the surviving copies of epitomes of Ibn al-Tayyib's commentaries on the *Organon* is also given."

44. ———. 2013. "Ibn Ḥazm' Logical Pedigree." In *Ibn Ḥazm of Cordoba: The Life and Works of a Controversial Thinker*, edited by Adang, Camilla, Fierro, Maribel and Schmidtke, Sabine, 417–428. Leiden: Brill.

    "Many years ago, I drew attention to the fact that after Abū Naṣr Fārābī (d. 339/950), Ibn Ḥazm was among the earliest Muslim authors to have suggested that a parallel can be drawn between Aristotelian modal logic and the modalities of a system of norms.(1) The subject is not unimportant, because norms regulate human behaviour, so that a better understanding of their perceived interconnections will lead to a better understanding of the workings of normative (i.e. legal) systems. As a Ẓāhirī, Ibn Ḥazm was a declared advocate of a literalist

interpretation of the sources of Islamic jurisprudence.(2) It is therefore reasonable to assume that his discussions of the modalities must have been aimed at strengthening his literalist legal views. But ahead of any future examination of this hypothesis, it will be helpful to first determine Ibn Ḥazm's lineage in the field of Aristotelian logic, which is what this article proposes to do." (pp. 417-418, a note omitted)

(1) Joep Lameer, *Al-Fārābī and Aristotelian Syllogistics: Greek Theory and Islamic Practice*, Leiden 1994, p. 240f. What is meant is the idea that a comparison can be made between the concepts of necessity, possibility and impossibility on the one hand, and the notions of obligation, permission and prohibition on the other. In western philosophy it is not until much later that we can find traces of similar ideas, for which see e.g. Georg Henrik von Wright, "On the Logic of Norms and Actions," *New Studies in Deontic Logic. Norms, Actions and the Foundations of Ethics*, ed. Risto Hilpinen, Dordrecht 1981, (3–35) p. 3 (referring to Leibniz, 1646–1716), and Simo Knuuttila, "The Emergence of Deontic Logic in the Fourteenth Century," *New Studies in Deontic Logic*, pp. 225–226, 240 (referring to Robert Holcot and Roger Rosetus, both 14th cent.). See also Paul McNamara, "Deontic Logic," The Stanford Encyclopedia of Philosophy (Fall 2010 Edition), ed. Edward N. Zalta).

45. ———. 2014. "(*Ghayr al-ma'lūmyamtanï al-ḥukm 'atayhi*) An Exploratory Anthology of a False aradox in Medieval Islamic Philosophyl." *Oriens* no. 42:397–453.

Abstract: "In Islamic philosophy, knowledge is divided into 'conception' (*taṣawwur*) and 'belief' (*taṣdīq*). While there is no objection to dividing knowledge in this way, problems arose when belief was described as being 'composed' of conceptions. An early objection to belief's dependence upon conceptions was based on a self-referential reading of the principle that 'the unknown cannot be a subject of predication,' which was another way of saying that 'what is not conceived, cannot be believed.' This objection was answered in various ways. While

Naṣīr al-Din Ṭūsī (d. 672/1274) may have been the first to know how to solve paradoxes of self-reference, it was Sirāj al-Dīn Urmawī (d. 682/1283) who dominated most of the later discussions."

46. ———. 2019. "Deontic Modalities in Ibn Ḥazm." In *Philosophy and Jurisprudence in the Islamic World*, edited by Adamson, Peter, 113–128. Berlin: de Gruyter.

"To this day, not much has been written about obligations, permissions, and prohibitions in Islamic law and their place in medieval Arabic logic.(1)"

(...)

"After al-Fārābī, the second earliest Muslim author known to have suggested that a parallel might be drawn between the modalities of Aristotelian logic and the deontic qualifications of "obligatory", "permissible", and "impermissible" is the Andalusian polymath Ibn Ḥazm (d. 456/1064), who earned his fame as a poet, historian, theologian, jurist, and minor philosopher (EI2 [*Encyclopaedia of islam*, Second edition], "Ibn Ḥazm").(12)

The comparison in question is found in his treatise on Aristotelian logic, a*l-Taqrīb li-ḥadd al-manṭiq* (*A Clarification of the Essence of Logic*).(13) Even if he did study logic in the tradition of the Baghdad school in logic as represented by Abū Bishr Mattā b. Yūnus and al-Fārābī (Lameer 2013, 417–428), Ibn Ḥazm was not a logician, but mostly a jurist and theologian. As such, he is especially known as a representative of the Ẓāhirī school, which propagated a literal interpretation of the Qur'an and the traditions (EI2 "al-Ẓāhiriyya")."

(1) The only relevant publications that I know of are Mikhail 2004, referred to in note 33 below; Auda 1428/2007, 237, where he says that Georg H. von Wright's "law of commitment" which states that "If doing what we ought to do commits us to do something else, then this new act is also something that we ought to do" is identical to the rule stating "*mā lā yatimmu al-wājib illā bihi fa-huwa wājib*" in Islamic law; Lameer 1994, 239–256, mentioned below in reference to al-Fārābī.

    Contain the translation of "On composition and stylistic excellence" (pp. 78-86).

    "Little is known about the life of Abui Bakr ᶜAbd al-Qa.hir b. ᶜAbd al-Rahmain al-Jurjāni(1), the author of the following translated selection.(2) Noted among his contemporaries as a grammarian, he was the student, in Jurjān, of ᶜAli b. ᶜAbd al-ᶜAziz al-Jurjāni and of Abu- l-usayn al-Fārisi, the maternal nephew of Abui ᶜ̲Ali al-Fārisi. He is not known to have studied anywhere outside his native Jurjān. His date of death is given as 471 a.h./1078 A.D. or 474 a.h./1081 A.D. Among his most important grammatical works are *Mi'at ᶜamil* (with its many commentaries) and *Kitāb al-jumal*. In the field of poetics, we have his two major treatises, *Asrar al-balāgha* and *Dalā'il iᶜjāz al-Qur'ān*. The following selection, translated from the latter of these two, constitutes the first succinct statement in the course of *Dalā'il iᶜjāz al-Qur'ān* of the stylistic theory ᶜAbd al-Qāhir is presenting." (p. ā76)

49. Laughlin, Burgess. 1995. *The Aristotle Adventure: A Guide to the Greek, Arabic, and Latin Scholars who Transmitted Aristotle's Logic to the Renaissance*. Flagstaff: Hale.

    "*The Aristotle Adventure* is a guide to individuals who had the courage and integrity to pursue their highest values despite distractions, setbacks, and threats. The object of their struggle was logic, the tool of an ancient philosophy of reason—a philosophy which offers the promise of happiness, here in this world.

This book is mainly a guide to the past, from the standpoint of one subject—Aristotle's logic. Where scarce historical evidence permits, this book is also partly:

* A saga (a straightforward account of a sequence of people and events).

* A drama (an account of fundamental values in conflict).

* An adventure story (an account of a bold, risky enterprise whose outcome was uncertain and hazardous).

This book is not a history of Aristotelianism, philosophy, or logic. Nor is it a scholarly book. (In the main text, I have not debated the evidence for my claims.) However, abundant end-notes allow readers to pursue more information.

In doing research for another project, I searched for a book such as *The Aristotle Adventure*.

I couldn't find one, so I wrote one. Specifically, this book has three purposes:

* Recreate the story from scattered bits and pieces in our record of the past.

* Offer the story as an inspiration to anyone who lives by reason today.

* Give perspective to anyone passing a philosophy of reason to the future." (*Preface*, p. VII)

50. Leaman, Oliver. 1997. "Logic and Language in Islamic Philosophy." In *Companion Encyclopedia of Asian Philosophy*, edited by Carr, Brian and Mahalingam, Indira, 862–874. London: Routledge.

"The development of logic in Islamic philosophy is significant not so much for its contribution to philosophy but for the part it played in the structure of Islamic law and theology. Although we tend now to regard logic as a part of philosophy, within Islamic philosophy logic came to have a rather controversial position which fostered its transplantation into other bodies of theory. The introduction of logic into the Islamic world followed the same sort of pattern as that of philosophy itself.

The tenth-century translators in Baghdad had available to them a large body of Syriac works covering wide areas of Greek thought, both practical and theoretical." (p. 862)

(...)

"Yet this positive role of logic was not universally acknowledged, as is revealed by the popular slogan *man taman aqa tazandaqa* ('whoever is in favour of logic is in favour of heresy'). What was the nature of Arabic logic which was both so favoured and so reviled? It consisted of Aristotle's *Organon* supplemented by Porphyry's *Eisagōgē* and Stoic and Neoplatonic developments. A popular organization of logic was the *Eisagōgē* presented as an introduction to the *Organon*, generally consisting of the Categories, *Hermeneutics, Analytics, Apodeictics, Topics, Sophistics, Rhetoric* and *Poetics*."

51. ———. 2000. "Islamic Philosophy and the Attack on Logic." *Topoi* no. 19:17–24.

"When Greek logic first entered the Islamic world it was treated by many thinkers with suspicion as a foreign interloper.(2) Logic sees itself as the most abstract theoretical vehicle for analysis, and although it may take the form of language, it actually regards itself as the deep structure of that language. Natural language has as its framework logic, and to understand language fully we need to understand logic first. Al-Fārābī, perhaps the most influential of all the *mashshāī* thinkers, presented this argument time and time again.(3) Some thinkers opposed the introduction of logic into Islamic culture since they saw it as setting up an alternative system of explanation to the Islamic sciences (grammar, jurisprudence, theology etc.) and so subtly challenging the universality and self-sufficiency of Islam itself.(4) This radical critique of logic obviously had a good deal of support, and an influential group of thinkers remained hostile to any theoretical machinery which could not display genuine Islamic credentials. Yet there was also an influential group who supported logic at the expense of philosophy. That is, they argued that logic could be cleansed as it were of its philosophical associations and used entirely neutrally in order

to express more perspicuously the truths which are otherwise available through religion. An important thinker within this latter tradition is al-Ghāzalī,(5) who strenuously opposed many aspects of philosophy on both religious and intellectual grounds, and yet who insisted nonetheless that the sort of logic which the philosophers pursued was valuable in itself and not to be ignored.(6)" (p. 17)

"Logic in Islamic philosophy

A number of features characterize logic in Islamic philosophy. First of all there was the development of a tradition of

commentary on the major Greek logical texts, commentaries that often were very perceptive in their scope. Some of these were to be translated into Latin and become much used in Christian Europe when philosophy was taken up there, a long time later than its career in the Islamic world. Some thinkers were far more than commentators, though. Ibn Sina (Avicenna) made several bold moves away from the Greeks, developing the notion of “second intentions” or “secondary concepts” by contrast with “first intentions.” The secondary nature is a characterization of the second order activity of the logician, in that the technique is applied to an existing subject matter and so is intrinsically secondary and reflective on something already existing.

This idea led him to posit also a sharp distinction between existence and essence, a distinction that was to play a large role in later Islamic and European philosophy. He also did a lot to construct the theory behind modal logic, the area that operates with the concepts of possibility and necessity. Later thinkers developed views on the nature of the syllogism, the issue of universals, the link between predication and existence, and the constant issue of logic and its relationship with grammar." (p. 296)

"2. Logic and Language

This section explains al-Fārābī’s contributions to logic and its relation with language. Al-Fārābī, and later Ibn Sīnā, were pivotal philosophers in the development of logic within the Islamic context." (p. 104)

"2.2 The Aristotelian–Fārābīan–Avicennian Logical Tradition

Ibn Sīnā picked up two notions used by al-Fārābī that are crucial for understanding the logic of Islamic philosophers: conceptualization or concept formation (*taṣawwur*) and assent (*taṣdīq*) (Black 2006: 36–38). By ‘conceptualization’ Ibn Sīnā

means the way in which the human intellect forms simple concepts or terms with no reference to their meaning within a proposition or to its truth-value. Assent, sometimes translated as ‘verification’, refers to the way in which the intellect combines those concepts, forming a proposition with a truth-value (1952a: 17). These two notions are equivalent, respectively, to the notions of simple apprehension and judgment, or to what Aristotle understands by *noesis* (understanding) and *apophantikós logos* (a declaratory statement with a truth-value). According to Ibn Sīnā, concept formation consists in the recognition of universal terms (intelligibles or first intentions), according to the five predicables (second intentions), namely, genus, difference, species, property, and accident." (p. 107)

"In the normal course of learning or teaching and understanding or speaking a language, we assume two things: the separateness of names and of the things they name, and a correspondence between the name we hear or utter and the thing named by it. Both assumptions appear amply supported by common experience.

But as we reflect on them we see that our convictions are largely unexamined. Are the things named themselves as separate from or related to each other as the names designating

them make them out to be ? If so, why do the same names designate things that are evidently separate from each other? Are the names themselves as separate from or related to each other as the things they name require them to be? If so, why do the same things have different names?. More generally, is the separateness of the things named a function of the separateness of names, or is the separateness of names a function of the separateness of the things they name? And on what ground does the name-maker or name-giver separate names and the things they name and establish the former as corresponding to the latter? Is it the nature of things and of names, which he learns more or less correctly; or an arbitrary convention that he establishes, an opinion that he imposes, or a law that he gives? Our initial assumptions about language and normal experience with it provide no clear answers to such questions, which seem to lead directly to an inquiry into the relation between nature and convention or law. This inquiry occupies the center of the stage in the discussion of language in classical Islamic thought as it had done earlier in classical Greek thought." (pp. 51-52 of the reprint)

55. Mahmmoud, Yagoubi. 2020. "Theory of Syllogisms with Categorical, Conditional and Disjunctive Connectives Developed by Arabian Logicians." *Studia Humana* no. 9:19–27.

    Abstract: "In this paper we are trying to summarize the peak of achievement of the Arabian logicians of the fifteenth century by making a classification and sketching in familiar terms the conditional and subjunctive syllogisms in Muḥammad Ibn Yusūf al Sinūsi's (1426-1490) work, i.e. in his explanation of *Kitāb al-Muḫtaşar fi al-Mantiq* of al-Imām Muhammad Ibn 'Arafa (1316-1401)."

56. Mahmmoud, Yagoubi, and Fatahine, Moussa. 2020. "The Status of Conditional Syllogism in Syllogistics." *Studia Humana* no. 9:12–18.

    Abstract: "The form of the conditional syllogism resembles that of the categorical syllogism, while its subject matter is at least a conditional premise, but its conclusion is always conditional conjunctive or disjunctive. This mixed structure to which we

apply the rules of the categorical syllogism, is a structure of which Aristotle did not have an idea, and which the Stoics did not conceive, and which the non-Arabian logicians did not know until in modern times. But what we have to notice here is the putting of a conditional matter in the form of the categorical syllogism, and it is this kind of hybridization, if we dare to say, which generated this mixed structure which appeared for the first time in the history of logic in the treatise on the logic of Ibn Sina and which can be considered a discovery by this author until proof to the contrary, and that the ancient Arabian logicians have taken the habit of exhibiting in their treatises."

    "Discussion between Mattā Ihn Yunus of Dair Kunnā, the phlosopher, and Abū Sa'īd al-Sīrāfī.

    ... the vizier Ibn al - Furāt addressed them as follows:

    I desire someone to come forward and debate with Mattā (Matthew) on the subject of Logic. He declares that it is impossible to know what is correct from what is incorrect, truth

from falsehood, right from wrong, proof from sophism, doubt from certainty, except by our command of logic, our control of the system estahlished and defined hy its author, and our acquaintance through him with its doctrines." (p. 111)

59. Marion, Mathieu. 2013. "Some Remarks on syllogistic, dialectic, and the study of their History." *Al-Mukhatabat* no. 8:9–36.

    Abstract: "In this paper, I argue that one should approach the study of Ancient Logic, Greek, Medieval and Arabic through a better understanding of the relation between dialectic and syllogistic. No claims are made about these, however, except concerning Aristotle and the invention of syllogistic. Numerous defects of the early a-historical study of syllogistic by Łukasiewicz in terms of axiomatic systems are presented in section 2, that show its inappropriateness. It is further argued that a proper consideration

    of the context of *Prior Analytics* shows that it involved the common practice of dialectical games, a characterization of which, in terms of game semantics, is provided in section 3. In the concluding remarks, the interest of this new approach is illustrated by explaining aspects of *Prior Analytics* that had been hitherto left unexplained."

Bibliography

1. Marmura, Michael E. 1975. "Ghazali's attitude to the secular sciences and logic." In *Essays on Islamic Philosophy and Science*, edited by Hourani, Albert, 100–111. Albany: State University of New York Press.

   "Religious zealots were prone to condemn such secular, “foreign” sciences [logic, mathematics, and physics] as contrary to Islamic teaching. What if these sciences were demonstrably true? Would not such condemnation result in detriment to religious principle? To what extent, if at all, did each of these sciences have an actual bearing on religion? It is to such questions that Ghazali in his *Tahāfut al-Falāsifa* (*The Incoherence of the Philosophers*) and other related writings addressed himself.

   The criterion Ghazali employed in answering such questions was that of demonstrability. A science whose conclusions are not demonstrably true and which are in conflict with the literal assertions of scripture must be rejected. On the other hand, if what is demonstrably true contradicts the literal sense of scriptural language, then the latter must be interpreted metaphorically. Ghazali shared with the majority of medieval thinkers the rationalist view that God cannot enact what is self-contradictory. The Islamic philosophers’ cardinal metaphysical doctrines, he tried to show in detail, failed to satisfy the conditions of demonstrative proof. Some, he argued, in fact were self-contradictory. Moreover, since these doctrines were not consistent with scriptural language, or its intent, as Ghazali understood it, he condemned many of them as heretical innovations (*bidāᶜ*), some as constituting outright Islamic unbelief (*kufr*).

Unlike metaphysics, Ghazali held mathematics to be demonstrably true. But, he argued, it has no bearing on religious matters, nor, for that matter, is the study of it necessary for understanding metaphysics, contrary to what the philosophers claim.(2)

The two sciences that concern us most are logic and physics. As we shall see, Ghazali insisted that the philosophers' logic is a doctrinally neutral tool of knowledge and can be used to advantage in the defense of religion.(3)" (p. 101)

2. ———. 1990. "The Fortuna of the "Posterior Analytics" in the Arabic Middle Ages." In *Knowledge and the Sciences in Medieval Philosophy*. *Vol I*, 85–103. Helsinki: Acta Philosophica Phennica.

   "In terms of the history of the transmission of Greek thought to medieval Islam, the *Posterior Analytics* was a relatively late arrival. A complete Syriac version was made by the Nestorian scholar Ishaq Ibn Hunayn (d. 910) and then, based on this Syriac version, another Nestorian scholar, the logician Abu Bishr Malta (d. 940) made the Arabic translation that has survived. The work became the object of intensive study by the tenth-century Baghdadi school of logicians that included the philosopher Alfarabi (al-Fārābī) (d. 950).(2)

   There are indications, however, that such earlier philosophers as Kindi (al-Kindī) (d. ca. 870) and his student al-Sarakhsī (d. 899) had some knowledge of the work.(3)

   But, properly speaking, the credit for its introduction to the main stream of Arabic philosophy belongs to the school of Baghdadi logicians.

   Its entry into medieval Islam marked a turning point in the development of Arabic philosophy. It provided the conceptual framework within which philosophical and scientific investigations operated. Its precepts became part of the texture of Arabic philosophical discourse, as the world came to be

perceived through the medium of logical connections, expressed in the language of middle terms. Its influence, moreover, went beyond philosophy to reach Islamic speculative theology, *kalām*. Thus, in the eleventh century, as will be indicated more fully, Ghazali (al-Ghazalf) (d. 1111), a leading member of the then dominant school of *kalām*, the Ash^{c}arite, suggested ways for retaining the Aristotelian requirements for demonstration within a non-Aristotelian occasionalist view of the world."    "We will trace the introduction of the syllogism and the problems posed by its practical application to three thinkers: the philosopher Abū Naṣr al-Fārābī (d. 950), the theologian/jurist Abū Ḥāmid al-Ghazālī (d. 1111), and the Hanbali jurist TaqI ai-Din Ibn Taymiyya (d. 1263). al-Fārābī is considered the first and greatest commentator on Aristotelian logic, a logician in his own right. Because he is instrumental in helping to introduce Aristotelian thought to Islamic literature, his work will proffer a point of departure for our other two thinkers who, themselves, provide the focal points of this discussion.

   Following al-Fārābī, al-Ghazālī recognized the dichotomy existing between logical and onto-logical realms, and attempted to relate Ash'arite theology and jurisprudence to Greek syllogistics without relying too heavily on the notion of causality. The uncomfortable discrepancy that arose in

Ghazālī's thought was unavoidable. Finally, we shall turn to Ibn Taymiyya who is perhaps the most polemical thinker of the three. His astute attack on the Aristotelian syllogism and the metaphysical contents which accompanied it were echoed several centuries later by the Scottish philosopher David Hume (d. 1776), albeit in a different metaphysical context." (pp. 114-115)

7. Mazlum, Farhad, and Azizi, Hassan. 2015. "The Nature of Language: Three Muslim Thinkers′ Perspectives." *The Polish Journal of the Arts and Culture* no. 1:77–89.

   Abstract: "One of the key issues attracting thinkers throughout the history of science was to set and define criteria for studying language – whether that of man or God – and to study its relation to the mind on the one hand and to the external world on the other. The purpose of this paper is to investigate three Muslim thinkers' [Al-Farabi, Fakhr ad-Din ar-Razi, Al-Ghazali] views about the nature and 'whatness' of language by focusing on their works. The rationale to choose these three thinkers is the fact that their views and ideas cover the issues inherent in the purpose of this study extensively. The issues addressed in paper include:

   1. What are the constituent elements of language?

   2. How does it affect mind and thought?

   3. What is its semantic function?

   Our findings indicate that the 'whatness' and nature of language of both God and men are the same. The elements are written and spoken, gestures and entity that serve to communicate meaning. As for the second question, language elements act like signs which evoke meaning and assist communication. As far as the semantic functions of language elements are concerned, when the communication of meaning is undertaken, the truth of *kalam* (speech, word) is different from the 'whatness' of meaning and the *mutakallim* (the one who makes words and speech). As a result of this discrepancy, language communicates something (i.e. meaning) different from the *mutakallim*′s inner world.

Although the constituent elements of language and how they affect mind and thought have been thoroughly investigated in Western philosophy (e.g. Wittgenstein), there has been little attention to such issues in Eastern philosophy. This paper is believed to be one of the few investigations that adopt a new perspective in attempting to provide a definition for language based on three Muslim thinkers′ dialectics and logics. The paper contributes to the field by defining language in a way that all its functions, particularly the religious function – that explains the relation between man and God – are taken into account."

8. Miller, Larry Benjamin. 1989. "A Brief History of the Liar Paradox." In *Of Scholars, Savants, and their Texts: Studies in Philosophy and Religious Thought. Essays in Honor of Arthur Hyman*, edited by Link-Salinger, Ruth, 173–182. Bern: Peter Lang.

   "The liar paradox or antinomy, the statement: "Whal I am saying is false", has occupied the attention of Russell, Wittgenstein, Tarski and many other modern philosophers. As is well-known, it has a long history stretching back to the very beginnings of Western logic.(1) Aristotle, for example, alludes to it in his *Sophistical Refutations,* while other ancient authors associated it with Epimenides of Megara and Eubulides of Miletus, a pupil of Euclid.

   It is less well-known that medieval Islamic scholars wrote highly sophisticated and independent discussions of the liar paradox. Virtually no work at all has been done on the subject, and to make matters worse, none of the major works on the paradox has been published.

   In what follows, I should like to give a brief sketch of the history of the liar paradox in Islamic thought from the tenth through sixteenth centuries highlighting a few important discussions. I should also like to suggest that Islamic philosophers anticipated modern solutions to the paradox.

   The first known reference to the liar paradox in Islamic philosophy appears as early as the tenth century. The Christian philosopher Yaḥyā ibn 'Adi mentions the paradox in a treatise

on sophisms deriving from Aristotle's *Sophistical Refutation*s. (2) But in theology, authors of the ninth century make use of it in religious disputations. A theological polemic of the early tenth century uses the paradox, in an argument propounded by the theologian Ibrahim al-Nazzām (d. 836), to refute Manichaean dualists." (p. 173)

(1) The above formulation comes from Cicero, *Academica*, 2,29 *si te mcntiri dicis idque verum dicis, mentiris an verum dicis?* A similar formulation is found in Alexander of Aphrodisias, CAG, *Comm. in Soph. El*, p. 171, lines 17 ff. Other references are given in Pranll, *Geschichre der Logik* (1955 Reprint of 1855 Edition] 1.50-51 and footnote 83; Bochenski, *A History of Formal Logic*, trans. I. Thomas (South Bend, 1961) pp. 237 ff.

9. ———. 2020. *Islamic Disputation Theory: The Uses & Rules of Argument in Medieval Islam*. Cham (Switzerland): Springer.

"Readers who, in the current volume, are first learning of this work and its author may be surprised to hear Larry Benjamin Miller's doctoral dissertation pronounced one of the more important contributions to Islamic Studies from the latter half of the twentieth century. This itself is a symptom of the considerable disciplinary void occasioned by its not being published—as it most certainly ought to have been—close after its acceptance in October 1984 by the Department of Near Eastern Studies at Princeton University." (*Foreword* by Walter Edward Young. p. VII)

(...)

"Why is this such a seminal work? The reasons are many, and stem from the importance of the field which Miller explores as well as the qualities and insights of his exploration. Though a handful of respected Islamicists had scouted certain shallows and bays of the vast ocean of Islamicate dialectical theory and practice,(1) Miller was the first to sound its depths and sketch its coastlines in systematic fashion. His broad survey (though it was, and remains, impossible to be fully comprehensive),

coupled with his logical analyses, revealed a series of rich and evolving genres of dialogical argument, directing us towards what, in the end, has proven to be a large and influential body of theory traditions cultivated in hundreds of treatises, commentaries, supercommentaries, and glosses." (*Foreword*, pp. VII-VIII)

10. Mlika, Hamdi. 2020. "Perspectives on the Notion of Truth in Arabic Philosophy." *Studia Humana* no. 9:28–39.

    Abstract: " In the present paper, I assume that the notion of “truth” in philosophy would not have been clarified and tackled properly, if philosophers did not take into account earlier Arabic Medieval research contributions and build upon previous research findings. In the first place, I embark on the scrutiny of the rich aspect (or nature) of the Arabic Lexicon in terms of the “truth” meaning.

    In the second place, I take on the assumption that Arabic linguistic traditions imply different kinds of truths, depending on various spheres of human thoughts and actions based on the logical approach to “truth” (from Al-Kindi up to Averroes via

Al-Farabi and Avicenna) and the term “al-haqiqha” as transliterated from Arabic, remain central. In conclusion, I take on an approach to “truth” that gives worth to logical perspectives at the very heart of Medieval Arab traditions in the light of what I would label as the “Omni-cultural Universality of Logic and Science”."

12. Moqbel, Tareq. 2025. "The Logic of Divine Discourse: Fakhr ad-Dīn ar-Rāzī’s Application of Logic to Qurʾānic Interpretation." In *Logic, Soul, and World: Essays in Arabic Philosophy in Honor of Tony Street*, edited by Ahmed, Asad Q., Zarepour, Mohammad Saleh and Strobino, Riccardo, 271–299. Leiden: Brill.

    "This article proposes to show in what way ar-Rāzī made use in *Mafātīḥ al-Ghayb* of views stated in the works of logic—in other words, how the theory of logic finds its way into his *tafsīr*. On the one hand this article shows us, through ar-Rāzī, what help logic can offer the exegete of the Qurʾān. On the other hand, it offers some hints for assessing the practical implications of ar-Rāzī’s logical project and, by extension, the reach of his philosophic oeuvre. I will proceed by briefly cataloguing the ways by which ar-Rāzī incorporates logic in his *tafsīr*.

    The main part of the article will then illustrate this application by way of concrete cases. I should also add that the aim of this article is not purely to show how logic was *used* in Qurʾānic interpretation, but it also has a forward-looking dimension: by taking ar-Rāzī as a model, it envisions how fresh and contemporary interpretations of the Qurʾān can be modelled

after ar-Rāzī through incorporating logical modes into the interpretation of the Qurʾān. More generally, ar-Rāzī's daring hermeneutical manoeuvres—within the knowledge of his day and age—can inspire readers today to think about novel ways for reading the Qurʾān including, but not limited to, logic." (pp. 271-272)

13. Movahed, Zia. 2010. "De re and de dicto modality in the Islamic traditional logic." *Sophia Perennis* no. 2:5–19.

    Abstract: "In Islamic traditional textbooks modal operators sometimes come before propositions, sometimes before the predicates and sometimes at the end of propositions. This makes the interpretation of modality in each case as *de re* or *de dicto* difficult. Given Ibn Sinā's discussion of and sensitivity to this distinction, in this paper by examining the position of modality in the contradictories and converses of modal categorical propositions as well as their positions in modal syllogisms I will try to find a reasonable answer to this important issue."

14. ———. 2010. "Suhrawardi on Syllogisms." *Sophia Perennis. The Semiannual Journal of Sapiential Wisdom and Philosophy* no. 2:5–18.

    Abstract: "Shihāb al- Dīn al-Suhrawardī (d. 1194), in his most important book, *Hikmat al-Ishrāq*, claims that he has simplified the Aristotelian theory of syllogisms by reducing its many rules to a few by which the validity of all moods can be proven. This is done by reducing all negative and particular categorical propositions to universal affirmative propositions and introducing two meta-language rules, one for the second and the other for the third figure. This is an exposition of the non-modal part of his syllogism and an examination of his claim to simplifying the Aristotelian theory of syllogism."

15. Nasr, Seyyed Hossein. 1978. "Metaphysics, Poetry and Logic in Oriental Traditions." *Sophia Perennis* no. 3:119–128.

    "The definitions given in Oriental civilizations for logic and poetry would be easily understood by Western students of these subjects, well versed in the knowledge of Western culture and

its roots, whether these definitions came from a Nagarjuna on the one hand, or an Ibn Sina (Avicenna) on the other. Logic in Eastern doctrines deals with the laws governing the movement of the human mind in its journey from the known to the unknown, whatever might be the epistemological foundations which make the attainment of logical certitude possible, and whatever differences may exist between let us say Nyaya logic and Aristotelian logic. As for poetry, it deals with human language as molded by the principles of harmony and rhythm, which also govern the cosmos. These two disciplines or activities of the human mind and soul have nearly completely parted ways in the modem West while they have preserved their complementarity and close association in theory and practice wherever the Oriental traditions still survive. There has always been in the Orient a logical aspect to poetry and a poetic aspect to the great expressions of logical thought. Still today, in many Oriental languages, works of a logical nature are studied in a poetic form which facilitates their mastery(2) while there is an innate logic to traditional poetry to the extent that this type of poetry is often used instead of a strictly logical argument, to prove a logical point." (p. 120)

(2) This is particularly evident in Islamic civilization where to this day many scientific disciplines are first taught as poems, for example the *al-Urjūzah fl' l-ṭibb* of lbn Sina in medicine, the *Alfiyyah* of lbn Mālik in grammar and *al-Sharḥ, al-manzūmah* of Ḥajjī Mullā Hādī Sabziwārī in logic and metaphysics.

16. Ndoye, Moussa, and Rahman, Shahid. 2025. Necessity and the Logical Turn in Arabic Debate Theory: Ādāb al-Baḥth Encounters Avicenna's Logic of Causation. *STL - Savoirs, Textes, Langage - Université de Lille*: 1–13.

    Preprint.

    Abstract: "Recent scholarship by Rahman and collaborators, inspired by Suhrawardī's Illuminationism, has undertaken a dialectical expansion of Avicenna's logic, opening new avenues for exploring both its potentials and limitations. This project is particularly significant in light of Avicenna's dismissal of dialectical reasoning within Islamic debate theory (*Risāla fī*

ta ʿaqqub al-mawḍiʿ al-jadalī), revealing what he took to be a tension between the formal rigor of logic and the, according to him, vague features of Islamic debate practice.

This tension becomes most visible in the "logical turn" in *adāb al-baḥth*, where debate theorists drew upon Avicennian modal logic to articulate the principles of legal causation. In this process, Avicenna's syllogistic framework was not merely applied but imaginatively reworked: its elements were woven into systematic structures that both extended and transformed his logic (see Young, 2021a,b,c). The turn thus operates on two levels at once, functioning as both a critique of Avicenna's skepticism toward juridical dialectics and a constructive reconfiguration of his logical legacy.

This paper examines this intersection, with particular attention to how the logical turn in debate theory coincided with efforts to produce a streamlined taxonomy of argumentative moves. This dual movement illuminates the interplay between formal reasoning and rhetorical practice, showing how classical logic was simultaneously preserved, adapted, and creatively reinvented to meet the demands of juridical and scholarly discourse. By tracing these developments, the paper highlights the inventive strategies through which scholars negotiated inherited theoretical structures alongside emerging methods of argumentation, offering a fresh perspective on the enduring and adaptable legacy of Avicennian thought."

"Logic as a science, in particular Aristotelian syllogistic reasoning, has been known among Muslim scholars since at least the early third/ninth century. Most Greek works on logic were translated into Arabic by the end of the third/ninth century. Al-Fārābī (d. 339/950) commented extensively on them (EI2 [*Encyclopaedia of islam*, Second edition], "Manṭiḳ"), and Ibn Sīnā's (d. 428/1037) writings on logic were well-absorbed in Islamic scholarship, not only in philosophy but also in theology (Rescher 1964, 15–18, 29, 40, 46, 51–53). Nevertheless, in jurisprudential writings, Aristotelian syllogistic logic was somewhat of a late-comer, not making itself felt much before the fifth/eleventh century. This is not to say that Islamic law was illogical or irrational nor that Greek logic had no impact on the articulation of legal theory prior to the late fifth/eleventh century. Al-Shāfiʿī's (d. 204/820) discussion of analogy (*qiyās*) was influenced by Aristotle's *Topics* (EI2, "Manṭiḳ"). Yet, by the end of the fourth/tenth century, one finds little use made of logic in legal arguments beyond the conjunctive and disjunctive syllogism (Hallaq 1990, 316–318)." (p. 95)

18. Ouyang, Wen-Chin. 2016. "Literature and Thought: Re-reading al-Tawḥīdī's Transcription of the Debate between Logic and Grammar." In *The Heritage of Arabo-Islamic Learning: Studies Presented to Wadad Kadi*, edited by Pomerantz, Maurice A. and Shahin, Aram A., 444–460. Leiden: Brill.

    "I will focus on one duality associated with al-Tawḥīdī, that he is both *faylasūf al-udabāʾ wa-adīb al-falāsifa*, and a story he tells on the eighth night of *al-Imtāʿ wa-l-muʾānasa* of the debate between Mattā b. Yūnus (d. 328/940) and Abū Saʿīd al-Sīrāfī (d. 368/978) on the "superiority" of Greek logic or Arabic grammar. I begin by showing the way in which the debate recounted in this story has come to be "mythologized" in past and present discourses as an antagonism between Greek philosophy and the Arabic language crystallized in the *munāẓara* between "logic" and "grammar." "Myth" according to Roland Barthes is an old "sign" emptied of its original "historical" context and replanted in a completely new historical context. The significance of the sign is now derived from this new "historical" context.(11) The debate between Mattā and al-Sīrāfī, as transcribed by al-Tawḥīdī, is often extracted as an autonomous, coherent text and interpreted outside the context of *al-Imtā wa-l-muʾānasa*, which is in turn a text, onto which the very same debate, similarly an extract, is grafted. In both cases, in *al-Imtāʿ wa-l-muʾānasa*, and later "texts" (e.g., *Muʿjam al-udabāʾ* by Yāqūt), the same debate is given a new context. For example, while Yāqūt situates this debate as the crown in the jewels of al-Sīrāfī's learnedness, contemporary discourses on medieval Islam structure various moments of the 'tension' between Greek philosophy and Arabic sciences before and after the debate around this seminal event. (12)" (p. 449)

    "This essay on the poetic syllogism (qiyās[-i] shiʿrī) takes as its point of departure two prominent treatments of our topic from the literature on Arabic philosophy.(2)" (p. 240)

    (...)

    "But what is a “poetic syllogism”?(5) The ‘poetic syllogism’ is a tool for (a) the regimentation of statements and (b) the analysis of images and (c) the formalization of inferences as these three occur in rhetorical and poetic speech. The poetic syllogism resembles the theoretical and practical syllogisms, but rarely, if ever, leads to a deductively valid inference. What a ‘poetic syllogism’ is, is intimated by Farabi in his reflections on the analysis of poetic imagery in *Qawānīn al-shiʿr*, the *Ars Rhetorica* commentary, *al-Qawl fī al-tanāsub*, inter alios; and is most explicitly formalized by Ibn Sina in his treatment of *qiyās* (roughly speaking, ‘semi-formal inference’) in the *manṭiq* (logic) section of his magnum opus *al-Shifā*’ (The Healing)." (p. 242)

(5) 5 Black (p. 212) paraphrases an example from Avicenna:

m. So and so is handsome S – M

M. Everything handsome is a moon M – P

Therefore, So and so is a moon S – P.

20. Özturan, Mehmet. 2015. "On Sayyid Sharīf al-Jurjānī's *Risala fī taqsīm al-ʿilm*: Analysis and Critical Edition." *Nazariyat Journal for the History of Islamic Philosophy and Sciences*:95–124.

Abstract: "This research focuses on the previously unpublished treatise by Sayyid Sharīf al-Jurjānī, *Risala fī taqsīm al-ʿilm*. the research is based on comparative evaluation of available manuscipts and is composed of a critical edition of the treatise and its analysis. The treatise is about the division (*taqsīm*) of *taṣawwur* (conception) and *taṣdīq* (assent) as divisions of knowledge. Al-Jurjānī presents views from diferent schools of logic. In the analysis section, I discuss the treatise's philosophical background and show that the aforementioned division is the first step of a chain of propositions on what the goal and methods of logic are focusing on the possibility of learning.

Remaining sections focus on the references in the treatise to various views and summarise them. Finally al-Jurjānī's position in this scene is made explicit through his critical analysis of competing views advocated by these diferent schools.

For al-Jurjānī, division of knowledge can be analysed formally and informally. Formally, the division should be restrictive and informally, it should emphasize methods of logic, that are proof (*ḥujja*) and definition (*taʿrīf*). The article shows that the goal of al-Jurjānī's discussion on the division of knowledge as conception and assent is basically to take the discussion out the context of traditional discussions on quiddity but rather build it on the division formally and the goals of the division informally."

21. ———. 2018. "An Introduction to the Critique of the Theory of Definition in Arabic Logic: Is Complete Definition Circular?" *Nazariyat: Journal for the History of Islamic Philosophy and Sciences*:85–117.

Abstract: "This study focuses on Fakhr al-Dīn al-Rāzī's thesis of the impossibility of giving a complete definition (al-ḥadd al-tāmm) and discusses its impact, the parties to the debate, and especially the positive argument contra al-Rāzī by the Ottoman savant Ṭāşköprīzāde. The negative argument of al-Rāzī postulates that the complete definition is strictly circular, for the totality of parts that makes up the defined object are included in the definition, and the object is identical to the sum of its parts. Therefore, complete definition strictly commits the fallacy of definining a thing by itself. Ṭāşköprīzāde argues against this view by defending the possibility of complete definition. According to him, although in complete definition the defined object and the defining features include the same set of things, the modes of their presentation to the mind are different. Thus, a complete definition becomes circular only if both the content of the defined object and its mode of presentation to the mind are the same. If it can be shown that the contents of the definiendum and definiens have distinct modes of presentation, then the charge of circularity is discarded. In this article, I illustrate the two opposing approaches by distinguishing between form and content, or sense and reference. Both parties take for granted that the contents of the *definiens* and the *definiendum* are the same when it comes to the complete definition. The main point of contention lies in the modes of apprehending the contents. This article analyzes the arguments of two opposing semantic theories particular to the complete definition and shows that the question emerges as a result of the theories of constant form and variable form concerning meaning. In the period between al-Rāzī and Ṭāşköprīzāde, Ṭūsī bolstered the complete definition whereas al-Ījī refuted it. Both Ṭūsī's and al-Ījī's arguments will be discussed, though briefly, in the body of paper as well."

22. Pacheco, Juan Antonio. 2012. "Ibn 'Arabī and Aristotelian Logic." *Ishraq: Islamic Philosophy Yearbook* no. 3:201–219.

    Abstract: "An inquiry into the works of Ibn ʻArabī reveals them to be like a web with indefinite frontiers between reason and faith, because his thought is primarily a thought and it must be linguistic or symbolic in character; that is, it must presuppose communication, and above all, understanding. In the vast and fecund wealth of ideas which was the intellectual background of Ibn ʻArabī, the originality of his rational thought grows from a broad and solid logical foundation as a product of his conviction that rational and mathematical elements must provide proof of spiritual achievements. The aim of this paper is to demonstrate the presence of logic in two of his works, The Book of Alif and Fuṣūṣ al-Ḥikam, as a paradigm of truth values that by means of its evident and rational principles can aid the Sufis' efforts to gain a correct understanding of the Truth."

25. Pournamdar, Amir Hossein. 2017. "Šaḫṣ: Its Origin and Development as a Logical Term." *Studia graeco-arabica* no. 7:277–290.

    Abstract: "Abundantly used as a technical term in the Arabic classical texts of logic and philosophy, the word *šaḫṣ* will be studied in detail as a preamble to a thorough analysis of a turning point which occurred in its meaning, during the Graeco-Arabic translation movement (starting from the 8th century). Through discovering the genuine meaning of *šaḫṣ* in the context of the Arabic language at the time of the emergence of Islam and its following two or three centuries, it will be ascertained that this term, in its common usage in the

intellectual tradition of Islam, i.e. ‘a thing or a person belonging to a species’, has imposed itself upon the non-specialized, ordinary language of the Arabs as the result of the dominance of the logico-philosophical literature. *Šaḫṣ* was never used to serve such a meaning before the transmission of the philosophical works to the Arab world, and it was the attempts of the translators that made this word signifying ‘a specific entity or individual’, in contrast to its real meaning, viz. ‘body’, ‘material appearance’. In the second part, by taking into account one of the oldest extant logical works in the Islamic tradition, i.e. *al-Manṭiq* attributed to Ibn al-Muqafaʿ, it is suggested that this change of meaning could be regarded as a case of Arabic borrowings from Persian."

26. Rahman, Shahid, and Seck, Alioune. 2025. "As-Suhrawardī’s Stance on Modalities and the Logic of Presence." In *Logic, Soul, and World: Essays in Arabic Philosophy in Honor of Tony Street*, edited by Ahmed, Asad Q., Zarepour, Mohammad Saleh and Strobino, Riccardo, 227–270. Leiden: Brill.

    "The objective of this paper is to contribute to a more unified interpretation of as-Suhrawardī’s thought, although the focus is primarily on the development of the elements of his modal logic initiated by Tony Street.(3) In more precise terms, we will do so by examining three crucial points as-Suhrawardī explicitly makes concerning the meaning of modalities. These are:

    (1) Modalities are to be understood as the different ways a predicate temporally relates to its subject.

    (2) Proving that a necessarily contingent relation holds requires relating every presence of the subject term—i.e. every instance of the subject—with a capacity or potentiality (neither necessarily nor impossibly actualised), expressed by the predicate.

    (3) The dependence of presences witnessing the actualisation of the predicate term upon those of the subject term constitutes the foundation of as-Suhrawardī’s logic." (p. 228)

    (3) See Tony Street, “Suhrawardī on Modal Syllogism”. See also Zia Movahed, “Suhrawardī’s Modal Syllogisms,” *Sophia*

Perennis 2, no. 4 (2012): 5–17; who follows the general lines of Street's interpretation—namely the embedding of a *de re ne*cessary or contingent modality in a *de dicto* necessary modality.

27. Rahman, Shahid, and Young, Walter Edward. 2022. "Argumentation and Arabic Philosophy of Language: Introduction." *Methodos. Savoirs et textes* no. 22:1–15.

    "With this in mind, the main objective behind this special volume of *Methodos* was to p rovide a venue for studies of hermeneutics, linguistic analysis, and deductivereasoning in the theory / practice of argumentation relevant to the Arabic philosophy oflanguage, including contributions on:

    1. theories which are geared towards argument (e.g., dialectical justifications and objections, linguistic fallacies, strategies and protocols for engagement on particular issues, etc.);

    2. the dynamic of argument in shaping concepts and theories (e.g., explaining how systematic argument fashioned certain scholars' solutions); and

    3. theories "in action" (e.g., argument analyses of the historical, scholarly dialectic on a certain problem).

28. ———. 2023. "Outside the Logic of Necessity: Deontic Puzzles and 'Breaking' Compound Causal Properties in Islamic Legal Theory and Dialectic." In *Fallacies in the Arabic, Byzantine, Hebrew and Latin Traditions*, edited by Cesalli, Laurent, Gazziero, Leoe, Manekin, Charles, Rahman, Shahid, Street, Tony and Trizio, Michele, 153–185. Turnhout: Brepols.

    Abstract: "This study examines an Islamic dialectical objection called *kasr,* or 'breaking', as treated by the dialecticians and legal theorists Abū Isḥāq al-Shīrāzī (d. 1083 CE) and Abū al-Walīd al-Bājī (d. 1081 CE). *Kasr* has both legitimate and illegitimate applications, and we confront the fallacious modes denounced by our theorists with deontic paradoxes and puzzles falling under the rubric of logical extrapolation fallacy. Our primary claim is that, whereas logical extrapolation produces fallacies or paradoxes by unsafely applying inference rules of standard alethic and/or logical necessity to the deontic realm,

the fallacies generated by illegitimate modes of kasr in Islamic legal theory (wherein logical rules are expressed dialectically) constitute a genuine source for reflecting on what patterns of reasoning should be endorsed for determining causality in legal – and, perhaps, natural – epistemological contexts. Ultimately, this is the first step towards a larger study of kasr, which will compare it with other dialectical objections and treat relevant critical discourses from later Muslim legal theorists and dialecticians."

29. Rahman, Shahid, Zidani, Farid, and Young, Walter Edward. 2022. "Ibn Ḥazm on Heteronomous Imperatives. A Landmark in the History of the Logical Analysis of Norms." In *Agency, Norms, Inquiry, and Artifacts: Essays in Honor of Risto Hilpinen*, edited by McNamara, Paul, Jones, Andrew J. I. and Brown, Mark A., 139–171. Cham (Switzerland): Springer.

    Abstract: "Ibn Ḥazm of Córdoba's (994–1064) defence of logic has lasting consequences for the logic of norms. His book *Facilitating the Understanding of the Rules of Logic and Introduction Thereto, with Common Expressions and Juristic Examples* is a demonstration of how Aristotelian logic may be applied in the religious sciences, especially law. Among other things, he thoroughly investigates deontic notions and their modal counterparts, assuring him a place among the fathers of the logic

    of norms. The basic units of Islamic deontic logic qualify the performance of actions as subject to either reward, or sanction, or neither; and they might therefore be called, indulging in terminological anachronism, heteronomous imperatives.

    With remarkable insight, Ibn Ḥazm pairs these with the natural modalities of necessity, possibility, and impossibility. Employing some features of Martin-Löf's Constructive Type Theory (CTT) to shape the logic of heteronomous imperatives thus emerging from Ibn Ḥazm's insights, the authors formulate a new approach to the logical analysis of deontic categories."

30. Ramon, Rafael. 2010. "The Beginning of Logic in Al-Andalus: Ibn Hazm of Cordoba." *Revista de Hispanismo Filosofico* no.

15:31–42.

Abstract: "The earliest texts of logic began to be known in the Arab world of the Middle East at the late eighth century. However, the development of logic did not occur until the tenth century. This took place with the work of logicians Christians and Muslims. It is not known in what time the logic was introduced in Muslim Spain. It is said that it occurred in the second half of the tenth century. The extant first text is dated at the beginning of the eleventh century. It is the work of Ibn Hazm of Cordoba titled Approximation to the Definition of Logic."

31. Ravitsky, Aviram. 2018. "Yaʿqūb al-Qirqisānī on human intellect, legal inference, and the meaning of the Aristotelian syllogism." *Journal of Jewish Thought and Philosophy* no. 26:149–173.

    Abstract: "In the fourth treatise of his legal-theological work *Kitāb al-Anwār wa-al-Marāqib*, Yaqūb al-Qirqisānī analyzes a criticism of the Aristotelian syllogism and its epistemological foundations. Qirqisānī defends Aristotelian logic by quoting a passage from an unknown commentary on Aristotle in which the Aristotelian theory of syllogism is explicated. This paper focuses on the historical, theological, and philosophical meanings of the criticism of the syllogism in Qirqisānī's discussion and analyzes his interpretation of the syllogism as a source of knowledge that should be applied in the realm of legal reasoning and in the interpretation of biblical law."

32. Rayan, Sobhi. 2010. "Ibn Taymiyya's Criticism of Aristotelian Definition." *American Journal of Islam and Society* no. 27:68–91.

    Abstract: "Aristotle wrote of two "points of definition": one posited in negative and the other in positive terms. The negative formulation argues that concepts can be comprehended only through definition, while the positive point stresses the consequences of definition by focusing on the benefits to the sciences achieved through those "concepts." Ibn Taymiyya criticizes these ideas on the grounds that definition neither necessarily leads to the revelation of the facts and

truths of things and their quiddities, nor does it necessarily help in developing the sciences. We notice that his main criticism is directed at specific metaphysical elements of definition, such as genus, species, differences (differentia/divisions), quiddity, and universality. He argues that these elements are purely mental and do not necessarily correspond to existence.

Ibn Taymiyya differentiates between metaphysics and the concrete physical world for, in his opinion, not all that comes to mind necessarily corresponds to existing objects in the concrete physical world. Therefore, human knowledge should be established on concrete rules subject to experiment. He therefore refutes the logic of quiddity, which depends upon pure intellect, and calls for an experimental logic devoid of metaphysics."

33. ———. 2011. "Ibn Taymiyya's Criticism of the Syllogism." *Der Islam* no. 86:93–121.

Abstract: "The purpose of this study is to examine Ibn Taymiyya's criticism of Aristotelian logic, and to test the arguments he raises against it, as well as the theory he proposes as an alternative.

Ibn Taymiyya tries to prove that Aristotelian logic cannot contribute to knowledge because it is based on metaphysical foundations. He raises arguments that are intended to expose the contradictions of Aristotelian logic. These arguments are based partly on the principles of relativity and skepticism, and partly on empirical presuppositions.

Ibn Taymiyya proposed the use of analogical reasoning (*qiyās al-tamthīl*) which is a type of evaluation and measurement based on the comparison between particulars, or the relations between two similar or dissimilar things. It can be seen that the most important and decisive thing in this relation is the common attribute that links two particular occurrences. Therefore, this inference deals with the relations between things and the causal connections between them. This is expressed in the research method used in the Islamic juridical sciences, which are causal methods, such as: the

coextensiveness and coexclusiveness (*tard wa-ᵉaks*), coextensiveness-cum-coexclusiveness (*dawarān*), and classification and successive elimination (*al-sabr wa l-taqsīm*)."

34. ———. 2012. "Criticism of Ibn Taymiyyah on the Aristotelian Logical Proposition." *Islamic Studies* no. 51:69–87.

    Abstract: "This article deals with Ibn Taymiyyah's criticism of the Aristotelian logical proposition. According to Ibn Taymiyyah, all universal judgments are in fact particular judgments. Therefore, the transition is from the particular to the universal.

    The basis for the axioms of proof is particular and not universal, and is founded upon experience and not on the intellect. This means that a person arrives at the particular proposition before the universal one."

35. ———. 2016. "Translation and Interpretation in Ibn Taymiyya's Logical Definition." *British Journal for the History of Philosophy* no. 19:1047–1065.

    Abstract: "This article deals with the concepts of translation and interpretation in Ibn Taymiyya's Theory of Definition. Translation is replacement of one name by another or of one named object by another, while, Interpretation is replacement of one name by a named object or of a named object by a name. The relationship between the definition and the definiendum is decided by the law of *al-Tard wa al-'Aks* (coextensiveness-cumcoexclusiveness) that looks at objects from all sides and decides the traits of the definiendum. It also aims at deciding the signification of the name and this is also the aim of the definition.

    Since the 'name' is a linguistic matter, the definition is related to the signification of the name and its language."

36. Reçber, Mehmet Sait. 2015. "On al-Ghazālī and Necessary Truths." In *900 Jahre al-Gazālī im Spiegel der islamischen Wissenschaften*, edited by Ucar, Bülent and Griffel, Frank, 117–126. Osnabrück: V&R unipress.

"Al-Ghazālī is well-known for his criticism of the Muslim philosophers (*al-Falāsifa*), predominately due to the mission he sets for himself in *Tahāfut al-falāsifa*." (p. 117)

(...)

"Instead, it will concentrate on the particular subject of necessary truths, which plays a significant role in al-Ghazālī's own philosophical agenda and reveals an essential character of his philosophical and theological thought.

Necessary truths primarily denote the propositions of logic and mathematics that are considered to be true no matter what, as they are analytic or true by definition. They are traditionally considered to be a priori as they are knowable independently of sense-experience. What has caused controversy, however, is the question regarding the ground of necessary truths: what sort of facts are supposed to be responsible for making certain propositions necessarily true? There have been various philosophical approaches on this issue, among the most notable of which are (Platonic) realism and varieties of conventionalism. In any case, the idea that necessary truths cannot conceivably be false has some considerable methodological implications on a system of thought inasmuch as they are not just responsible for its structural properties but also have semantic, metaphysical as well as epistemological implications.! (pp. 117-118)

(...)

"It is well-known that al-Ghazālī attached a great significance to logic. Considering that one's knowledge of logic is a precondition for a person's, so to speak, epistemic reliability, he introduced the study of logic – that is, the logico-inguistic categories and various methods of deductive reasoning – as a preliminary introduction to the study of the other sciences. This is not to mention the books he devoted exclusively to logic. Considering that it is logic that provides the elements of valid reasoning which underlie sound thinking in religious matters, the motivation for such an initiative ought to be appreciated." (pp. 118-119)

37. Rescher, Nicholas. 1962. "Some Arabic Technical Terms of Syllogistic Logic and their Greek Originals." *Journal of the American Oriental Society* no. 82:202–204.

    "We shall be concerned with the meaning in Arabic logical texts of three technical terms of syllogistic logic : *qarīnah* (" connection ") *ǧāimi'ah* (" union "), and *ṣan'ah* (" construction "). None of these words are treated satisfactorily in even the specialized lexicons of philosophical Arabic.(1) Particular interest and importance attaches to the third of these terms." (p. 202)

    (1) M. Horten, *Die Spekulative und Positive Theologie des Islams* (Leipzig, 1912) ; A. M. Goichon, *Lexique de la Langue Philosophique d'Ibn Sinā* (Paris, 1938). Miss Goichon gives an adequate explanation of only the first of our terms: *qarīnah* (p. 303).

38. ———. 1963. "Al-Kindi's Sketch of Aristotle's *Organon*." *The New Scholasticism* no. 37:44–58.

    Reprinted as Chapter 2 in N. Rescher, *Studies in the History of Logic*, Frankfurt: Ontos Verlag 2006, pp. 15-27.

    "In the present discussion, our sole concern will be with al-Kindī as a logician, more accurately as a student of logic. For he was, unlike his successor al-Fārābī, no specialist in logic. His encyclopedic interests embraced all of Greek science and philosophy, and his concern with logic was derivative in nature, resulting almost as a by-product from the fact that logic was not only an integral but even a fundamental branch of Greek philosophico-scientific knowledge. (p. 15 of the reprint)

    (...)

    "It is a matter which cannot but cause regret to students of the history of logic that none of these logical works of al-Kindī's have survived.

    In view of these losses, it is a piece of good fortune that we possess, in Arabic, a treatise by al-Kindī bearing the title "On the quantity of the books of Aristotle and what is needful of them for the attainment of philosophy", the text of which was

published by M. Guidi and R. Walzer in 1940.(5) This treatise contains a sketch, amounting to roughly a third of the whole, of Aristotle's Organon which qualifies as *the oldest extant Arabic logical text*.(6)" (p. 16 of the reprint)

(5) Guidi-Walzer (1940) gives the *editio princips* of our text, together with an Italian translation. The Arabic text is also printed in Abū Rīdah (1950).

(6) This statement requires slight qualification. In two instances the "old" Arabic translations of Aristotelian logical texts—antedating the work of Hunain ibn Ishāq and his associates—have survived: that of *Anal. Pr*. by one "Theodore" and that of *Soph. Elen*. by 'Abd-al-Mashīh ibn Nā'imah al-Himsī. But in these two cases the surviving versions were "modernized" in the school of Hunain. See R. Walzer, "New Light on the Arabic Translations of Aristotle," *Oriens*, vol. 6 (1953), pp. 91-142.

"The existence of widespread distrust towards Greek science, philosophy, and logic within the three major religious communities upon which Greek learning made its impact in the 6/12th centuries -the Christians,(1) Muslims,(2) and Jews(3)-is a well-known phenomenon.

An entire genre of literature-the *defense raisonnée* of the religious acceptability of philosophical studies-is known to have developed on account of this antagonism. My present concern is with a portion of an almost unexplored sector of this tradition-the *apologia* for logic." (p. 1)

(1) E. Gilson has graphically described the unremitting opposition with which, since the days of Tertullian, some Christian circles combated philosophical speculation in general, and dialectical techniques in particular. *Reason and Revelation in the Middle Ages* (N.Y. 1938), pp. 5-15 (especially pages 6 and 11).

(2) See the classic study of Ignaz Goldziher, "Stellung der Alten Islamischen Orthodoxie zu den Antiken Wissenschaften," *Abhandlungen der Preussischen Akademie der Wissenschaften* (Philosophisch-historische Klasse) Berlin, 1916 (Jahrgary 1915). Already al-Kindi, the first notable Muslim philosopher, included in his treatise on metaphysics a chapter "That religion does not conflict with philosophy" (*fī anna-' l-dīn Iā yata 'āriḍ ma' al-falsafah*). Note also his comment that, "As late as 1765 Moses Mendelssohn felt it necessary to apologize for recommending the study of logic, and to show why the prohibition against the reading of extraneous or profane books does not apply to works on logic" (*ibid.*)

41. ———. 1964. *The Development of Arabic Logic*. Pittsburgh: University of Pittsburgh Press.

Contents: Preface 7; Introduction 11; Part I. Survey of Arabic Logic; 1. The First Century of Arabic Logic 15; 2. The First Flowering of Arabic Logic 33; 3. The Century of Avicenna 48; 4. The Century of Averroes 55; 5. The Clash of the Schools 64; 6. The Period of “Reconciliation” and The Age of Schoolmasters 73; Conclusion 82; Part II. Register of Arabic Logicians; Contents [166 names] 87; The Register 93; General Bibliography 256; Index 259-262.

"While much has been written about Arabic medicine, astronomy, mathematics, philosophy, etc., the story of the evolution of logical studies in Islam has never even been attempted, with the result that this important chapter in intellectual history remains almost wholly unopened. Although this terrain cannot yet be mapped with the precision of an aerial photograph, enough materials are now available to make it possible to draw a rough sketch of the area. This limited objective is our aim here.

This book falls into two parts. Part I is devoted to an exposition of the structure of Arabic work in logic, describing its main features, giving generalized accounts of the trends and

tendencies of its development, and attempting to identify major contributions.

Part II gives a register of Arabic logicians, placing each contributor into his context in the tradition, and identifying his personal contribution to the development of Arabic logic.

Much of the discussion will perforce have to be devoted to considering the substantive contents of Arabic logic in general outline, rather than with a view to individual details and to the particular content of specific theories and doctrines. In part, but in part only, is this due to the chosen character of the present work as a general and synoptic survey. To a regrettably large extent it is attributable to the paucity of preparatory investigations of points of detail and the deplorably large mass of yet unexamined manuscript material. At least another generation's worth of work will have to be done before the historian of Arabic logic can traverse his ground with the sure foot needed for the accurate appraisal of specific contributions. A sampling—though one that is admittedly minuscule—of the sort of detailed investigations needed on a vastly increased scale is given in a companion piece to the present work, the writer's *Studies in the History of Arabic Logic* (University of Pittsburgh Press, 1963)." (*Introduction*, p.11)

42. ———. 1964. *Studies in the History of Arabic Logic*. Pittsburgh: University of Pittsburgh Press.

    Contents: Preface 7; Introduction 11; I. Arabic Logic: A Brief Account 13; II. Al-FarabI on Logical Tradition 21; III. Al-Kindi's Sketch of Aristotle's *Organon* 28; IV. Al-FarabI on the Question: Is Existence a Predicate? 39; V. An Interpretation of Aristotle's Doctrine of Future Contingency and Excluded Middle 43; VI. A Tenth-Century Arab-Christian Apologia for Logic 55; VII. The Logic-Chapter of Muhammad ibn Ahmad al-Khwarizml's Encyclopedia, *Keys to the Sciences* 64; VIII. Avicenna on the Logic of "Conditional" Propositions 76; IX. Abu-'l-Salt of Denia on Modal Syllogisms 87; X. Averroes' Quaesitum on Assertoric (Absolute) Propositions 91; Index 107-108.

"Six of these studies have appeared as articles in learned journals. (See the Preface for detailed citations.) Four papers—numbers I, V, VI, and IX—are here published for the first time.

Chapters II -X deal with selected special topics in the history of Arabic logic. The first chapter, presenting a "Brief History" of Arabic logic, is of a different character. Written especially for this volume, this historical survey presents the requisite background for the more specialized studies that follow. Each of the contributors to Arabic logic subsequently dealt with is here put into his proper context in the historical development of the subject. While it is hoped that these studies will provide information useful to the historian of philosophy and the student of the intellectual history of Islam, their author hopes fondly that their perusal will provide an incentive to others to carry further the work which he has here taken in hand and has carried forward, as he knows full well, but very little." (*Introduction*, p. 11)

43. ———. 1967. *Temporal Modalities in Arabic Logic*. Dordrecht: Reidel.

"In the wake of A. N. Prior's book on *Time and Modality*(1) an active interest has sprung up among logicians in the logical theory of chronological propositions generally, and particularly in the relationships that obtain between such propositions and modal concepts. This phenomenon is not surprising, because the issue is one that ramifies widely into various topics of logico-philosophical interest: the theory of tensed discourse, the problem of determinism, and the puzzle of future contingency, among others. The modern discussions have gone forward wholly oblivious to the fact that medieval Arabic logicians had given extensive attention to the development of a theory of temporal modalities, and had developed an extensive and subtle machinery for dealing with problems in this area. The aim of the present monograph is one of "intellectual archeology" - to present the Arabic contributions to this branch of logic in such a way that their linkage with ideas and concepts of present-day interest can be assessed and appreciated." (p. 1)

46. ———. 2006. "Logic in the Islamic World." In *Encyclopedia of Philosophy. Second Edition*, edited by Borchert, Donald M., 417–420. New York: Thomson Gale.

    Arabic logic, like the rest of medieval Arabic science and philosophy, is entirely Western and has nothing to do with Oriental philosophy. It developed wholly in the wake of the classical Greek tradition as preserved in and transmitted through late Greek Aristotelianism. The present account briefly traces the evolution of Arabic logic from its inception in the late eighth century to its stultification in the sixteenth century, mentioning only the most important trends, figures, and achievements. Information on individual writers can be found in Carl Brockelmann's monumental *Geschichte der arabischen*

Litteratur, cited hereafter as GAL (2 vols.—I, II—Weimar, 1890; Berlin, 1902; 2nd ed., Leiden, 1943–1949; 3 supp. vols.—SI, SII, SIII—Leiden, 1937–1942)." (p. 417)

With an *Addendum* by Tony Street, p. 421.

"For more on everything in the entry, see especially Hans Daiber's *Bibliography of Islamic Philosophy* (1999). Few scholars would now accept that Arabic logic is "entirely Western"; it grew out of Greek texts, but developed differently from both Hellenistic and Latin logic." (p. 421)

47. Rescher, Nicholas, and van der Nat, A. 1974. "The Theory of Modal Syllogistic in Medieval Arabic Philosophy." In *Studies in Modality*, edited by Rescher, Nicholas, Manor, R., vander Nat, A. and Z., Parks., 17–56. Oxford: Blackwell.

"The aim of the present discussion is one of "intellectual archeology" —to present the Arabic contributions to this branch of logic in such a way that their linkage with ideas and concepts of present-day interest can be assessed and appreciated.

The logic of modality was a relative latecomer to the domain of Arabic logic. Only after the time of Abu Bishr Matta ibn Yunus (ca. 870-940), translator of *Posterior Analytics*, did the study of Aristotle's modal syllogistic come to be taken up.(2)" (p. 17)

(...)

"The present essay seeks to present in systematic form the theory of modal temporal syllogistic as it is presented in tracts by two authors, al-Qazwīnī and al-Shirwānī. It goes perhaps without saying, that although we base our discussion in the main upon the treatises of these two authors, the exposition will draw upon a wider range of Arabic logicians, including

such more prominent figures as Avicenna and Averroes. In particular, we shall see that al-Qazwīnī al-Kātibī follows and draws upon Avicenna. Details of this reliance will be obvious at many points to anyone who compares al-Qazwīnī's treatment with the corresponding treatment of Avicenna's *Kitāb al-ishārāt wa-l- tanbīhāt,* which is fortunately accessible to European scholars in an excellent French version: A. M. Goichon (tr.), Ibn Sinā'. *Livre des Directives et Remarques* (Beyrouth and Paris, 1951). al-Qazwīnī's dependence upon Avicenna is strikingly evidenced by the close parallelism in organization, mode of treatment, and substance between the two treaties." (p. 19)

"Arabic manuscript codex OR 12405 of the British Museum contains a logical treatise entitled *Sharḥ Al-takrmīl fī 'l-manṭiq*, whose author is one Muhammad ibn Fayḍ Allah ibn Muḥammad Amīn al-Shirwānī.

(...)

"Al-Shirwānī's treatise is of some interest because it enables us to confirm and extend in significant ways our information regarding the Arabic theory of temporal modal syllogistic as available from other sources.(4) This paper seeks to present the new light this source affords for our knowledge of Arabic logic. On the information now available it would seem that the theory of temporal modalities represents the most significant addition made by the medieval Arabic logicians to the body of logical material that they received from the Greeks. The entire subject has only begun to be studied in recent years, and until many more texts have been studied and analyzed our conclusions must remain provisional and tentative. Much work remains to be done before our feet can be set on firm ground. But already

at this early juncture a claim can be entered with considerable assurance regarding the value and interest of such further work." (p. 189, a note omitted)

49. Rezakhany, Hassan. 2023. "A Forgotten Mereological Paradox." In *Fallacies in the Arabic, Byzantine, Hebrew and Latin Traditions*, edited by Cesalli, Laurent, Gazziero, Leoe, Manekin, Charles, Rahman, Shahid, Street, Tony and Trizio, Michele, 187–207. Turnhout: Brepols.

    Abstract: "From the thirteenth century to the nineteenth, philosophers of the eastern Islamic world (Iraq to India) studied a mereological paradox of great philosophical interest.

    Here are documented many of the important formulations of the paradox, solutions, and objections to those solutions. After the philosophical contributions to the literature are summarized, there follows a section analyzing their merits and shortcomings as well as a section plotting their historical evolution and trajectory. In addition to the article's intrinsic philosophical interest, it is also a touchstone for evaluating historical hypotheses regarding the intellectual decline of the post-classical Islamic world. In the 'Historical Development' section, it is briefly argued that the paradox is functionally equivalent to Russell's. The study ends with an appendix of translations."

50. Rundgren, Frithiof. 2007. "On the Greek Influence on Arabic Grammar." In *The Early Islamic Grammatical Tradition*, edited by Baalbaki, Ramzi, 75–100. Aldershot: Ashgate.

    "Arab tradition generally considers Abu 1-Aswad al-Du'alīī (d. - according to al-Mada'inī - 688 in Basra) to have been the originator of Arabic national grammar.(1)" (p. 75)

    (...)

    "The Arabic language, the language of the Qur'ān, was at first the only tie that bound the different ethnic groups of the rapidly growing empire together. The Arabic language spoken

in 'Iraqi war camps was by no means homogeneous and often deviated considerably from the standards set by ancient poetry and, gradually,(5) the Qur'ān. Moreover, the Qur'ān was considered to be the unattainable paragon of the art of language and had to be recited absolutely correctly. Therefore people had to master the rules established subsequently for the Arabic dialect of the Qur'ān." (p. 76)

(...)

"However that may be, the concept of grammatical errors presupposes an existing understanding of correct speech of the kind that had been found among the Greeks since Antiquity and was now beginning to evolve among the Arabs. Thus it is not too far-fetched to assume that the προσῳδία of Greek philology can in some way be found behind the Arabic term. After all, Arabic philology evolved among the *qurra'* who devoted themselves to the correct recitation of the Qur'ān,. It is safe to assume that these were the circles where *laḥn* first assumed the definitive meaning of 'melody of speech, manner of speech'. According to Mujahid (d. ca. 720) there is a tradition: *wa marra 'Umaru bi-qawmin, yatanāḍalūna fa-laḥana aḥaduhum fa-qāla 'Umaru: su'u l-laḥni aqbaḥu min su'i l-ramyi* (Chester Beatty Collection, MS Arab. 705, ed. P Kahle, The Cairo Geniza,[2] 1959, p. 346). In the phrase *su'u l-laḥni*, *laḥn* probably had the meaning 'manner of speech' in general." (p. 77)

(1) A. Spitaler might possibly prefer the term national-Arabic grammar here, cf. *Orientalistische Literaturzeitung* 63/1968 p. 50ff.

(5) P. Kahle, The Cairo Geniza[2] (1959) p. 141ff.

51. Sabra, Abdelhamid I. 1965. "A twelfth-century defence of the fourth figure of the syllogism." *Journal of the Warburg and Courtauld Institutes*:14–28.

Reprinted in A. I. Sabra, *Optics, Astronomy and Logic: Studies in Arabic Science and Philosophy*, Aldershot: Variorum 1994. (Essay XVI).

"It was widely believed until recently that the fourth figure, omitted by Aristotle in his systematic treatment of the syllogisms, was invented by Galen in the second century a.d. This view is known to have been first circulated in the West through the work of Averroes.(1) It is, however, contradicted by Galen himself in the *Introduction to Logic*, the only complete logical work of his that has survived in Greek. Galen says in this work that there cannot be more than three figures for the categorical syllogisms, adding that he has shown this in his book *On Demonstration*.(2) A new light was thrown on this question when J. Lukasiewicz drew attention to a published Greek scholium which may be taken to explain how the doctrine of four figures came to be attributed to Galen. The unknown scholiast divides categorical syllogisms into simple and compound. In accordance with Aristotle, he divides simple syllogisms consisting of three terms into three figures. Then he continues: 'Galen, however, says in his *Apodeictic* that there are four figures, because he looks at the compound syllogisms consisting of four terms, as he has found many such syllogisms in Plato's dialogues.(3) It would thus appear that someone who misunderstood the relevant passage in Galen's book, or who had simply heard about 'Galen's four figures', assumed that Galen's doctrine applied to simple, not compound syllogisms. (4)

It is known that Galen's *Demonstration* was translated into Arabic in the second half of the ninth century.(...)" (p. 14, a note omitted)

(...)

"It is, therefore, only natural to turn to the Arabic sources for more light on the historical problems connected with the fourth figure. The present article is a first attempt in this direction. It is based on a twelfth-century Arabic work, entitled 'On the fourth figure of the categorical syllogism, which is the figure attributed to Galen'. The author, Najm al-Din Abu-l-Futuh Ahmad ibn Muhammad ibn al-Sari, also known as Ibn al-Salah, was educated at Baghdad where he studied logic, mathematics

and medicine; he later settled in Damascus where he died in a.h. 548 = a.d. 153-54.)(..)" (p. 15)

(....)

"In Part II of this article I shall give a translation of the prologue to Ibn al-Sariì treatise, followed in Part III by a commentary on the translated text. Part IV will be devoted to an analysis of Ibn al-Sari's arguments contained in the bodv of his treatise." (p. 16)

(1) Averroes ascribes the fourth figure to Galen both in his *Expositio media* (Bk. I, Chaps. 8 and 23) and *Epitome* (Ch. i) of the *Prior Analytics;* he does not indicate his source in either place.(...)

52. Sanson, David, and Alwishah, Ahmed. 2016. "Al-Taftāzānī on the Liar Paradox." *Oxford Studies in Medieval Philosophy* no. 4:100–124.

"Saʿad al-Dīn Masūd ibn ʿUmar ibn ʿAbd Allāh al-Taftāzānī (1322–1390) was a Persian polymath who wrote on a wide range of subjects— grammar, logic, theology (*kalām*), jurisprudence (*fiqh*), and literature.

Here we translate and discuss his remarks on the Liar Paradox, in which he (a) presents the first example of a Liar Cycle or Deferred Liar in the tradition, (b) gives the paradox a puzzling name—the fallacy of the "irrational root" (*al-jadhr al-aṣamm*) —which became the standard name for the paradox in the tradition, and (c) suggests a connection between the paradox and what it tells us about the nature of truth and falsehood, and

related puzzles concerning reason and the nature of goodness and badness." (p. 100)

53. Schleifer, Aliah. 1990. "Ibn Khaldun's Theories of Perception, Logic and Knowledge: An Islamic Phenomenology." *Islamic Quarterly* no. 34:225–231.

    "Ibn Khaldūn's theories about perception, logic and knowledge are clearly influenced by Aristotelian thought; however being somewhat eclectic, he adds, synthesizes and arrives at his own perspective. In addition, however novel Ibn Khaldūn's conclusions may be, there is the underlying awareness of the Source of all knowledge: "Knowledge comes only from Allah, the Strong, the Wise."' His philosophy, guided by the Qur'ān and the Sunnah and sparked by his own genius and capacity for speculative thought, sometimes has much in common with Scholastic Realism, and indeed might be classified as Islamic Phenomenology." (p. 225)

    (...)

    "In summary, Ibn Khaldūn presents man as the focal point of the Universe.

    But, man before he reaches the stage of discerning intellect, is simply matter in as much as he is ignorant of all knowledge. Through knowledge, however, he reaches the perfection of his form. It is the discerning intellect, the god given ability to think which enables man to arrange actions in an orderly, logical manner. The experimental intellect represents man's ability to acquire useful knowledge from his fellow men. The speculative intellect is man's ability to perceive existent things, whether present or absent. Thus, with the help of the soul and by Allah's mercy, man may acquire knowledge of a spiritual nature." (p. 230)

54. Schöck, Cornelia. 2016. "Major Issues and Controversies of Arabic Logic: Preface." *Oriens* no. 44:179–180.

    "The project "Major issues and controversies of Arabic logic and philosophy of language," co-funded by the British Arts and Humanities Research Council (ahrc) and the Deutsche Forschungsgemeinschaft (dfg), is an attempt to fill some gaps

in our knowledge regarding fundamental research questions to do with Arabic logic and philosophy of language. Against the twofold background of the late antique commentaries on Aristotle's *Organon* and of the debates on issues pertaining to logic and philosophy of language in the formative period of the Arabic-Muslim sciences, the focal points of the project are:

(a) the relationship of Arabic logic and philosophy of language with Arabic-Muslim theories of science and argumentation theory, including the ultimate reception of Greek-derived theories in Muslim jurisprudence, rhetoric, theology, and

(b) the development of Arabic logic and philosophy of language after Ibn Sīnā (d. 428/1037).

(…)

Over the last five years, a number of papers first presented and discussed at the project workshops at Cambridge have been published in *Oriens*. The papers published in the issues 44.3–4 (2016) of Oriens focus on problems of Arabic logic and on argumentation theory.

55. Schoeck, Cornelia. 2025. "'Subtraction' (*raf*)as Method for Finding First Principles of Demonstrations and for Establishing or Destroying: From Aristotle to al-Fārābī." In *Logic, Soul, and World: Essays in Arabic Philosophy in Honor of Tony Street*, edited by Ahmed, Asad Q., Zarepour, Mohammad Saleh and Strobino, Riccardo, 46–113. Leiden: Brill.

"The method of "subtracting," "taking away," or "removing" (Arab. *raf ʿ*; pass. *irtifā ʿ*) is omni-present in Ibn Sīnā's logic, in particular in the *Topics* (*K. al- Jadal*), the *Isagoge* (*K. al-Madkhal*) and the *Demonstration* (*K. al-Burhān*) of his *Shifā ʾ*, but also in the *Metaphysics* (*al-Ilāhiyyāt*) of his *Shifā ʾ* where he explains the ontological aspect of this method. And in the *Canon of Medicine* (*al-Qānūn fī aṭ-Ṭibb*) he applies this method. I intend to give an overview on how this method works in Aristotle up to al-Fārābī and to explain its philosophical and logical background and its function. I also refer to some influential passages in Alexander of Aphrodisias, Galen, Sextus Empiricus, Proclus, Philoponus, but I disregard influential

testimonies from ancient medicine and from Philodemus.(2). The aim is to provide the background before we should study Ibn Sīnā's theory of 'taking away' and consequence (luzūm), including his semantic theory of the signification of linguistic expressions (*dalālat al-alfāẓ*)." (pp. 46-47)

56. Schoeler, Gregor. 2013. "The 'Poetic Syllogism' Revisited." *Oriens* no. 41:1–26.

    Abstract: "The term 'poetic syllogism' appears in the late antique Greek commentary and scholia literature.

    Arabic philosophers, however, are the first to explain how this kind of syllogism is constructed; al-Fārābī introduces one type and Avicenna adds two more. Each syllogism that follows one of these three types includes among its premises or its conclusion at least one figurative statement. The poetic syllogism plays a key role in Arabic 'philosophical' poetics, which contains an important theory of figurative language.—A treatise on *Poetics* by Ibn ʿTumlūs discusses the relationship between the three types. The present study closely analyses Ibn ʿTumlūs's reasoning. Furthermore, it clarifies previously unexplained or misunderstood terms such as 'poetic statement', 'poetic premise' and 'poetic definition'.

    It finally points to an example for a specific type of sophistical inference Aristotle introduces in his *Sophistical Refutations* which Avicenna and other Arabic philosophers cite as a poetic syllogism. Commentators, perhaps as early as late antiquity, could have taken this type of inference to be the poetic syllogism they failed to find in Aristotle's *Poetics*."

57. Shehaby, Nabil. 1975. "The Influence of Stoic Logic on AI-Jaṣṣāṣ's Legal Theory." In *The Cultural Context of Medieval Learning*, edited by Murdoch, John Emery and Sylla, Edith Dudley, 61–80. Dordrecht: Reidel.

    Discussion, pp. 80-85.

    "My aim in writing this paper was to clarify some of the most obscure, and at the same time crucial, passages in al-Jaṣṣāṣ's *Usūl al-Fiqh*. These passages reveal part of the logical

apparatus that Muslim legal theorists used in building up their systems. In many instances this apparatus reflects a striking resemblance to Stoic views on logic, even though there is no proof that Stoic writings were available to Muslims. Some of this logic was also employed by the *mutakallimūn* (theologians); and it is for this reason that the above reflections may prove to have a wider significance by helping to decipher certain methods used in *kalām*. What I would like to add here is that the Stoic material in al-Jaṣṣāṣ's book does not come from the Aristotelian commentators. As I have shown in my recent *The Propositional Logic of Avicenna,* the Stoic material in Avicenna's treatment of conditional propositions and syllogisms in contrast bears the stamp of the Peripatetic philosophers." (p. 75)

58. Spevack, Aaron. 2010. "Apples and Oranges: The Logic of the Early and Later Arabic Logicians." *Islamic Law and Society*:159–184.

    Abstract: "In a recent article in *Islamic Law and Society*, Khaled El-Rouayheb proposed that opposition to logic was probably never the predominant view of Sunni Muslim scholars.

    El-Rouayheb also expressed doubt in the position of later scholars who argued that there existed two approaches to the study of logic, one whose permissibility was debated, and another whose permissibility was agreed upon. In response to El-Rouayheb,

    Mufti Ali argued in his own article that opposition to logic was the predominant view of Sunni Muslim scholars between the thirteenth and fifteenth centuries. In this article, I argue, pace Ali, that there is merit to the claim that neither opposition to, nor support for, logic achieved predominance, especially between the thirteenth and fifteenth centuries, even if favorable opinions came to be viewed as the soundest position in later centuries. I also argue, pace El-Rouayheb, that there is merit to the proposition that there are two distinct approaches to logic, one that mixes objectionable elements from Greek philosophy, and one that, in varying degrees, may have rid itself of these

elements. Additionally, I argue that the thirteenth through fifteenth centuries may have marked a transitional period during which the two approaches became more distinct, although some jurists who ruled on logic did not always notice, or acknowledge, the distinction."

59. ———. 2022. "Defending Definitions: The Tools of Disputation in Logic of al-Fanārī." *Methodos. Savoirs et textes* no. 22:1–30.

    Abstract: "Al-Abharī's (d.1265) *Isagoge* (*al-Īsāghūjī*) is an introductory primer in logic which has received numerous commentaries, each geared towards students of various levels of familiarity with this instrumental science. Al-Fanārī's (d. 1431) advanced commentary on the Isagoge, called *al-Fawā 'id al-Fanāriyya*, has confounded students of logic for centuries due to its terse and dense style as well as the presumption that the reader knows well the science of disputation along with the subtle interpretive disagreements discussed in other texts and commentaries."

60. Stodolsky, Muhammed Volkan Yildiran. 2023. "What is a Kalima, What is a Definition: The Relationship between Logic and Grammar in theLater Arabic Linguistic Tradition." *The American Society of Islamic Philosophy and Theology Online Journal*:1–31.

    "The purpose of the discipline of *naḥw* (Arabic syntax) has been defined as making one familiar with the endings of the *kalima,* meaning the case endings of nouns and moods of verbs. Hence, defining what a *kalima* is constitutes one of the most fundamental subjects of naḥw. This study will discuss and compare three explicit definitions of *kalima* by al-Zamakhsharī (d. 538/1144), Ibn al-Ḥājib (d. 646/1249), and Ibn Hishām al-Anṣārī (d. 761/1360), in light of ʿAbd al-Raḥmān al-Jāmī's (d. 898/1492) analysis and evaluation of the definitions of al-Zamakhsharī and Ibn al-Ḥājib in his commentary on the latter's al-Kāfiya. The articulation and evaluation of different definitions of *kalima* depend on selecting the criteria through which one definition becomes preferable to another.(2) This article will also study the different criteria Muslim grammarians and logicians have used in their conceptualization

of the best definition in the context of Ibn Hishām's attempt to fully use the criteria of logic in his grammatical

definition of *kalima*." (p. 1, a nte omitted)

(2) For an overview of the concept of definition, see Takashi Yagisawa, "Definition," in *Cambridge Dictionary of Philosophy*, edited by Robert Audi, 2d ed. (NY: Cambridge University Press, 2006).

Ancient Islamic Logic. Selected bibliography of studies in English: Str - Z

Bibliography

1. Street, Tony. 2000. "Towards a History of Syllogistic after Avicenna: Notes on Rescher's Studies on Arabic Modal Logic." *Journal of Islamic Studies* no. 11:209–228.

   "The main contributions made by Rescher in these studies [on categorical syllogistic] lie, firstly, in recording the syntax of a system whose central features are common to both writers and, secondly, in putting forward a semantics which seems pretty much inferentially equivalent to that system.

   These are substantial contributions, not only to the study of two logicians [al-Qazwīnī al-Katībī (d. 1276) and Muhammad b. Fayd Allāh b. Muhammad Amīn al-Shirwānī (fl. early 15th c.?)] writing after Avicenna, but also to the study of Avicenna himself, providing us with purchase on systems set down as alternatives to the Avicennian.

   Notwithstanding the important contributions these studies make to the analysis of medieval logic, they suffer from a number of shortcomings."

   (...)

   "In my opinion, however, the most serious shortcomings in Rescher's work are the historical conclusions at which he arrives, and his failure to treat the Arabic technical terms. Among his claims regarding the history of logic, Rescher seeks to relate the writings of Qazwīnī and Shirwānī to Avicenna's *Pointers,* and characterizes that relation in ways which are at best distorted, and at worst wrong. The absence of any treatment of the Arabic technical terms for the propositions or operations which are described has meant that the studies have been less useful to Arabists than might otherwise have been the

case. What I seek to do in the following is, firstly, to assemble notes aimed at correcting and nuancing Rescher's historical conclusions, and, secondly, to gather some of the important terms together in an incipient conspectus which may help scholars read both Rescher, and the texts with which he worked." (pp. 211-212)

2. ———. 2004. "Arabic Logic." In *Handbook of the History of Logic, Volume 1: Greek, Indian and Arabic Logic*, edited by Gabbay, Dov M. and Woods, John, 523–596. Amsterdam: Elsevier North-Holland.

   "This chapter limits itself to logical writings in the peripatetic tradition produced in Arabic between 750 and 1350. It is intended to provide a tentative framework for analysis of these logical works by describing aspects of the historical and intellectual context within which they were written. This is done by testing the model put forward in Rescher's *Development of Arabic Logic* against accounts of the syllogistic in a number of authors.

   By about 900, the Organon had been translated into Arabic, and was subject to intensive study. We have texts from that time which come in particular from the Baghdad school of philosophy, a school which at its best proceeded by close textual analysis of the Aristotelian corpus. The school's most famous logician was Alfarabi (d. 950), who wrote a number of introductory treatises on logic as well as commentaries on the books of the *Organon*.

   (...)

   The success and rapid spread of Avicenna's philosophy and logic elicited a strong reaction from establishment theology, whose very intellectual vitality was perceived to be threatened. The clearest and most influential response to Avicenna was given about half a century after his death by Abū Ḥāmid al-Gazālī (d. 1111). A case had been made at least as early as Alfarabi that logic could help Muslim scholars in juristic and theological reasoning.

Gazālī accepted these arguments and went so far as to preface his juridical summa, *The distillation of the principles of jurisprudence,* with a short treatise on logic. Logic continued to face pious opposition after Gazālī but even scholars who were opposed to Greek philosophy in its various manifestations were agreed that, taken as a formal system, logic was unobjectionable.

(...)

By 1350, it is clear that the Avicennan tradition predominated over the Farabian and Averroist traditions throughout the Islamic world, and the systematic problems in Avicenna's formal syllogistic were taken as being settled. By this time, texts were being produced which continued to figure in the syllabus of the *madrasa* down until recent times. For centuries after, advanced logical investigations continued in the Islamic world, but the *madrasa* texts were always the way that Muslim scholars had come to be able to conduct those investigations." (pp. 523-524)

3. ———. 2005. "Logic." In *The Cambridge Companion to Arabic Philosophy*, edited by Peter, Adamson and Taylor, Richard C., 247–265. Cambridge: Cambridge University Press.

"A chapter on logic in an introductory book on Islamic philosophy could legitimately be expected to cover a range of topics, from the argument techniques used by ninth-century theologians and jurists to the semantical analyses of the fourteenth-century grammarians.(1)

But by the late tenth century, the Arabic word commonly translated as “logic,” *manṭiq*, had come to refer almost exclusively to Peripatetic traditions of distinguishing a good from a bad argument, and those are the traditions to which this chapter is limited. This means that the Arabic logical writings examined here are, like their medieval Latin counterparts, concerned with a problematic arising from the Aristotelian texts; more than medieval Latin logic, however, the dominant tradition of Arabic logic is mainly at one remove from those texts, as will be exemplified below.

Even with this limitation, the writings which fall under the chapter's remit stretch from 750 to the present day, covering the whole course of subjects developed in the *Organon*. For practical purposes, I impose the further limitation of referring the material covered back to *al-Risāla al-shamsiyya*, the Logic for Shams al-Dīn by Najm al-Dīn al-Kātibī (d. 1276).(2)" (p. 247)

(1) For information on these interesting topics, see respectively J. van Ess, "The Logical Structure of Islamic Theology," in von Grunebaum [184], 21–50; and B. Weiss, "Ilm al-Wad.': An Introductory Account of a Later Muslim Philological Science," *Arabica* 34 (1987), 339–56.

(2) The whole of the *Shamsiyya* is available in translation, though a new translation is overdue. See A. Sprenger (ed. and trans.), *Bibliotheca Indica: A Collection of Oriental Works,* no. 88: *First Appendix to the Dictionary of Technical Terms used in the Sciences of the Mussulmans, containing the Logic of the Arabians* (Calcutta: 1854); this partial translation is completed in Rescher [178], 39–45. Rescher added to his translation a somewhat faulty analysis of the logic; he corrected it later in his study with A. vander Nat [180].

4. ———. 2005. "Faḫraddìn ar-Ràzì's Critique of Avicennan Logic." In *Logik und Theologie. Das Organon im arabischen und im lateinischen Mittelalte*, edited by Perler, Dominik and Rudolph, Ulrich, 99–116. Leiden: Brill.

"This study is a preliminary exploration of certain changes introduced into the modal syllogistic over the two and a half

centuries following Avicenna's death.

(...)

Unsurprisingly – given the title of this paper – the scholar advancing the argument is Faḫraddīn ar-Rāzī (d. 1210). The specific change I focus on here is one which is apparent on comparing the system put forward in the works of Avicenna(2) (d. 1037) with the one put forward in the much-studied *Logic for Śamsaddīn*(3) written by Nag-maddīn al-Kātībī (d. 1276). There are actually a number of differences between the system of Kàtībī and that of Avicenna, but here I concentrate on one relating to syllogisms with *dātī* premises (*dātī* is explained below) and whether or not they are productive with possible minors. This difference creates only a few further differences between the two systems. But Kātībī's decision to differ from Avicenna seems to me to mark deeper changes relative to the perceived role and function of the syllogistic, the cultural significance of Aristotle, and the importance of the theological concerns of the day for logic.

And one argument for the moves Kātībī makes is given by Rāzī.

In the following, I make a few general comments about how we have to go about the study of Rāzī's logic, and then sketch relevant aspects of Avicenna's and Kātībī's systems. I go on to state the argument advanced by Rāzī, and to note some of the differences among the three logicians. I conclude with some points relative to the development of post-Avicennan logic and the possible importance of theological concerns for that development." (pp. 99-100)

"The *dātī* reading is concerned with the things picked out at least once by the subject term as long as they exist as a substance (*mā dāma mawgūda d-dāt*), and by the predicate according to the proposition's modality or temporality.

This is probably best explained by way of example. All sitting may be standing is true as a *dātī* reading; each person who sits can at a later time stand, all other things being equal." (p. 102)

(2) For an outline of the system, with an exposition of all technical terms, assumptions and proofs, see Street (2002).

(3)Kātībī, *Śamsìya*.

5. ———. 2008. "Rescher on Arabic Logic." In *Rescher Studies: A Collection of Essays on the Philosophical Work of Nicholas Rescher*, edited by Almeder, Robert, 309–324. Frankfurt: Ontos Verlag.

"The study of Arabic philosophy has come on by leaps and bounds in recent years, as is clear from a bibliography of the field compiled in 1999 by Hans Daiber.(1) Of course, the work going on at the moment depends in large measure on the great pioneering studies of years ago. Those studies are dutifully and compendiously listed by Daiber, and among them are thirty-five publications by Nicholas Rescher, mainly on Arabic logic. (2)

I do not intend in this paper to go through more than a few of these contributions; indeed, I limit myself to Rescher's overview history of Arabic logic, the D*evelopment of Arabic Logic,* and his series of studies on Arabic modal syllogistic as laid out by Nağmaddīn al-Qazwīnī al-Kātibī (d. 1276; henceforth Kātibī) and Muhammad ibn Faydallāh aš-Širwānī (d. 1707).(3)

In what follows, I direct a number of critical remarks to aspects of these contributions, and it will be helpful if I make clear at the outset the nature of the debt that students of Arabic logic owe to Rescher. None of the current work on Arabic syllogistic would be possible without Rescher's studies.

And even today, no one dares write about Arabic logicians, particularly those after Avicenna, without citing *Development*. With Rescher's work on Arabic logic, in short, we are confronted by one of those rare cases in scholarship where a scholar has single-handedly opened up a field." (p. 309)

(1) Daiber [1999].

(2) Daiber [1999] 1: 776-771.

(3) Khaled El-Rouayheb has shown, in a study yet to be published, that the logical text in British Library codex Or. 12405 is in fact written by an Ottoman scholar Muhammad Sādiq ibn Faydallāh ibn Muhammad Amin ibn Sadraddīn aš-Šīrwānī, 1630-1707, a number of centuries after the time Rescher thought he lived. This means that the text analysed by Rescher in his later studies of Arabic modal logic was written at pretty much the same time as the Port-Royal Logic.

6. ———. 2008. "Suhrawardī on Modal Syllogisms." In *Islamic Thought in the Middle Ages: Studies in Text, Transmission and Translation, in Honour of Hans Daiber*, edited by Akasoy, Anna and Raven, Wim, 163–178. Leiden: Brill.

   "On first encounter, Suhrawardī's modal syllogistic in the *Philosophy of Illumination* looks to be quite different from Avicenna's. Closer inspection, however, reveals that Suhrawardī's system is deeply Avicennan, more so than, for example, the system in Najm al-Dīn al-Kātibī's *Shamsiyya*. In this paper I examine what Suhrawardī achieves by reading all modal propositions as embedded in the phrase 'by necessity' (*bi'l-ḍarūra*), what help it can offer the historian of Arabic logic, and what it means for assessing Suhrawardī's larger philosophical project." (p. 163)

7. ———. 2014. "Afḍal al-Dīn al-Khunājī (d. 1248) on the conversion of modal propositions." *Oriens* no. 42:454–513.

   Abstract: "Afḍal al-Dīn al-Khūnajī (d. 1248) was an Arabic logician working in thirteenth-century Cairo. Responding to the logical writings of both Avicenna and Fakhr al-Dīn al-Rāzī, he produced highly innovative work that set the agenda for the subsequent logical tradition.

   In this study, the chapter on conversion from Khūnajī's magnum opus, *Kashf al-Asrār ʿan Ghawāmiḍ al-Afkār* (*The Disclosure of Secrets as to the Obscurities of Thoughts*), is

translated and provided with a commentary. The chapter serves to highlight, among other things, the way Khūnajī understood a proposition in the essentialist (*ḥaqīqī*) reading."

8. ———. 2016. "Al-ʿAllāma al-Ḥillī (d. 1325) and the Early Reception of Kātibī's *Shamsīya*: Notes towards a Study of the Dynamics of Post-Avicennan Logical Commentary." *Oriens* no. 44:267–300.

   Abstract: "*Al-Risāla al-Shamsīya fī l-qawāʿid al-manṭiqīya* by Najm al-Dīn al-Kātibī (d. 1277) is one of the most widely-read textbooks on logic ever written. Its first readers, however, were less enthusiastic about it than later generations proved to be. In the earliest commentary written on the *Shamsīya*, al-ʿAllāma al-Ḥillī (d. 1325) expressed serious reservations about a number of Kātibī's decisions, decisions which developed ideas first put forward by Fakhr al-Dīn al-Rāzī (d. 1210). In the following article, I examine how the commentary Ḥillī wrote on the *Shamsīya*, *al-Qawāʿid al-jalīya fī sharḥ al-Risāla al-Shamsīya*, fits in with his other works on logic, and how it responds to Kātibī's logical program in general and to the syllogistic in particular. When set against the preceding two centuries of commentary on Avicenna's *Kitāb al-Ishārāt wa-ltanbīhāt*, Ḥillī's response to the *Shamsīya*—and indeed Kātibī's writing of the *Shamsīya* itself—can be seen as seamlessly carrying forward a commentary tradition in which Rāzī and Naṣīr al-Dīn al-Ṭūsī (d. 1274) figure prominently. The first appendix to the article examines the transformation of a lemma in the *Ishārāt* into the corresponding lemma in the *Shamsīya* through 150 years of commentatorial debate; the second appendix presents translations of a number of texts on syllogistic from *al-Qawāʿid aljalīya*."

9. ———. 2017. "Kātibī (d. 1277), Taḥtānī (d. 1365), and the *Shamsiyya*." In *The Oxford Handbook of Islamic Philosophy*, edited by El-Rouahyeb, Khaled and Schmidtke, Sabine, 348–374. New York: Oxford University Press.

   "The *Epistle for Shams al-Dīn on the Rules of Logic*— for short, the *Shamsiyya*— is a remarkable book.(1) It is one of the most

widely read logic texts of all time. Written sometime after 1262 by Najm al-Dīn al-Kātibī (d. 675/ 1277), it attained immediate celebrity that it continues to enjoy down to today. It has been widely taught in madrasas, especially in the arc of Muslim countries running from Egypt through to India. So popular did it become, it effectively replaced the volume on logic in Avicenna's *Pointers and Reminders* (*al-Ishārāt wa-l-tanbīhāt*) (normally read with Naṣīr al-Dīn al-Ṭūsī's *Solution to the Problems of Pointers*);(2) most manuscripts of *Pointers and Solution* copied after 1400 no longer contain the logic section. Ultimately, as we shall see, even specialists in logic began to look on *Shamsiyya* logic as Avicenna's logic." (p. 348)

(...)

"The commentary with which it was most commonly read was written by Quṭb al-Dīn al- Rāzī al-Taḥtānī (d. 766/1365) in 1329, the Redaction of the *Rules of Logic in Commentary on the Epistle for Shams al-Dīn*. The *Redaction* is a classic in itself; indeed, the supercommentaries on it outnumber the commentaries on the *Shamsiyya* (Wisnovsky 2004, 163– 65)." (p. 348)

(...)

"In what follows, I say a few words about Kātibī and his working circumstances; I say even fewer about Taḥtānī. I go on to reflect on the *Shamsiyya*, its structure, contents, and the broader project it forms part of. In the third section I consider two of Kātibī's logical proofs. I then concentrate on a short but significant section of the text (3 of the text's 120 lemmata) to show how immediately preceding discussions led Kātibī to write what we find in the *Shamsiyya*. Throughout, I draw on material from Taḥtānī's commentary to illustrate the nature of that work. In conclusion, I glance at the career of the *Shamsiyya* and its logical doctrine in the centuries after Kātibī's death.

The chapter has two appendices. One is a table of the *Shamsiyya*'s contents. The second is a concordance (table 16.1) to help navigate between the Arabic of the *Shamsiyya*, its

English translation, and my numbering of the lemmata." (p. 349)

(1) Taḥtānī, *Taḥrīr* (1948) contains the text of the *Shamsiyya* I have used; it also contains Taḥtānī's *Redaction*.

(2) Ṭūsī, *Ḥall*; I check this version against MS British Library Or. 10901.

"This volume is loosely limited to the period from 800 to 1200.1 I am grateful for the latitude the editors have given me in writing the following paper; many of the texts I consult and quote come from the late thirteenth century. They are, however, all directed to a body of doctrine that was first formulated by Avicenna in the first half of the eleventh century. The thirteenth-century treatment of that doctrine was shaped

by two books written by Fakhr al-Dīn al-Rāzī (d. 1210) in the late twelfth century, books written to question the rigour of many of Avicenna's formulations. The thirteenth-century texts quoted here are, in short, part of a process of reception of a doctrine developed and then challenged through the last two centuries of the period on which the volume focuses. Specifically, the texts are devoted to an account of a fundamental aspect of the philosophy of language, namely, the relation of signification (*dalāla*) between an expression (*lafẓ*) and the meaning (*maʿnan*) or – nearly always – meanings (*maʿānin*) it signifies." (p. 101, a note omitted)

11. ———. 2021. "Abū l-Barakāt al-Baġdādī and the Traditions of Arabic Logic." *Studia graeco-arabica* no. 11:41–66.

    Abstract: "In the anonymous *al-Nukat wa-l-fawāʾid,* a summa of Avicennan philosophy written around 1200, a partisan of Avicenna accuses Faḫr al-Dīn al-Rāzī (d. 1210) of having come under the influence of the reprehensible Leader of the Jews, Abū l-Barakāt al-Baġdādī (d. c. 1165). The reasons for the anonymous author's antipathy toward Abū l-Barakāt relate to the way Avicenna's contribution to logic is both pillaged and pilloried in stretches of *al-Kitāb al-muʿtabar*. The claim that Abū l-Barakāt exercised direct influence over Faḫr al-Dīn is, at least in logic, unlikely to be true. Nonetheless, Abū l-Barakāt's presentation and methods highlight significant changes in the methods of the later traditions of Arabic logic."

12. ———. 2025. "A Thirteenth-Century Debate About Avicenna's Definitions of Differentia." *The Monist* no. 108:306–317.

    Abstract: "Avicenna (d. 1037) gave two different definitions of *differentia*, the first, in the Introduction of the *Cure*, the second, in *Pointers and Reminders*. In the 1230s, Afḍal al-Dīn al-Khūnajī (d. 1248) was spurred to consider the relative superiority of the two definitions by a question posed fifty years earlier by Fakhr al-Dīn al-Rāzī (d. 1210). Khūnajī argued that the *Pointers* definition was superior to that in the *Cure*; his argument turns on criteria used to assess a deduction of the predicables. Toward the end of the thirteenth century, Shams al-Dīn al-Samarqandī (d. 1322) came to the defence of the *Cure*

definition. In his argument against Khūnajī, Samarqandī seems to have relied on claims made in demonstration theory about, first, the hierarchy of the sciences, and second, scientific questions.

I conclude by considering whether Rāzī's theological commitments influence how he approached these logical problems. The material presented in this paper represents a fraction of the contributions made to defining *differentia* and, in consequence, an even smaller fraction of the discussions of universals in thirteenth-century Arabic logic."

13. Strobino, Riccardo, and Thom, Paul. 2016. "The Logic of Modalities." In *The Cambridge Companion to Medieval Logic*, edited by Novaes, Catarina Dutilh and Read, Stephen, 342–369. Cambridge: Cambridge University Press.

    The Arabic Tradition, pp. 343-359.

    "Avicenna (d. 1037) is the most influential logician in the Arabic tradition. His late work *al-Ishārāt wa-t-tanbīhāt (Pointers and Reminders*) became for subsequent generations the canonical text to discuss and refer to, replacing Aristotle both as a textual source and in terms of doctrine, until it was itself supplanted by Kātibī's (d. 1276) *al-Risāla al-Shamsiyya* (*Epistle for Shams al-Dīn*). Many of Avicenna's innovative contributions to the history of logic are related to modalities.

    Even though modal notions are central to other areas of his philosophy, especially metaphysics, we will focus here only on the logic." (p. 343)

    (...)

    "Post- Avicennan Arabic modal logic is still to a large extent uncharted territory: recent groundbreaking work has only started to reveal the enormous wealth of interesting and sophisticated materials it offers, and foundations are in the process of being laid in the form of critical editions, translations and studies.(1) Post-Avicennan logicians depend primarily on Avicenna's exposition of his modal logic in *al-Ishārāt* and focus on problems that are characteristic of it. Among them, the interpretation of the subject term and the

evaluation of syllogisms with possibility minors are the object of special controversy." (p. 348)

14. Stroumsa, Sarah. 2020. "Logic as Interconfessional Weapon in the Early Islamicate World: *Manṭiq, Qiyās, Kalām*." *Journal of Eastern Christian Studies* no. 72:181–201.

    Abstract: "The present paper focuses on the use of logic (including Aristotelian logic) by Arabic-speaking theologians in the formative period of theology in Arabic, especially in polemical settings. It attempts to draw on the evidence regarding a somewhat neglected edge of the monotheistic triangle, namely the Arabic-speaking Jewish theologians in the third/ninth and fourth/tenth century."

    "In studying the logic of *kalām*, van Ess has pointed to its peculiarities, andto the fact that they reflect a non-Aristotelian logical system. For instance, *kalām* texts do not use syllogistic proofs but rather resort to inference from ‘an indicative sign’ (*dalīl*, pl. dalāʾil), which, according to van Ess, translates the Stoic *sēmeion*. At times, the word *burhān*, the Arabic Aristotelian term for apodictic proof, would also be used, with the same non-syllogistic meaning.

    Thus, the presence of smoke is an indicative sign for the existence of fire; the presence of a finely written book is an indicative sign for the existence of a competent scribe. In this and other matters, van Ess pointed to the Stoics as one possible source of inspiration for the logical structure of *kalām*, but we have no idea how the early mutakallimūn could come by this Stoic logic.(22) (p. 188)

15. Taç, Afife Şeyma 2019. "How to Define Definition: An Analysis on the Dispute about the Relation between the *Definiens* and the *Definiendum* in the Post-Avicennan Arabic Logic." *Entelekya Logico-Metaphysical Review* no. 3:5–19.

    Abstract: "As standing at the very heart of the conception (*taṣawwur*), definition is not only the ultimate purpose of conception but also paves the way for the assent (*taṣdīq*). Therefore, it would merely be surprising to find definition sections at right after the principles of conception, namely five universals, and before the first part of assent, viz. the proposition, in the books compiled through the tradition of post-Avicennan Arabic logic. Having begun with identifying what definition is, definition sections proceed with its conditions, types, and the things that violate an ideal definition. This paper focuses on the absolute definition itself by considering it as a *definiendum* and its definition as its *definiens* to analyse whether this definiens satisfies one particular condition set in definition theory, namely the condition that a *definiens* must not be applied to anything other than the *definiendum*. In terms of this specific rule, we encounter with two opposing views on the convenience of the terms implying “necessity” *(istilzām*) utilized when formulating the *definiens* of absolute definition."

16. Tahir, Umar Sheikh Tahir. 2018. "Arabic Grammar and Logic Debates at Medieval ages: a Quest for Muslim Contributions to Philosophical Development." *Al-Habir. Journal of Islamic Studies* no. 2:158–178.

    Abstract: "This paper focuses on historiography of relationship between Logic and Arabic grammar in the Muslim Medieval Ages (a period between 750 and 1100/ 150 and 500 Ah) This sensation appears in the famous debate among many others between grammarians represent by abū Sa'id al-Sairafī and logicians represent by abū Bishr Mattā on Logic and its validity. This incident took place in Baghdad around 932 AD. However, this study singlehandedly samples these debates as the base for the contributions of Islamic philosophers to philosophy of language as well as Epistemology. The question that shapes this

research is: What is the intellectual development for Muslim thinkers to philosophy of language in regards to this debate? The current research addresses the Arabic grammar and logical debates by conducting historiography to emphasize on Islamic philosophers' concerns about this issue. Consequently, this debate generates philosophical phenomena and resolutions in deep-thinking using philosophical mode. In addition, these dialogues create a language impression for Philosophy in Islamic world from the period under study. Thereupon, Islamic philosophers' discourse on this phenomenon serves as contribution to the Philosophy of Language."

18. Tekin, Ali. 2018. "On Arabic-Islamic Logic and Philosophy: Some Notes and Interview with Charles E. Butterworth." *Beytulhikme: An International Journal of Philosophy* no. 8:871–884.

    "Prof. Charles E. Butterworth and his predecessors have made important contributions to the classical philosophy with the editions, translations and studies of that philosophical text from a philosophical perspective and commented on them in this purpose. To understand the world and the life philosophically and the history of philosophy we need to study on those classical texts forever. Although we have many important studies in Arabic and Islamic philosophy there are many works that still waiting to be unearthed. Prof. Charles E. Butterworth has many editions and translations as we said above. He has been editing and translating Alfārābī's the *Book of Letters* and Ibn Rushd's all of *Short Commentaries on Logic* and we wait for those studies to read and comment. To learn about him and his experiences and studies we talked with Prof. Charles E. Butterworth about his academic journey and Arabic-Islamic logic and philosophy.

    The interview was done on July 27, 2018, at Georgetown University Lauinger Library, Washington, D. C. We hope this

interview is going to be useful and helpful for those who study on Arabic logic and philosophy." (p. 874)

19. ———. 2024. "Commentary Styles of Peripatetic Islamic Logicians on Aristotle's Definition of Syllogism." *Entelekya Logico-Metaphysical Review* no. 8:27–45.

    Abstract: "Aristotle (d. 322 BC) was the first philosopher in the history of thought to examine all modes and types of belief acquisition such as knowledge, supposition, error and indirectly imagination. In his *Prior Analytics*, which he wrote primarily to clarify his theory of demonstration, Aristotle examined in detail the syllogism, which he saw as the most important form of reasoning, and his analysis was subject to interpretation by different traditions of thought for centuries. Aristotle's *Prior Analytics* was translated into Arabic in the classical period and later interpreted by many Islamic logicians. This article aims to show how Aristotle's definition of the syllogism in the *Prior Analytics* was taken up and interpreted in the Peripatetic Islamic logical tradition. These interpretations of the definition of the syllogism will provide us with an idea about the unique features of the commentaries on the *Prior Analytics* in the Islamic world.

    Here, introductory information about the translation of the *Prior Analytics* into Arabic and its commentators in Arabic will be given, Aristotle's definition of the syllogism and its versions in Peripatetic Islamic logicians will be indicated, and the interpretation of the basic terms in the definition by Peripatetic Islamic logicians will be revealed."

    Reprint New York: Routledge 2017. Chapter 4: *Avicenna*, 65-80; Chapter 5: *Averröes*, 81-91.

    Chaper 5:

    "Summary.

    Averroes's late investigations into modal syllogistic do not propound an unambiguous theory. Nonetheless, two features of

his thought appear to emerge. First there is his explicit deployment of essentialist notions in an attempt to clarify Aristotle's logic. He distinguishes a *per se* from a *per accidens* sense of modal propositions, making use of the *per se* sense when dealing with the LLL moods. This idea will find a following in thirteenth-century Latin writers, led by Robert Kilwardby. The *per se* in any domain is determined not just by the way things are, but by the way they are described (for example, to deny that the Chancellor *per se* is a member of the Board of Governors is to speak not simply of the human being who is Chancellor but rather of that person under the description 'Chancellor'). A *per se* necessity would therefore be one that depended not just on how things are but on how they are described. Averröes' s use of the notion of *per se* necessity thus stands (along with Avicenna's ampliationist analysis) as an alternative to the Abélardian *de rebus* analysis of modals. It is more successful than the ampliationist approach in that it secures all the Aristotelian modal conversion-principles, not just those for Le- and Mi-propositions.

By virtue of those principles, the pure necessity-moods in Figures 2 and 3, other than Baroco and Bocardo, reduce to the first figure, thus permitting a base consisting of the first-figure LLL moods along with

Baroco and Bocardo LLL.

Second, Averrões thinks that in mixed syllogisms the conclusion expresses a different, and derivative, kind of necessity than does the modal premise. In other words, he sees the syllogism as marking a transition from a central strong sense of necessity to a derivative sense, rather than simply as a logical link between two necessity-propositions mediated by an assertoric. This way of seeing mixed necessity-syllogisms will be taken up in the twentieth century by Ulrich Nortmann, who proposes a 'rule of thumb' according to which, when an equivocal expression occurs in a premise as well as in the conclusion of a syllogism, it should be interpreted in its strong sense in the premise and in its weak sense in the conclusion. (20)" (pp. 90-91)

    Abstract: "The Persian philosopher Aṭīr al-Dīn al-Abharī (d. 1265), in his *Revealing Thoughts*, sketches out several different logics of propositions containing complex terms such as 'writing man'. I will outline his results and the criticisms of them made by Naṣīr al-Dīn al-Tūsī (d. 1274) in his *Setting the Scale* for an Evaluation of "Revealing Thoug*hts",* and I will compare Abharī's various logics of complex terms with modern treatments."

22. ———. 2016. "The Syllogism and Its Transformations." In *The Cambridge Companion to Medieval Logic*, edited by Novaes, Catarina Dutilh and Stephen, Read, 290–315. Cambridge: Cambridge University Press.

    "Every medieval logic compendium, and every medieval commentary on Aristotle's *Analytics*, has something to say about the syllogism.

    While there is a core of standard logical syllogistic theory that is unchanging across the Middle Ages, there are also significant theoretical differences from one author to another. Some of these concern the very definition of the syllogism. Aristotle had crafted the classic definition; but at different times during the Middle Ages, and in different traditions, opinions differed on how much of the Aristotelian definition should be retained, and how the retained clauses should be interpreted. In this chapter, we examine some of the more interesting transformations that the definition of the syllogism underwent in the Arabic and Latin Middle Ages." (p. 290)

    (...)

    "Summary

    The Aristotelian definition of the syllogism, as it was transmitted in Arabic, underwent a number of simplifications

in the later writings of Avicenna, simplifications that were widely, though not universally, adopted in the Arabic tradition. In the Latin tradition, things started a little differently, with a focus on dialectical syllogisms; and the Latins took an interest in redundancy that does not seem to have been prominent among the Arabs. A tendency towards simplification is evident in both traditions. Some of these simplifications had the effect of broadening the class of syllogisms, some providing it with a more elegant definition. In both traditions, interest came to focus on syllogistic theory itself, at the expense of its application to everyday argumentation.

Both traditions were exercised about the question whether *per impossibile* reasoning could be analysed into some combination of ostensive syllogisms. Avicenna's view, highly original though it was, was not universally taken up by later logicians; many preferred to stay closer to what Aristotle had said on the matter.

Both traditions reflected on the question whether there are syllogisms from impossible premises. These reflections led a few logicians in both traditions to semantic insights that to some extent anticipate Smiley's work on the syllogism." (p. 315)

"Introduction

The expression 'Arabic logic' is used by scholars to cover a tradition of writing over a period stretching from the eighth century to the present day. The treatises and handbooks that belong to this tradition were written in various languages, including Arabic, Persian, Turkish, Hebrew, and Urdu. The central figures are Alfarabi (d. 950), Avicenna (d. 1037) and Averroes (d. 1198) (Street 2013a , introduction). Because of

limitations of space, this chapter will omit Alfarabi, discussing only Avicenna and some of the more significant thinkers (including Averroes) whose work is based on, or reacts against, the latter's logical theories." (p. 91)

(...)

"Summary

The Arabic logicians analysed necessity-propositions by considering various sorts of things to which the necessity which these propositions express is relative. The two most important relativities are to the subject-term's underlying essence, and to the description explicitly given by the subject-term.

The post- Avicennian logicians also distinguished those necessity-propositions whose subject is picked out purely extensionally from those where the subject is identified intensionally. Some of the thirteenth-century logicians extended the application of intensional propositions to those having impossible subjects. The distinction between extensional and intensional necessities can be combined with the essential / descriptional distinction.

There is no concept of purely logical necessity among the Arabic logicians surveyed. The necessity of the Necessary Being's existence is ontological. The necessity of essentially necessary propositions like Man is an animal depends on a metaphysical concept of essence. Even the necessity of a descriptionally necessary proposition like 'Whatever walks moves' derives its necessity from the essential necessity 'Walking is a species of movement'." (pp. 110-111)

"Conclusions

(...)

As an original logician, his account of necessity, while not itself a “statistical” one, nevertheless contains elements that when detached can serve as the foundation of a “statistical” interpretation of the modalities.

His work on the character of the terms in modal predications constitutes an important step in the history of essentialist construals of modality and anticipates the work of Marko Malink.(37) His confrontation with Avicenna on the nature of simple and compound predicates is driven by a refusal to restrict logical theory to the investigation of terms having fixed meanings.

He does not think this is the way Aristotle did logic, and he does not think it is the way logic should be done: in his view, the proper discussion of simple and compound predicates requires a sensitivity to the variability of meanings in different contexts. His critique of Avicenna on necessity raises fundamental questions about the way necessary propositions should be understood. And his view that certain types of proposition have a double aspect, as either necessary or assertoric, exhibits his subtlety as a logician." (p. 95)

"Introduction

Porphyry’s *Eisagoge* distinguishes five types of concept: genera, species, differentiae, propria and accidents. Scholars have wondered whether this list rests on a rational principle, so that it had to have exactly five members, and those members had to be just as Porphyry describes them. Among the attempts to articulate such a rational basis for the list, the account given by Najm ad-Dīn al-Kātibī is specially interesting." (p. 186)

(…)

"Al-Kātibī's results can be summarized as follows. A multiple-species genus such as body is a quiddity of all its particulars, is a part of a quiddity of all its particulars (e.g., is a part of *animal*), and has particulars belonging to several quiddities (e.g., *human* and *horse*). A single-species genus is distinguished by not belonging to several quiddities. A higher species like *animal* is distinguished from a lowest species by belonging to several quiddities. A higher differentia like *sensate* is distinguished from a lowest differentia by belonging to several quiddities.")p. 203)

    "This chapter does not contain a general history of logical literature in the Islamicate world. Excellent surveys of Arabic texts on logic exist (Endreß 1992, 47–57; el-Rouayheb 2011, 2019; Street 2016; Rudolph et al. 2016). Instead, following the aim of this volume, practical aspects of logic are addressed. Some of these aspects have not been studied well or at all. The topics chosen are learning logic, controversies on logic and integration of logic into other scientific disciplines. This chapter consists therefore of a set of examples and unavoidably lacks historical continuity." (p. 419)

    Abstract: "*Mi'yar al-'Ilm fi Fann al-Mantiq* of al-Ghazali is the first book written specifically on Muslim logic. But the comprehensive and exclusive study on the essence of its scientific contents of the book and its significance in developing scientific thinking has never been done. Thus this study investigates the objectives and referral sources of *Mi'yar* writing. This qualitative study uses content analysis method. The data which were collected using the documentation has been analyzed using the inductive, deductive, and comparative methods. The process of analysis of logic in *Mi'yar* be done using textual analysis or textual content analysis and constant comparison method. It is because of this study is a textual study. This study found that *Mi'yar* written by two objectives. Firstly; to provide an understanding on the methodologies of thinking and researching, and explain the rules of constructing syllogisms and analogies. Secondly; to review the matters which have been written in *Tahafut*. The study also found that al-Ghazali wrote *Mi'yar* based on three books, a book of his own, namely *Maqasid*, and two books of Ibn Sina, namely *al-Isharat* and *al-Risalah fi al-Hudud*. Therefore *Mi'yar* should be a fundamental source of learning logic and methods of thinking of Muslims either at high school or university. Hence the constant and deep study on the content of *Mi'yar* is very significant and has high impact. But the dissemination of the findings of this study is the next action that should be realized."

Abstract: "*Miʿyār al-ʿIlm fī Fann al-Manṭiq* of al-Ghazālī is the first book on Islamic logic.

But a specific, comprehensive and exclusive study on its essence of the scientific contents and its importance in developing scientific thinking has never been done yet. Therefore, this study investigated qualitatively the background of *Miʿyār* and its contents using content analysis. In this study, the data which were collected using documentation method has been analyzed using the inductive, deductive and comparative methods. The process of analysis on logic in *Miʿyār* also been done using textual analysis method or textual content analysis method. This is because it is textual study. This study found that the theories, methods and thoughts on logic in *Miʿyār* have several similarities and differences with the logic of Aristotle. This study also found that many reforms, improvements, purifications and reconciliations have been made in *Miʿyār* which uplifted the theories on logic in *Miʿyār* as the theories of Islamic logic. In addition, this study found that the examples of logic application in *Miʿyār* are highly relevant to the life of a Muslim. *Miʿyār* should be a basic source of learning on logic and thinking methods of Muslims either in secondary schools or universities. Hence the constant and deep study on the content of *Miʿyār* is very significant and has high impact. But the dissemination of the output of this study is the next action that should be realized."

Abstract: "*Miʿyār al-ʿIlm fī Fann al-Manṭiq* of al-Ghazālī is the first book on Islamic logic. But the specific, comprehensive and exclusive study on the essence of its scientific contents and its significance in developing scientific thinking has never been done. Thus this study investigates the methodology of *Miʿyār* writing. This qualitative study uses content analysis method. The data which were collected using the documentation has been analyzed using the inductive, deductive, and comparative methods. The process of analysis of logic in *Miʿyār* be done using methods of textual analysis or textual content analysis

and constant comparison. It is because of this study is a textual study. This study found that *Miʿyār* written by two objectives. Firstly; to provide an understanding on the methodologies of thinking and researching, and explain the rules of constructing syllogisms and analogies. Secondly; to review the matters which have been written in *Tahāfut*. The study also found that al-Ghazālī wrote *Miʿyār* using at least 18 methodologies of writing. Therefore *Miʿyār* should be a fundamental source of learning logic and methods of thinking of Muslims either at high school or university. Hence the constant, thorough and deep study on the content of *Miʿyār* is very significant and has high impact. But the dissemination of the findings of this study is the next action that should be realized."

31. Troupeau, Géerard. 2007. "The logic of Ibn al-Muqaffaʿ and the origins of Arabic grammar." In *The Early Islamic Grammatical Tradition*, edited by Baalbaki, Ramzi, 27–35. Aldeshot: Ashgate.

    "These observations lead us to assert, once again,13 that there exists no conformity between primitive Arabic grammatical terminology and the terminology of Greek logic; and that, in particular, the division of the discourse into three parts, established by the first Arab grammarians, owes nothing to Aristotelian logic. And, in order to give an idea of the importance of the logic of Ibn al-Muqaffa' for the history of grammatical and philosophical notions, it has been reckoned appropriate to supply non-Arabists with a translation of the first six chapters of his epitome of the *Hermeneutics*." (p. 31)

    (13) Cf. G. Troupeau, *L'origine de la grammaire arabe a la lumière du Kitab de Sibawayhi,* in *Journal of the Jordan Academy of Arabic*, I (1978), p. 125-38 (in Arabic).

Abstract; "This paper examines al-Fārābī's logical thought within its Arabico-Islamic historical background, and attempts at conceptualizing what this background contributes to his logic. After a brief exposition of al-Fārābī's main problems and goals, I shall attempt at reformulating the formal structure of Arabic linguistics (AL) within ontological and formal characteristics where the Arabic logic is built upon. Having discussing the competence of al-Fārābī in the history of the AL, I will propose further three interrelated theses about al-Fārābī's logic those are *logico-linguistic* conception, the *project of logicization*, and *nuclear logic* whereby I will attempt to redefine his logic. The final question that will arise is how Aristotle's logic could be built upon the AL which has a contrary nature to logic. The present paper also contributes examining our traditional research habits in the Arabic studies."

33. Vagelpohl, Uwe. 2010. "The Prior Analytics in the Syriac and Arabic tradition." *Vivarium* no. 48:134–158.

    Abstract: "The reception history of Aristotle's *Prior Analytics* in the Islamic world began even before its ninth-century translation into Arabic. Three generations earlier, Arabic authors already absorbed echoes of the varied and extensive logical teaching tradition of Greek- and Syriac-speaking religious communities in the new Islamic state. Once translated into Arabic, the *Prior Analytics* inspired a rich tradition of logical studies, culminating in the creation of an independent Islamic logical tradition by Ibn Sīnā (d. 1037), Ibn Rušd (d. 1098) and others. This article traces the translation and commentary tradition of the *Prior Analytics* in Syriac and Arabic in the sixth to ninth centuries and sketches its appropriation, revision and, ultimately, transformation by Islamic philosophers between the ninth and eleventh centuries."

The *usul an-nahw* and Greek empiricist medicine 90; V. The period of the two schools 107; VI. The influence of Greek logic 113; VII. The use of logic in grammar 128; VIII. The Mu'tazila 149; IX. The origin of speech 162; X. The Stoic component in the theory of meaning 178; Diagram of the most important Arabic grammarians 192; List of abbreviated titles 196; Arabic, Greek, Hebrew, Latin authors quoted 205; Originals of the Arabic and Greek texts quoted in English translation 209; Indexes: Personal names 230; Arabic terms 234; Greek terms 238; Latin terms 242; Hebrew and Syriac terms 243.

    "The influence of pure, mostly Peripatetic, Greek logic remained preponderant in the logical works of Arabic philosophers. Many of the ideas and terms of the Aristotelian tradition are found for instance in Gazzāli's works, such as the *Kitāb al-maqṣad al-asnā fī asmā' Allāh al-husnā*, the *Kitāb al-mustasfā*, the *Miyār al-ilm*, and the *Kitāb al-ma'ārif al-aqliyya*. We may also refer to Ibn Hazm's *Kitāb at-taqrib li-ḥadd al-manṭiq* and to the section about logic in Ḥwarizmi's *Mafātiḥ al-'ulūm*. But the most important contribution to our knowledge of Aristotelian logic in the Arabic world comes from Ibn SInā's commentaries and from the works of Fārābī: notably his commentary on the *De Interpretatione,* and the section about logic in his *Iḥṣā al-ulūm*. From these writings Aristotelian logic found its way to grammar, though it never succeeded in replacing completely the earlier influence of the direct contact with Greek grammar.

It should be noted that with the introduction of Greek logic other elements besides the Peripatetic theory were brought to the Arabic world, among them Stoic elements. This applies for instance to Stoic materialism, which had a strong influence on the Mu'tazilite philosopher Nazzam (d. 845/231) and which is also discernible in the theories about the nature of sound. The theory of meaning and the Stoic traces found in it will be discussed below, as well as those Stoic elements which are present in Arabic grammatical theories." (pp. 126-127, notes omitted)

36. Versteegh, Kees. 2000. "Grammar and Logic in the Arabic Grammatical Tradition." In *History of the Language Sciences: An International Handbook on the Evolution of the Study of Language from the Beginnings to the Present. Vol. I*, edited by Auroux, Sylvain, Koerner, E.F.K., Niederehe, Hans-Josef and Versteegh, Kees, 300–306. Berlin: Walter de Gruyter.

    "The [Arab] grammarians were, of course, aware of the fact that there were other languages.

    The point is that they did not regard these languages as worthy of linguistic study. The first Arab grammarian who wrote a complete analysis of the language, Sībawayhi (d. 177/793?), was a Persian, but nowhere in his *Kitāb* does he make any effort to compare the Arabic and the Persian language, and there is no indication at all that he was interested in the analysis of languages other than Arabic.

    At a later period the grammarian Ibn Ginnī (d. 392/1002) mentions in his *Ḥaṣa iṣ* (I, 243) that he asked his teacher al-Fārisī (d. 377/987) and other scholars whose mother tongue was Persian, what they thought about the Persian language: they were unanimous in upholding the superiority of the Arabic language (*lutf al-'arabiyya*).

    This general disinterest in languages other than Arabic remained an essential trait of the entire Arabic grammatical tradition. It was at least partly responsible for the fact that the relationship between speaking and thinking, between language and thought, fell outside the frame of reference of the grammarians.

In the 9th century CE, however, the introduction of Greek logical and philosophical ideas forced them to consider the issue of the relationship between language and thought. During this period logicians, who were influenced by Greek thought, claimed that thought processes were universal, but that the linguistic expression of these processes was accidental.

This claim forced the grammarians to deal with problems they had until then ignored." (p. 300)

37. Vural, Mehmet 2010. "Classic Logic of Al-Ghazali Methodology." *Journal of Islamic Research* no. 3:143–148.

"In the Islamic thought, it was al-Ghazalī who for the first time tried to reconcile the logic of Aristotle with the religious sciences. He demonstrated his understanding of logic especially in his works *Maqasid al-falaslfa* (*The Aims of Philosophers*), *Miyar al-ilm* (*Criterion of Knowledge*) and *Mihak al-nazar* (*Touchstone of Reasoning*) as well in *al-Qistas al-mustaqim* (*The Correct Balance*), which he wrote during his solitary life. Later on, following this period of solitary life, besides focusing on Sufi experience, he did not ignore the science of logic. The importance he stressed on logic is quite obvious in his work *al-Mustasfa min 'ilm al-usu!* (*The Clarified in Legal Theory*), so that it was al-GhazalI, who in the Islamic thought for the first time had suggested Aristotelian logic as a method for religious sciences beyond philosophical sciences, e.g. for Kalam, Fiqh or even Sufism.(3)" (pp 143-144)

38. Walbridge, John. 2000. "Logic in the Islamic Intellectual Tradition: The Recent Centuries." *Islamic Studies* no. 39:55–75.

"In what follows I will be attempting a preliminary exploration of this tradition of logic, which I will call the "school logic". I suspect that my treatment will appear to some readers as encyclopaedic, but I hasten to assure them that there is virtually no scholarly study of this period of Islamic logic. Histories of philosophy or logic oriented towards the European

tradition - Kneale and Kneale or Dumitriu, for example - have nothing to say about later Islamic logic because they are working mainly from the Latin sources, and no Arabic logical works after Averroes were translated into Latin in the Middle Ages.(3) The historians of Islamic logic, repelled by the mass of unreadable commentaries and supercommentaries, dismiss the period - the last half to two-thirds of the history of Islamic logic! - as a period of stagnation.(4)

That judgment is probably warranted in part, although no one has yet seen fit to demonstrate it, but it misses two points: first, the sociological question of why this kind of logic was taught for so long, and the intellectual question of where we should draw the boundary lines of Islamic logic." (p. 57)

(4) This is the view of Nicholas Rescher, *The Development of Arabic Logic* (Pittsburgh: University of Pittsburgh Press, 1964), 73-75, 80-82, whose account of Islamic logic stops with the fifteenth century; of R. Arnaldez, *The Encyclopaedia of Islam*, 2nd. ed.; s. v. "Mantiq", whose account goes up to al-Ghazali (d. 505/1111), and Shams lnati, "Logic", in Seyyed Hossein Nasr and Oliver Leaman, eds., *History of Islamic Philosophy* (Routledge History of World Philosophies I: l; London: Routledge, 1996), 2: 802-23, whose account stops with Avicenna, 950 years ago.

Rescher's work is mainly a catalogue of the major Islamic logicians through about 1500 but is nonetheless the only attempt to write a book-length history of Islamic logic. I wish I could say that it was outdated, but I do not know of any work that attpts to supercede it. Rescher also wrote or co-authored a number of other articles and monographs of various aspects of Islamic logic, especially modal logic. Most recent research on Islamic logic has been devoted either to editions, translations, or explications of particular texts, almost all earlier than the period I discuss here, or to the discussion of particular

problems. In Arabic there are two works worth of notice. 'Alī Sāmi al-Nashshār, *Manāhij al-Bahth 'inda Mufakkirī al-Islam wa Iktishāf al-Minhāl al- 'Ilo fl 'l-'Alam al-Islami* [*Research methods of the thinkers of Islam and an investigation of a scientific method in the Islamic world*], 2nd ed. (Cairo Dar al-Ma'arif, 1965), discusses the whole question of research methodology in the mature Islamic sciences, dealing with both logic proper and the applied logic of such disciplines of law, theology, and rhetoric. 'Alī Kāshif al-Ghiṭā, *Naqd al-Arā' al-Manṭiqiyyah wa Hall Mushkilātihā* [*Critique of logical opinions and resolution of their difficulties*) {Najaf: al-Nu'man, several printings) is a survey of the disputed points in the school logic, an essential reference for anyone studying the subject, and is a sort of complement to Muḥammad-Ridā al-Muzaffar, *al-Manṭiq* (Baghdad: al-Tafayyuḍ, 1367 /1948, and several times reprinted in Najaf, Qom, and Beirut), which has been for some decades the standard textbook for students studying logic in the Shi'ite seminaries in Iraq and which is apparently also used in Iran.

39. ———. 2003. "A Nineteenth-Century Indo-Islamic Logic Textbook." *Islamic Studies* no. 42:687–693.

"Among the lesser treasures of the Punjab University Library in Lahore, Pakistan, is a book with the unassuming title *Majmū'ah-yi Manṭiq*, "anthology on logic", a lithograph published in Ramaḍān 1293/October 1876 at the printing house of the distinguished Hindu publisher Munshi Naval Kishore in Lucknow, then in British India. It is not a very big book - iv+ 142 pp., 6 x 9.5 inches - but its title page lists thirteen logical texts.(2) The absence of dots on the final *h* of *majmu 'ah* in the title tells us that the title is Persian, even though most of the texts are in Arabic. Such a document raises a number of questions. Who compiled it and why? What are the texts of which it is composed? How are they interrelated? Why were they selected in place of other texts? Who were the readers, and what did they use this book for? One might further ask: what is the place of the teachings of these texts in the history of the development of Islamic logic, but neither I - nor, I think, anyone else at present - knows enough about the development

of Islamic logic in the later period to comment intelligently on the doctrinal significance of these texts." (p. 687, a note omitted)

(2) The book is to be found in the University Library under the call number Ar. h. II 69 .

40. ———. 2011. *God and Logic in Islam: The Caliphate of Reason*. Cambridge: Cambridge University Press.

Chapter 6: *Where Is Islamic Logic? The Triumph of Scholastic Rationalism in Islamic Education* 107; Chapter 7: *The Long Afternoon of Islamic Logic* 121; Chapter 8: *The Institutionalization of Disagreement* 142-153.

Abstract: "This book investigates the central role of reason in Islamic intellectual life.

Despite widespread characterization of Islam as a system of belief based onlyon revelation, John Walbridge argues that rational methods, not fundamentalism, have characterized Islamic law, philosophy, theology, and education since the medieval period. His research demonstrates that this medieval Islamic rational tradition was opposed by both modernists and fundamentalists, resulting in a general collapse of traditional Islamic intellectual life and its replacement by more modern but far shallower forms of thought.

The resources of this Islamic scholarly current, however, remain an integral part of the Islamic intellectual tradition and will prove vital to its revival. The future of Islam, Walbridge argues, will be marked by a return to rationalism."

"So perhaps *manṭiq* is not the whole of Islamic logic but rather the name of a particular tradition of Islamic logic, and the indigenous traditions of Islamic thought might supply other logics. Where, then, would we find these other logics? I think that there are four plausible major candidates:

1) Arabic grammar;

2) Arabic rhetoric;

3) *Uṣūl al-fiqh*, the science of the principles of the deduction of Islamic law; and

4) *Kalām*, Islamic dogmatic theology.

That these traditions might be linked, especially in the postclassical period, is shown by the fact that the authors of the standard texts in each of these fields usually also wrote on the others. For example, the great writer of textbooks al-Sharīf al-Jurjānī (1339–1413), who would be classed as a *faqīh,* a scholar of religious law, wrote original works, glosses, or commentaries on popular works of Qurān commentary, hadith, Arabic grammar and rhetoric, logic, philosophy, Kalām theology, Islamic law, disputation theory, and astronomy, among other subjects. Two of his elementary textbooks on logic in Persian were still in use in India in the nineteenth century. There were many others like him, and in later centuries it would be unusual for a major religious scholar not to have also written on the rational sciences." (p. 110)

41. Whittingham, Martin. 2015. "Al-Ghazālī on Syllogistic Logic as a Source of Certainty about the Qurʾān." In *900 Jahre al-Gazālī im Spiegel der islamischen Wissenschaften*, edited by Ucar, Bülent and Griffel, Frank, 127–138. Osnabrück: V&R unipress.

"This study explores a question of key concern to all reflective Muslims – and indeed to reflective believers of any faith. How can a believer be sure about the basis of their faith? Al-Ghazālī is well known for his account of doubt and certainty in his spiritual autobiography, *Al-Munqidh min al-ḍalāl*,(1) but this focuses on the subjective and experiential certainty which al-Ghazālī contends is available to the believer. The aim here is somewhat different, namely to explore al-Ghazālī's views on three ways in which the Qurʾān itself yields certainty.

Al-Ghazālī addresses the issue of the Qurʾān and certainty in a number of ways which draw on the use of syllogistic logic. In *Prior Analytics,* Aristotle defines the syllogism as "a discourse in which, certain things being stated, something other than what is stated follows of necessity from their being so."(2)

Rather than offer a full technical exposition of the syllogism, it is sufficient for this enquiry to note that the syllogism contains three propositions, the third of which should follow as a conclusion if the first two are true. For example, All scholars are intelligent / Professor X is a scholar / Therefore Professor X is intelligent." (p. 127)

42. Widigdo, Mohammad Syifa Amin. 2018. "Aristotelian Dialectic, Medieval *Jadal*, and Medieval Scholastic Disputation." *The American Journal of Islamic Social Sciences* no. 35:1–24.

Abstract: "This article argues that medieval Christian and Muslim scholarship employed Greek dialectic to differing purposes. Greek dialectic aims to defeat an opponent by exposing logical contradictions; Christian scholarship claims to use the dialectic to search for the truth in a pedagogical setting; and Muslim scholarship employs it to arrive at the truth with a degree of certainty. As a result, this article further argues, Greek dialectic in Christian and Muslim contexts undergoes some modifications. In the Christian context, dialectic serves a didactical purpose, which is to find the truth that resides in the mind of the teacher. In the Islamic context, Greek dialectic is employed to find epistemological (qaṭ͑ī) or psychological (ghalabat al-ẓann) certainty in religious knowledge."

43. Wisnovsky, Robert. 2009. "Arabic Logicians on Perfect and Imperfect Syllogisms: A Supplement to Patzig's 'Historical Excursus." In *Avicenna and His Legacy: A Golden Age of Science and Philosophy*, edited by Langermann, Y. Tzvi, 257–273. Turnhout: Brepols.

"In his influential monograph *Die aristotelische Syllogistik*, Günther Patzig claimed that 'up to now' — that is, in the over two thousand years between Aristotle and Patzig — the nature

of Aristotle's distinction between perfect and imperfect syllogisms 'has not been properly understood'.(1) In one powerfully argued chapter of the book, Patzig introduced Aristotle's distinction as well as the problems that arose from it; surveyed and picked apart previous explanations of the distinction — from the ancient and late antique Greek and medieval Latin commentators, as well as from nineteenth-century European historians of logic — and also proposed his own alternative explanation; and finally concluded that Aristotle's distinction, when understood along the lines that Patzig proposed, turns out in the end to be logically unjustifiable. My aim in this paper is to supplement Patzig's survey of previous interpretations of how perfect and imperfect syllogisms differed one from the other, by taking into account how a representative sample of Arabic thinkers dealt with the distinction. I shall begin, like Patzig, by summarizing what Aristotle has to say about it. I shall then turn to three confusions that arise from the distinction, and survey the reactions and attempted solutions of subsequent thinkers from the late antique Greek exegetical tradition, as well as from the Arabic philosophical tradition that was its direct heir. Finally, I shall return to Aristotle and suggest that there is a potentially crucial element in this discussion that might have informed the commentators' views and which modern scholars, including Patzig, seem to have ignored: Aristotle's discussion of *to teleion* (the perfect or complete) in *Metaphysics,* V.16." (pp. 257-258)

(1) Günther Patzig, *Die aristotelische Syllogistik* (Göttingen, 1959; repr. 1963). Here I am quoting from Jonathan Barnes's translation, *Aristotle's Theory of the Syllogism: A Logico-Philological Study of Book 'A' of the 'Prior Analytics'* (Dordrecht, 1968), p. 43. All translations are my own unless otherwise noted.

44. Young, Walter Edward. 2016. "*Mulāzama* in Action in the Early *Ādāb al-Baḥth*." *Oriens* no. 44:332–385.

Abstract: "By presenting and analyzing an early *ādāb al-baḥth* commentary's illustrative dialectical sequences, the current study: (1) reveals a set of distinct strategies employed in *mulāzam*a justification; (2) sheds light on a number of

additional argument types in regular use; and (3) provides a scripted impression of how a disputation governed by the *ādāb al-baḥth* would, in practice, have sounded. These general patterns, impressions, and particular argument identifications, together with those of future microstudies, may, it is hoped, inform the analytical foundation for both exploring the *ādāb al-baḥth*'s argumentative genealogy, and assessing its formative influence in "postclassical" Islamic rational disciplines."

45. ———. 2017. *The Dialectical Forge: Juridical Disputation and the Evolution of Islamic Law*. Chm (witzerland): Springer.

"The primary title of this monograph is "The Dialectical Forge," and its individual terms provide a suitable launching point for discussing the current project as a whole. As for the first, the most common Arabic terms for "dialectic" are *jadal* and *munāẓara*, both denoting formal disputation between scholars in a given domain, with regard to a specific thesis. When one encounters the term "dialectical" in the present work, one should think foremost of procedure-guided debate and the logic inherent to this species of discourse. A dialectical confrontation occurs between two scholars, in question and answer format, with the ultimate aims of either proving a thesis, or destroying it and supplanting it with another. A proponent-respondent introduces and attempts to defend a thesis; a questioner-objector seeks (destructively) to test and undermine that thesis, and (constructively) to supplant it with a counter-thesis. Through progressive rounds of question and response the questioner endeavours to gain concession to premises which invalidate the proponent's thesis, justify its dismantling, and provide the logical basis from which a counter-thesis necessarily flows.

(...)

Thus, "the dialectical forge" aims to convey the intellectually-formative dynamic of dialectical debate, and, with specific regard to the current project: debate within the Islamic juridical domain. My argument throughout this monograph is that dialectical disputation was a vital dynamic in the evolution of Islamic law—not only with respect to doctrinal bodies of

substantive rulings, but to Islamic legal theories, and to a continually-evolving set of dialectical theories as well. The exigencies of dialectical debate provided key motives and forged key structures, elements, principles, and concepts for what became known as the sciences (*ʿulūm*) of derived substantive law (*fiqh*), legal theory (*uṣūl al-fiqh*), and juridical dialectic (*jadal* or *munāẓara*), not to mention certain sub-genres of the juristic sciences—e.g., the arts of discovering *qiyās* -invalidating inter-case distinctions (*furūq*) and weaker and stronger analogues (*ashbāh wa naẓā'ir*)." (pp. 1-2)

46. ———. 2022. "On the Logical Machinery of Post-Classical Dialectic: The *Kitāb ʿAyn al-Naẓar* of Shams al-Dīn al-Samarqandī (d. 722/1322)." *Methodos. Savoirs et textes* no. 22:1–46.

    Abstract: "The post-classical (or post-Avicennan, post-Rāzian) genre of the “protocols for dialectical inquiry and disputation” (*ādāb al-baḥth wa-l-munāẓara*) has its more proximate origins in the famed *Risāla* of Shams al-Dīn al-Samarqandī (d. 722/1322). The greater part of his conceptions and methodology, however, consists in a streamlining and universalizing of the more strictly juristic dialectic (*jadal / khilāf*) of his teacher Burhān al-Dīn al-Nasafī (d. 687/1288); and this in turn draws on the highly logicized dialectic of Rukn al-Dīn al-ʿAmīdī (d. 615/1218) and his teacher Raḍī al-Dīn al-Nīsābūrī (d. 617/1220). At the heart of methods in this lineage, and carried forward by al-Samarqandī into the universal *ādāb al-baḥth*, are three truth-preserving logical relationships critical to the truth-seeking enterprise of dialectic: entailment (*talāzum / mulāzama*), mutual negation or exclusion *(tanāfin / munāfā*), and causal concomitance (*dawarān*). The practical elaboration of these relations reveals a logic in action—a premodern dialogical logic for living disputation praxis. In fact, so critical were these to the dialectical enterprise that al-Samarqandī devoted a specialized treatise entirely to summarizing their defining features and rules, aptly naming it the ʿAyn al-Naẓar, or “Wellspring of Rational Investigation.” In this article, and drawing upon a recently published digital

critical edition, I will present an analytical outline of these core logical relations as presented in the ʿAyn al-Naẓar. Then I will address a number of points of interest in this text, grouped under six themes: the potential for cross-disciplinary advancement; notions in discursive development; significant or uniquely contributive formulations; peculiarities of content; signs of an evolving, universalist agenda; and evidence that the ʿAyn al-Naẓar was designed as an *aide-mémoire* for the active disputant."

47. ———. 2022. "The Formal Evolution of Islamic Juridical Dialectic: A Brief Glimpse." In *New Developments in Legal Reasoning and Logic: From Ancient Law to Modern Legal Systems*, edited by Rahman, Shahid, Armgardt, Matthias and Kvernenes, Hans Christian Nordtveit, 83–113. Cham (Switzerland): Springer.

    Abstract: "The development of Islamicate dialectical theory (*jadal / munāzara / ādāb al-baḥth*) is both pluralistic and nonlinear, even when restricted to the juridical domain. Deeper trends are nevertheless apparent; the most important may be the infusion of post-Avicennan syllogistic commonly understood to have begun in the eleventh century CE. This trend towards logical formalism found its greatest expression in a rigorously syllogistic twelfth and thirteenth century Eastern juristic dialectic which in turn informed a new, universal dialectical method: the *ādāb al-baḥth wa'l-munāz ara*, or "protocols for dialectical inquiry and disputation."

    Equally applicable in theology, philosophy, and law, this streamlined system quickly grew into a core discipline in the Islamic sciences, generating a massive commentary tradition. This article presents three vignettes of dialectical argument in action—snapshots from various moments in variant streams of Islamic juridical dialectic—marking certain key features at each stage. Critical roles are highlighted for the dialectical objections of intra-doctrinal inconsistency (*naqḍ*) and counterindication (*muāraḍa*), and special focus is maintained on the formative dynamic of dialectical disputation in shaping both legal theory and dialectical theory itself."

48. ———. 2025. "Four Moves to Rule Them All: Qiyās-Dialectic Metatheories and the Ascendancy of Master-Category Objections in Post-Classical Islamic Dialectics." In *Logic, Soul, and World: Essays in Arabic Philosophy in Honor of Tony Street*, edited by Ahmed, Asad Q., Zarepour, Mohammad Saleh and Strobino, Riccardo, 366–426. Leiden: Brill.

"In this study I will introduce the four directly relevant categories of metatheory, illustrating them with examples predating Molla Fenârî's early Ottoman formulations. In so doing, I believe a general picture will emerge of how and why the master-category objections became the singular focus of post-classical dialectical theory. Before proceeding, however, a quick disclaimer. In short, this study should not be considered the final say in the matter. To date, I have surveyed the qiyās-oriented dialectic of only eighteen works belonging to fourteen authors.(7) There are, of course, several dozen more works which may contain material of interest, and further surveys are bound to uncover additional, hypothesis-refining details. However, I believe that the general picture emerging at this stage is sufficient to answer the objection-reduction question, and, in so doing, yield a model dynamic that sheds light on other transformative processes essential to the streamlining of juristic dialectics and subsequent birth of a universalist *ādāb al-baḥth wa-l-munāẓara*." (pp.368-369)

(7) They are, in rough chronological order (works marked by an asterisk did not contain a significant amount of qiyās-dialectic metatheory): the *Taqwīm al-Adilla* of Abū Zayd ad-Dabūsī (Ḥanafī, d. 430/ 1039); the *Sharḥ al-Lumaʿ** and *al-Mulakhkhaṣ fī l-Jadal** of Abū Isḥāq ash-Shīrāzī (Shāfiʿī, d. 476/1083); the *Iḥkām al-Fuṣūl fī Aḥkām al-Uṣūl** and *Kitāb al-Minhāj fī Tartīb al-Ḥijāj* of Abū l-Walīd al-Bājī (Mālikī, d. 474/1081); the *Kanz al-Wuṣūl ilā Maʿrifat al-Uṣūl* of Fakhr al-Islām Abū l-Ḥasan al-Bazdawī (Ḥanafī, d. 482/1089); the *Mustaṣfā** of Abū Ḥāmid al-Ghazālī (Shāfiʿī, d. 505/1111); the *Maḥṣūl** and *Maʿālim** of Fakhr ad-Dīn ar-Rāzī (Shāfiʿī, d. 606/1209); the *Mughnī* * of Jalāl ad-Dīn al-Khabbāzī (Ḥanafī, d. 691/1292); the *Iḥkām fī Uṣūl al-Aḥkām* of Sayf ad-Dīn al-

Āmidī (Shāfiʿī, d. 631/1233); the *Muntahā* and *Mukhtaṣar al-Muntahā* of Jamāl ad-Dīn Ibn al-Ḥājib (Mālikī, d. 646/1249); the *Sharḥ al-Fuṣūl fī l-jadal* of Burhān ad-Dīn al-Nasafī (Ḥanafī, d. 687/1289); the *Risāla fī Ādāb al-Baḥth* of Shams ad-Dīn as-Samarqandī (independent [?], d. 722/1322); the *Sharḥ Mukhtaṣar Ibn al-Ḥājib* of ʿAḍud ad-Dīn al-Ījī (Shāfiʿī, d. 756/1355); the *Baḥr al-Muḥīṭ* of Badr ad-Dīn az-Zarkashī (Shāfiʿī, d. 794/1392); and the *Fuṣūl al-Badāʾiʿ fī Uṣūl al-Sharāʾiʿ* of Molla Fenârî (Ḥanafī, d. 834/1431)

49. Zarepour, Mohammad Saleh. 2021. "Abharī's Solution to the Liar Paradox: A Logical Analysis." *History and Philosophy of Logic* no. 42:1–16.

    Abstract: "The medieval Islamic solutions to the liar paradox can be categorized into three different families. According to the solutions of the first family, the liar sentences are not well-formed truth-apt sentences. The solutions of the second family are based on a violation of the classical principles of logic (e.g. the principle of non-contradiction).

    Finally, the solutions of the third family render the liar sentences as simply false without any contradiction. In the Islamic tradition, almost all the well-known solutions of the third family are inspired by the solution proposed by Atīr al-Dīn al-Abharī (d. 1265). Providing a logical analysis of his discussion of the liar paradox, I show that his solution is based on a conception of truth according to which every sentence signifies, usually among other things, its own truth. This makes Abharī's solution of the same spirit as certain solutions that were later developed in the Latin tradition, in particular by John Buridan (d. 1358) and Albert of Saxony (d. 1390)."

50. ———. 2024. "Dashtakī's Solution to the Liar Paradox: A Synthesis of the Earlier Solutions Proposed by Ṭūsī and Samarqandī." *History and Philosophy of Logic* no. 45:219–245.

    Abstract: "Ṣadr al-Dīn al-Dashtakī (d. 1498) has proposed a solution to the liar paradox according to which the liar sentence is a self-referential sentence in which the predicate 'false' is

iterated. Discussing the conditions for the truth-aptness of the sentences with nested and iterated instances of the predicates ‘true’ and/or ‘false’, Dashtakī argued that the liar sentence is not truth-apt at all. In the tradition of Arabic logic, the central elements of Dashtakī’s solution—the self-referentiality of the liar sentence and the implicit iteration of the predicate ‘false’—were initially highlighted in two earlier solutions proposed by Naṣīr al-Dīn al-Īusī (d. 1274) and Shams al-Dīn al-Samarqandī (d. 1322), respectively. Here I investigate all three solutions and show that Dashtakī’s solution can be taken as a synthesis of the other two. None of these solutions seems to be convincing at the end of the day. Nevertheless, all of them include significant logical and philosophical insights. In particular, although Dashtakī’s solution is not itself compelling, it is only a few steps away from a promising solution. The appendix to this paper includes translations of the relevant passages."

51. Zeraatpisheh, Mahmood. 2023. "Note on the Negative Approach of al-Shahīd al-Thānī Towards Logic in *al-Iqtiṣād wa al-Irshād*." *History and Philosophy of Logic* no. 44:247–254.

    Abstract: "Aversion towards logic is a characteristic feature of the Islamic traditionalists.

    There is in fact a history of opposition to logic in Islam. As any other areas of history, here also the correct picture will not be achieved unless all of the pieces are put together. In what follows, I am going to shed light on a chapter written by Zayn al-Dīn al-–' Āmilī (d. 966/1558), the Twelver Shī'ī Scholar better known as al-Shahīd al-Thānī. The chapter not only shows al-Shahīd al-Thānī’s negative stance towards logic, but also is important because it is a part of less studied Shī'īte traditionalists’ tendencies towards logic; those who are considered as the most influential figures in Iranian seminaries from the Safavid period up until today."

52. ———. 2024. "The Development of the Concept of Predication in Arabic Philosophy." *History and Philosophy of Logic*:1–15.

    Abstract: "Predication is a central theme in Arabic logic that has undergone significant semantic transformation throughout history. This article explores the evolution of predication’s

scope and meaning across four successive stages. Rather than pinpointing specific historical moments—given that these transitions lack clearly defined beginnings or endings—the focus is on key propositions that enrich our understanding of predication, drawing on the classifications of thinkers such as Abū Naṣr al-Fārābī (d. 950), Athīr al-Dīn al-Abharī (d. 1262-65), Mullā Ṣadrā (d. 1635), and Muhammad Ḥusayn Ṭabātabāī (d. 1981). The transition from the first to the second stage is characterized by the acceptance of natural propositions (*ṭabīʿīya*), while subsequent stages involve essential primary (*dhātī awwalī*) and stronger/weaker (*ḥaqīqa-raqīqa*) propositions. This progression illustrates a shift from expressing the properties of external objects to articulating the properties of concepts, ultimately culminating in the expression of identity between concepts and external entities.

The four stages can be summarized as follows: (1) First-order predication; (2) Second-order predication; (3) Second-order identity; (4) First-order identity."

53. Zonta, Mauro. 2013. "Three New Fragments of a Paraphrase of Aristotle's *Topics* ascribed to Themistius in Hebrew Quotations of al-Fârâbî's ‚Long Coimmentary' on the *Topics,* Book VIII,"." In *Ad notitiam ignoti. L' Organon dans la translatio studiorum à l'epoque d'Albert le Grand*, edited by Brumberg-Chaumont, Julie, 217–224. Turnhout: Brepols.

"According to a recent study by Ahmad Hasnawi(1), the well-known Greek philosopher and commentator of Aristotelian works, Themistius (317-388), probably wrote two different treatises specifically devoted to the contents of Aristotle's *Topics* : a Paraphrase of the *Topics*, and a shorter work on T*he Examination of the (Logical) Places*. The Greek text of both is missing ; however, some direct references to their contents, as well as quotations of specific passages of them, can be found in four Medieval philosophical works : *De Topicis Differentiis* by the 6th-century Latin philosopher Boethius (d. 525), *The Reflective Book* by the 12th-century Judeo-Arabic philosopher Abū l-Barakāt al-Ba˙gdādī (d. 1167), and the *Middle Commentary* on Aristotle's *Topics* and *The Meanings of the*

Discourse On the Whole by the 12th-century Arab-Islamic philosopher Averroes (1126-1198)." (p. 217)

(...)

"The case studied here is partially different. The three passages which seem to be ascribed to Themistius were apparently not taken from a direct reading of the Greek text in Arabic translation ; probably, they were found in al-Fārābī's lost work on book eight of Aristotle's *Topics*, which Todros [ben Meshullam ben David Todrosi] employed as one of the main sources for his anthology, as found on folios 67v-75r and 85v-93v of the London manuscript. As a matter of fact, the name of their author was apparently altered."(p. 219)

Writings of E. Jennifer Ashworth on the History of Logic. First Part

Introduction

Earline Jennifer Ashworth (born 1939) studied at Cambridge University and at Bryn Mawr College, where she was awarded a Ph.D. in 1964 (*The Logica Hamburgensis of Joachim Jungius*); she is Distinguished Professor Emerita at the University of Waterloo, Ontario (retired July, 1st 2005) and her main interests are Late Mediaeval and Renaissance logic and philosophy of language; she is Renaissance subject Editor for the *Routledge Encyclopedia of Philosophy*.

I wish to thank Professor Ashworth for helping me to complete this bibliography.

Books authored

1. Ashworth, Earline Jennifer. 1974. *Language and Logic in the Post-Medieval Period*. Dordrecht: Reidel.

Secondary Sources on the History of Logic 1400-1650 291; INDEX OF NAMES 297-304.

"Keckermann remarked of the sixteenth century, "never from the beginning of the world was there a period so keen on logic, or in which more books on logic were produced and studies of logic flourished more abundantly than the period-in which we live." (1) But despite the great profusion of books to which he refers, and despite the dominant position occupied by logic in the educational system of the fifteenth, sixteenth and seventeenth centuries, very little work has been done on the logic of the postmedieval period. The only complete study is that of Risse [a], whose account, while historically exhaustive, pays little attention to the actual logical doctrines discussed. (2) Otherwise, one can tum to Vasoli [b] for a study of humanism, to Muñoz Delgado [c] for scholastic logic in Spain, and to Gilbert [d] and Randall [e] for scientific method, but this still leaves vast areas untouched. In this book I cannot hope to remedy all the deficiencies of previous studies, for to survey the literature alone would take a life-time.

As a result I have limited myself in various ways. In the first place, I concentrate only on those matters which are of particular interest to me, namely theories of meaning and reference, and formal logic. For discussions of such matters as demonstration, the logic of scientific method, the categories, the topics, informal fallacies, humanist logic, Ramist logic, and the whole range of commentaries on Aristotle, the reader will have to look elsewhere. However, in my first chapter, which I must confess to be based largely on secondary sources, I attempt to give an overall picture of the period, so that the

reader can assess the place of the people and the theories I discuss in a wider context.

In the second place, although I make extensive references to one or two medieval logicians, particularly Peter of Ailly, whose work was still widely read and discussed in the post-medieval period, I have made no attempt to fill in the medieval background, or to trace the historical antecedents of every doctrine I mention. There are two reasons for this deficiency. One lies in my original purpose, which was simply to describe just what logic a well-read man of the sixteenth or seventeenth century would have been acquainted with. The other, and most important, reason lies in the monumental nature of such a task. An adequate treatment of the historical antecedents would not only double the size of my book, but would quadruple the number of footnotes, as well as taking many years to accomplish. Fortunately medieval logic has been by no means as thoroughly neglected as post-medieval logic, and a very good idea of its scope and achievements can be obtained from the following works, which themselves contain extensive bibliographies:

Nuchelmans, G., *Theories of the Proposition. Ancient and Medieval Conceptions of the Bearers of Truth and Falsity*, Amsterdam, 1973.

Pinborg, J., *Logik und Semantik im Mittelalter. Ein Uberblick*, Stuttgart-Bad Cannstatt, 1972.

Rijk, L. M. de, *Logica Modernorum, Vol. I, On the Twelfth Century Theories of Fallacy*, Assen, 1962.

Rijk, L. M. de, *Logica Modernorum, Vol. II, The Origin and Early Development of the Theory of Supposition*, Assen, 1967. This volume is in two parts, the second of which contains texts and indices.

In the third place, I have found myself unable to shed very much light on the historical relations between many of the authors whom I discuss.

So far as those from whom I most frequently quote are concerned, there is little problem. The bulk of my references are to Caubraith, Celaya, Clichtoveus, Enzinas, Pardo, de Soto and Tartaretus, all of whom studied and/or taught at the University of Paris in the first years of the sixteenth century, or earlier in the case of Tartaretus. Needless to say, these men were acquainted with each other's works. Many other references are to Hieronymus of St. Mark of whom I know only that he studied at Oxford and that he frequently quotes from the work of Pardo; and to the Germans, Trutvetter, Gebwiler and Eckius, who are of the same period and who obviously knew the works of the Parisian logicians as well as the works of Ockham, Buridan, Marsilius of Inghen and Albert of Saxony.

The only later sixteenth century author of whom I make much use is Fonseca, and the only seventeenth century author of whom I make much use is John of St. Thomas. The influences on these men have been comprehensively described in the works of Munoz Delgado, and they stem back to early sixteenth century Paris. However, once one strays outside Spain and the Paris of the early sixteenth century, a number of obstacles to historical understanding immediately appear. Despite Risse's efforts, we still do not know exactly how many logic texts were published, where they were written, or when their first edition appeared. The books themselves usually contain neither biographical nor bibliographical information. Authors not only used each other's work without acknowledgement, but they also criticized each other's work without giving more specific references than "a certain doctor said". Little is known about the curricula of most sixteenth and seventeenth century universities.

Moreover, there is a tremendous amount of sameness about the contents of logical textbooks, particularly in the later period. They can be roughly categorized as Philippist, Ramist, Philippo-Ramist, Aristotelian, or eclectic, but finer distinctions are hard to draw. Even when an author cites his sources, this may be of little help. For instance, we know that Joachim Jungius told Rhenius that he based his logic text upon the works of Dietericus and Johann Kirchmann, (3) but his work

bears little obvious relation to that of Dietericus, and I have been unable to see a copy of Kirchmann. In any case, the first edition of Kirchmann listed by Risse appeared in 1638, the very year of the *Logica Hamburgensis*.

On the whole, I think that I will be content to leave the task of unraveling all the relationships between logicians of the later period to the intellectual historian. It is true that a number of medieval doctrines were preserved into the seventeenth century, much later than such authors as Boehner had supposed, and it is true that some new work was done, particularly with respect to the fourth figure of the syllogism, but generally speaking, nothing of interest to the logician was said after 1550 at the very latest. Indeed, now that I have written this book, I have compiled a large list of logic texts from the period 1550-1650 which I shall be happy never to open again. On the other hand, an enormous amount of interesting work remains to be done for the period 1450-1550, and I very much hope that my own research will provide a useful starting point for research by others." (*Preface*, X-XI)

2. ———. 1978. *The Tradition of Medieval Logic and Speculative Grammar from Anselm to the End of the Seventeenth Century: A Bibliography from 1836 Onwards*. Toronto: Pontifical Institute of Mediaeval Studies.

   Contents: Preface VII; Part One. Anselm to Paul of Venice (items 1-632) 1; Part Two. After Paul of Venice (items 633-879) 73; Index of Names 101; Index of Texts 105; Index of Translations 107; Index of Subjects 109.

   "My main interest in drawing up this bibliography was to list all the books and articles which have to do with formal logic and semantics from the time of Anselm to the end of the seventeenth century. I see this area as including such topics as consequences, syllogistic, supposition theory, and speculative grammar, but as excluding such topics as the categories, the struggle between nominalism and realism, and pure grammar. It is not, of course, always easy to draw a line between works which are concerned with formal logic and semantics and works which are not so concerned, and inevitably my choice of borderline cases will seem too restrictive to some and too liberal to others. However, my hope is that I have not excluded any book or article which obviously falls into the area I have delimited.

   I have used the phrase "the tradition of medieval logic" in the title in order to indicate that although I include the seventeenth century, I am not concerned with the contributions of modern philosophy. The work of men such as Pascal, Descartes, Arnauld, Leibniz and Locke carries us far indeed from medieval discussions of logic and semantics. Moreover, there is already such an extensive literature on these figures that to include them in my bibliography would completely change its character. On the other hand, I do include humanist logic and renaissance Aristotelianism, since they involve a reaction to the medieval tradition which can only properly be understood in the light of that tradition.

   This is a bibliography of secondary works and of modern editions of early texts. Accordingly I have excluded those nineteenth century reprints of earlier works such as Aldrich's

Artis Logicae Compendium which were produced merely as text books, and I have also excluded modern facsimile editions of early printed texts unless they are accompanied by substantial editorial material. In addition, I have omitted a list of the various editions of Milton's *Artis Logicae Plenior Institutio*, since printings of his complete works are both numerous and easily found. The earliest book I list is Victor Cousin's 1836 edition of Abelard, since this can properly be viewed as the starting point of modern scholarly work on medieval logicians.

I do not refer to short edited or translated passages in books of readings. I have included only the more lengthy book reviews, and only a few unpublished dissertations. I have not included biographical and general historical works unless they have some specific contribution to make to the history of logic. I have tried to include all relevant material published before 1977, but the listing of 1976 publications is inevitably incomplete, given the delays which so often occur in the printing of books and journals.

I have endeavoured to look at each item personally, and to include as much information as possible. In those cases where I have failed to locate an item, or have located it in a place where I could not conveniently see it, I have made a note of my failure. The reader should bear in mind that these entries may be quite inaccurate. Where I have only been able to see a copy of an article, I have added the note: "Journal not seen."

Works which deal with the period as a whole will be found in Part One.

Where an author has more than one book or article, the items are arranged chronologically.

Below each item I list the headings under which it is indexed and, where relevant, cross-references to reviews, discussions, translations and reprints. The ordering of the headings corresponds to the four indexes I have provided: (1) an index of names; (2) an index of texts; (3) an index of translations; (4) an index of subjects. Only substantial texts and translations are

indexed. In the few cases where a book review is not cross-referenced, the reason is that only the review contains material relevant to my purposes. It is my hope that these indexes, which are based on my knowledge of a work's contents rather than its title alone, will prove one of the most valuable aspects of my bibliography.

Readers who wish to find articles dealing with related fields or published after 1976 are recommended to consult two bibliographical sources in particular. They are:

1. *Repertoire Bibliographique de la Philosophie*. Publié par l'Institut supérieur de philosophic de l'Université catholique de Louvain.

2. *The Philosopher's Index*. An International Index to Philosophical Periodicals.

Readers who wish to remedy the omissions I describe in my first three paragraphs are also recommended to consult the following:

Risse, Wilhelm. *Bibliographia Logica*. Band II. 1801-1969. Hildesheim-New York: Georg Olms Verlag, 1973.

Risse's work is far more comprehensive than my own, since he includes not only formal logic, but what might be described as the logic of ideas.

On the other hand, his bibliography is arranged chronologically rather than alphabetically; and inevitably, given the scope of his work, he does not give full publication details and his indexes are minimal. Volume II contains only books, and it is to be hoped that the volume listing journal articles will appear before too long. (*)

I owe a great debt of gratitude to those people who went through an earlier version of this bibliography and provided me with a large number of extra references. In particular I would like to thank William McMahon, Jan Pinborg, Charles Schmitt, and Paul Vincent Spade. I would also like to thank the editorial staff of the Pontifical Institute of Mediaeval Studies for their helpful advice on organization and presentation, the staff of

Inter-Library Loan at the University of Waterloo for their unfailing help, and the Canada Council for various grants which have enabled me to work in British libraries. Finally, I should like to thank the Humanities Research Council of Canada for aiding the publication of this book." (*Preface*, pp. VII-IX)

Addenda et Corrigenda; Index.

"With one exception (IX) the papers in this volume were written after my first book, *Language and Logic in the Post-Medieval Period* (Synthèse Historical Library 12, Dordrecht: Reidel 1974), and they are devoted to a single theme, the philosophy of language in the period from the late fifteenth to the late seventeenth century. The first group of papers (I, II, III) deals with problems of reference in intensional contexts, and the second (IV, V, VI) with problems concerning the nature of propositions and mental language. The last three groups of papers take up more specialized problems. VII and VIII deal with scholastic influences on John Locke's philosophy of language; IX and X discuss two areas of technical logical analysis which had a close bearing on semantic issues; and XI and XII discuss two types of paradox, one of which is clearly semantic, and one of which should perhaps be classified as pragmatic. Many of the issues had been touched on in my book, but here they are presented in much greater depth, on the basis of a closer analysis of the relevant sources. The papers also represent my growing awareness both of the importance of the medieval background to post-medieval philosophy, and of the diversity of intellectual currents which characterized the post-medieval period. For a summing-up of these matters, which will place the logicians discussed here in their proper historical

context, I refer the reader to my chapter on logic and language in the *Cambridge History of Renaissance Philosophy*, edited by Charles B. Schmitt (Cambridge: Cambridge University Press, [1988]).

On re-reading the papers collected here, I found that in general I still agree with what I wrote. Nonetheless there are some things that I would now do differently. In particular, I would edit the Latin texts, rather than presenting them in their raw form. I would also try to standardize my use of language. For instance, the verb 'supponere' is variously translated here as 'suppose' and 'supposit'. In this reprint the opportunity has been taken to correct misprints and simple mistakes in the texts themselves; more complicated mistakes are discussed in the *Addenda et Corrigenda*. Where there is, inevitably, an overlap of material I have sometimes used the *Addenda* to indicate where my most up-to-date treatment of the subject is found. I have also brought bibliographical references up to date, and I have added details of recent editions of Latin texts." (from the *Preface*)

4. ———. 2008. *Les Théories De L'analogie Du Xiie Au Xvie Siècle*. Paris: Vrin.

   Conférences Pierre Abélard, Université de Paris-IV Sorbonne (2004).

   Table des matières: Avant-propos par Irène Rosier-Catach 7; Préface de l'auteur 11; Chapitre premier: Les problèmes: logique, métaphysique, théologie 13; Chapitre II: Thomas d'Aquin: interprétations et malentendus 33; Chapitre III: L'analogie et les concepts: le virage vers l'intérieur 55; Chapitre IV: Autour de l'analogie: ambiguïté et métaphore 79; Bibliographie 105; Index nominum des auteurs avant 1650 119; Index nominum des auteurs modernes 121.

   "Afin de donner au lecteur une idée plus précise du plan de mon exposé, je dirai que dans les trois premiers chapitres, j'essaierai d'expliquer le trajet qui mène des Catégories et des Réfutations sophistiques d'Aristote à la tripartition de l'analogie telle que Burley la présente. Dans le premier chapitre, je donnerai un bref historique de la réception des textes et de I

'apparition de l'analogie d'attribution au mn e siècle. Je parlerai aussi des antécédents de la notion dans les textes des théologiens de la fin du XII e siècle et du début du XIII e siècle. Dans le chapitre il, je commençerai par un bref aperçu de la pensée de Thomas d'Aquin au sujet de l'analogie en général, avant d'examiner l'analogie de proportionnalité plus en détail. Dans le chapitre in, nous serons de nouveau avec Gauthier Burley et sa doctrine des concepts analogiques. Pour terminer, je consacrerai le dernier chapitre à deux problèmes concernant le langage parlé ou écrit: quand faut- il désambiguïser les propositions en faisant des distinctions, et quel est le rôle de la métaphore dans les discussions des théologiens et logiciens du Moyen Âge?

Prenons comme point de départ la question de savoir pourquoi les auteurs du Moyen Âge ont cru nécessaire de développer une théorie de l'analogie sémantique. Afin de trouver une réponse, nous devrons répondre à trois questions préliminaires: 1) Quelles sont les théories métaphysiques et théologiques qui ont produit l'analogie métaphysique? 2) Quelle est la théorie du langage qui prédominait? (3) Quels sont les textes canoniques qui donnaient les instruments que l'on pouvait utiliser pour résoudre le problème des rapports entre réalité et langage? Dans ce qui suit, j'esquisserai une réponse aux trois questions, avant de parler plus en détail des textes logiques. Ensuite je retournerai aux théologiens afin de parler d'une solution au problème des noms divins qui semble contenir les racines d'une théorie de l'analogie. Pour terminer ce chapitre, j'expliquerai comment l'arrivée des nouvelles traductions d' Aristote et des écrits arabes a mené à la théorie de l'analogie telle qu'on la retrouve chez Thomas d'Aquin. Évidemment je ne serai pas en mesure de donner les réponses avec toute la complexité qui s'impose, surtout à la première question, mais ces quelques remarques, même superficielles, pourront déjà nous indiquer la direction à suivre." (pp. 15-16)

Books edited

1. Sanderson, Robert. 1985. *Logicae artis compendium*. Bologna: Editrice CLUEB

Reprint of the second edition (1618, first anonymous edition 1615), edited with an introduction by E. J. Ashworth.

Contents: Editor's Introduction IX-LV; I. Robert Sanderson: Life and works XI; II. The history of logic in the Sixteenth century XVI; III. Logic in England XXIII; IV. The Oxford curriculum XXXII; V. An analysis of the *Logicae Artis Compendium* XXXV-LV.

Logicae artis compendium. Pars prima 11; Pars secunda 81; Pars tertia 129; Appendix prima 243; Appendix posterior 331; Indices; Index of pre-twentieth century authors and works 371; Index of twentieth-century authors 375; Index of names used in examples 377; Index of Latin terms 379-382.

"V. An Analysis of the *Logicae Artis Compendium*.

In this section I intend to relate Sanderson to his background by focussing on four specific aspects of the *Logicae artis compendium*. I shall discuss (i) the nature of logic; (ii) the medieval heritage; (iii) changes in syllogistic; (iv) method and the art of discourse.

(i) The Nature of Logic

I shall begin by analyzing Sanderson's first chapter, which in a brief compass touches on a range of classificatory issues that were the subject of lively debate during the sixteenth century. The first of these issues concerns the very use of the word 'logica' as opposed to 'dialectica'. It was a medieval commonplace that the word 'dialectica' could be used in two senses, a broad sense which equated dialectic with logic, and a narrow sense, whereby dialectic was that kind of probable argumentation discussed in the *Topics*. (94) Which word was used for the study of all kinds of argumentation was a matter of taste. Peter of Spain had used 'dialectica'; John Buridan and others preferred logica'. However, in the sixteenth century greater doctrinal significance became attached to the word 'dialectica'. Ramus argued at some length that Aristotle's 'Organon' did not as was commonly thought discuss three special kinds of logic, i.e. apodictic or demonstrative, dealing with necessary material; dialectic, dealing with probable

material; and sophistic, dealing with fallacious material. Instead, there was one general doctrine, which included a general doctrine of invention. (95) Hence, there was no specialized use of the term 'dialectic' and it both could and should properly be applied to logic as a whole. In response Zabarella, for instance, argued that 'dialectic' did name a distinct part of logic, and should be used as the name of that part only. (96) Sanderson allows the wider use; but his remark that logica' is `Synecdochiche Dialectica' is significant, given that synecdoche is the figure of speech whereby a part is put for the whole.

Sanderson next classifies logic as an 'ars instrumentalis'. Once more, his choice of words has to be understood in the light of sixteenth century polemic. There were four ways in which logic could be classified. (97) Peter of Spain had called it both an art and a science; scholastics tended to call it a science; humanists tended to call it an art;" and Zabarella called it neither an art nor a science but an instrumental habit. Giulio Pace in turn argued that an instrumental habit was in fact an art;" and it seems to be this usage that Sanderson has adopted. Moreover, Sanderson was fully conscious of the implications of his choice, for in Appendix 1, chapter 2, pp. 31-37, he gives a sample speech on the genus of logic. He cites Zabarella (as well as Keckermann) and he concludes that logic is properly speaking an art. In this he is departing from some of his English predecessors, especially Seton, who had classified logic as a science. (100)

The final part of Sanderson's initial characterization of logic is the phrase "dirigens mentem nostram in cognitionem omnium intelligibilium." This definition is very similar to one found in Keckermann, who may well have influenced Sanderson here. Keckermann wrote "[Logica] Est ars humani intellectus operationes sive Hominis cogitationes ordinandi & dirigendi in rerum cognitione." (101) According to the Conimbricenses, the view that logic directed the operations of the mind was found in Fonseca and Suarez, and it is not found explicitly in the *antiquiores*. (102) In order to understand the full significance of Sanderson's definition, it is necessary to relate his remark

about directing the mind to his subsequent discussion of the divisions of logic, and it is also necessary to explore his reference to the knowledge of intelligible things in relation to his subsequent classification of the objects and subjects of logic." (pp. XXXV-XXXVIII)

(...)

"Conclusion.

Tolstoi's view of history as an inevitable process, which the actions of Napoleon affect no more and no less than those of the meanest soldier, is an overstatement. Yet it is true that the textbook-writers and schoolteachers of a period may be as important as the leading intellectuals, for it is by these minor figures that all innovations are accepted, altered, and made into the new commonplace. To concentrate solely upon the great thinkers is to obscure the reality of university and school, of the main stream of orthodoxy which lies behind these thinkers and which feeds them. To judge the true stature of such men as Locke it is helpful to know both what they were taught and how their teaching affected others; but to judge the intellectual quality of the seventeenth century as a whole, such a wider knowledge is essential. Great men stand to some extent outside their period, and it is only the minor thinkers who can provide a safe basis for generalization about that period. This fact alone would be a sufficient basis for the investigation of Sanderson's *Logicae artis compendium*. One cannot claim that it shows new insights into formal logic or the philosophy of language, but it is clearly written and well organized; and, given its success as a logic textbook, it is a valuable historical document. A study of this book will throw ihuch light upon the training and the preoccupations of those who used it; and it will help us to understand not only the development of logic textbooks in seventeenth century England, but also the type of education offered at Oxford and Cambridge." 2. Bricot, Thomas. 1986. *Tractatus Insolubilium*. Nijmegen: Ingenium Publishers

Artistarium Vol. 6. Critical edition of the treatise by Thomas Bricot with an introduction, notes, appendices and indices by E. J. Ashworth.

Table of Contents: Introduction: 1. Thomas Bricot: Life and Works XIII; 2. The *Tractatus Insolubilium* XIV; 3. About this Edition XV; 4. Description of the Early Printed Editions Used XV; Notes to the Introduction XIX; Bibliography of Secondary Sources XXII; Edition of text: Table of Contents 5; Signs and Abbreviations 11; *Tractatus Insolubilium Magistri Thomae Bricot* 13; Notes to the Text 113; Appendices: Appendix One 123; Appendix Two 129; Appendix Three 138; Indexes: 1. Index of Names 147; 2. Index of Examples 149; 3. Subject Index 153-155.

"1. *Thomas Bricot: Life and Works*

Thomas Bricot was one of the men who laid the foundations for the last flowering of medieval logical doctrines which took place at the University of Paris in the first two decades of the sixteenth century. (1) Little seems to be known about his early life except that he came from Amiens. (2) He took his BA at Paris in 1478, his MA in 1479, and his doctorate of theology in March 1490. Diring the 1480s he taught philosophy at the Collège de Sainte-Barbe, but when he took his licence of theology in January 1490 he was a *bursarius* of the Collège des Cholets. After 1490 he held a variety of ecclesiastical and academic posts. He spent some time in Amiens; but by 1502 he

was back in Paris. Between 1506 and 1516 he often served as dean of the faculty of theology; and he was both canon and penitentiary of Notre Dame. He died in Paris on April 10, 1516. His philosophical work belongs entirely to his early years in Paris.

Much of his activity was directed toward editing the works of others, including a 1487 edition of John Buridan's *Tractatus Summularum*. (3) He produced abbreviated versions of Aristotle's *Organon* and of his natural philosophy; (4) he wrote a series of questions on the *Analytica Posteriora;* (5) but most notably he edited and added questions to the commentaries on Aristotle and on Peter of Spain which had been written by the Paris master, George of Brussels. (6) Bricot's only original works seem to have been the *Tractatus Insolubilium* and the *Tractatus Obligationum* which were always published together and which received at least nine editions between 1489 and 1511. (7) The *Tractatus Obligationum* is largely based on the *De Obligationibus* of Marsilius of Inghen; (8) the *Tractatus Insolubilium* will be discussed below.

Bricot's works enjoyed considerable success in Paris in the last two decades of the fifteenth century as one can see from the number of editions printed there, as well as in other French centres. He was also known outside France. His abbreviation of the *Organon* was printed in Basel in 1492 and in Salamanca, ca.1496. It was printed together with a work by George of Brussels in Venice in 1506. (9) Bricot was prescribed to be read at the University of Vienna in 1499; (10) and some of his works were sold by the Oxford bookseller,

John Dorne, in 1520 . (11) Indeed, as late as 1535 the University of Cambridge found it necessary to forbid the reading of Bricot. (12) However, I judge that his success was largely due to the usefulness of his texts as teaching manuals rather than to any great originality. The only doctrine of his which I know to have been discussed by other logicians was his solution to the problem of semantic paradoxes found in the *Tractatus Insolubilium*, to which I shall now turn.

2. The '*Tractatus Insolubilium*'

In the *Tractatus Insolubilium* Bricot discusses three approaches to the problem of semantic paradoxes. (13) In the second question he takes up the solution attributed to Ockham, (14) whereby the part of a proposition cannot supposit for the whole. Bricot did not favour this solution. In the third question he discusses two versions of a solution stemming from Peter of Ailly but reworked by George of Brussels. In the first question he presents his own view. This owes much to Roger Swyneshed, but avoids some of the more paradoxical consequences of Swyneshed's view. Bricot allows self-reference to be legitimate; and he treats simple insolubles as being straightforward categorical propositions. However, he revises the conditions under which a proposition is said to be true. An affirmative proposition is true if and only if (I) it signifies that things are as they are and (II) it does not signify itself to be false. On the other hand, a negative proposition needs to meet only one condition. Either (I) it signifies that things are not as they are not or (II) its contradictory signifies itself to be false. It is here that Bricot differs from Swyneshed, who had treated affirmative and negative propositions alike.

Among the authors who were to discuss Bricot's solution are found Pierre Tartaret; (15) David Cranston; (16) John Mair; (17) and Domingo de Soto. (18) In the version of his *De Insolubilibus* published in 1516, John Mair said explicitly that *opinio magistri nostri thome Briquot ... nunc est communis*. (19)

The *Tractatus Insolubilium* is noteworthy for its treatment of two other issues. First, there is a short discussion of non-semantic paradoxes. (20) Second, there is a very long discussion of the issue of *complexe significabilia* or the significates of propositions, when the latter are viewed as occurrent entities. (21) As with semantic paradoxes, I have discussed Bricot's treatment of these issues at length in other places, and will not dwell on them here.

As an appendix to my edition of the *Tractatus Insolubilium* I have included two short texts in which Bricot takes up the issue

of semantic paradoxes once more, and a third text in which he discusses *complexe significabilia*." (pp. XIII-XIV)

3. Pauli, Veneti. 1988. *Logica Magna. Secunda pars. Tractatus de Obligationibus*. Oxford: Oxford University Press

   Classical and Medieval Logic Texts V. Edited with an English Translation and Notes by E. Jennifer Ashworth.

   Contents; Introduction VII-XVI; Part One. 3; Part Two: Concerning *positio*; Chapter One: Against the Rules 101; Chapter Two: On Conjunctions 327; Chapter Three: On Disjunctions 335; Chapter Four: On Similars and Dissimilars 345; Parth Three: Concerning *depositio*; Chapter One: Rules 369; Chapter Two: Theses 379; Chapter Three: Sophisms 379; Bibliography: I. Oblications Treatises 393; II. Other Sources 394; Indexes: Index of sophisms 398; Index of names 401; Index of doctrines 404-409.

   "*The Purpose of Obligations Treatises*

   A contentious and as yet unresolved issue has to do with the purpose of lllillgations treatises. The treatises themselves do not offer much discussion of this point, being content to remark that the opponent in a disputation is to try to push the respondent into accepting a contradiction, whereas the respondent has to resist this, even when faced with the curious consequences Ilf grunting such a propositum as 'You do not exist.'(23) In the process both participants would have their knowledge of valid inferences thoroughly tested, for each proposition put forward would be such that it followed from preceding steps, or such that its negation followed, or such that neither it nor Its negation followed. In this third case either it or its negation would enter the sequence as an extra premiss for further conclusions or non-conclusions. It should also be emphasized that the bulk of almost all treatises on obligations consisted of a series of sophisms which, as Edith Sylla has argued Ilf the 'physical' sophisms, formed an integral part of logic teaching, at least in fourteenth century Oxford, and were designed to develop a student's subtlety and skill in handling logical rules.(24) These remarks suggest that obligational disputations (if such were ever in fact held) had the primary

function of providing oral exercise in formal logic, and hence were of mainly pedagogical significance.

This solution has been adopted by a number of authors; but reflection on the complex and sophisticated nature of the controversy between Swyneshed and others has led P.V. Spade to suggest that obligations treatises offer us an account of counterfactual reasoning.(25) This theory in turn has been criticized by E. Stump, who points out that the treatises reflect a number of diverse concerns, including 'epistemic logic, indexicals, propositional attitudes, and other issues in the philosophy of language.'(26) She also points out that in Burley at least there was 'a concern with special sorts of difficulties in evaluating consequences or inferences as a result of the disputational context in which the inferences occur.'(27)

My own view is that there is probably something to be said for all these accounts. Insofar as the treatises described a routine to be followed in class-room disputations, the purpose could only have been that of testing a student's skill in formal logic, since truth was explicitly not an issue;(28) but the authors and readers of such treatises obviously welcomed the opportunity to discuss other matters in some depth. Paul himself was particularly concerned with the difference between use and mention, as will be seen from many of his sophisms. One must also bear in mind the often-noted link between treatises on obligations and treatises on insolubles. They go together not only in Paul, but in Swyneshed, Albert of Saxony and Strode, to mention but three names. This suggests a general interest in discussing all kinds of paradoxes, both semantic and non-semantic. Whatever the final answer is, reading Paul of Venice should help us to arrive at it, since his Tractatus de Obligationibus is a compendium of all the main views current in the second half of the fourteenth century."

Articles 1967-1972

1. Ashworth, Earline Jennifer. 1967. "Joachim Jungius (1587-1657) and the Logic of Relations." *Archiv für Geschichte der Philosophie* no. 49:72-85.

   "In histories of logic, the sixteenth and seventeenth centuries, at least until Leibniz began his work, are either ignored or are referred to with the utmost brevity as being hardly worthy of attention (1).

   (...)

   However, there is one name which appears with fair regularity in the literature, and that is the name of Joachim Jungius, whose *Logica Hamburgensis* is often contrasted favorably with the Port Royal Logic. Both Bochenski and the Kneales allow this book, published in 1638 for the use of the Classical Schools at Hamburg, to be one of the better textbooks of the period (2); while Heinrich Scholz in his influential *Geschichte der Logik*, not only praises it highly, but discusses Jungius's contributions to logic at some length (3). More impressive yet are the varied tributes paid to Jungius by Leibniz, who called him "one of the most able men that Germany has ever had" (4); compared him with Galileo and Descartes (5); and said that "he surpassed all others in the knowledge of true logic, not even excepting the author of the *Artis Cogitandi* [Arnauld]" (6). Of course, much of Leibniz's praise arose from his admiration of Jungius's varied activities, his career as a medical doctor, his contributions to physics, botany, mineralogy, theology, educational theory, and his foundation of the first-learned society in Germany (7). More specifically, however, Leibniz admired Jungius for his demonstration that not all inferences could be reduced to syllogistic form, and he praised his logical acuteness in this respect on a number of occasions (8). The purpose of this paper is to shed some light on a much neglected area of the history of logic by inquiring whether Jungius's treatment of non-syllogistic or, in this context, relational

inferences, is commensurate with the logical distinction which has been claimed for him; and, more briefly, to see whether there are any further factors which set Jungius above other logicians of the same period." (pp. 72-73)

(...)

"In conclusion one may say that although the *Logica Hamburgensis* shares in all the faults of its age, the superficiality, the lack of metalogical perceptiveness, it also has merits which are peculiarly its own. The body of truth-functional logic contained in it would alone be sufficient to distinguish Jungius from his contemporaries, and still more impressive, given the background, is his use of relational inferences. It is true that the argument *a divisis ad composita* is both unoriginal and unremarkable, despite Scholz's praise; it is true that the inversion of relations is found in other contemporary logicians; while discussion of the oblique syllogism was quite usual; but the argument *a rectis ad obliqua* was both original and clearly presented. Moreover, Jungius seems to have been fully conscious that relational inferences were inferences in their own right, to be treated as such and not to be hidden away among the categories. Without this realization, any amount of originality in the discovery of actual inferences could have gone for nought. Hence, while the verdict of Heinrich Scholz needs modification, his praise of Jungius is basically justified, for it was he who brought the logic of relations to the attention of his successors, especially Leibniz." (p. 85)

(1) In this context, it must be acknowledged that historians of thought have been kinder than those devoted strictly to formal logic. For instance, Peter Petersen's seminal work, *Geschichte der aristotelischen Philosophie im protestantischen Deutschland*, Leipzig 1921. contains much material of interest to the historian of logic. The publication in 1964 of Dr. Wilhelm Risse's work, *Die Logik der Neuzeit. 1. Band. 1500—1640*, Stuttgart-Bad Cannstatt 1964, marks a great step forward in the study of the field.

2. ———. 1968. "Propositional Logic in the Sixteenth and Early Seventeenth Centuries." *Notre Dame Journal of Formal Logic* no. 9:179-192.

"Until recently, historians of logic have regarded the early modern period with unremitting gloom. Father Boehner, for instance, claimed that at the end of the fifteenth century logic entered upon a period of unchecked regression, during which it became an insignificant preparatory study, diluted with extra-logical elements, and the insights of men like Burleigh into the crucial importance of propositional logic as a foundation for logic as a whole were lost.(1) Nor is this attitude entirely

unwarranted, for the new humanism in all its aspects was hostile to such medieval developments as the logic of terms and the logic of consequences. Those who were devoted to a classical style condemned medieval works as unpolished and arid, and tended to subordinate logic to rhetoric; while those who advocated a return to the original works of Aristotle, freed from medieval accretions, naturally discounted any additions to the subject matter of the *Organon*.

But it would be a mistake to dismiss the logical work of the period too readily. In the first place, the writings of the medieval logicians were frequently published and widely read. To cite only a few cases, the *Summulae Logicales* of Petrus Hispanus received no fewer than 166 printed editions;(2) Ockham's *Summa Totius Logicae* was well known; the 1639 edition of Duns Scotus included both the *Grammaticae Speculativae* attributed to Thomas of Erfurt and the very interesting *In Universam Logicam Quaestiones of Pseudo-Scotus*; (3) the *Logica* of Paulus Venetus was very popular; and a number of tracts by lesser known men like Magister Martinus and Paulus Pergulensis were printed. Moreover, since logic still played such a preeminent role in education, contemporary scholars were not backward in producing their own textbooks; and numerous rival schools of logic flourished.(4) The purpose of this paper is to make a preliminary survey of some of the wealth of material available from the sixteenth and first half of the seventeenth centuries, in order to ascertain how much of the medieval propositional logic had in fact been retained.(5) It will become clear that the situation was better than has been thought." (p. 179)

3. ———. 1968. "Petrus Fonseca and Material Implication." *Notre Dame Journal of Formal Logic* no. 9:227-228.

   "Little attention has been paid to the question of whether material implication was recognized in the sixteenth and seventeenth centuries, although it has been argued that John of St. Thomas was aware of the equivalence '(p ⊃ q) ≡ (~p v q)'.(1) The other usual test-case for a knowledge of material implication is '(p ⊃ q) ≡ ~(p . ~q) and I intend to show that the sixteenth century Jesuit, Petrus Fonseca, whose *Institutionum Dialecticarum libri octo* was one of the most popular textbooks of the period, (2) was well acquainted with this second equivalence." (p. 227)

   (...)

   "One must conclude that Fonseca was aware both of strict and of material implication." (p. 228)

   (1) See Ivo Thomas, "Material Implication in John of St. Thomas", *Dominican Studies* 3 (1950), p. 180; and John J. Doyle, "John of St. Thomas and Mathematical Logic", *The New Scholasticism* 27 (1953), pp. 3-38.

   (2) First published in 1564, it went into at least 44 editions. See Wilhelm Risse, *Die Logik der Neuzeit*, Band I. 1500-1640 (Stuttgart-Bad Cannstatt, 1964), p. 362, n. 395.

4. ———. 1969. "The Doctrine of Supposition in the Sixteenth and Seventeenth Centuries." *Archiv für Geschichte der Philosophie* no. 51:260-285.

   "The purpose of this paper is to make a preliminary survey of some of the wealth of material available from the sixteenth and first half of the seventeenth centuries, in order to ascertain how

much of the medieval propositional logic had in fact been retained.(5) It will become clear that the situation was better than has been thought.

The vocabulary and organization of the textbooks under consideration were fairly standard. The discussion of the proposition [*Enuntiatio, Propositio*, or, in Ramist texts, *Axioma*] followed sections on the predicaments and predicables or the Ramist equivalent, on arguments. Medieval logicians had called the compound proposition 'hypothetical', but sixteenth and seventeenth century writers more usually referred to *enuntiatio conĭuncta* or *composita*, sometimes with a note to the effect that it is vulgarly or improperly called 'hypothetical'.(6) Melancthon retained the name 'hypothetical', as did one or two others.(7) The Spanish scholastic, Petrus Fonseca, discussed the whole question in some detail, saying that the name 'hypothetical' most properly applies to conditional propositions, but can also be used of disjunctions, because they imply a conditional.(8) A compound proposition was generally said to consist of two (or more) categorical propositions, joined by one (or more) of a list of propositional connectives. The assumption that the truth of these propositions depended upon the truth of the parts, the kind of connective employed, and in certain cases the relationship between the parts usually remained implicit, but the seventeenth century German logician, Joachim Jungius, said explicitly that truth or falsity depended on "the kind of composition involved";(9) while Alsted had written previously that truth or falsity depended "on the disposition of parts". (10)

There was much agreement as to the kinds of compound proposition to be considered. Conditional, conjunctive, and disjunctive propositions were always mentioned. Those logicians in the scholastic tradition, like Campanella, Cardillus, Fonseca, Hunnaeus and John of St. Thomas, included causal and rational propositions, as did some outside the tradition like Cornelius Martini and Jungius, who discussed the causal proposition at length. Only a few, including Fonseca and C. Martini, mentioned the temporal and local propositions which had been discussed by such medieval logicians as Ockham and

Burleigh; but both Ramus and Burgersdijck spoke of 'related' propositions which exhibit 'when' and 'where' among other connectives.(11)

Ramus and those influenced by him added a new kind of compound proposition, the discretive.

Although compound propositions were rarely called 'hypothetical', the traditional title of 'hypothetical syllogism' was usually retained for the discussion of propositional inference forms. Only a few spoke of *syllogismus compositus* or *coniunctus*. (12) In all cases the categorical syllogism was discussed before the hypothetical, and usually such matters as sorites, example, enthymeme and induction also came first. A few books had, in addition, a section on the rules for valid inference or *bona consequeentia*.

Melancthon in his *Erotemata Dialectices* included a chapter entitled *De Regulis Consequentiarum* after his discussion of sorites and before his discussion of the hypothetical syllogism. Alsted placed his canons of material consequence in the same position; while the remarks of Caesarius come after his section on the hypothetical syllogism. On the other hand, the three scholastics, Campanella, Fonseca, and Hunnaeus introduced their rules for good consequence before they discussed the syllogism, thus approaching most closely to the later medieval order of priorities." (pp. 179-180)

(...)

"It is indeed true that the logicians of the sixteenth and early seventeenth centuries failed to appreciate the fundamental importance which the logicians of the later middle ages had attributed to propositional logic; and a number of the texts I have been concerned with even give instructions for the reduction of hypothetical syllogisms to categorical syllogisms. (88) On the other hand, the amount of propositional logic retained was by no means negligible, and some authors, such as Fonseca and Jungius, included a great deal. No startling advances were made, but there were innovations in detail, like

Jungius's discussion of the posterior subdisjunctiva, or the linking of the conditional with a negated conjunction.

One may therefore conclude that, while the period is not one of great excitement for the historian of logic, it merits considerably more attention than it has been granted in the past." (p. 188)

5. ———. 1970. "Some Notes on Syllogistic in the Sixteenth and Seventeenth Centuries." *Notre Dame Journal of Formal Logic* no. 11:17-33.

"Although a number of different schools of logic flourished in the sixteenth and seventeenth centuries (2), they seem to have shared a lack of interest in formal logic which expressed itself in a greater concern for the soundness than for the validity of arguments. An example of this tendency is the emphasis placed upon the Topics, or the ways of dealing with and classifying precisely those arguments which were not thought to be susceptible of formal treatment, since they depended for their effectiveness upon the meaning of the terms involved.(3) It is true, of course, that the Humanists and, later, the Ramists, devoted considerably more space to the Topics and to the "invention" of arguments than did the scholastics, the Aristotelians, the Philippists or followers of Melancthon, or even the eclectics; but this was balanced by the greater devotion of the other schools to the categories, the predicables, the pre-, post-, and even extra-predicaments.(4) However, there was one subject which was both formal in inspiration and common to all text-books, namely, the syllogism; and as a result it provides a very good test of how much interest and competence in purely formal matters was retained during these centuries of logical decline." (p. 17)

(...)

"In the light of this discussion, I find myself driven to the reluctant conclusion that genuine competence in formal logic was not often to be found in this period, at least where syllogistic was concerned. One distressing feature is the lack of discussion of issues like the definition of the major and minor terms or the status of singular propositions. Frequently one is

left to guess differences in meta-theory from differences in usage.

And even where there is discussion, it is not always adequate. For instance, a doctrine of the relationship between terms was used to exclude the fourth figure without any realization that this doctrine could not properly be applied to the first, second or third figures. Another characteristic of logicians of this period was a random introduction of new modes. What reason could be given for listing only two indirect modes of the second figure, or for allowing singular terms to appear only in third figure syllogisms? Finally, many logicians introduced frankly extra-logical considerations into their discussions. What was natural, what was fitting, what people tended to say, were all thought to be relevant issues. Only Arnauld and Alsted and, to a lesser extent, Campanella, present the right doctrines for the right reasons, unencumbered by extraneous material." (pp. 27-28)

(1) This study is based on an examination of printed texts in the British Museum, the Cambridge University Library, and the Bodleian. I do not mention Leibniz because he was not a writer of logical textbooks.

(2) For a comprehensive account of the various schools, see Wilhelm Risse, *Die Logik der Neuzeit. I Band. 1500-1640* (Stuttgart-Bad Cannstatt, 1964).

(3) The situation is rather different today. For instance, much of the material discussed under the Topic of *genus* and *species* could be dealt with by set theory, and much of that discussed under the Topic of part and whole could be formalized by the methods of S. Lesniewski. The *Topics*, as treated by Boethius, Abelard, and Peter of Spain, are discussed by Otto Bird, in his article "The Formalizing of the Topics in Mediaeval Logic," *Notre Dame Journal of Formal Logic*, vol. 1 (1960), pp. 138-149.

(4) For a typical account of these matters see Joachim Jungius, *Logica Hamburgensis*, edited by R. W. Meyer (Hamburg, 1957), Book I.

6. ———. 1972. "The Treatment of Semantic Paradoxes from 1400 to 1700." *Notre Dame Journal of Formal Logic* no. 13:34-52.

   "During the middle ages, semantic paradoxes, particularly in the form of "Socrates speaks falsely", where this is taken to be his sole utterance, were discussed extensively under the heading of *insolubilia*. Some attention has been paid to the solutions offered by Ockham, Buridan, and Paul of Venice, but otherwise little work seems to have been done in this area.

   My own particular interest is with the generally neglected period of logic between the death of Paul of Venice in 1429 and the end of the seventeenth century; and the purpose of this paper is to last some light both upon the new writings on paradoxes and upon the marked change in emphasis which took place during the sixteenth century. Although the traditional writings on *insolubilia* were available throughout the period, the detailed discussions of the fifteenth and early sixteenth centuries were soon entirely replaced by briefer comments whose inspiration seems wholly classical. Even the mediaeval word *insolubile* was replaced by the Ciceronian *inexplicabile*. In this area at least there is strong evidence for the usual claim that the insights of scholastic logic were swamped by the new interests and studies of Renaissance humanism." (p. 34)

   (...)

   "Whether any of these solutions is likely to bear fruit today is for the reader to decide. It is, however, clear that the writers of the fifteenth and early sixteenth century were inspired by a genuine interest in problems of logic and language, and that they handled them with the finest tools available. That their discussions should have been so completely ignored by subsequent logicians, some of whom were doubtless their pupils, is surprising, given both the availability of their books and the persistence of other traditional doctrines like supposition. (81)" (p. 45)

   (81) See my article, "The Doctrine of Supposition in the Sixteenth and Seventeenth Centuries", *Archiv fur Geschichte*

der Philosophie vol. 51 (1969), pp. 260-285.

7. ———. 1972. "Strict and Material Implication in the Early Sixteenth Century." *Notre Dame Journal of Formal Logic* no. 13:556-560.

   "One of the favorite games played by historians of logic is that of searching their sources for signs of the Lewis-Langford distinction between strict and material implication. There are three ways of going about this, but the first two are often reminiscent of the conjurer searching for his rabbit, and only the third has real merit, for it alone involves the study of what was said about the conditional as such. I shall look at each way in turn, in relation to writers of the early sixteenth century." (p. 556)

   (...)

   "I think it is fair to conclude by saying that some early sixteenth century logicians were beyond doubt aware of the distinction between strict and material implication; and that no special pleading is necessary to establish this." (p. 560)

8. ———. 1972. "Descartes' Theory of Clear and Distinct Ideas." In *Cartesian Studies*, edited by Butler, Ronald Joseph, 89-105. Oxford: Basil Blackwell.

   "It is widely agreed that Descartes took ideas to be the objects of knowledge and that his theory of clear and distinct ideas arose from his attempt to find a way of picking out those ideas whose truth was so certain and self-evident that the thinker could be said to know them with certainty. To say of an idea that it is clear and distinct was, he believed, to say of it both that it was certainly true and that any claim to know it was justified. No other criterion need be appealed to. It is at this point, however, that most of those who set out to expound Descartes' theory of knowledge are brought to a standstill. The part played by clear ideas is obvious enough, but what did Descartes mean by `clear and distinct'? This paper is an attempt, not to make an original contribution to the study of Descartes, but to elucidate his terms and evaluate his criterion in the light of what both he and others have written." (p. 89)

(...)

"The fact that Descartes adopted the word ‘idea’ is itself significant. When scholastic philosophers discussed human cognition, they spoke of the mind as containing concepts (*species, intentiones*). They claimed that these concepts originated through our sense perceptions, and hence that they stood in some relation to external objects. The term ‘concept’ was contrasted with the term ‘idea’. Ideas were the eternal essences or archetypes contemplated by God, and the question of their external reference did not arise. They were an integral part of God’s mind. God could create instances of one of his ideas, but his idea was in no way dependent upon the existence of such instances. Descartes took the word ‘idea’ and applied it to the contents of the human mind because he wanted to escape the suggestion that these contents must be in some sense dependent on the external world as a causal agent. (9) He wished to establish the logical possibility that a mind and the ideas contained within it are unrelated to other existents, and can be discussed in isolation from them.

Descartes saw the term ‘idea’ as having a very wide extension.

He said “ . . . I take the term idea to stand for whatever the mind directly perceives,”(10) where the verb ‘perceive’ refers to any possible cognitive activity, including sensing, imagining and conceiving.(11) Thus a sense datum, a memory, an image, and a concept can all be called ideas. This, of course, leads to the blurring of distinctions. For Descartes, “I have an idea of red” may mean that I am now sensing something red, or that I have a concept of the colour red, even if I am not now picking out an instance of that concept. Moreover, when Descartes speaks of an idea, he may be taking it as representative of some object or quality in the physical world, as when he says “I have an idea of the sky and stars,” or he may be referring to the meaning he assigns to a word, as when he says “I have an idea of substance.” Nor does he make any distinction between “having an idea” and “entertaining a proposition.” Such statements as “Nothing comes from nothing” and “The three angles of a triangle are equal to two right angles” are

categorized as ‘common notions’,(12) and are included among the contents of the mind. Descartes does remark that in some cases an idea may be expressed by a name, in other cases by a proposition,(13) but he does not bother to pursue this line of inquiry.

One of the characteristics of an idea is 'objective reality’, a scholastic phrase which Descartes adopted, but used in a new way. In scholastic writings the terms ‘subjective’ and ‘objective’ have meanings which are the reverse of the modem meanings. An object like a table exists subjectively or as a subject if it has spatio-temporal existence, if it is real or actual. In contrast, the concept of a table can be looked at as having two kinds of existence. The concept *qua* concept has formal existence, but the concept as having some specifiable content is said to have objective existence, or existence as an object of thought. The concepts of a table and of a chair are formally similar but objectively different. So far as subjective realities were concerned, the scholastics assigned them different grades of reality according to their perfection and causal power. For instance, a substance is more perfect and causally more efficacious than an accident, hence a man has a higher grade of reality than the colour red.

It was also held that every effect had a cause with either an equal or a higher grade of reality. These doctrines were not seen as having any relevance to concepts. As formally existent, a concept has of course to have some cause, but the content of the concept was not seen as having any independent reality. Descartes, however, felt that the objective reality could be considered independently of its formal reality, and that it must be graded just as subjective reality was graded. The idea of a man, he felt, has more objective reality than the idea of a colour. Moreover, the cause of the idea containing a certain degree of objective reality must have an equal or greater degree of subjective reality. For instance, the idea of God has so high a degree of objective reality that only God himself is perfect enough to be the cause of such an idea.(14)" (pp. 91-93)

(...)

"Although Descartes struggled to defend his criterion, his struggles ended in an impasse. He had made the mistake of trying to prove too much. He had wanted to develop an introspective technique by which he could be sure of recognizing those ideas which were objects of certain knowledge; but such an enterprise was doomed from the start. He could only escape from the objection that nothing about an idea can justify us in making judgment about its external reference by entering into an uneasy and unjustifiable alliance with God; and by such an alliance he negated his claim that a single criterion for true and knowable ideas could be found." Writings of E. J. Ashworth on the History of Logic. Second Part: Articles from 1973 to 1979

Articles 1973-1979

1. Ashworth, Earline Jennifer. 1973. "Are There Really Two Logics?" *Dialogue. Canadian Philosophical Review* no. 12:100-109.

   "As a historian of logic, I am frequently puzzled by the things which people have to say about the relationship between mathematical logic and some other kind of logic which is variously described as ‘intentional’ and ‘traditional.’ Part of my puzzlement arises from my failure to understand precisely what kind of system is being offered under the guise of intentional logic. I have always taken it that logic is concerned with valid inferences, with showing us how we may legitimately derive a conclusion from a set of premisses; yet the validation of inferences seems to be the least of the concerns of the intentional logician. He says that it can be done, but he does not bother to show us how. My purpose in this paper is to list some of the sources of my puzzlement in the hope that an exponent of intentional logic will show me how they can be resolved, and how their resolution will contribute to the building of a system (however informal) in which different types of argument can be validated."

2. ———. 1973. "Existential Assumptions in Late Medieval Logic." *American Philosophical Quarterly* no. 10:141-147.

"There are three types of existential assumption that are commonly made by logicians: (1) that subject terms refer to non-empty classes; (2) that proper names have referents; and (3) that formulas are to be interpreted only within non-empty domains. In the standard first-order quantificational calculus with constants, the second and third of these assumptions are retained, but the first, which is attributed to traditional syllogistic, has been abandoned.

Subject terms may refer to empty classes, and a distinction can be drawn within the system between those inferences which are valid only for non-empty classes and those which are valid for both empty and non-empty alike. For instance, given the assumption that universally quantified propositions whose subject terms refer to empty classes are true, but that existentially quantified propositions whose subject terms refer to empty classes are false, it turns out that the inference from "All *A*s are *B*" to "Some *A*s are *B*" only holds with the addition of the premiss, "There is at least one *A*." More recently, systems have been constructed in which the other two assumptions have also been discarded. Their valid formulas are valid in both empty and non-empty domains, and non-denoting constants are admitted. Any inference whose validity depends on the assumption that the domain of interpretation is non-empty, or that a constant denotes, is distinguished from the others by the presence of an extra premiss.(1) Thus, what was an assumption implicitly applied to all cases, is now made explicit and is shown to apply only to a subset of formulas within the system.

It is frequently assumed that medieval logic operated with a group of implicit existential assumptions similar to those I have mentioned, but this view is erroneous. Late medieval logicians were just as concerned as contemporary logicians to deal with non-denoting terms within their systems, and to draw explicit distinctions between those inferences whose validity involves existential assumptions and those whose validity does not involve existential assumptions. It is inappropriate to ask whether they took their formulas to be valid within the empty domain or not, both because they worked with ordinary language rather than with formal systems, and because they did

not use the notion of interpretation within a domain. When they interpreted a sentence such as "All men are animals," they did not speak of a domain of individuals some of whom were men and some of whom were animals, but only of those individuals who were either men or animals.

However, they explicitly concerned themselves with the other two existential assumptions, and they admitted both non-denoting constants and terms referring to empty classes to their system. In this paper I intend to examine how some logicians of the late 15th and early 16th centuries interpreted sentences containing non-denoting terms, how they assigned truth values to them, and how they dealt with those inferences which needed an existential premiss to ensure validity." (p. 141)

(...)

"My discussion has been necessarily somewhat sketchy, and I have not examined all the contexts in which *constantia* was used,(28) but it should have become clear by now not only that late medieval logicians had clear views about the existential import of various types of sentences, but that they used their initial decisions about the truth and falsity of sentences containing non-denoting terms to build a consistent system. It is to be regretted that the vast majority of logicians after the third decade of the 16th century ceased to discuss these matters, with the result that modern readers tend to think of traditional logic as lacking a sophistication which it did indeed possess." (p. 147)

(1) See, for example, W. V. O. Quine, "Quantification and the Empty Domain" in *Selected Logic Papers* (New York, 1966), pp. 220-223; Hugues Leblanc and Theodore Hailperin, "Non-Designating Singular Terms," *The Philosophical Review*, vol. 68 (1959), pp. 239-243; B. C. van Fraassen, "Singular Terms, Truth Value Gaps and Free Logic," *The Journal of Philosophy*, vol. 63 (1966), p. 481-495. There is a large and growing body of literature on the topic of logics which are free from existential suppositions.

(29)

3. ———. 1973. "Andreas Kesler and the Later Theory of Consequence." *Notre Dame Journal of Formal Logic* no. 14:205-214.

   "In another paper I examined the theory of consequence presented by a number of later fifteenth and early sixteenth century writers, ending with Javellus, an Italian who died in 1538. (1) For this earlier period, there was an abundance of material, containing much sophisticated discussion of semantical issues; but the next hundred years do not offer more than a few sources, and these are of limited value. The only really outstanding figure, so far as I can see, is that of Andreas Kesler. He was a Protestant theologian who was born at Coburg in 1595, educated at Jena and Wittenberg, and died in 1643 after a long career in education. In 1623 he published a book entitled *De Consequentia Tractatus Logicae* which is unique, both for its own time, and as compared to the products of this earlier period, in that it explicitly subsumes the whole of formal logic under the theory of consequence. The laws of opposition and conversion, the categorical and hypothetical syllogism, were all seen as different types of consequence. Moreover, no extraneous material was included. Instead of starting with the categories, like the Aristotelians, or with the invention of arguments, like the Ramists, he devoted his first chapter to the definition of consequence. Topics, informal fallacies and other such subjects found no place, whereas some rarely discussed matters like exclusive and reduplicative propositions and the modal syllogism did appear. Thus he stands out for his contents as well as for his organization." (p. 205)

   (...)

   "After this brief survey one can only conclude that the theory of consequence suffered an abrupt decline after the first part of the sixteenth century. The one outstanding writer on the subject was Andreas Kesler, but he stands out for a single insight, rather than for any awareness of the ramifications of the theory. Unlike his sources, he saw that all of formal logic could be subsumed under the basic notion of consequence, and he was able to exclude extraneous material, but that was as far

as he went. About the definition and division of consequence, and about consequential rules, he had nothing to say but what had been said before him by Fonseca and Regius. Nor did he betray any knowledge of earlier writers, although some at least must have been available to him in Wittenberg. For once those who deplore the loss of mediaeval insights during the sixteenth century seem to be justified." (p. 210)

(1) See my paper "The Theory of Consequence in the Late Fifteenth and Early Sixteenth Centuries,", to appear in *Notre Dame Journal of Formal Logic*, vol. XIV (1973), No. 3, pp. 289-315.

4. ———. 1973. "The Theory of Consequences in the Late Fifteenth and Early Sixteenth Centuries." *Notre Dame Journal of Formal Logic* no. 14:289-315.

"In this paper I intend to examine the treatment accorded to consequences by a group of writers from the late fifteenth and early sixteenth centuries, although I shall make some reference to earlier periods. The subject of consequences (or valid inference) is of central importance to the historian of logic because those who discussed it covered such a wide range of logical issues, including criteria for validity, problems of self-reference, the status of the so-called paradoxes of strict implication, and the systematization of valid inference forms. Indeed, a large part of semantics and the whole of formal logic could be subsumed under this general heading. Whether the authors themselves fully appreciated that this was so is unfortunately not such an easy question to answer, for those I am concerned with frequently leave the reader in doubt as to their view of the relation of consequences to the rest of logic. So far as they discussed the matter, syllogistic was seen to be consequential in nature,(1) but they certainly did not make the subordinate position of the syllogism as clear as Burleigh had in the fourteenth century, or indeed as Andreas Kesler was to do in the seventeenth century.(2) A good guide to the way they viewed the problem is to see where consequences were discussed.

A very few authors, including J. Major, A. Coronel and J. Almain, devoted a whole treatise to them, but generally speaking they came in on the coat-tails of other topics so far as separate treatises were concerned.

They appear at the beginning of Dolz's treatise on the syllogism, at the end of Celaya's treatise on supposition and under 'hypothetical propositions' in the treatises on opposition written by R. Caubraith and F. Enzinas. The best places to look for a discussion of consequence turn out to be commentaries on Peter of Spain, where they appear either as an appendage to the *Parva Logicalia* or under the heading of 'hypothetical propositions', and, of course, general textbooks of logic. In these, a separate tract was sometimes devoted to consequences, as it was by C. Javellus, but more usually they were associated with the syllogism, whether as an introduction to it or, sometimes, as an appendix to it. Savonarola, for instance, said all he had to say of consequences in a section on the powers of the syllogism.

The bibliography at the end of this paper should give a fairly clear picture of the situation; though it must be noted that the majority of commentaries and textbooks belonging to the sixteenth century did not mention consequences at all." (pp. 289-290)

(1) Enzinas, *Tractatus Syllogismorum*, fo.I vo, said "syllogismus est consequentia bona et formalis . . . omnis consequentia formalis que non tenet gratia alicuius regule logicalis tenebit syllogistice." Cf. Heirich Greve, *Parva Logicalia nuper disputata*, Leipzig (149-).fo. lxxi.

(2) Andreas Kesler, *De Consequentia Tractatus Logicus* (Wittenberg, 1623). See my paper, '*Andreas Kesler and the later theory of consequence," *Notre Dame Journal of Formal Logic*, vol. XIV (1973), pp. 205-214.

5. ———. 1973. "The Doctrine of *Exponibilia* in the Fifteenth and Sixteenth Centuries." *Vivarium* no. 11:137-167.

   Reprinted as essay IX in: *Studies in Post-Medieval Semantics*.

"One of the most neglected parts of late medieval logical theory is that devoted to *exponibilia*, or those propositions which need further analysis in order to lay bare their underlying logical form and to make clear under what conditions they can be said to be true or false. My main intention in this paper is to examine the rich array of printed sources which are available to us from the later fifteenth and early sixteenth centuries, but I will consider some texts written before the invention of printing, and I will also give some account of what happened to the theory in the late sixteenth and seventeenth centuries. The sources fall into three main groups. There are separate treatises on exponibles, especially those written by Peter of Ailly(*) and later Parisian logicians; there are commentaries on the treatise on exponibles attributed to Peter of Spain; and there are those parts of longer works which were devoted to 'Proofs of Terms', as in Paul of Venice and his followers. These groupings are not, of course, exhaustive. For instance, Marsilius of Inghen and George of Brussels discussed exponibles in the second part of a treatise on consequences, and Albert of Saxony included exponibles in the part of *Perutilis Logica* devoted to different kinds of proposition. As might be expected, the authors of the separate treatises on exponibles were considerably more detailed and careful in their analysis than were those authors who treated exponibles as a subsidiary matter. In my view, the two most outstanding treatises are those written by Peter of Ailly (d. 1420) and by Domingo de Soto (d. 1560). The latter is not original, but it is a very acute and thorough survey of the doctrines which were current in late fifteenth and early sixteenth century Paris, where de Soto had studied under and with such logicians as Major, Celaya and Lax, whose names will frequently occur in my text. Outside treatises devoted to exponibles, good brief treatments are to be found in the anonymous commentator on Marsilius of Inghen, and in George of Brussels, (both of the later fifteenth century) and in Hieronymus of St. Mark (of the early sixteenth century). The earlier writers are often disappointing.

For instance, although Paul of Venice's *Logica Magna* is sometimes described as an encyclopedia of medieval logic, the

section on exponibles lacks the precise analysis of types and sub-types of exponible propositions found in other authors, and the examples are frequently confusing.

Similarly, the treatise wrongly attributed to Peter of Spain lacks detail, and derives most of its value from the remarks of commentators." (pp. 137-138)

(...)

"To conclude, one can say that the history of exponible propositions mirrors the history of medieval logical doctrines in general. At the end of the fifteenth and beginning of the sixteenth centuries there was a sudden surge of activity, during which such topics as *exponibilia, insolubilia* and *suppositiones* were analyzed, clarified and elaborated in works which are highly respectable from the logician's point of view, even if they contain little that is original. This period of activity was followed by a period of decline, in which medieval doctrines continued to receive some attention, especially in Spain, but they are clearly subordinated to the main business of expounding Aristotelian logic. By the end of the seventeenth century they cease ever to be mentioned." (p. 165)

6. ———. 1973. "Priority of Analysis and Merely Confused Supposition." *Franciscan Studies* no. 33:38-41.

"In a recent article John J. Swiniarski discusses William of Ockham's use of merely confused supposition.(1) He claims that, in the case of universal affirmative propositions, Ockham's method of attributing merely confused supposition to the predicate accomplishes much the same result as Peter Thomas Geach's method of attributing determinate supposition to the predicate and using a priority of analysis rule, whereby the subject is always analysed first. However, he notes, Ockham's analytical procedures when applied to particular negative propositions can lead to erroneous results,which are only avoided by the adoption of a priority of analysis rule. Since such

a rule renders merely confused supposition unnecessary, he concludes that Geach was right and that Ockham ought to have employed only distributive and determinate supposition to get her with a priority of analysis rule in his treatment of standard categorical propositions. I do not wish to criticize what Swiniarski has to say about the interpretation of Ockham. Instead, I wish to make a few remarks about the use of merely confused supposition by sixteenth century logicians in order to show that it is not in general so easily dispensed with. (2)" (p. 38)

(...)

"In the light of these two examples, I conclude that there was good reason for sixteenth century logicians to retain merely confused supposition, and to use Domingo de Soto's priority of analysis rule rather than Geach's." (p. 41)

(1) Swiniarski, John J., "A New Presentation of Ockham's Theory of Supposition with an Evaluation of Some Contemporary Criticisms," *Franciscan Studies*, 30 (1970), 209-217. Those readers who are not familiar with supposition theory should be reminded that merely confused supposition involves an analysis into a disjunctive subject or predicate, whereas distributive supposition involves an analysis into a conjunction of propositions and determinate supposition involves an analysis into a disjunction of propositions.

(2) For further details about supposition theory in the sixteenth century, see my paper: " The Doctrine of Supposition in the Sixteenth and Seventeenth Centuries, " *Archiv für Geschichte der Philosophie*, 51 (1969), 260-285.

7. ———. 1974. "Some Additions to Risse's *Bibliographia Logica*." *Journal of the History of Philosophy* no. 12:361-365.

"One of the greatest contributions to the history of logic in recent years was the publication in 1965 of Wilhelm Risse's *Bibliographia Logica*, Vol. I, which covers the years from 1472 to 1800. However, despite the fact that Risse's monumental work lists an estimated 8,000 logical works, it is still far from comprehensive, as Mr. Hickman pointed out in an earlier

article in this journal. Why this should be the ease immediately becomes apparent when one starts to work in a library such as the Bodleian at Oxford with its handwritten catalogue of books printed before 1920 and its lack of any specialized bibliographies such as the British Museum has provided for early printed books. Even in well catalogued libraries such as the University Library at Cambridge it can be difficult to locate texts, and one often stumbles across a new logical work through the accident of its being bound in the same volume as better known works. As a result of my researches over the last few years, I have put together a list of works which do not appear in Risse in the hope that other historians of logic may benefit from my discoveries. I cannot, however, claim that I have exhausted the resources of the libraries which I have visited. Doubtless there are still not only new editions but new authors left to be discovered." (p. 361)

"This paper concerns logic texts published between 1472 and 1800. I list 20 items whose authors do not appear in Risse, 12 items whose authors appear in Risse in connection with another title or other titles, and 58 items which appear in Risse in another edition or in other editions. I indicate the libraries in which all these items are to be found, and I also list some useful bibliographical works."

8. ———. 1974. "Classification Schemes and the History of Logic." In *Conceptual Basis of the Classification of Knowledge / Les fondements de la classification des savoirs*, edited by Wojciechowski, Jerzy A., 275-283. New York - München - Paris: K. G. Saur.

   Proceedings of the Ottawa Conference on the Conceptual Basis of the Classification of Knowledge, October 1st to 5th, 1971.

   "Logic is one of the most important means of classification we have, for it enables us to appraise our reasoning by drawing the distinction between valid and invalid inferences. Its aim is a simple one, and easily stated, but when we get down to the task of specifying under precisely what conditions a true premiss set will entail a true conclusion, it seems that a whole range of different types of classification is necessary.

Logicians commonly start by drawing the distinction between informal or natural languages and formal or artificial languages. Even at this point, divergent interpretations are possible. One can argue with the early Wittgenstein that natural language has a hidden ideal structure, which it is the task of the logician to uncover; or one can argue with the later Wittgenstein that natural language involves a series of games with different structures, any one of which the logician can choose to present as a formal language. Given both the complexities of natural languages and the variety of formal languages which have been developed, the latter interpretation is by far the most pausible. Once the notion of a formal language has been isolated, one can go on to draw the distinction between syntax, or the study of the relations of signs among themselves, and semantics, or the study of signs as interpreted, as having meaning and as being true or false. In turn we can obtain the notion of different types of logical calculi. For instance, a propositional calculus has one set of signs with certain limited transformations of these signs, and it is interpreted by the assignment of truth values to its constituent parts; whereas a quantificational calculus has a more elaborate set of signs with transformations to match, and it is normally interpreted by means of the assignment of members or sets of members of domains to its constituent parts.

The teacher of logic is often tempted to claim that these types of classification are integral to the study of logic. This is true when logic is seen as the foundation of mathematics, but to say that only, through these distinctions can one sensibly talk about valid and invalid inferences is a much larger claim, and a more dubious one. I intend to look at selected aspects of the history of logic in order to throw some light on the problem of just what kinds of classification are necessary to the isolation of valid inferences, which I take to be the true task of logic. In particular, I shall look at the definitions of valid inference offered by the Scholastic logicians of the late fifteenth and early sixteenth centuries, since this is the historical period with which I am best acquainted. (1)" (p. 275)

(...)

"Are we now to conclude that elaborate classification schemes are irrelevant to the pursuit of logic, so long as we have an adequate definition of a valid inference? The answer to this question will depend in part on how much one wants out of logic.

If one wishes to study the metalogical properties of formal systems, to obtain a complete set of rules, or to relate logic to mathematics, scholastic logic is necessarily inadequate. However, if one wishes to classify those inferences which are used in ordinary language, then one can argue that an elaborate classificatory apparatus combined with the development of formal systems will be a hindrance rather than a help. Even the simplest sentence contains subtleties which will be lost in symbolization. Moreover, there is the grave problem of which system to choose when one is symbolizing and assessing an inference. This problem has two facets. First, one may pick a system which is inadequate to one's purposes. If one attempts to show that a relational inference is valid in terms of the standard monadic predicate calculus, one will fail. Yet one has not proved that the inference in question is not valid. Second, one may pick a system whose standard interpretation is alien to one's purposes. A logician who wishes to show that '—P', therefore 'P' holds would be ill advised to choose the intuitionist propositional calculus. Similarly a logician who wishes to show that " 'Fa' therefore '(Ex)Fx' " should not choose a version of the quantificational calculus which admits non-denoting constants.

The more systematic one's approach to formal logic, the more arbitrary the choise of system seems to be, and hence the less relevant to the normal day to day task of assessing arguments. Scholastic logic, on the other hand, seems perfectly adapted to normal requirements. It is both unpretentious and powerful; it does not violate normal intuitions; and it is non-arbitrary. Or so one might think.

However, let us look a little more closely. What are we to make of the following claims? "An impossible proposition implies any

other proposition." "A necessary proposition follows from any other proposition." "If you come to me I will turn you into an ass" is true provided that you do not come to me." "All chimeras are chimeras" is false because there are no chimeras, but "No chimeras are chimeras" is true for the same reason." The first two examples, the paradoxes of strict implication, follow straight from the definition of a valid inference. The third example is a consequence of the truth-functional interpretation given to promissory conditionals. The last examples are a consequence of the arbitrary decision to save the square of opposition by counting all affirmative propositions with non-referring subjects as false. Yet none of the examples corresponded to the normal intuitions of the sixteenth century. They all gave rise to acrimonious debate, and were accepted only because of the exigencies of the desired system of rules and the desired interpretation of that system. Thus even the scholastics, operating within the framework of ordinary language, were forced to make some of the arbitrary decisions which people tend to blame modern logic for. One may still prefer scholastic logic to modern logic for various reasons, but that it enshrines a true and completely non-arbitrary system of picking out valid inferences cannot be one of them.

In the last resort, the presence or absence of modern classification schemes logic does not make so much difference as one would like to think." (pp. 282-283)

(1) I intend to use the term 'scholastic logician' more narrowly than is proper, to refer to those men whom 1 am concerned with.

9. ———. 1974. "*For Riding is Required a Horse*: A Problem of Meaning and Reference in Late Fifteenth and Early Sixteenth Century Logic." *Vivarium* no. 12:146-172.

Reprinted as essay I in: *Studies in Post-Medieval Semantics*.

"One of the most interesting features of the works of the logicians associated with the University of Paris in the late fifteenth century and the first part of the sixteenth century is their application of medieval logical doctrines to the discussion

of actual examples. In this paper I intend to present a detailed study of one specific example, "For riding is required a horse" [*Ad equitandum requiritur equus*]. I shall first discuss each of the arguments that was used, showing its place in the general body of logical doctrine; then I shall present three typical texts, together with an analysis of the pattern of argument found in each. One text will deal with the problem in the context of contradiction, one in the context of conversion, and one in the context of supposition theory.In this way I hope to deepen our understanding both of the theories and of the techniques of medieval and post-medieval logic." (p. 146)

(...)

"The claim that the gerund 'riding' implies a reference to particular acts of riding,which can in turn be identified with individual horses, solved the problem of "For riding is required a horse" at the expense of raising further philosophical problems about both language and the world. However, the claim that the sentence should be regarded as equivalent either to a simple conditional or to some kind of modal proposition solved all the problems very neatly without, apparently, raising new ones. In the light of such an analysis one could maintain the truth of "For riding is required a horse" without at the same time having to argue that the sentence had the same truth-value as its contradictory or a different truth-value from its simple conversion, since these related sentences would have undergone a similar analysis, thus turning out to have the desired truth-values. Whichever solution one prefers, it seems to have been amply demonstrated that the simple minded approach in terms of personal supposition alone was inadequate. To speak of horses being required for riding is to do more than to make reference, successful or otherwise, to individual horses or any other identifiable objects in the world." (pp. 157-158)

10. ———. 1975. "Descartes' Theory of Objective Reality." *New Scholasticism* no. 49:331-340.

"In the *Third Meditation* Descartes, who is at the beginning sure only of his own existence, presents a complex proof for the

existence of God which is based on the fact that he finds within himself an idea of God. I intend to ignore the supplementary proof which deals with the conservation of his existence, and to focus on his discussion of the properties of ideas, for it is here that Descartes is most difficult to comprehend yet most vulnerable to criticism. With the exception of Gassendi's remarks in the *fifth objection*, I shall concentrate upon what Descartes himself had to say, for a thorough survey of all the secondary sources often serves only to obscure the main issue." (p. 331)

(...)

"Descartes reinforced his arguments with various claims about the nature of predicates and the way in which we come to understand them. He thought, mistakenly, that one could not only distinguish between negative and positive predicates, but that one could demonstrate the logical priority of such positive predicates as 'infinite' or 'perfect' by showing that one can only understand the finite or imperfect in the light of a prior acquaintance with the infinite or perfect. (29) However, although he seems now to be talking about epistemology rather than ontology, it turns out that his claims rest upon the same assumptions about the content and causation of ideas as are involved in the main proof, so they do not need to be discussed further.

However liberal one is in granting Descartes his desired premises, I think it is fair to conclude that his arguments do not prove what they purport to prove. This seems to be a strong indication that one will lose nothing by being illiberal from the very beginning." (p. 340)

11. ———. 1976. "*I Promise You a Horse*. A Second Problem of Meaning and Reference in Late Fifteenth and Early Sixteenth Century Logic (First Part)." *Vivarium* no. 14:62-79.

    Reprinted as essay II (first part) in: *Studies in Post-Medieval Semantics*.

"The logicians associated with the University of Paris in the late fifteenth and the first part of sixteenth century were at one with their medieval predecessors in their attempt to formulate a unified theory of the reference of such general terms as 'horse'. To be successful, any such theory has to give a plausible account of what happens to general terms in modal and intentional sentences, and the logicians I am concerned with clearly tried to deal with this problem. However, because of the rather standard way in which logic texts tended to be organized, the relevant material has to be sought in various places. In an earlier paper, I made a detailed study of the reference the word 'horse' was said to have in the modal sentence, "For riding is required a horse"; and in order to carry out that study, I had to draw material from the discussion of contradiction, of conversion, and of supposition. (1) In this paper, I intend to make a detailed study of the reference the word 'horse' was said to have in the intentional sentence "I promise you a horse", and my material will be drawn from the discussion of contradiction, of conversion, of supposition and of appellation. (2) I shall first examine each of the arguments that was used, showing its place in the general body of logical doctrine; then I shall present four typical texts, together with an analysis of the pattern of argument found in each.

One text will deal with the problem in the context of contradiction, one in the context of conversion, one in the context of supposition, and one in the context of appellation. In this way I hope to show what problems intentional sentences were seen to raise for the standard theory of reference, and how these problems were dealt with." (pp. 62-63)

(...)

"On the whole, it seems fair to say that the logicians I have examined failed to produce a theory of the reference of general terms which applied with equal success to all contexts. Some, like Sbarroya, found themselves forced to emphasize the difference between intentional and non-intentional contexts by postulating completely different types of referent. Some, like Heytesbury, overlooked the difference altogether in their

appeal to personal supposition. Some, like Buridan, recognized that terms in an intentional context have a function which goes beyond that of referring to individual objects; but they were unable to say with precision just how this broader function was to be reconciled with the referential function. However, one thing is common to those who struggled with the logical problems caused by "I promise you a horse". That is, they managed to save the validity of those inferences they were concerned with, either by so interpreting sets of sentences that they were not to be counted as instances of the inferences in question, or by so interpreting sets of sentences that they came out to have the desired truth-values, and could no longer be cited as counter-examples to a general rule. Thus, they were successful as logicians, if not as philosophers of language." (p. 78)

(1) " "For Riding is Required a Horse": A Problem of Meaning and Reference in Late Fifteenth and Early Sixteenth Century Logic". *Vivarium*, XII (1974) pp. 146-72.

(2) Enzinas, Pardo and de Soto discussed the matter in the context of their discussion of contradiction; Celaya, Coronel (*Prima Pars*), Sbarroya and de Soto discussed the matter in the context of their discussion of conversion; Hieronymus of St. Mark and Martinez Siliceo discussed the matter in the context of their discussion of supposition; Tartaretus discussed the matter in the context of his discussion of descent; and Coronel (*Secunda Pars*), Dorp, Hieronymus of St. Mark, Major, Manderston, Mercarius and Pardo discussed the matter in the context of their discussion of appellation. It will be noted that some authors discussed the matter in more than one place. For details of the texts, see the bibliography at the end of the paper. Of the authors cited, Hieronymus of St. Mark and Sbarroya are not, so far as I know, specifically associated with Paris, though they are clearly influenced by Parisian logicians.

For medieval discussions of the problem, see P. T. Geach, "A Medieval Discussion of Intentionality" in *Logic Matters* (Oxford, 1972) 129-138, and J. Trentman, "Vincent Ferrer and His Fourteenth Century Predecessors on a Problem of

Intentionality" in *Arts Libéraux et Philosophie au Moyen Âge* (Montréal/Paris,1969) 951-956.

13. ———. 1976. "Agostino Nifo's Reinterpretation of Medieval Logic." *Rivista Critica di Storia della Filosofia* no. 31:353-374.

    "A year ago, if I had been asked to give a brief account of medieval logic and its relationship to Renaissance logic, I would probably have said something like this. In the medieval period, logicians had made great advances in the areas both of semantics and of formal logic. In the area of semantics, we find lengthy and sophisticated discussions of terms, of propositions, of supposition theory, which dealt with the reference of terms in various contexts, and of *insolubilia*, or semantic pardoxes, with their farreaching implications for our ordinary assumptions about the truth and reference of propositions. In the area of formal logic, we find equally lengthy and sophisticated discussions of *consequentiae*,

    or valid inference forms for both unanalyzed and analyzed propositions, and of *exponibilia*, those propositions whose logical form needs to be uncovered by means of analysis. A natural result of these advances was a relative down-grading of Aristotle. Aristotelian syllogistic was put in a subordinate place, as just one variety of valid inference, and in general

    the logical works of Aristotle did not receive as much attention as one might have expected. Medieval logicians were as likely to comment on Peter of Spain or to write independent treatises on particular topics as they were to comment on Aristotle; and unless they were directly discussing Aristotle, they were unlikely to pay much attention to the matters

treated of in the *Analytica Posteriora*, *Topica* and *De Sophisticis Elenchis*.

All this, however, was to change with the coming of the Renaissance

Ignoring those at the University of Paris and at various Spanish universities who consciously continued the medieval tradition (2), we find two completely new developments. On the one hand there is Humanism, with its bitter attacks on medieval sophistry, its dropping of virtually all formal logic, and its emphasis on the topics. On the other hand, there is Aristotelianism, with its emphasis on the pure text of Aristotle, freed from medieval accretions, and to be interpreted either directly or with the aid of Greek and Arab commentators. These two schools certainly differed in important respects, but they were united in their rejection of what I have described as the great advances of the medieval

period. Supposition theory, *insolubilia, consequentiae* and *exponibilia* were to be discussed no more; and terms and propositions were to appear only as described by Aristotle or by the grammarians and rhetoricians.

My view of the medieval advances remains unchanged, but I am not now so sure about the abruptness of the change from medieval to Renaissance logic in the works of the Aristotelians of the period. In this paper, I intend to present a case study of the transition as it appears in the works of one Aristotelian, namely Agostino Nifo (or Augustinus Niphus). I intend to show that medieval doctrines were still relatively well-known to him, and were discussed by him at length; but that he presented them in a way which diminished their value and hence made them easier to abandon. Someone who knew of the theory of terms or of supposition theory, to mention just two examples, only through Nifo could well wonder what use these doctrines were, despite the apparent care with which they had been expounded, and could therefore decide to abandon them completely in his own work. Whether this is indeed what happened in the sixteenth century can, of course, only be

established after a good deal of further investigation; and I present the possibility here only as a tentative hypothesis.

(1) I would like to thank Dr. C. B. Schmitt of the Warburg Institute, University of London, for inviting me to read an earlier version of this paper as part of a series devoted to Renaissance Aristotelianism. I would also like to thank the Canada Council for the generous financial support which made the research for this paper possible.

14. ———. 1976. "Will Socrates Cross the Bridge? A Problem in Medieval Logic." *Franciscan Studies* no. 14:75-84.

Reprinted as essay XII in: *Studies in Post-Medieval Semantics*.

"In their treatises on *insolubilia*, or semantic paradoxes, medieval logicians frequently mentioned other cases in which the assumption that a proposition was true led to the conclusion that it was false, and the assumption that it was false led to the conclusion that it was true. Some of these cases were easily solved. If one considers the proposition "Socrates will enter a religious order" in relation to Socrates' vow, "I will enter a religious order if and only if Plato does," and to Plato's vow, "I will enter a religious order if and only if Socrates does not," one sees at once that the problem stems from contradictory premises.(1). But not all cases were of this sort. Consider the favourite example, "Socrates will not cross the bridge," when said by Socrates, in relation to the two premises, "All those who say what is true will cross the bridge" and "All those who say what is false will not cross the bridge."(2) It is easily demonstrated that "Socrates will not cross the bridge" is true if and only if it is false, but what is not so easily demonstrated is the source of the paradox. Certainly it is not a paradox just like "What I am now saying is false," since the key proposition does not speak of its own semantic properties, but the premises do indeed speak of truth and falsity in a way which has implications for the truth-value of "Socrates will not cross the bridge." The question thus arises whether "Socrates

will not cross the bridge" is to be counted as a semantic paradox, to be dissolved in the same way as the Standard Liar is dissolved, or whether it is to be seen as needing another kind of solution, perhaps less radical in its implications for our common-sense notions about such matters as the legitimacy of self-reference or the definition of truth." (pp. 75-76)

(...)

"In conclusion, I would like to say that Paul of Venice's reputation as the last of the great medieval logicians seems to me to be vastly overrated. Several logicians of the late fifteenth and early sixteenth centuries, including Bricot, Eckius, Major and de Soto, offer more acute discussions of logical problems and more satisfactory solutions, as I hope I have demonstrated by this examination of the bridge paradox." (p. 83)

(1) Thomas Bricot, *Tractatus Insolubilium* (Parisius, 1492) sign. b. viii and sign, c i; Johannes Eckius, *Bursa Pavonis* (Argentine, 1507) sign, k v; John Major, *Insolubilia* (Parrhisiis, 1516) sign, c ii ff. Cf. Albert of Saxony, *Perutilis Logica* (Venetiis, 1522) fo. 46 vo; Robertus de Cenali, *Insolubilia in Liber Prioris Posterioris* (Parisius, 1510) sign, o iiii.

One should note here that vows, promises and the like were treated as propositions with truth-values rather than as performative utterances with no truth-values. This view was combined with a realization that there are certain conditions which have to be met before a vow is binding. For instance, the vower must genuinely intend to do what he vows to do, and what he vows to do must be both moral and within his power. These extra conditions were not thought relevant to the question whether "Socrates will enter a religious order" was true or false.

To the slightly different question of whether Socrates would be bound by his vow, Major, for instance, held that he would not, on the grounds that his vow was conditional and that the condition, given Plato's vow, could not be fulfilled.

For references to Major's text and to other discussions of vows and promises, see below, note 15.

(2) Paul of Venice, *Logica Magna* (Venetiis, 1499) fol. 198 and Paul of Venice, *Tractatus Summularum Logice Pauli Veneti* (Venetiis, 1498) sign. e i vo. The latter work which appeared in many editions, is known as the *Logica Parva*. See also John Buridan, *Sophisms on Meaning and Truth,* translated and with an introduction by T. K. Scott (New York, 1966), pp. 219-220; Cenali, loc. cit.; David Cranston, *Tractatus Insolubilium et Obligationum* [Paris, c. 1512] sign. e iiii; Eckius, op. cit., sign, k iiii vo; Robert Holkot, *Super Quattuor Libros Sententiarum Questiones* (Lugduni, 1497) sign. E ii; Major, op. cit., sign. c ii vo; Peter of Ailly, *Conceptus et Insolubilia* (Parisius, 1498), sign. b. viii; Peter of Mantua, *Logica* (Venetiis, 1492), sign, o vivo; Domingo de Soto, Opusculum Insolubilium in Introductiones Dialectice (Burgis, 1529), fol. cxlvi f. Bricot, op. cit., sign. b. vii vo f. speaks of giving a penny to the truth-teller rather than of allowing him to cross a bridge, but the principle is the same. Some authors (e.g. Eckius, op. cit., sign. k v) gave both versions of the paradox, as did Paul of Venice himself (*Logica Magna* fol. 197 vo f., Lógica Parva, sign. e i f.) It should be noted that there are many variations in the names of the characters and in the phrasing of the propositions. Some authors substituted "You will throw me into the water" for "Socrates will not cross the bridge."

(15) It is because of this association with promising that we find the bridge paradox and others similar to it discussed in theological works as well as logical, e.g. Holkot, op. cit., sign. C iiii ff., sign. D viii vo ff.; John Major, *In Quartum Sententiarum Questiones* ([Paris], 1519), sign. ccxcii vo ff. For general discussions of promising see, e.g., Gratian, *Decretum*, Chapter XXII (various editions) and Richard Mediavilla (or Middletown) *Scriptum Super Quarto Sententiarum* ([Venice], 1489) Book IV, distinction 38.

15. Ashworth, Earline Jennifer. 1977. "Thomas Bricot (D. 1516) and the Liar Paradox." *Journal of the History of Philosophy* no. 15:267-280.

Reprinted as essay XI in: *Studies in Post-Medieval Semantics*.

"Preliminary Remarks.

No one interested in the history of the Liar Paradox will gain a just appreciation of the variety and sophistication of the solutions that were offered unless he pays attention to the logicians working at the University of Paris at the end of the fifteenth century and the beginning of the sixteenth.(1) The study of semantic paradoxes, known as *insolubilia*, formed a significant part of the first-year logic curriculum, which was of course the curriculum for all arts students; and those who taught the subject by no means confined themselves to a repetition of earlier views. Although Ockham, Buridan, Paul of Venice and Peter of Ailly certainly were read and discussed, original work was also produced. One of the earliest and most influential of these original treatises was written by Thomas Bricot. First published in 1491, it received its eighth edition in 1511, (3) and was still being read as late as 1529 when Domingo de Soto discussed it in his own work on semantic paradoxes. (4)

(...)

The only original self-contained works of Bricot that I know are his *Tractatus Insolubilium* and his *Tractatus Obligationum*, which were always printed together. In this paper I intend to discuss only the *Tractatus Insolubilium*.

The book's organization is worthy of some preliminary comment. Its main division is into three *Questiones,* each phrased in a similar manner. In the first *Questio* Bricot inquires whether there is a way of saving the possibilities, impossibilities, contingencies, necessities, truths and falsities of self-referential propositions; the second and third *Questiones* ask simply whether there is another Way of saving, that is, justifying, the attribution of these modalities. The first *Questio* contains what is apparently Bricot's own solution to the problem. In the second *Questio* he discusses the solution that stems from Ockham, and the solution derived from Peter of Ailly is covered in the third. Each *Questio* has exactly the same internal organization. At the beginning, Bricot poses five main questions concerning the proposed solution. He then divides the subsequent discussion into three sections: the first, headed *notabilia*, setting out the main principles of the proposed

solution; the second, *conclusiones*, giving a brief list of conclusions; and the third, *dubia*, taking up a series of problems arising from the proposed solution. Each doubt is aimed at one of the *notabilia* and gives rise to a series of arguments against the proposed solution. Once these have been stated, they are refuted one by one.

After all the doubts have been dealt with, Bricot offers replies to the five main questions posed at the beginning of the section. At no point are the separate solutions compared to one another, though arguments drawn from one view may be used in the critical discussion of another view; and at no point does he actually claim that the first solution is his own and hence to be preferred. Bricot is more forthright in a note on *insolubilia* he added to George of Brussels's commentary on *De Sophisticis Elenchis*, where he says that the solution in question is "omnium probabilissimus." (6) The first solution is explicitly attributed to Bricot by de Soto,(7) who himself studied at Paris, and there is also indirect evidence to support de Soto's claim. The first solution does not figure among the fifteen solutions described by Paul of Venice in his Logica Magna (8) yet it does appear in the works of Parisian logicians contempory with or junior to Bricot. For example, Tartaretus discussed it in a treatise on *insolubilia* first published in 1494, (9) and it was also discussed by John Major and David Cranston.(10) Unfortunately these authors followed the normal practice of mentioning names only in a few outstanding cases. The German Trutvetter did both recommend Bricot by name and describe the view I attribute to him, but without specifically linking the two.(11)"

"I. *Prefatory Note*.

In the following paper I shall be discussing a particular problem of meaning and reference as it was formulated by a group of logicians who studied and/or taught at the University of Paris in the early sixteenth century.(1) In alphabetical order they are: Johannes Celaya (d. 1558) who was in Paris from 1500 or 1505 until 1524; Ferdinandus de Enzinas (d. 1528) who was in Paris from about 15x8 until 1522; John Major (1469-1550)

who was in Paris from 1492 or 1493 until 1517 and again from 1525 to 1531; William Manderston who taught at Sainte-Barbe from about 1514 and returned to Scotland in or shortly before 1530; Juan Martinez Siliceo (1486-1556) who left Paris in about 1516; Hieronymus Pardo (d. 1502 or 1505); Antonius f Silvester who taught at Montaigu ; and Domingo de Soto (1494-1560) who left Paris in 1519. I shall also discuss the work of the Spaniard Augustinus Sbarroya and the Germans Jodocus Trutvetter (d. 1519) and Johannes Eckius (1486-1543). Both Sbarroya and Eckius were well acquainted with the works of the Paris-trained logicians. Further material is drawn from the fifteenth-century Johannes Dorp and the anonymous author of Commentum emendatum et correctum in primum et quartum tractatus Petri Hyspani. The work of the medieval authors Robert Holkot, John Buridan and Marsilius of Inghen will appear as it was described by early sixteenth-century authors.

II. *Introduction*.

One of the main features of late medieval semantics was the attempt to formulate a unified theory of the reference of general terms. It is true that this attempt was not explicitly discussed, but many of the problems which arose in the context of such topics as signification, supposition, ampliation, appellation, and the logical relations between sentences clearly owed their existence to the assumption that general terms always referred to spatio-temporal individuals; and in the solutions offered to these problems, much ingenuity was employed to ensure that this assumption was modified as little as possible, if at all. I have already shown in two earlier papers how some logicians dealt with reference in the modal context “For riding is required a horse” and in the intentional context “I promise you a horse.” (2) At the end of this paper, I shall discuss another intentional sentence, "A man is imaginarily an ass”, which was thought to present a difficulty. However, it would be a mistake to think that context was the only complicating factor, for there were general terms which placed an obstacle in the path of those seeking a unified theory, not only by virtue of the contexts in which they appeared, but by virtue of their meaning. The favourite example of such terms

was “chimera”, but “irrational man”, “braying man”, and “golden mountain” also served as illustrations. The problem was not merely that they failed to refer, but rather that they were thought to be incapable of referring because the objects which they apparently denoted were impossible just as, for the modern reader, a round square is impossible. The main purpose of the present paper is to explore the way in which the problem was presented, and some of the solutions which were offered." (pp. 57-58)

(...)

"VI. *Conclusion*.

This survey of the way some early sixteenth century logicians treated the problem of chimeras reveals very clearly the alternatives faced by any philosopher who wants to give a unified theory of the reference of general terms. If one adopts a purely extensionalist interpretation of propositions, and allows only ordinary spatio-temporal entities into one’s universe of discourse, then one is faced with the choice between rejecting as false many sentences, such as “I imagine a chimera”, which one would wish to accept as true, and accepting as true many sentences, such as “ “Chimera” signifies an ass”, which one would wish to reject as false. If one extends one’s universe of discourse to include imaginary objects which are not just ordinary objects regarded in a certain way, one faces grave ontological problems. On the other hand, to appeal to appellation theory is to acknowledge that no purely extensionalist interpretation of all propositions can be given and that no unified theory of reference is possible; and to adopt Holkot’s solution is to admit that sentences which seem to be structurally similar are not in fact similar and that some sentences which appear to be about objects in the world are in fact about the contents of our own minds. On the whole my sympathies lie with those who abandoned the belief that both general terms and subject-object sentences can be given a uniform treatment, but I have great respect for the subtlety and sophistication with which arguments for a uniform treatment

were presented. Post-medieval logicians were by no means mindless followers of their medieval predecessors." (p. 79)

Ashworth, 'I Promise You a Horse': A Second Problem of Meaning and Reference in Late Fifteenth and Early Sixteenth Century Logic, in: *Vivarium* 14 (1976), 62-79, 139-155." (pp. 57-58)

17. ———. 1977. "An Early Fifteenth Century Discussion of Infinite Sets." *Notre Dame Journal of Formal Logic* no. 18:232-234.

"In the opening years of the fifteenth century, or perhaps a little earlier, John Dorp (1) wrote a commentary on Buridan's *Compendium Totius Logicae* (2) and it is here that one finds a discussion of infinite sets which is not only quite unexpected (3) but which suggests that other thinkers of that period were interested in the same topic.

The question of infinite sets arose in the context of the theory of reference. Medieval logicians assumed that affirmative sentences were true only if the subject and object terms had reference, but this assumption conflicted with their intuitions about such sentences as "I imagine a chimera" and "The word 'chimera' refers to a chimera". These sentences seem to be true, but "chimera" cannot refer to actual or possible chimeras, since a chimera is an impossible object, just as a round square is an impossible object. The question then arose of how such sentences were to be treated, and one obvious answer was to postulate a class of imaginary objects which included impossible objects and to which reference could be made in intentional contexts. (4) In his discussion of this answer, Dorp presented several arguments against the claim that one could refer to impossible objects." (p. 232)

(...)

"Historians of logic must always be wary of taking isolated passages out of context and reading modern developments into them. However, in the case of Dorp there do seem to be good grounds for claiming that he was aware of something

describable as a non-denumerably infinite set. It is a great pity that he does not give us more detail about the reasoning that lay behind his assertions, but it is to be hoped that further research into late fourteenth and early fifteenth century mathematics will reveal it to us." (p. 233)

(1) Dorp received his M.A. from the University of Paris in 1393 and he was last heard of at the University of Cologne in 1418. The dates of his birth and death are not known.

    "I have three reasons for writing this paper. In the first place, I want to explain the early sixteenth century practice of using the letters 'a', 'b', 'c', and 'd' as special signs governing the interpretation of terms within sentences. In the second place, I want to investigate the analysis which logicians in the medieval tradition gave of such sentences as "There is somebody all of whose donkeys are running", "Everybody has at least one donkey which is running", and "At least one of the donkeys which everybody owns is running".(2) In the third place, I want to show that, despite what Geach has suggested, (3) logicians in the medieval tradition were capable of offering good reasons for rejecting such inferences as "Every boy loves some girl,

therefore there is some girl that every boy loves". My discussion will be based mainly on the work of a group of logicians who were at the University of Paris in the first two decades of the sixteenth century, in particular Fernando de Enzinas, Antonio Coronel, and Domingo de Soto." (p. 599)

(...)

"Although the logicians whose work I have examined display considerably more flexibility and subtlety than scholastic logicians have usually been credited with, their discussion reveals two important weaknesses. In the first place, they can only cope with the relations expressed in certain kinds of sentences, particularly those containing genitives; and in the second place, they do not give adequate instructions for distinguishing the case in which one is speaking of all members of a class such as donkeys from the case in which one is speaking only of the members of a subclass, such as the donkeys belonging to a particular man. On the other hand, they are clearly sensitive to the different facets of such relationships as donkey-ownership, and they are also sensitive to the kinds of inference which have to be debarred. A complete account of these strengths and weaknesses will have to await further research." (pp. 610-611)

"I. *Prefatory Notes*

In his excellent book, *Theories of the Proposition. Ancient and Medieval Conceptions of the Bearers of Truth and Falsity*, (1) Gabriel Nuchelmans carries the story up to Paul of Venice, who died in 1429.

In this paper I intend to consider the discussions of propositional sense and reference found in the works of a group of authors connected with the University of Paris in the last decade of the fifteenth century and the first three decades of the sixteenth century. I confine myself to this group not only because it is a group, but because I know of few other sustained discussions of the problem by logicians after Paul of Venice. Two fifteenth century authors, Stephanus de Monte and Andreas Limos raised the matter in the context of insolubilia; (2) the Italian Agostino Nifo (1470-1538) discussed it in two places; (3) and various other authors, such as the German Jodocus Trutvetter, mentioned the topic only in passing. (4) Nor is the matter pursued in any of the early printed *Sentence Commentaries* I have examined, including those written by such authors as Celaya and Major. (5)

The authors I shall discuss are first the two Frenchmen, Thomas Bricot (d. 1516) who did his main logical work in the last decade of the fifteenth century, and Jean Raulin (1443-1514) who entered the Benedictine Order at Cluny in 1497. Second, there is one German, Gervase Waim (c. 1491-1554) who began his studies at Paris in 1507 and was Rector of the University in 1519. Third, there is one Belgian, Pierre Crockaert (Peter of Brussels) (d. 1514) who became a Thomist. Fourth, there are two Scotsmen, John Major (1469-1550) who was taught by Bricot and Pardo before teaching at Paris himself from 1505 to 1517 and again from 1525 to 1531, and George Lokert (d. 1547) who was a pupil of Major. Fifth, there are five Spaniards, Hieronymus Pardo (d. 1505), Juan Celaya (d. 1558), Antonio Coronel, Juan Dolz and Fernando de Enzinas. Finally, there is Hieronymus de Sancto Marco about whom I know little except that he was at one time connected with Oxford, and that he studied theology at Paris. (6)

The contexts in which theories of the proposition were discussed varied. Bricot and Major discussed the matter in their works on *insolubilia*, (7) though what Major had to say was reprinted, somewhat amplified, as a separate section in complete editions of his works.(8) This context was a natural one, since in order to solve the problem of semantic paradoxes

it was necessary to ask what it was that was true or false, and how these properties were to be defined. Dolz inquired about the total significate of the proposition in his treatise on Terms, (9) while Coronel and Pardo asked the same question in more general logic treatises. (10) In a commentary on Peter of Spain, Enzinas asked whether a proposition was true or false by indicating and if so, what it indicated. (11) Similar questions were posed by Raulin and Hieronymus de Sancto Marco. (12) Enzinas also asked about the total significate of a proposition in his work on mental propositions, and Waim asked the same question in his *Tractatus Noticiarum*. (13) Lokert raised the matter in his *Tractatus Noticiarum* by asking about the object of judgment. (14) Bricot, Celaya and Coronel asked about the objects of science, judgment and assent in their commentaries on the *Analytica Posteriora*. (15) Finally, Pierre Crockaert asked about the truth of a proposition in the second *quodlibet* attached to his commentary on Peter of Spain. (16) Presumably because of the nature of a *quodlibet* his discussion is a good deal more elliptical and allusive than that found in the other sources." (pp. 81-83)

(...)

"*Conclusion*.

One of the main features of late medieval logic was the heavy emphasis placed on the notion of reference. Another feature was the ontological parsimony which led logicians to reject impossible and imaginary objects, including complexe and incomplexe significabilia of the sort proposed by Gregory of Rimini. When we consider the theory of terms, we can see these two influences joining to produce a series of attempts to explain the reference of terms in intentional and modal contexts without abandoning either the view that entities must not be multiplied beyond necessity or the view that a unified theory of the reference of general terms is possible. Similar attempts were directed toward the explanation of the reference of such terms as “chimera,” which were thought of as having no possible extension. In other places I have argued that one of the main virtues of Parisian logicians of the early sixteenth century

was their recognition that the views mentioned above were irreconcilable, and that a purely ex-tensionalist approach to the signification of terms would have to be abandoned.165 Their achievements with respect to the theory of the proposition itself are very similar. A number of them saw that both the attempt to postulate special objects of reference for propositions and the attempt to argue that propositions referred to things in the world had failed; and they also saw that the way of escape lay in the acknowledgement that the referential role of propositions is not after all primary. Their function is not to name or to refer, but to make an assertion which can only be further described by a that-clause or a paraphrase. In the last resort, one can only see what the meaning of a proposition is by understanding what claim has been made; pointing to an object or group of objects will never serve as an answer." (pp. 120-121)

"I. Introduction

In this paper I intend to analyze two early printed logic texts, the *Libellus Sophistarum ad Usum Cantabrigiensium* (or Cantabrigiensem) published four times between 1497 and 1524,

and the *Libellus Sophistarum ad Usum Oxoniensium*, published seven times between 1499 and 1530. I also intend to demonstrate the origin of these books in the manuscript tradition of the early fifteenth century.

A complete description of the various editions of the printed texts, together with their reference numbers in the new Short Title Catalogue, (2) will be found in the appendix." (p. 134)

(...)

"Obviously I do not pretend to have done more than sample the available manuscript sources, but the interested reader will find a large number of further references in De Rijk's invaluable studies of the *Logica Cantabrigiensis* and the *Logica Oxoniensis* (7).

The importance of my task stems from the fact that the *Libelli Sophistarum* provide the main evidence we have for the nature of logic teaching at Oxford and Cambridge in the first three decades of the sixteenth century. The nature of this evidence can best be brought into focus if we start by considering the state of logic in continental Europe, as revealed by a study of publication between 1472 and 1530. As a brief glance at Risse's *Bibliographia Logica* (8) will show, European presses produced an extremely large number of logic texts during this period. Some of them were editions of medieval authors alone, and some of them were editions of medieval authors combined with a contemporary commentary. Many more contained only contemporary writing, whether this took the form of a general introduction to logic, or a discussion of a particular topic such as terms or insolubles. Virtually none were anonymous, and virtually all were highly structured, with topics following one another in an orderly sequence. Even those few texts which were a compendium of shorter treatises were united either by author, as were the editions of Heytesbury's works, or by theme, as was the 1517 edition of Strode, Ferrybridge, Heytesbury and others on the topic of consequences. The texts were devoted purely to logic, and natural science crept in only in predictable places, such as commentaries on the *Analytica Posteriora*, the discussion of *incipit* and *desinit* in works on

exponibles, or editions of such earlier writers as Heytesbury and Menghus Blanchellus Faventinus. In the assessment of these texts, knowledge of the manuscript tradition is vital only when one wishes to know how original the writers were, or how accurately medieval texts were reproduced. On the whole the texts are self-explanatory, and simply by reading them one can get a good idea of how they might have been used in teaching.

The situation in England could not have been more different. In the first place, the number of logic books published was extremely small, even if one bears in mind that some may have perished without trace. Including the two *Libelli Sophistarum*, only seven separate works seem to have appeared, and of these only two are by named authors, both medieval. The first author is Antonius Andreas whose commentary on the *ars vetus* appeared at St. Albans in 1483, and the second is Walter Burleigh, whose commentary on the *Analytica Posteriora* appeared at Oxford in 1517. Apart from the *Libelli Sophistarum*, the remaining works are a *Logica* which appeared at Oxford in 1483 [StC 16693]; the *Opusculum insolubilium* which appeared at Oxford in about 1517 [StC 18833] and in London in about 1527 [StC 18833a]; 9 and the *Libellulus secundarum intentionum* which appeared in London in 1498 [STC 15572], in about 1505 [STC 15573], and in 1527 [STC 15574] as well as in Paris before 1500.(10) I do not know the provenance of the first two works, but the third is an edition of the medieval tract which starts "Bene fundatum preexigit debitum fundamentum", and which is found incomplete in both Gonville and Caius 182/215 (p. 70) and Corpus Christi 378 (105 r 107 r).(11)" (pp. 135-136)

Writings of E. J. Ashworth on the History of Logic. Third Part: Articles from 1980 to 1989

Articles 1980-1989

1. Ashworth, Earline Jennifer. 1980. "*Can I Speak More Clearly than I Understand?* A Problem of Religious Language in Henry of Ghent, Duns Scotus and Ockham." *Historiographia Linguistica* no. 7:29-38.

   Reprinted in Konrad Koerner, Hans-J. Niederehe and R. H. Robins (eds.), *Studies in medieval linguistic thought dedicated to Geoffrey L.Bursill-Hall on the occasion of his sixthieth birthday on 15 May 1980*, Amsterdam: John Benjamins, pp. 29-38.

   "The title of this paper is somewhat misleading. The problem I intend to discuss is certainly one of religious language, but none of the three authors I am concerned with would have put the problem in the terms used above. The question Henry of Ghent (d. 1293) asked in his *Summae Quaestionum Ordinariaum* was: “Can God be more truly understood than he is signified or named?”. Duns Scotus (1265-1308) and William Ockham (1280/85-1349) put their questions in yet another way. In their commentaries on Book I, Distinction 22, of Peter Lombard’s *Sentences*, they asked respectively: “Is God nameable by us by a name signifying his essence?” (Duns Scotus 1966: 301) and “Can itinerant man impose a name to signify the divine essence distinctly?” (Ockham, *Sent*., sign, z vi rb). The concern of all these authors arose from their beliefs

that a spoken word can only signify if it is subordinated to an appropriate concept in the speaker's mind, and that our concept of God is an imperfect one. When we inquire about the relationship between the words we use of God and the idea we have of him, it may seem that our words are more precise than our ideas warrant; yet it may also seem that our words fail to do justice to what we know about God. These apparent variations in the relation between word and concept have to be explained, given the natural assumption that our words will be neither more nor less precise than our ideas.

Before I consider the actual texts, I will discuss briefly two essential background issues, the notion of signification, and the question whether words signify ideas or things. The notion of signification was of course closely related to the notion of a sign, which Augustine had defined (1975: 87) as "Something which is itself sensed and which indicates to the mind something beyond the mind itself."(1) Accordingly, for a word to signify was for it to make known, reveal, express, or represent. Exactly which of these descriptions was most appropriate depended on the context, for in addition to written and spoken language, if was taken for granted that there was a mental language formed of elements all of which were naturally meaningful. A spoken word could make known an object or reveal it by causing (or by expressing) a concept, but a mental term, being itself a concept, could not be thought of in this way. In the early 16th century the Parisian author Raulin (c. 1443-1514) explained that concepts signified in their capacity as formal representations of objects, but that spoken words signified because they were objective representations (Jean Raulin, *Commentarium in logicam Aristotelis,* 1500. sign, g v ra-rb). That is, they were both the object and the cause of a cognition. Thus the explicitly causal definition of signification, "to signify is to constitute an understanding", (2) applied, he said, only to signs which had objective signification and not to concepts. What it was that a spoken word made known could be an object in the world, a formal element of an object in the world, the speaker's concept of that object, or the definition of that object. (3) Indeed, a spoken word could also make known

itself or its speaker, but these ways of making known were accidental to it as a conventionally significant unit. It should be obvious that the notion of *significatio* is by no means to be identified either with meaning or with reference, though elements of both meaning and reference were certainly involved." (pp. 29-30)

(...)

" Ockham was in essential agreement with the position adopted by Duns Scotus in his much briefer treatment of the question “Is God nameable by us by a name signifying his essence?“. Duns Scotus began *(Opera Omnia. Vol 17: Lectura in Librum Primum Sententiarum,* Civitas Vaticana, 1966:301) by saying that he took the view of Thomas Aquinas that nothing could be named by us more properly than it was understood to be false. (10) He said that he would offer no arguments instead, he offered an example. Suppose that we see a wall as having both whiteness and shape. Because the colour can vary while the shape remains, and the shape can vary while the colour remains, we conclude that there is some substratum. We can name this substratum A, and can use the general term ‘body’ of it, yet we have no specific notion of it. All we understand of it is that it is ‘This being', and hence we can name it more truly than we can understand it. Just the same situation obtains with respect to God (p. 301). We have a general understanding of him as "This infinite being which depends on nothing”, and we can refer to the divine nature by such names as ‘God', yet we have no particular understanding of the divine nature which our terms denote. We do not understand it as "This essence'. "Whence”, he wrote," I believe that we have many names of God which properly signify the divine nature, even though we do not understand it." (11)

Henry of Ghent, Duns Scotus and Ockham differed in the way they supported their positions and in their epistemological assumptions; yet there are two extremely important subjects on which they agreed: first, that the problem of religious language was not one of religious language alone; and second, that the Thomistic connection between spoken language and

understanding had to be loosened. They all accepted the doctrine whereby spoken language was subordinated to mental language; and they all accepted the commonsense view that in the absence of mental activity speaking becomes mere parrotting, but these beliefs did not blind them to the fact that language has functions which are to some extent independent of the individual's ability to understand the world. As Henry of Ghent emphasized, language has a descriptive function, and because words are common currency, human beings can describe more, or less, accurately than they understand. As Duns Scotus and Ockham emphasized, language also has a denotative function, and human beings can use words to denote objects even if they know little about these objects. Signification and naming are essentially linguistic activities, and they must be assessed as such. Our words can have degrees of truth and distinctness which our understanding lacks, just as our understanding can go beyond our words." (pp. 37-38)

(1) The more usual reference is to *De Doctrina Christiana* II, but Henry of Ghent made heavy use of *De Dialectica*.

(2) For discussion of this definition, see Spade "Some Epistemological Implications of the Burley-Ockham Dispute," *Franciscan Studies* 35 (1975), pp. 212–222; see pp. 214-15.

(3) The Latin translation of *Metaphysics* IV.7 1012 a 23 was "*ratio quam significat nomen est definitio*" (Thomas Aquinas, *Summa Theologiae* 1a 13.6, p.68) and accordingly a word was often said to signify a rath. But *ratio* had a variety of meanings, including "concept", "definition", "a formal element of things" and the "essence of things." For discussion see McCord Adams in Paul of Venice, *Logica magna: Part II, Fascicule 6: Tractatus de veritate et falsistate propositionis et tractatus de significato propositionis*, F. del Punta (ed.), M. McCord Adams (trans.), (Oxford: Oxford University Press, 1978), pp. 272-73.

(10) He does not refer to Thomas by name. "Ad quod dicendum - sine argumentis -quod, ut mihi videtur, haec propositio falsa est quod nihil potest nominari a nobis magis proprie quam intelligatur, sicut quidam dicunt quod sicut intelligimus sic significamus, et quia non intelligimus Deum nisi ex creaturis,

ideo non significamus nisi per nomina accepta a creaturis. Hoc enim falsum est."

(11) “Unde credo quod multa nomina habemus de Deo quae proprie significant naturam divinam quam tamen non intelligimus.”

2. ———. 1980. "The Scholastic Background to Locke's Theory of Language." In *Progress in Linguistic Historiography. Papers from the International Conference on the History of the Language Sciences, Ottawa, 28-31 August 1978*, edited by Köerner, Konrad, 59-68. Amsterdam: John Benjamins.

   "In III.2.2 of the *Essay concerning Human Understanding* Locke said: "Words in their primary or immediate signification, stand for nothing but the ideas in the mind of him that uses them." In the eyes of most subsequent commentators, this statement encapsulates what Kretzmann ("The main thesis of Locke’s semantic theory", *Philosophical Review,* 77, 1968, p. 177) has called "one of the classic blunders in semantic theory", namely, the thesis that words name or refer to ideas rather than things, and that meaning depends on private mental events. Since Locke's statement when so interpreted seems clearly false, many commentators, including Kretzmann and Landesman ("Locke’s theory of meaning", *Journal of the History of Philosophy,* 14 1976, p. 35), have struggled to interpret it in some other way. However, they have undertaken this task without considering Locke's intellectual background. In this paper I intend to argue that the work of various 17th-century scholastics who were read at Oxford, particularly the Polish Jesuit Martin Smiglecius (1564-1618), throws much light on Locke's thesis, both by filling in the arguments which he only sketched in passing, and by limiting the ways in which the argument quoted above can be read.

   It is true that no direct link between Locke and Smiglecius has been established. However, since Locke recorded that two copies of Smiglecius’ *Logica* were bought by his students (W. H. Kenney, *John Locke and the Oxford training in logic and metaphysics,* unpublished Ph.D. Thesis, St. Louis University, 1959, pp. 31-32), and since the work was published in Oxford in

1658, the year Locke took his M.A. degree, it can be hardly a matter of accident that many of his remarks in Book III of the *Essay* seem to echo remarks made earlier by Smiglecius." (p. 59)

(...)

"So far as Locke is concerned, he obviously followed such logicians as Burgersdijck in adopting the view whereby concepts rather than things are said to be the immediate significates of words. He may have been influenced in this by introductory logic textbooks, but it also fitted his general philosophical position better than the view of Smiglecius. His discussion of general terms indicates one reason why he thought it necessary to assign a certain kind of primacy to ideas, and in addition I think that Kretzmann was right (p. 184) when he mentioned Locke's representative theory of perception in the context of his theory of language. If ideas are the immediate objects of perception, then it makes good sense that they should also be the immediate objects of signification.

However, if I am right in supposing that Locke was acquainted with Smiglecius and some of the other authors, if only at second-hand, then certain limitations are surely imposed on what he could have meant when he wrote: "Words in their primary and immediate signification stand for nothing but ehe ideas in the mind of him that uses them". He cannot have intended to say that words refer to concepts, that when we way "The man is disputing" we are talking only about our own thoughts. Nor can he have intended to deny the obvious corollary that we use words to signify things secondarily and mediately. The alternative hypothesis, that Locke intended to convey some new doctrine by his use of the conventional phraseology, could only be sustained if one were willing to overlook two outstanding features of Locke's discussion. First, nearly everything he says about language in the first two chapters of Book III is closely parallel to the scholastic texts which were read at Oxford when Locke was an undergraduate and a tutor there. Second, he does not bother to give a detailed explanation and justification of his claim that words signify

ideas primarily and immediately, which would be a very curious oversight on the part of one who had in mind a doctrine radically different from that normally conveyed by these words. Locke was careless, but he was not as careless as that." (pp. 66-67)

"In bis excellent book *Theories of the Proposition. Ancient and Medieval Conceptions of the Bearers of Truth and Falsity*, Nucbelmans states that "after the beginning of the fifteenth Century no really new or interesting views concerning our topics were put forward."(1) In this paper I hope to modify his judgment somewhat by examining the theories presented by Juan Dolz and Fernando de Enzinas, two Spaniards associated

with the University of Paris in the early sixteenth Century (2). One cannot expect that their views on the signficate of the proposition were new in every detail, given the thoroughness with which earlier writers had explored the issue.

Nevertheless, one can argue that they put elements from earlier views together in a new way, and that they displayed an insight into the nature of propositions which had not been achieved by their predecessors.

I shall begin by saying a little about the background to their views. In the late fifteenth and early sixteenth centuries, the question of *complexe significabilia* was discussed by a small group of logicians. Those writers in whom I have found more than a passing reference are Bricot, Juan de Celaya, Antonio Coronel, Dolz, Enzinas, Hieronymus of St. Mark, Limos, Major, Nifo, Pardo, Peter of Brüssels, Raulin and Gervase Waim; and all of these except Nifo and possibly Hieronymus of St. Mark were associated with Paris (3). Although some of them wrote theological works, they raised the issue only in their logical writings, either in works on *insolubilia*, in general introductions to logic, or in treatises on such topics as terms and mental propositions. The question was introduced in one of two closely related ways. Either they took the statement that a proposition was an *oratio* which signifies the true or the false by indicating and inquired whether there was indeed a thing which was true or false, or they took such sentences as " "Man is an animal" signifies man to be an animal" and asked whether the *dictum* or infinitive phrase functioned as the name of some object or other. In the words of Dolz the question was: "Does a proposition signify some thing or some things or in some way? Is there to be given a *complexum significabile* or not, and if so, is it to be distinguished from the significates of the terms of the proposition?'" (4) The issues of theological and scientific knowledge were referred to, if at all, only in passing, and the question of objects of belief versus objects of knowledge, objects of doubt and so on, was not often raised. In other words, we are faced with a discussion which is limited to those aspects of the matter which primarily concern a logician.

References to earlier authors included mention of Ockham, Duns Scotus, Ugolino and André de Neufchateau, but the focal point of discussion was provided by the rival positions of Gregory of Rimini and the one which, as Coronel put it, "Buridan applauded in whole or in part." (5)" (pp. 511-512)

(...)

"To conclude, I would like to say that of all the sources mentioned by late fifteenth and early sixteenth Century authors, Dolz and Enzinas are obviously most influenced by Peter of Ailly. It is from him that they take the notion of a proposition signifying *aliqualiter*, and it is from him that Enzinas takes his emphasis on the relationship between the *dictum* and a phrase beginning with the word "that". But they also go beyond Peter of Ailly in ways which I find interesting and important. First, they introduce the notion of the proposition as having a syncategorematic function, and second, they reconcile the notion of propositional sense with the notion of propositional reference by admitting that in some contexts the *dictum* can have legitimate referential use (12). Moreover, Enzinas made use of Peter of Ailly's point about "that" phrases to reinforce the insight that propositions are not referring phrases. I do not know of any earlier authors who approached the matter in quite the way that Dolz and Enzinas did; and, I must confess, I find their view more plausible than any of the others I am acquainted with." (p. 516)

(1) G. Nuchelmans, *Theories of the Proposition* (Amsterdam-London: North Holland Publishing Company, 1973) p. 279. This book should be consulted for a very thorough survey of the medieval background to the authors I am concerned with.

(2) Little seems to be known about their lives. Dolz came from Castellar in Spain, and taught at the College of Lisieux in Paris. Enzinas went to Paris in 1518, where he studied at the Colleges of Saint Barbara and Beauvais. He later taught at the University of Alcala.

6. ———. 1981. ""Do Words Signify Ideas or Things?" The Scholastic Sources of Locke's Theory of Language." *Journal of the History of Philosophy* no. 19:299-326.

   Reprinted as essay VII in: *Studies in Post-Medieval Semantics* and in Udo Thiel (ed.), *Locke, Epistemology and Metaphysics,* Aldershot: Ashgate 2002, pp. 383-410.

   "My aim in this paper is to shed some light on Locke's claim that words signify ideas. Although I shall start by considering two contemporary attempts to interpret Locke's theory of language, I shall devote most of my attention to a group of late-sixteenth- and early-seventeenth-century authors whose views are likely to have influenced Locke. My main claim will be that Locke's theory of language is easier to understand, if not to accept, when it is placed in what seems to be its proper context. When one is dealing with the great figures of early modern philosophy it is always a mistake to overlook their background. At Oxford, as at European universities, students were still reading scholastic texts in the mid-seventeenth century. That is, they were reading works written as university text books by Roman Catholic philosophers, predominantly Jesuit, who consciously placed themselves within the tradition of medieval philosophy and theology while at the same time making use of sixteenth-century developments in Aristotelian studies. Locke makes it very clear that he did not approve of the scholastic philosophy he was acquainted with, but it is *prima facie* implausible to suppose that nothing of what he read had any effect upon his writings. As I shall try to make clear, my own view is that his theory of language was produced within a scholastic context, and relied heavily on the arguments which had been developed by scholastic philosophers. Locke was

original and innovative, but not when he said that word s signify ideas.

Obviously the scholastic philosophers of the late sixteenth and early seventeenth centuries were themselves writing within a tradition which cannot be overlooked if one wishes to understand their discussions. Equally obviously one cannot within the compass of a short paper on the background to Locke deal adequately with the background to Locke's background . However, a few brief remarks may be in order. The view that words signify ideas or concepts (two words which for the purposes of this paper may be used interchangeably) stems from Aristotle and in particular from Boethius's translation of Aristotle, *De lnterpretatione* I6 a 3. (1) He said that spoken words (*ea quae sunt in voce*) were signs (*notae*) of those passions which are in the mind; and every commentator agreed that *passiones* were to be taken as concepts rather than passions in the normal sense. By the late thirteenth century a debate was raging over the question whether words could properly be said to signify concepts rather than things. (2) Roger Bacon said that there was " not a moderate strife among famous men," (3) and a little later Duns Scotus wrote of a "great altercation. (4) Everyone who wrote a commentary on *De Interpretatione* had something to say on the issue; and it also turned up in other works, in Sentence commentaries and, for instance, in Buridan's *Sophismata*. Aristotle commentaries written in the late fifteenth and early sixteenth centuries were still largely focused on the arguments of earlier writers, especially Duns Scotus and Buridan, though occasional use was m a d e of the commentary by St. Thomas Aquinas. (5) The later-sixteenth- and early-seventeenth-century writers I am concerned with took their theme from the medieval debates and, for the most part, their conclusions. However, as I shall explain below, their emphases and some of their arguments are quite different. Thus a by-product of this paper will be additional evidence of ways in which late scholasticism differed from medieval scholasticism." (pp. 299-301)

(...)

"To conclude, I would like to ask whether Locke intended to summarize his theory of meaning when he said that words primarily and immediately signify ideas. I have argued that in the scholastic authors the issue was one of making known rather than of meaning, and this is borne out by the distinction I earlier quoted from Smiglecius between the confused idea conveyed by a name and the explicit idea conveyed by the definition of the name. Obviously one would answer the question "What does this word mean?" not by exhibiting the confused idea expressed by the word, but by producing the definition. If it turns out that a definition just is a sequence of concepts, then meanings can be identified with concepts; but this is a thesis which has to be stated and justified separately from the initial thesis, that words make known concepts. I suggest that the same distinction should be applied to Locke. In III. 3. 10 he tells us that "the defining of words . . , is nothing but declaring their signification." Later, in IV. 8.4., he refers to the romance knight "who by the word *palfrey* signified these ideas: -- body of a certain figure, four-legged, with sense, motion, ambling, neighing, white, used to have a woman on his back"; and I think that this passage and others like it are certainly intended to give an account of meaning. What a word means according to Locke just is a series of ideas. However, one must now ask whether a distinction can be drawn between this series of ideas and the original complex idea of a palfrey. I think that it can, at least psychologically.

There is certainly a sense in which a complex idea for Locke just is a group of less complex ideas, but this group is unified by its name, "which is as it were the knot that ties them fast together" (III. 5. 10). Furthermore, giving a meaning must involve a psychological progression from the original idea to its components listed separately. The romance knight would have to reflect before he recognized all the eight components of his complex idea "palfrey," just as one may have to reflect before one realizes that 12 is identical to 7 + 5. T o be sure, there is a close link between a word's signifying an idea and a word's having a meaning. If the speaker cannot on reflection give a definition for the word he has used, if he cannot break down his

complex idea into its component parts, then one will be tempted to say that he has no idea of what a palfrey is, and that nothing was made known by his utterance of the word "palfrey." But the fact that giving a definition serves as a criterion for having an idea does not entitle one to blur the distinction between an idea's being made known through the utterance of a word and a word's having a meaning. Locke has an ideational theory of meaning, but contrary to what Kretzmann and Landesman assert, it is not stated in III. 2." (pp. 325-326)

(1) Aristoteles Latinus II I-2. *De Interpretatione vel Periermenias Translatio Boethii Specimina Translationum*, edidit Laurentius Minio-Paulello (Leiden: E. J. Brill, 1965), p. 5. For an interesting discussion of Aristotle's original text and what he may have meant by it, see Norman Kretzmann, "Aristotle on Spoken Sound Significant by Convention," in *Ancient Logic and Its Modern Interpretations*, John Corcoran, ed. (Dordrecht and Boston: D. Reidel, 1974), pp. 3-21.

(2) There was also a debate among the ancient commentators on Aristotle, but its influence on the Middle Ages seems to have been only through references in Boethius's two commentaries on the *De Interpretatione*.

(5) For further discussion see E. J. Ashworth, "Words, Concepts and Things: A Study of *Perihermenias* Commentaries from the Late Thirteenth to the Sixteenth Century," to appear in a special issue of *Paideia* on medieval philosophy [not published]. For interesting material on the reception of St. Thomas Aquinas's views in the sixteenth century, see F. E. Cranz, "The Publishing History of the Aristotle Commentaries of Thomas Aquinas," *Traditio* 34 (1978): 157-92. Cranz's work has considerable bearing on what I shall say below about the differences between

late-sixteenth and early-seventeenth-century commentaries on *De Interpretatione* 16 a 3 and the medieval commentaries.

7. ———. 1981. "Mental Language and the Unity of Propositions: A Semantic Problem Discussed by Early Sixteenth Century Logicians." *Franciscan Studies* no. 41:61-96.

   Reprinted as essay VI in: *Studies in Post-Medieval Semantics*.

   "Gregory of Rimini's influential *Sentence Commentary* was written in the 1340s. One of the questions which he discussed in his prologue was how it is that a mental proposition functions as a united whole, with a force that its apparent parts taken separately do not possess. (1)

   In this article I intend to explore the reactions to Gregory's arguments among a group of logicians who studied or taught at Paris in the first three decades of the sixteenth century. The most important of the authors I shall examine are three Spaniards: Jerome Pardo (d. 1502 or 1505) whose *Medulla Dialectices* was published in 1500 and again in 1505; Antonio Coronel, whose *Duplex Tractatus Terminorum* was published in 1511 and whose *Prima Pars Rosarii in qua de Propositione Multa Notanda* was published at about the same time; and Fernando de Enzinas, whose most noteworthy book for our purposes was his *Tractatus de Compositione Propositionis Mentalis Actuum Sincathegoreumaticorum Naturam Manifestans*, first published in 1521, and reprinted in 1526 and 1528." (p. 61)

   (...)

   "In conclusion there are two points I would like to make. On the one hand it is quite clear that when early sixteenth century logicians were discussing mental language they took it that they were concerned with philosophy of mind. In part this is the natural result of their approach to signification as a causal process. If one defines "signify" in terms of making known or representing to the cognitive faculty, then the question of the various effects of words upon the hearer's mind, and what they reveal about the speaker's mind, will embrace both semantic and psychological issues. One also has to bear in mind the part

played by speaker intentions in endowing linguistic aggregates with their propositional force.(134) At this level the study of language cannot be separated from the study of mental attitudes and processes. On the other hand, if one isolates the part of the discussion which was devoted to purely semantic issues, then it is no longer necessary to postulate mental language as such. Everything that was said about the semantic function of syncategorematic acts, subject and predicate, the unity of propositions and the equivalence between propositions, could be described in neutral terms as the study of semantic structure leaving it quite open what the relationship is between the semantic structure of a given utterance and the psychological states of the speaker. Nor does there seem any genuine need to postulate a naturally meaningful language in addition to conventionally meaningful language, since a given speaker's psychological states can be adequately described in terms of conventional language, and since synonymy can be redefined for conventional languages.

Indeed, one can argue that the notion of a naturally meaningful mental language is without any function, since we have no criteria for identifying it or its structures. But this is to go far beyond Gregory of Rimini and sixteenth century reactions to his arguments." (pp. 95-96)

(1) Gregory of Rimini, *Gregorii Ariminensis O.E.S.A. Super Primum et Secundum Sententiarum* (Reprint of the 1522 edition: St. Bonaventure, N.Y.: The Franciscain Institute; Louvain: E. Nauwelaerts; Paderborn: F. Schöningh, 1955), fol. 3va-5rb.

(134) But Michael Dummett, *Frege: Philosophy of Language* (London: Duckworth, 1973, p. 311, reminds us that "*linguistic* acts should be classed as conventional actions, not as the external expression of interior states. Assertion, for example, is to be explained in terms of the conventions governing the use of those sentences which are understood as having assertoric force, not as the utterance of a sentence with the intention of expressing one's interior act of judgment (or interior state of belief) that it is true."

8. ———. 1982. "The Eclipse of Medieval Logic." In *The Cambridge History of Later Medieval Philosophy*, edited by Kretzmann, Norman, Kenny, Anthony P. and Pinborg, Jan, 787-796. Cambridge: Cambridge University Press.

   "The view that the insights and developments of medieval logic were eclipsed during the fifteenth century by a humanist, rhetorically-oriented logic has long been popular, but it needs considerable revision and modification. In what follows I shall first give a brief account of what happened to the writing, teaching, and publication of logical works in the medieval style, by which I mean those which discuss such topics as consequences, insolubles, exponibles, and supposition. I shall then examine in more detail what was actually said about certain medieval doctrines in the late fifteenth and sixteenth centuries in order to indicate both where logicians of the period had something new to contribute, and where there were departures from medieval doctrines which cannot be attributed to new logical insight. (1) My conclusion will be that medieval logic as a living tradition did largely disappear, but that the eclipse dates from about 1530 (in so far as a specific date can ever sensibly be offered) rather than the mid fifteenth century." (p. 787)

   (...)

   "Conclusion.

   Why did these interesting and varied treatments of medieval logical themes cease so abruptly after 1530? (9) Humanism alone cannot be the answer, since it apparently triumphed only by default. Italian universities continued to teach medieval logic long after the attacks on it by such men as Lorenzo Valla; and Agricola's logic did not capture Paris until the production of texts in the medieval style had already ceased. (10) Humanism certainly had a part to play in the process, however. Soto, for instance, came to believe as a result of humanist influences that doctrines which were difficult and not clearly expressed by Aristotle should be omitted from logic, and that too much time was devoted to summulist doctrines in the teaching of logic. Accordingly, the later editions of his

Introductiones dialecticae were very much altered and simplified. Another instructive example is Agostino Nifo's *Dialectica ludicra* (1520). Here we have an introductory text written by a leading Aristotelian who had a good knowledge of medieval doctrines, yet he distorts them completely by describing only those parts of the scholastic theory of terms and supposition theory which are directly applicable to standard categorical propositions. (11) No one who became acquainted with medieval logic through Nifo would understand the function of the non-Aristotelian parts at all. A very plausible account of the indirect effect of humanism on logic teaching is provided by Terrence Heath, whose study of the teaching of grammar at three German universities at the end of the fifteenth century and beginning of the sixteenth century shows that the change to non-medieval logic was preceded by the change to humanistic grammar. (12) The significance of this sequence of changes is brought out in Heath's claim that medieval grammar prepared the student for medieval logic, whereas humanist grammar did not. One may also speculate that social changes were influential in creating a need for men with a new style of education. The rise of modern physics has been cited as a possible cause, but this suggestion cannot be accepted, given that modern physics can hardly be said to have risen before the end of the sixteenth century. (13) The judgement of a contemporary logician might be that medieval logic came to an end because no further progress was possible without the concept of a formal system and without the development of a logic of relations. This view is borne out by the desperate, complicated attempts to analyse such propositions as 'Every man has a head' that are to be found in the writings of the Parisian logicians. They certainly pushed medieval logic to its limits, but whether they gave up in despair because they realised that that was what they had done is another matter. For the moment our question must remain without a fully satisfactory answer." (pp. 795-795)

(1) For further details about the period as a whole, and for some of the doctrines mentioned below, see Ashworth, *Language and Logic in the Post-medieval Period* (Synthese Historical

Library, 12), Reidel 1974, and Wilhelm Risse, *Die Logik der Neuzeit* (Band I: 1500-1640), Frommann Holzboog 1964. For a bibliography of primary sources, see Risse, *Bibliographia Logica. Verzeichnis der Druckschriften zur Logik mit Angabe ihrer Fundorte*, (Band I. 1472-1800), Georg Olms 1965. For a bibliography of secondary sources, see Ashworth, *The Tradition of Medieval Logic and Speculative Grammar from Anselm to the End of the Seventeenth Century: A Bibliography from 1836 Onwards* (Subsidia Mediaevalia, 9), Pontifical Institute of Mediaeval Studies 1978.

(9) Charles B. Schmitt, 'Philosophy and Science in Sixteenth-Century Universities: Some Preliminary Comments', in Murdoch, John E. and Edith Sylla, eds., *The Cultural Context of Medieval Learning*, Reidel 1975, p. 512, notes that certain branches of medieval physics also declined. He writes: '... several fourteenth-century traditions - including nominalism, the logical traditions of *sophismata* and *insolubilia*, and the Merton and Paris schools of philosophy of motion - continued on into the first few decades of the sixteenth century and after that quickly lost ground to other approaches and sets of problems. The printing-history of the medieval texts in question as well as new commentaries being written on Aristotle indicate this. Why this happened is not clear.

Humanism had a strong impact, as did the reintroduction of the writings of the Greek commentators on Aristotle, but neither of these facts explains why the calculators and writers on *sophismata* lost out, while the commentaries of Averroes did not. In brief, certain medieval aspects of the tradition expired in the early sixteenth century, while other equally medieval aspects continued to play an important role.'

9. ———. 1982. "The Structure of Mental Language: Some Problems Discussed by Early Sixteenth Century Logicians." *Vivarium* no. 20:59-83.

   Reprinted as essay V in: *Studies in Post-Medieval Semantics*.

   "Preface.

   As is well known, late and post-medieval logicians shared the belief that were three types of language, spoken, written, and mental. (1) Spoken and written languages had conventional meaning, and were in fact, though not necessarily so, different for different groups of people. Mental language, on the other hand, was thought to have natural meaning and to be common to all men. The obvious question to ask about mental language concerns its structure and how this relates to the structure of spoken or written languages, especiallyLatin. Ockham's position on the matter has been investigated by more than one author; (2) so in this paper I intend to focus on the views held by logicians in early sixteenth centuryParis, and by some of those earlier logicians who most influenced them. I shall leave firmly aside the obvious philosophical question of what criteria could possibly be used in determining a structure for mental language which is independent of spoken or written language. Sufficeit to say that late medieval logicians saw no problem here.

   The main issues concerning structure arose from a consideration of the categorical proposition.This was taken to be the simplest kind of proposition, which at its most basic displays a subject and a predicate, both in the nominative case, and the copula "is" or "are". To these ingredients may be added

quantifiers such as "all" and "some", negation signs, adjectives, adverbs, and other modifiers. Two kinds of problem are presented by this account. First there is the question of what to say about spoken or written propositions which do not fit the standard mould.I include here such sentences as "Pluit"/"It is raining" which do not have a subject; sentences displaying so-called adjectival verbsuch as "runs" in "Socrates runs" which do not have a separate copula and predicate; and sentences containing pronouns and demonstrative terms such as "I am running"and "This is white", whose subject is given only by the context of the utterance. Second, there is the question of how to account for certain features of those spoken and written propositions which do fit the standard mould, namely such features as syncategorematic terms, tense variations (which will not be discussed in this paper) and variations of number, case and gender. It was in their discussion of these issues that Parisian logicians gave their most detailed account of the structureof mental propositions." (pp. 59-60)

(...)

"It seems that the road was left open to considerable variation in mental language. Two speakers could perfectly well utter sentences which were logically equivalent and which picked out the same state of affairs without using the same mental propositions.As a result,one can suggest both that it is consistent with the post-medieval view that sentences in different languages may be equivalent and translatable without exhibiting precisely the same deep structure, and that there is no reason why one should speak of mental language as containing "*the* forms that are necessary for any true description of the world", as Trentman put it in his account of Ockham's view of mental language. (110) Ockham may have had an ideal language in mind; Enzinas and his contemporaries did not. (111)". (p. 82)

10. ———. 1983. "English *Obligationes* Texts after Roger Swyneshed. The Tracts beginning *Obligatio est quaedam ars*." In *The Rise of British Logic. Acts of the Sixth European Symposium on Medieval Logic and Semantics, Balliol College, Oxford, 19-24 June 1983*, edited by Lewry, Osmund P., 309-333. Toronto: Pontifical Institute of Mediaeval studies.

"Introduction.

In this paper I hope to shed some light on the development of *obligationes* in England by examining a number of texts which all have the same *incipit*.

'*Obligatio est quaedam ars*'. A list of the manuscripts and early printed books I have used, together with the sigla I have adopted, will be found in Appendix A. (1) In Appendix B I have given a list of other relevant manuscripts which I was unable to consult for reasons of time. (2) My paper has three parts. Part One contains a general survey of the texts, with an account of their relationship to each other and to the *Logica oxoniensis* text.

Part Two contains a discussion of the doctrines and influence of Billingham's *Ars obligatoria* and the almost identical treatise found in the *Logica oxoniensis*. Part Three contains a detailed analysis, with references, of the texts discussed in Part Two.

It seems appropriate to begin with some further remarks about the incipit itself. The fullest version is found in Richard Billingham, who wrotes: (3)

'Obligatio est quaedam ars mediante qua aliquis opponens potest ligare respondentem ut ad suum bene placitum respondeat ad obligationem sibi positam; vel obligatio est

oratio mediante qua aliquis obligatus tenetur affirmative vel negative ad obligationem respondere.'

(Obligation is an art whereby some opponent can bind a respondent to reply at the opponent's pleasure to the obligatory sentence posited to him. Alternatively, an obligation is a sentence by virtue of which someone who is obligated is committed to reply affirmatively or negatively to the obligatory sentence.)

As can be seen from the appendices, a number of variations in this incipit were possible. A and Q replaced 'opponens potest ligare' in Billingham's first definition with the phrase 'obligatus tenetur' from the second definition; and a number of authors added 'affirmative vel negative' to tyhe first definition.

Dspite these minor variations, there is no doubt that the texts listed in Appendix A have basically the same *incipit*; but as il shall show, it does not follow from this that the texts listed are otherwise identical, or even similar." (pp. 309-310)

(...)

"I shall finish with a few remarks about the influence of Billingham and the *Logica oxoniensis*. Generally speaking, it seems to have been slight. Apart from Wyclif, no named author, including John of Holland and Paul of Venice in the *Logica parva*, adopted Billingham's organization of the material. There was a little discussion of Billingham's definition of *obligatio*, of his attitude to inconsistent *posita* and of his conjunction rules, but one cannot claim that these topics loomed large in the literature. The most striking influence is that of the sophisms themselves, a number of which reappear in Albert of Saxony (see Part Three, Section B). I suspect that the apparent popularity (judging by the number of extant manuscripts) of the *Logica oxoniensis* in the fifteenth century, a period when people had on the whole ceased to write original *obligationes* treatises, stems solely from its character as a convenient brief compendium." (pp. 317-318)

11. ———. 1984. "Inconsistency and Paradox in Medieval Disputations: A Development of some Hints in Ockham."

Franciscan Studies no. 44:129-139.

"The Liar Paradox is well-known, as is the way it calls into doubt some of our most basic semantic assumptions. In this paper, I intend to consider a more modest group of paradoxes, that is, propositions which seem puzzling, absurd or even inconsistent whether because of some feature of the proposition itself or some feature of the situation in which it is uttered.(1) Examples from ordinary English include the familiar cases "I have nothing to say to you," "My lips are sealed," "I have no comment to make." They also include such sentences as "I'm sorry, I don't speak any English," "I'm quite incapable of uttering a grammatically correct sentence," "I never generalize," "Don't talk to me, I'm asleep," or even "I do not exist." Such pragmatic paradoxes will turn out to have certain features in common with the Liar Paradox.

Some of them give rise to logical contradictions, some of them are self referential, some of them seem to include a reference to their own truth or falsity. But there are also important differences, as I hope to demonstrate.

Hints of a solution to some of these problems are to be found in Ockham; but my main discussion will be based on the work of several later medieval logicians, notably John Buridan, Albert of Saxony and William Buser, all of whom were active at the University of Paris in the middle years of the fourteenth century. To be precise, Buridan taught there from about 1320 to about 1360, Albert taught there from 1351 to 1362, and Buser taught there from 1357 until after 1364. (2) I shall also draw on the work of Paul of Venice, who wrote his *Logica Magna* in 1397-1398. These writers all had a very strong interest in pragmatic paradoxes. The reason for this has to do with the nature of the university curriculum. Virtually all undergraduate students were in the Arts Faculty, and at least the first two years of the four year course were largely devoted to the study of logic." (pp. 129-130)

(...)

"I shall conclude with some brief remarks about the relationship between pragmatic paradoxes and the Liar Paradox. One general way of characterizing the cases I have examined is to say that in each case there is an inconsistency which arises from the relationship between the rules of the game, the facts of the situation (including the syntactic properties of what is said) or some initial conditions on the one hand, and a particular utterance on the other. However, these rather general remarks could also be applied to the Liar Paradox. Alternatively, one might say that the difference between pragmatic paradoxes and the Liar Paradox lies in the importance of the principles which are thrown in doubt. This is true, but unhelpful. Perhaps the real difference is that in none of the cases I have mentioned was it difficult to fix a referent for the sentence uttered, whereas in the case of the Liar Paradox the apparent reference fails. If I say "My reply is in the negative" the referent of "my reply" is fixed by the context; and if I say "What I am now saying is in English" the referent of what I am now saying is similarly fixed. But if I say "What I am now saying is false," apparent reference is made to the content of my utterance, and there is now nothing either in the context of my utterance or in its syntactic features which fixes that reference.26 Unsurprisingly, it is the presence of the semantic term "false" which brings about this unhappy situation." (p. 139)

12. ———. 1984. "Locke on Language." *Journal of Philosophy* no. 14:45-73.

    Reprinted as essay VIII in: *Studies in Post-Medieval Semantics*.

    Reprinted also in: Vere Chappell (ed.), *John Locke, Theory of Knowledge*, New York: Garland Publishing 1992, pp. 55-83 and in: Vere Chappell (ed.), *Locke*, New York: Oxford University Press 1998 pp. 175-194.

    "Locke's main semantic thesis is that words stand for, or signify, ideas. He says this over and over again, though the phraseology he employs varies. In Book III chapter 2 alone we find the following statements of the thesis: (1) '... *Words* ... come to be made use of by Men, as the *Signs* of their *Ideas*' [111.2.1; 405:10-11] (*); (2) 'The use then of Words, is to be sensible Marks of *Ideas*; and the *Ideas* they stand for, are their proper and immediate Signification' [III. 2.1 ; 405:15-17]; (3) *Words in their primary or immediate Signification, stand for nothing, but the* Ideas *in the Mind of him that uses them*' [111.2.2; 405:21-2]; (4) 'That then which Words are the Marks of, are the Ideas of the Speaker' [111.2.2; 405:27-8]; (5) Words, as they are used by Men, can properly and immediately signify nothing but the Ideas, that are in the Mind of the Speaker' [111.2.4; 406:29-31]. Locke offers no explanation of the terms he uses in these remarks, and I am going to take it that the phrases 'stand for; 'being a mark of,' and 'being a sign of are all roughly synonymous with the term 'signify.' The purpose of this paper is to explore what Locke intended to convey when he said that words signify ideas. I shall attempt to defend him against some, though not all, standard objections; and part of my defense will rest on the claim that Locke was using 'signify' in the same way that his scholastic predecessors used the Latin term '*significare*'. My paper falls into three parts. First, I shall give a general description of Locke's account of language; second, I shall look more closely at the scholastic theories of mental language and of signification, and their relation to Locke's theory; third, I shall return to Locke's text to examine what he has to say about the signification of general terms, and

how it is that our ideas conform both to the ideas of other men and to external objects." (pp. 45-46)

(...)

"I have now arrived at the heart of my argument, for not only was 'signify' a quasi-technical term for Locke; it was a genuinely technical term in the scholastic literature of the period, and indeed, in all medieval writings concerned with the theory of language. I wish to contend that Locke's use of the term 'signify' makes much more philosophical sense if one sees it against the scholastic background than if one approaches it from the point of view of twentieth century theories of meaning. It also makes a good deal more historical sense to suggest that Locke was influenced by his background, rather than being a complete innovator in every aspect of his thinking.

But before I examine the late and post-medieval doctrine of signification, I should explain my grounds for supposing that Locke was acquainted with it. Locke went to Oxford in 1652 at the age of twenty, and he stayed there until 1665, first as an undergraduate at Christ Church, and then as a lecturer and tutor at the same college. The Oxford curriculum, as laid down by the Laudian statutes of 1636, covered a variety of subjects. (17) The undergraduate was supposed to study grammar, rhetoric, logic, moral philosophy, political philosophy, geometry, and music; and at the M.A. level such subjects as metaphysics, natural philosophy, history and Greek were added. In theory the main texts studied for logic and metaphysics (as for ethics, natural, and political philosophy) were those of Aristotle, but in practice secondary sources were used. The leading metaphysics texts included some by Catholics such as the Frenchman, Eustace of St. Paul, and some by Protestants, such as the German, Scheibler, and the Dutchman, Burgersdijck. They were all predominantly scholastic in nature, by which I mean that they were highly organized, were heavily influenced by the renewed Aristotelianism of the sixteenth century, and were equally heavily influenced by such medieval authors as Thomas Aquinas (who was undoubtedly more popular in the seventeenth century than in the thirteenth) and

Duns Scotus. Even the Protestant authors seem to have used mainly Catholic sources. The leading logic texts were also predominantly Aristotelian, with a few references to specifically medieval developments such as supposition theory. Two of the most popular at Oxford were by the Flemish Jesuit, Du Trieu, and the Polish Jesuit, Smiglecius, though Burgersdijck's logic text was used as well as his metaphysics text. Indigenous Oxford authors were represented by such men as the very popular Robert Sanderson whose logic text was repeatedly published up to 1841. Nothing that anyone would count as new philosophical work was being done at Oxford (except by Robert Boyle, who was not a member of the university) and hardly any attention was paid to such figures as Descartes. Locke himself may not have read Descartes until 1666 or 1667, after he had left Oxford.(18)" (pp. 55-56)

(...)

"Conclusion

If Locke has been correctly absolved of the twin accusations that words mean ideas and that ideas are invariably images, his discussion of language can be viewed in a somewhat more sympathetic light than is usually the case. His emphasis on the place of ideas in the significative process can be interpreted as an emphasis on the importance of a speaker's concepts, beliefs, and experiences, in the process of communication; and he can be credited with a genuine awareness that there is also something public about language use. Not only must the things spoken of be publicly accessible (at least some of the time), but definitions too must be publicly ascertainable (and this all of the time). To this extent Hacking is wrong when he argues that Locke has no theory of meaning in the sense of a theory of public discourse,(46) but he is correct if we place the emphasis on the word 'theory.' In so far as Locke had a fully-fledged semantic theory, as opposed to a collection of observations." (p. 72)

    "Josse Clichtove represents a turning point in the history of disputation, for he combines one of the earliest accounts of the doctrinal disputation with one of the latest accounts of the obligational disputation. This paper describes the nature and significance of the theories that he offered. Particular attention is paid to the doctrines of truth, necessity and possibility which lie behind his doctrines; and also to the light which his work throws on the aims and nature of an obligational disputation."

15. ———. 1987. "Jacobus Naveros (fl. ca. 1533) on the Question: "Do Spoken Words Signify Concepts or Things?"." In *Logos and Pragma. Essays on the Philosophy of Language in Honor of Professor Gabriel Nuchelmans*, edited by Rijk, Lambertus Maria de and Braakhuis, Henk A.G., 189-214. Nijmegen: Ingenium Publishers.

    "In a volume dedicated to the celebration of Gabriel Nuchelmans' achievements, it seems appropriate to pick up one of the themes that he himself has discussed. In his seminal

work on post-medieval philosophies of language, *Late Scholastic and Humanist Theories of the Proposition*, Nuchelmans devoted a section to the relation between written, spoken and mental propositions (1). In it he made reference to a few writers Grom the fifteenth and sixteenth centuries, such as George of Brussels and Petrus Tartaretus, and he spoke of their reactions to arguments put forward by Aquinas, Ockham and Buridan. In this paper I intend to explore in more detail the question of whether words signify concepts or things, as it was discussed by Jacobus Naveros, a Spaniard who studied and taught at Alcalâ, and whose lengthy and interesting commentary on the Perihermenias was first published in 15332. I shall also discuss the 1530 commentary of Alphonsus Prado, who taught at Alcalâ juntil 1534, when he moved to Coimbra3. Both men were influenced by the strong school of logic at Paris, and I shall make particular reference to the Parisian authors Johannes Raulin (1443-1514), Petrus Crockaert de Bruxellis (1455/70-1514), and Johannes Dullaert (ca. 1470-1513)4. A number of other authors who discussed the question in some detail will be mentioned in passing, particularly in the footnotes5. I shall thus use my examination of Naveros to add to the material given by Nuchelmans, and to explore further the impact of Aquinas, Ockham and Buridan on later writers.

The debate about whether words signified concepts or things was not, of course, a new one. It was already raging in the late thirteenth century, when Roger Bacon said that there was "not a moderate strife among famous men"6. A little later, Duns Scotus wrote of "a great altercation"7. Nearly everyone who wrote a commentary on the Perihermenias had something to say on the issue, and it was also discussed in Sentence commentaries and in Buridan’s Sophismata. The debate had been triggered by the words of Aristotle, who had opened his Perihermenias (16a3) by saying that spoken words were signs of affections in the mind. As translated by Boethius the passage reads: "Sunt ergo ea quae sunt in voce earum quae sunt in anima passionum notae, et ea quae scribuntur corum quae sunt in voce"8. What Aristotle himself had intended to assert can be ignored here9, for the later debate began not just from

Boethius' Latin, but from a particular interpretation of it. Notae were taken to be signa, passiones were taken to be concepts10; and ea quae sunt in voce were taken to be primarily such substantive nouns as 'human being' and 'animal'. Those words which themselves stand for signs were excluded for the obvious reason that, at least in the case of mental signs, the referents must be concepts11. In his analysis of the passage in question12, Naveros argued that because nothing is called a sign of something unless it is representative or significative of it, Aristotle intended to assert that spoken words do signify concepts. Moreover, because Aristotle went on to state that spoken words were not the same for all men, Aristotle had meant to assert that this signification was ad placitum, i.e. conventional. Naveros strengthened the claim by adding the word proprie: the signification is not merely conventional, but conventional in the strictest sense. On the face of it, Naveros came down very strongly on one side of the debate. However, as we shall shortly see, this did not involve him in any denial that words also signified things. Indeed, the very theory of signification committed him to the assertion of a word-thing relationship." (pp. 189-190)

(...)

" Conclusion.

I would like to conclude by making three brief observations. First, any modern attempt to construe the thesis that spoken words signify concepts as a theory of meaning involves a simple misunderstanding of the verb significare. Second, although Naveros, like others, asserted that spoken words did signify concepts, he had no intention of overlooking the referential function of words. Nor did those who asserted that spoken words signified things have any intention of overlooking the place of concepts in the significative process. In many ways the dispute between the two groups was verbal rather than real. Third, when one considers the influence of the great medieval philosophers on the discussions found in the late fifteenth and early sixteenth centuries, it seems that Duns Scotus held pride 'of place, followed closely by Buridan. Ockham's conclusions

were influential, though his arguments were not; and the arguments presented by Aquinas in his Perihermenias commentary had little effect." (p. 214)

(2) For some details about Naveros' life and works, see V. Munoz Delgado ("La lógica en la Univesidad de Alcalà durante la primera mitad del Siglo XVI", *Salamanticensis* 15, 1968:193-200).

(3) For some details about Prado, see Munoz Delgado, *op.cit.*, pp. 184-187.

(4) For details of these and other authors, see Lohr ("Renaissance Latin Aristotle Commentaries", 1974-1982).

(5) On the other hand, there are many *Perihermenias* commentaries I have looked at and shall not make any further reference to. Details of most of the works I exclude are to be found in Risse (*Bibliographia Logica. Verzeichnis der Druckschriften zur Logik mit Angabe ihrer Fundorte. I. 1472-1800,* Hildesheim 1965).

16. ———. 1988. "The Historical Origins of John Poinsot's Treatise on Signs." *Semiotica* no. 69:129-147.

"Introduction.

In 1631-1632 John Poinsot (otherwise known as John of St. Thomas) published his *Ars Logica* at Alcalá. From this massive work John Deely has extracted all those parts relating to the theory of signs, and has given them the general heading of *Tractatus de Signis (Treatise on Signs),* though it should be noted that the *Treatise on Signs* (*) proper consists of just three Questions related to Aristotle's *Perihermenias*. The project is a valuable one, for Poinsot was an interesting writer in his own right who frequently had original observations to make. Deely's contribution, so far as the edition and translation are concerned, is superb; and the book itself is a splendid example of the printer's art. However, I have some very grave reservations about Deely's interpretation of Poinsot's work, and it is these reservations that I intend to discuss here. Others

(notably Sebeok, "A signifying man. Review of Tractatus de Signis" *The New York Time Book Review,* March 30, 1986, pp. 14-15) have already sung the praises of Deely and Poinsot; and as one of the few philosophers who has actually read some of the sixteenth-century authors to whom Poinsot was indebted, I feel it incumbent on me to point out that there is another side to the coin. However, I do not intend my remarks to detract in any way from the achievement represented by Deely's version of the *Treatise on Signs*.

I shall first discuss Deely's attitude toward the historical interpretation of Poinsot and how it differs from my own. In so doing, I shall show that there was a tradition of placing the discussion of signs in a *Perihermenias* commentary. Second, I shall discuss the topic of relations, since Deely claims that the 'revolutionary' nature of Poinsot's doctrine of signs stems from his classification of relations. I shall remark that a very similar classification of relations is found in at least one of Poinsot's sources, namely Domingo de Soto (1494-1560). Third, I shall discuss the details of the theory of signs as described by some early sixteenth-century writers, and I shall show that the general lines of Poinsot's classification are due to Domingo de Soto. Finally, I shall make some remarks about other aspects of the translation and editorial material which seem to need further comment." (p. 129)

* John N. Deely (trans. and ed.), with Ralph Austin Powell, *Tractatus de Signis. The Semiotic of John Poinsot,* Berkeley: University of California Press, 1985.

17. ———. 1988. "Traditional Logic." In *The Cambridge History of Renaissance Philosophy*, edited by Schmitt, Charles B. and Skinner, Quentin, 143-172. Cambridge: Cambridge University Press.

"There were several waves of commentaries during the period after 1350.

Some of these were on individual books from the *Organon*, such as the commentary on the *Prior Analytics* by Marsilius of Inghen, which was published in Venice in 1516, and the commentary on the *Posterior Analytics* by Paul of Venice,

which had been published seven times by 1518, nearly always in Venice. (4) In the fifteenth century we find important commentaries on both the *Logica vetus* and the *Logica nova* being produced by the Thomists at the Bursa Montis in Cologne (5) and by Johannes Versor in Paris. However,

such commentaries were soon to disappear. Bartholomaeus Arnoldi de Usingen, who taught at Erfurt, seems to be one of the last to write specifically on the *Logica vetus* (1514) and the *Logica nova* (1507, 1516) as such. Of the earlier medieval commentaries the most popular was that on the *Logica vetus* by Walter Burley, which had thirteen printed editions, the last in Venice in 1541. The most prevalent form of commentary from the late fifteenth century on dealt with the entire *Organon* in one book . The first commentaries of this sort, such as those by George of Brussels and Petrus Tartaretus (both first published at Paris in 1493) were in a traditional style, but almost at once the influence of humanism became apparent. In Paris Jacques Lefevre d'Etaples produced his *Paraphrases et annotationes in libros logicorum* (eleven editions up to 1588) and in Germany in 1516-17 Johannes Eck published a complete commentary based on the new translations of Johannes Argyropulos but using the work of logicians in the medieval

tradition. (6) Eck's work was produced for the University of Ingolstadt, and was prescribed by the statutes of 1519-20; but it is not clear how much it was actually used." (pp. 143-144)

(...)

"At the end of the sixteenth century we find both new texts and new emphases in the curricula of various institutions. There are three kinds of text which are particularly noteworthy. First, there are commentaries on specific works by Aristotle, such as Jacopo Zabarella's commentary on the *Posterior Analytics* which , along with his other works, was to be extremely popular in the first part of the seventeenth century, especially in Germany.

Second, there is the extensive commentary on selected parts of the whole *Organon*, most notably the *Commentarii in*

universam dialecticam Aristotelis by the Coimbra Jesuit Sebastian Couto , which first appeared in 1606. It has been described as presenting a fusion of two late sixteenth-century approaches to Aristotle, the philosophical one of Zabarella and the philological one of Pace. (13) Third, there are numerous shorter works which offer a complete introduction to the logic of Aristotle, such as those by Toletus and Fonseca (see below, p. 163)." (pp. 145-146)

(...)

By about 1530 most of this activity had come to an abrupt end. New commentaries on medieval authors disappeared except in Spain, where Thomas de Mercado's commentary on Peter of Spain was first published as late as 1571 . Treatises on individual topics ceased to be written, with an occasional exception such as Antonius Kesler's treatise on consequences of 1623. (56) The publication both of the newer works in the medieval tradition and of the older ones virtually ceased . (57) At the same time the university curricula changed. Authors such as Rudolph Agricola and Johannes Caesarius were required in place of the medieval texts, (58) and Philipp Melanchthon's simplified summary of Aristotelian logic swept Germany.

Later, Petrus Ramus was to enjoy a runaway success. Yet the most important and influential texts of the last years of the sixteenth century were by no means simplified humanist manuals, and they contained not only considerably more syllogistic logic than Lorenzo Valla, Agricola or Ramus had thought appropriate, but also treatments of such medieval doctrines as supposition theory." (pp. 152-153)

18. ———. 1988. "Changes in Logic Textbooks from 1500 to 1650: The New Aristotelianism." In *Aristotelismus und Renaissance. In Memoriam Charles B. Schmitt*, edited by Kessler, Eckhard, Lohr, Charles H. and Sparn, Walter, 75-87. Wiesbaden: Otto Harrassowitz.

"My own interest is in the fate of specifically medieval logical doctrines and the process whereby they were either lost from view or were transmuted into a subordinate part of Aristotelian logic. In order to pursue this theme, I have chosen six textbooks which were used at various times and places during the period 1500 - 1650; and I intend to consider their contents in some detail so as to demonstrate the interaction between medieval logic and the other three streams I isolated above. It must, of course, be pointed out that there were many other textbooks which did not contain any medieval logic, and hence were not suitable for my purposes. The works I have chosen are as follows: (I) the *Libelli Sophistarum*, loose collections of late fourteenth-century material which were used at Oxford and Cambridge in the first decades of the sixteenth century (11), (II)

the *Logica parva* (12) of Paul of Venice, probably written 1395 - 1396 (13), printed many times up to 1614 (or beyond), and used as a textbook particularly in Italy. Both the *Libelli Sophistarum* and the *Logica parva* show how well-embedded medieval logic could seem, even in the early sixteenth century. (III) the *Summulae* of Domingo de Soto, a Spaniard who studied at Paris (14). The first edition appeared in Burgos in 1529, and the much-altered second edition in Salamanca in 1539 (15). Soto's work is illustrative both of early sixteenth-century developments within the medieval tradition; and, in its second edition, of the impact of rhetorical humanism. (IV) the *Institutionum Dialecticarum libri octo* of Pedro da Fonseca (16). It was first published in Lisbon in 1564, and the last of its fifty-three editions appeared in Lyon in 1625 (17). This work typifies the solid, late-scholastic textbook, full of detail and heavily influenced by Aristotelian humanism. (V) the *Logicae Artis Compendium* of Robert Sanderson, dating from 1615, and used as a textbook in Oxford well into the eighteenth century (18). In this work, all the four streams are mingled. (VI) the *Logica Hamburgensis* of Joachim Jungius, first published as a whole in 1638 (19), though Books 1 to 3 had appeared in 1635 (20). This too is a solid, detailed textbook, but it brings us to the end of the road so far as the medieval contribution to logic is concerned." (pp. 76-78)

21. ———. 1989. "Boethius on Topics, Conditionals and Argument-Forms." *History and Philosophy of Logic* no. 10:213-225.

"Eleonore Stump's splendid translation of *Boethius's In Ciceronis Topica* (Ithaca and London: Cornell University Press, 1988) is a very welcome companion to her earlier translation of Boethius's *De topicis differentiis* (Ithaca and London: Cornell University Press, 1978). Together the iwo volumes provide us with a hitherto unequalled opportunity to come to grips with

the logical work of an author whose influence on medieval and Renaissance developments in this field was surpassed only by Aristotle himself. Indeed, it was only because of Boethius, his translations and commentaries, that Aristotle was first transmitted to the Latin speaking West. The importance of Boethius's work on the Topics is not purely historical, for it offers us a valuable insight into a type of logic which is aimed not at the production of formal languages or the examination of valid inference forms, but at ways to produce belief in the context of debate and against a background of straightforwardly metaphysical doctrines.

In this essay review I shall first make some general remarks about the nature of Topics-logic, with particular reference to *In Ciceronis Topica*. I shall then explore just one Topic, that of incompatibles, which is a particularly interesting Topic for several reasons. First. Boethius's attempt to define incompatibles shows the limitations of any formal approach to the material in hand. Second, Boethius's use of the Topic casts considerable light on his view of conditionals and their basis in metaphysical features of the world. Third, the examination of these issues helps explain Boethius's interpretation of certain key argument forms and their relation to Stoic logic. Finally, I shall make some remarks about Stump’s translation and notes." (p. 213)

Writings of E. J. Ashworth on the History of Logic. Fourth Part: Articles from 1990 to 1995

Articles 1990-1995

1. Ashworth, Earline Jennifer. 1990. "Paul of Venice on Obligations. The sources for both the *Logica Magna* and the *Logica Parva* versions." In *Knowledge and the Sciences in Medieval Philosophy. Vol. II*, edited by Knuuttila, Simo, Työrinoja, Reijo and Ebbesen, Sten, 407-415. Helsinki: Yliopistopaino.

   Proceedings of the Eighth International Congress of Medieval Philosophy, Helsinki, 24-29 August 1987.

   "Treatises on obligations formed part of the specifically medieval contribution to logic along with treatises on supposition theory, consequences, and insolubles.(1) Their history may go back as far as the late twelfth century; but the most important early treatise was the *Tractatus de Obligationibus* of Walter Burley, which dates from around 1302. This work presented the theory in a fully developed form, and set the stage for all subsequent discussion. For my purposes, the next leading figure was Roger Swyneshed, who probably wrote between 1330 and 1335, and who held controversial views about the treatment of conjunctions and disjunctions. His doctrines were presented in a favourable light by Martinus Anglicus,(2) Robert Fland and Richard Lavenham, (3) but were otherwise generally rejected. Richard Billingham, who became a fellow of Merton College, Oxford, in 1344, wrote

a text on obligations which formed part of the *Logica Oxoniensis*, a loose collection of logic treatises which was popular in the fifteenth century, and which was printed in England as late as 1530. (4) Another Englishman, Ralph Strode, who was a fellow of Merton 1359-1360, wrote a treatise which was especially popular in Italy. (5) At Paris, we find Albert of Saxony, whose discussion of obligations in his *Perutilis Logica* (6) was particularly influential for the 1360 treatise of the Dutchman William Buser (7). In turn, Buser's treatise was heavily used in the treatise by his pupil, Marsilius of Inghen. (8) Two Italian authors must also be mentioned. Peter of Candia, later Pope Alexander V, wrote an obligations treatise perhaps between 1370 and 1380.(9) Peter of Mantua, writing between 1384 and 1392, included a long section on obligations in his *Logica* (10) This is the background against which Paul of Venice must be considered.

Four independent logic treatises have been attributed to Paul: the *Logica Parva* (11) the *Logica Magna* (12) the *Quadratura*; and the *Sophismata Aurea*. The first two are general texts, each of which contains a section on obligations. There is also some relevant material in the *Quadratura*, but I shall not consider it here. (13) Francesco Bottin has given reasons for dating the *Logica Parva* 1395-96 and for dating the *Logica Magna* 1397-98. (14) However, there is some controversy about the relationship between these works; and it has even been asked whether Paul was the author of both. (15) In this paper I shall first give a brief survey of the sources for the *Logica Magna* treatise on obligations; and I shall then argue that, in light of what I have discovered, there is good reason to attribute both the *Logica Magna* and the *Logica Parva* tracts on obligations to the same author." (pp. 407-409)

(...)

"To sum up: the pattern of sources for the *Logica Parva*'s treatment of obligations is exactly the same as the pattern of sources for the *Logica Magna*'s treatment. We find Albert of Saxony, Buser, the *Logica Oxoniensis,* Strode and Peter of Candia. The rules given are generally standard rules, but their

organization is idiosyncratic, and common to both the *Logica Magna* and the *Logica Parva*. The sophisms in the *Logica Parva* are nearly all found in the *Logica Magna*. Given these facts, I would be astounded to discover that the same man had not compiled both treatises. Whether similar conclusions can be drawn for other parts of the *Logica Parva* remains to be seen." (p. 415)

(7) I have used Oxford, Bodleian Library MS Canon. Class.Lat. 278, fol. 72ra-fol. 78rb. For discussion of Buser, see C.H. Kneepkens, "The Mysterious Buser Again: William Buser of Heusden and the Obligationes Tract Ob Rogatum" in *English Logic in Italy in the 14th*

and 15th Centuries, edited by A. Maierù (Napoli: Bibliopolis, 1982), pp.147-166.

(8) I have used Cracow, Biblioteka Jagiellonska MS 2602, fol. 70r - 101r.

(9) I have used Oxford, Bodleian Library MS Canon.Class.Lat. 278, fol. 65ra - fol. 69rb. For the date, I have used Green-Pedersen's conjecture about the date of Peter of Candia's *Consequentiae*: see N.J. Green-Pedersen, 'Early British Treatises on Consequences' in *The Rise of British Logic*, p.307.

(10) I have used Peter of Mantua, *Logica* (Venice, 1492), sig. G iira -sig. G viiivb. For the dating of his logical works, see T.E. James, 'Peter Alboini of Mantua: Philosopher Humanist', *Journal of the History of Philosophy* 12 (1974), pp.161-170.

(11) Paulus Venetus, *Logica* (Venice, 1472; Hildesheim, New York: Georg Olms, 1970). For a translation of this edition, see A.R. Perreiah, *Paulus Venetus. Logica Parva* (München, Wien: Philosophia Verlag, 1984). I shall use the citation LP, with page references to the 1472 edition. These references are included in Perreiah's translation.

(12) Paulus Venetus, *Logica Magna* (Venetiis, 1499); E.J. Ashworth, editor and translator, *Paul of Venice. Logica Magna. Part II. Fascicule 8. Tractatus de Obligationibus* (printed for the British Academy by the Oxford University Press, 1988). I shall use the citation LM, with folio references to the 1499 edition. These references are included in my edition.

(13) Paulus Venetus, *Quadratura* (Venetiis, 1493): see *Dubium secundum*, cap. 11; *Dubium tertium*, cap. 6, cap. 23, cap. 29.

(14) F. Bottin, 'Logica e filosofia naturale nelle opere di Paolo Veneto' in *Scienza e Filosofia all'Università di Padova net Quattrocento*, edited by A. Poppi (Contributi alla Storia dell'Università di Padova 15. Trieste: Lint, 1983), pp.87-93.

(15) See F. del Punta and M.M. Adams, edition and translation, Paul of Venice, *Logica Magna. Part II. Fascicule 6. Tractatus de Veritate et Falsitate Propositionis et Tractatus de Significato Propositionis* (Published for the British Academy by the Oxford University Press, 1978), p.xiii: '...while the common authorship of the *Logica Magna*, the *Logica Parv*a, the *Sophismata,* and the *Quadratura* is highly probable, it has not been proved with certainty.... We have found that the teachings of the *Logica Parva* are in any event often inconsistent with those of the *Logica Magna*.' Perreiah, op.cit., pp. 327-343, gives the strong impression that he doubts common authorship of the *Logica Parva* and the *Logica Magna*.

2. ———. 1990. "The Doctrine of Signs in Some Early Sixteenth-Century Spanish Logicians." In *Estudios de Historia de la Lógica. Actas del II Simposio de Historia de la Lógica, Universidad de Navarra, Pamplona, 25-27 de Mayo de 1987*, edited by Angelelli, Ignacio and D'Ors, Angel, 13-38. Pamplona: Ediciones Eunate.

   "In this paper I intend to discuss the doctrine of signs as it was presented by six Spanish logicians from the first half of the sixteenth century, all of whom except Naveros studied or taught at the University of Paris. I shall consider the *Termini* of Gaspar Lax, whose second edition appeared in 1512; the *Termini* of Juan Dolz, which appeared about 1510; the *Dialecticae introductiones* of Juan de Celaya, published as early as 1511; the *Summulae* of Domingo de Soto, which appeared in 1529 and were heavily revised for their second edition in 1539; the posthumous *Termini perutiles* of Fernando de Enzinas, published in 1533; and the *Praeparatio dialectica* of Jacobo de Naveros, published in 1542. I shall, of course, be mentioning various other authors, particularly from Paris, both to set the stage for the work of the Spanish logicians, and in order to trace subsequent developments.

There are three reasons why I have chosen to focus on the doctrine of signs. First, there is the link with the doctrine of signification. For the early sixteenth-century logician, at least for those writing in the medieval tradition, to signify was to be a sign; and unless we understand how the notion of sign was handled we will be unable to understand such crucial debates as that concerning the question whether words signify concepts or things (1). In particular, we will be likely to fall into the modern trap of translating the word '*significatio*' by the word 'meaning', and thereby misreading large portions of medieval and post-medieval logic and philosophy of language (2). Second, it is in the late fifteenth and early sixteenth centuries that logicians broke away from the medieval trend of discussing signification only in relation to *voces* or utterances (3), and attempted to present the linguistic sign in a much wider framework. Third, recent attention has been focussed on the sign-theory of later authors, particularly the seventeenth-century John of St. Thomas, and I think it is important to reveal the true pioneers in this field (4)." (pp. 13-14)

(1) See E. J. Ashworth, "Jacobus Naveros (fl.ca.1533) on the Question: 'Do Spoken Words Signify Concepts or Things?", in *Logos and Pragma. Essays on the Philosophy of Language in Honour of Professor Gabriel Nuchelmans*, edited by L. M. de Rijk and H. A. G. Braakhuis, pp. 189-214 (Artistarium, Nijmegen: Ingenium Publishers, 1987); and E. J. Ashworth, "'Do Words Signify Ideas or Things?' The Scholastic Sources of Locke's Theory of Language", *Journal of the History of Philosophy* 19 (1981), pp. 299-326, reprinted as Study VII in E. J. Ashworth, *Studies in Post-Medieval Semantics* (London: Variorum Reprints, 1985).

(2) For examples of such misreading, see E. J. Ashworth, "Locke on Language", *Canadian Journal of Philosophy* 14 (1984), pp. 45-73, reprinted as Study VIII in *Studies in Post-Medieval Semantics*.

(3) Two medieval exceptions to this trend were Robert Kilwardby and Roger Bacon. For references, see below notes 31 and 32.

(4) See John N. Deely, translator and editor, with Ralph Austin Powell, *Tractatus de Signis. The Semiotic of John Poinsot* (Berkeley: University of California Press, 1985). See also E. J. Ashworth, "The Historical Origins of John Poinsot's 'Treatise on Signs', *Semiotica* 69 (1988), 129-147.

3. ———. 1990. "Domingo de Soto (1494-1560) and the Doctrine of Signs." In *De Ortu Grammaticae. Studies in Medieval Grammar and Linguistics Theory in Memory of Jan Pinborg*, edited by Bursill-Hall, Geoffrey L., Ebbesen, Sten and Köerner, Konrad, 35-48. Amsterdam-Philadelphia: Benjamins.

   "Doctrines of signs permeated medieval culture, being found in such diverse fields as medicine, rhetoric and theology (Maierù 1981). However, despite Augustine's important insight that words could be treated as one type of sign (Markus 1957; Jackson 1969) it seems true to say that the notion of a sign as such was not of central importance to medieval logicians. Certainly words were spoken of as being signs, but no attempt was made to place them in a wider setting. Peter of Spain in his *Summulae Logicales* had focussed on the notion of a *vox* or utterance, so that the distinction between significative and non-significative was introduced only in a linguistic context (Peter of Spain 1972:1-2) and his commentators were thus given no incentive to go beyond this context. William Ockham did give a general definition of sign in his *Summa Logicae,* but he immediately said that he did not intend to use the word 'sign' in this wider sense (William Ockham 1974:89); and his remarks were later echoed by Albert of Saxony (Albert of Saxony 1522:f.2ra). The only medieval exceptions to this trend in the field of linguistic sciences seem to have been Robert Kilwardby, who discussed signs as such in his grammatical work (Kilwardby 1975:1-7) and Roger Bacon who, when writing on logic, followed Augustine in firmly subordinating the notion of a linguistic sign to the notion of a sign in general (Roger Bacon 1978:81-84; Pinborg 1981:405). One of Jan Pinborg's many achievements was to find and publish Roger Bacon's treatise *De Signis*. Hence, it seems appropriate that in a volume devoted to Pinborg's memory, some attention should be paid to another

logician, Domingo de Soto, who attempted to place linguistic signs in a wider context.

It must be recognized that Soto was not the first sixteenth century author to focus afresh on the notion of a sign. Humanism had resulted in new attention being paid to the rhetorical concept of sign (cf. Melanchthon 1854:cols.750-751, and Melanchthon 1846:cols.704-706) and various fifteenth and sixteenth century logicians referred to the definitions of sign found in Cicero (Versor 1572:f.6v; Raulin 1500:sig.g 5ra) and Quintilian (Sanchez Ciruelo 1519:sig.B 5vb). Another factor which should be taken into account was the renewed interest in medieval metaphysics and theology which characterized many of the great sixteenth and seventeenth century writers. However, of the early sixteenth century writers I know only Pedro Sanchez Ciruelo paid attention to the work on signs found, for instance, in Thomas Aquinas (Sanchez Ciruelo 1519:sig.B 5vb-6ra); and it seems to have been the Jesuits of Coimbra who were responsible for bringing together the rich theological tradition of the Middle Ages with the new logical tradition (Conimbricensis 1607:11 cols,7-33). This new logical tradition, found in such authors as Tomas de Mercado (1571:f.3vb-5va), Alonso de la Vera Cruz (1572:22 A-23 A), Francisco de Toledo (1596:208 A-209 B) and Diego Mas (1621:11 7 B-10 A) stems almost entirely from Domingo de Soto. He it was who classified the subject-matter, and set up the framework within which his successors would discuss the topic of signs. (1)

The main inspiration for Soto's work was obviously the then-standard Parisian doctrine of signification, which was directly derived from Peter of Ailly's Conceptus et Insolubilia. In this work, Peter of Ailly (c. 1350-1420) had, without elaboration, remarked that "a term is a sign" (1980:16; cf. Stanyol 1504:sig.a 3r, Sanchez Ciruelo 1519:sig.B 5va, Enzinas 1533:sig.b 3rb); that "to 'signify' is the same as to be a sign of something" (17; cf. Buridan 1977:22) and that something can be a sign in two ways (17). It can itself be an act of knowing a thing, or it can lead to an act of knowing. In the second case, there is a further division to be made, since the act of knowing can be either primary or

secondary (18). He also gave a definition of ‘signify’ which reappeared in text after text “... to ‘signify’ is to represent (a) something, or (b) some things or (c) somehow, to a cognitive power by vitally changing it” (16). In the hands of various early sixteenth century logicians at Paris, Peter’s remarks had been elaborated into a doctrine which Soto found profoundly misleading; and which he therefore set out to rework completely." (pp. 35-36)

(...)

"Once Soto had completed his general classification of signs, he came up against another problem, this time specifically to do with linguistic signs. According to Aristotle, spoken words were signs of concepts; yet there seemed to be an obvious sense in which spoken words were signs not of concepts but of actual things. (7) In order to deal with this issue, Soto introduced a distinction. When I utter the word ‘homo’ I signify men in the sense of making them known (facere cognoscere), and I definitely do not make known my own concept of man. On the other hand, I do express (exprimer e) the fact that I have such a concept, and I do so in order to cause my hearers to form similar concepts (Soto 1529:f.6ra). Facere cognoscere and exprimere are two types of signification, the second being a less general kind which pertains only to written and spoken words (f.6ra). In the later edition of his work Soto put the same point in terms of a distinction between two kinds of instrumental sign, one of which leads the cognitive power to form a concept of a thing, and the other of which expresses the presence of a concept. Thus a vocal sign can represent both a thing and a concept, but in different ways (Soto 1554:f.3rb-va). The whole matter was put more generally by the later author, Francisco de Toledo, who introduced the notion of manifestive and suppositive signs. A manifestive sign, he wrote, is one which leads to the knowledge of another thing. Thus a sound can be a manifestive sign that reading is to occur. A sign which is both manifestive and suppositive is one which not only manifests another thing, but can be used in place of it. Thus a Viceroy both manifests or makes known the king and acts in his place. Utterances are signs of both kinds. On the one hand, they

manifest concepts; on the other hand they both manifest and stand for actual things (Toledo 1596:209 A). Clearly Toledo did not find it awkward that a linguistic sign could perform several significative functions at once. Indeed, he had already pointed out that all utterances signify their utterer in the same way that smoke signifies fire, i.e. as an effect does its cause, so that one and the same sign can have both natural and conventional signification (Toledo 1596:209 A).

These last remarks point to one of the main strengths of the doctrine of signs developed by Domingo de Soto and his immediate successors. While many of the distinctions made seem to be ordinary, common-sense distinctions without much philosophical novelty, they enable one to place the linguistic sign in the context of signs in general. As a result one gets a much better apprehension of the various uses which can be made of a single utterance. At the same time, it is made perfectly evident that the doctrine of signification developed by medieval and post-medieval logicians was not, and should not be confused with, a theory of meaning in the contemporary sense. To say that words signify things is to say that they make things known; to say that words signify ideas is to say that they express ideas; and we are not given any license to identify the meaning of words with either type of significate. (8)" (pp. 44-45)

(1) There is a curious tendency among linguists to attribute Domingo de Soto's achievements to the much later John of St.Thomas (1589-1644). For instance Arens (1984:509) refers to John St.Thomas's "remarkable faculty for systematization" in relation to a series of distinctions about signs taken directly from Domingo de Soto; and Deely (1983:116) calls him "the earliest systematizer of the doctrine of signs." In fact John of St.Thomas's discussion of signs (John of St.Thomas 1930:9A-10A, 646A-722A) draws very heavily not only on Soto but also on the lengthy and more ontologically oriented discussion in the Coimbra commentary. He comes at the end of a tradition, not at the beginning.

(7) For a survey of medieval discussion of the question whether words signify ideas or things, see Ashworth (1981); and for a survey of post-medieval discussion, see Ashworth (1987).

(8) For a fuller discussion of this issue see Ashworth (1984).

4. ———. 1991. "Signification and Modes of Signifying in Thirteenth-Century Logic: A Preface to Aquinas on Analogy." *Medieval Philosophy and Theology* no. 1:39-67.

"My study of Aquinas in the context of thirteenth-century logic has two parts. In the first part, which constitutes the present essay, I shall explore the general theory of language that lies behind theories of equivocation and analogy. I shall explain such key concepts as imposition, signification, and *res significata,* and I shall pay particular attention to the notion of *modi significandi*. In the second part, to be published separately, (*) I shall survey thirteenth-century accounts of equivocation from Peter of Spain to John Duns Scotus. I shall show how the discussion of analogy came to be subsumed under discussions of equivocation and how logicians developed a threefold classification of analogy that has a close relation to Aquinas's own classification in his *Sentences*-commentary.

In embarking on this study, I am guided by the belief that to understand Aquinas fully we need to know how his words would have been understood by his contemporaries. We need to know which phrases had a standard technical usage and what distinctions were routinely made. I do not intend to argue that we will always find just one correct interpretation, nor do I want to claim that Aquinas was never innovative in his use of material taken from logicians. I am convinced, however, that a careful reading of the logicians will not only show us which interpretations of Aquinas's philosophy of language can be ruled out as fanciful reconstructions, but will also shed light on much that is currently obscure to the twentieth-century reader." (pp. 40-41)

(...)

"Conclusion.

What I have examined in this paper is a theory of language that tends to take words as units, endowed both with their signification and their *modi significandi* before they enter sentences and independently of speaker intention on any given occasion, (123) This attitude was reinforced by Priscian's claim that the noun has priority over other parts of speech, which led logicians to argue that the noun received its imposition first. (124) One might think that equivocal and analogical terms are precisely those whose functioning is best explained through context and use, but although Roger Bacon at least did recognize that any term could be used equivocally, (125) there was a tendency to speak as if equivocal and analogical terms formed special classes that could be identified in advance of use. To the extent that Aquinas's doctrine of analogy is embedded in such a general theory, one may fear that it will share the theory's defects." (p. 67)

(*) See: *Analogy and Equivocation in Thirteenth-Century Logic. Aquinas in Context*.

(123) For some references to authors who paid more attention to speaker intention, see Irène Rosier, "Signes et sacrements: Thomas d'Aquin et la grammaire speculative," Revue des sciences philosophiques et théologiques 74 (1990): 392-436.

(124) Priscian, *Institutionum grammaticarum* libri XVIII, in *Grammatici Latini,* edited by Heinrich Keil (Leipzig: Teubner, 1855), reprint ed. (Hildesheim and New York: Georg Olms, 1981), 2:115-121. Priscian's remarks were used to show that an equivocal noun could not have a conjunctive signification, since syncategorematic terms were posterior to nouns. 5. ———. 1991. "Equivocation and Analogy in Fourteenth-Century Logic: Ockham, Burley and Buridan." In *Historia Philosophiae*

Medii Aevi. Studien zur Geschichte der Philosophie des Mittelalters. Festschrift für Kurt Flasch zu seinem 60. Geburtstag. *Vol. I*, edited by Mojsisch, Burkhard and Pluta, Olaf, 23-43. Amsterdam, Philadelphia: B. R. Grüner.

"In this paper I shall explore the notions of equivocation and analogy as they were handled by William of Ockham in his logical writings; (1) and I shall compare his position with those adopted by Walter Burley and John Buridan.(2) I realize that Ockham's views on these issues have already been discussed in print, (3) and I shall not be able to point to hitherto unnoticed material in his works. My main intention is to place his views in perspective, by locating them in their historical context. This project is one which has been touched on only indirectly by scholars, (4) yet it is crucial to the proper understanding both of Ockham himself and of later developments in the theory of analogy.

My study of Ockham is part of a series in which I intend to explore the notions of equivocation and analogy as they were handled by logicians from the mid-thirteenth to the end of the sixteenth century. (5) I became interested in this issue when I noticed that virtually the only logician ever referred to in discussions of Aquinas's theory of analogy is Cajetan, despite the fact that he wrote over two centuries later, and had a rather different philosophical agenda. In fact, there are a number of striking dissimilarities between logicians contemporary with Aquinas and such sixteenth-century logicians as Domingo de Soto. Some of these are of minor importance. For instance, sixteenth-century logicians had access to more of the Greek commentators on Aristotle's *Categories*, and they tended to discuss analogy in the context of commentary on the *Categories* rather than in the context of commentary on the *Sophistici Elenchi*. Others affect the general approach: here I have in mind the different theories of signification which were predominant in the two periods, and the more-or-less complete abandonment of the grammatical doctrines of *modi significandi*. Yet others are crucial to the details. In the thirteenth century, the analogy of attribution was the important kind, and the analogy of proportionality was barely mentioned.

The reverse is true after Cajetan. In the thirteenth century, the key notion was that of signification *per prius et posterius*, and the implications of this were spelled out partly in terms of concepts (whether one or more), but especially in terms of common natures. In the sixteenth century the focus was on concepts, whether one imprecise concept matched with more than one precise concept, or one formal concept matched with more than one objective concept. In addition, sixteenth-century logicians worried about the differences between intrinsic and extrinsic denomination, not an issue which had concerned late thirteenth-century logicians.

The fourteenth century had two big contributions to make to the changes in doctrine that I have just outlined. First, John Duns Scotus's arguments about the univocity of being seem to have persuaded logicians that it makes sense to postulate just one concept of being, even if one goes on to reject the claim that <*ens*> is a univocal term. Second, Ockham and his followers diverted attention from common natures, which they rejected, to words and concepts. Sixteenth-century discussions of analogy have to be understood in terms of a reaction to these fourteenth-century developments, and not just in terms of a reaction to the writings of Thomas Aquinas. I shall leave the elucidation of Scotus and his influence to others; but it must be remembered that in concentrating on Ockham and the logicians I am telling only part of the story." (pp. 23-25)

(...)

"Conclusion.

In this brief paper I have not been able to address the issue of how Ockham handled religious language (85) or the issue of how he handled the notion of ens. (86) Nor have I been able to pursue Burley's theory of analogy in the depth and detail which it clearly deserves. However, I have shown the place analogy occupies in relation to equivocation in the logic of both Ockham and Buridan - and a very modest place it is." (p. 43)

(1) William of Ockham, *Summa Logicae,* edited by P.Boehner, G.Gál, S.Brown, Opera Philosophica I (St.Bonaventure, N.Y.:

St.Bonaventure University, 1974); *Expositio in librum Praedicamentorum Aristotelis*, edited by G. Gal in Opera Philosophica II (St.Bonaventure, N.Y.: St.Bonaventure University, 1978); *Expositio super libros Elenchorum*, edited by F. del Punta, Opera Philosophica III (St.Bonaventure, N.Y.: St.Bonaventure University, 1979). I shall also refer to the following theological writings: Scriptum in librum Primum Sententiarum Ordinatio. Distinctiones II-III, edited by S. Brown with G.Gál, Opera Theologica II (St.Bonaventure, N.Y.: St.Bonaventure University, 1970); *Quaestiones in librum Tertium Sententiarum (Reportatio)*, edited by F.E. Kelley and G.I. Etzkorn, *Opera Theologica VI* (St.Bonaventure, N.Y.: St. Bonaventure University, 1982); *Quodlibeta Septem*, edited by J.C. Wey, Opera Theologica IX (St. Bonaventure, N.Y.: St.Bonaventure University, 1980).

(2) Much research remains to be done on both Burley and Buridan. I shall draw most of my material relating to Burley from his 1337 commentary on the *Categories* in *Burlei super artem veterem Porphirii et Aristotelis* (Venetiis, 1497). For Buridan I have used *Iohannes Buridanus. Quaestiones in Praedicamenta*, edited by J. Schneider (Munchen: Verlag der Bayerischen Akademie der Wissenschaften, 1983) and extracts from his *Summulae* in S. Ebbesen, *The Summulae. Tractatus VII. De Fallaciis* in *The Logic of John Buridan*, edited by Jan Pinborg (Copenhagen: Museum Tusculanum, 1976), pp.139-160.

(3) The most recent and best discussion is found in M.McCord Adams, *William Ockham* (Notre Dame, Indiana: University of Notre Dame Press, 1987), Vol.II, pp.903-960, especially pp.952-960. See also G. Leff, *William of Ockham: The Metamorphosis of Scholastic Discourse* (Manchester: Manchester University Press, 1975) pp.149-164 for a detailed but very confused discussion. A much earlier work, containing some useful material, is M.C. Menges, *The Concept of Univocity Regarding the Predication of God and Creature According to William Ockham* (St.Bonaventure, New York: The Franciscan Institute, Louvain: E.Nauwelaerts, 1952).

(4) For a bibliography of works on fallacies, which of course include equivocation, and some discussion. see S.Ebbesen, *The way fallacies were treated in scholastic,* Cahiers de l'institut du moyen-age grec et latin 55 (1987), 107-134.

(5) See E. J. Ashworth, *Analogy and Equivocation in Thirteenth-Century Logic: A New Approach to Aquinas*. I am currently writing a paper on equivocation and analogy in sixteenth-century logicians. Full documentation of my claims about thirteenth and sixteenth-century logic will be found in these papers.

6. ———. 1991. "*Nulla propositio est distinguenda:* la notion d' *equivocatio* chez Albert de Saxe." In *Itinéraires d'Albert de Saxe. Paris-Vienne au XIV siècle. Actes du Colloque organisé les 19-22 juin 1990 dans le cadre des activités de l'URA 1085 du CNRS à l'occasion du 600 anniversaire de la mort d'Albert de Saxe*, edited by Biard, Joël, 149-160. Paris: Vrin.

   "Le célèbre statut édicté à l'université de Paris le 29 décembre 1340 exige que personne ne dise qu'aucune proposition ne doit être le sujet d'une distinction — « quod nullus dicat quod nulla propositio sit distinguenda » (1). Cette interdiction est liée à la conviction qu'il y a d'importantes propositions, surtout dans la Bible, qu'on peut regarder comme fausses de *virtute sermonis*, c'est-à-dire au sens littéral des mots, tout en étant vraies d'après les intentions de leurs auteurs (2). Le statut condamne ceux qui nient tout simplement de telles propositions, au lieu de les accepter ou de faire une distinction entre leurs divers sens (3). Dans le passé, les historiens de la philosophie médiévale ont souvent soutenu que Guillaume d'Ockham était la cible de ce décret, mais Katherine Tachau et William Courtenay ont récemment attaqué cette prétention (4). Je ne reprendrai pas leur argumentation, que je trouve assez convaincante, mais je me concentrerai sur un aspect que Tachau et Courtenay n'ont pas considéré en profondeur: le lieu

que les distinctions entre les divers sens d'une proposition occupait dans la logique du XIVe siècle.

Je choisis ce thème à cause de son rapport avec la pensée d'Albert de Saxe. Assez curieusement, dans sa *Perutilis logica* (5) ainsi que dans ses *Quaestiones in logicam* (6), Albert adopte une position tout à fait contraire à celle du statut. Il dit carrément qu'aucune proposition ne doit être le sujet d'une distinction: « nulla propositio est distinguenda ». En disant cela, il attaque implicitement Aristote, au moins l'Aristote des logiciens du Moyen Age (7), et en meme temps il attaque explicitement « Occham et socios eius » (8). Cela peut nous surprendre, étant donné qu'en général Albert suit Ockham de très près, mais il faut reconnaître que Guillaume d'Ockham était, entre les logiciens sinon les théologiens, le défenseur prééminent des distinctions (9).

(1) Le texte du statut est donné par W. J. Courtenay et K. H. Tachau dans « Ockham, Ockhamists, and the English-German Nations at Paris, 1339-1341 », in *History of Universities*, 2 (1982), p. 84, n. 17.

(2) Pour une discussion récente, voir W. J. Courtenay, « Force of Words and Figures of Speech: The Crisis over Virtus Sermonis in the Fourteenth Century », in *Franciscan Studies*, 44 (1984), pp. 107-128.

(3) Cf. Tachau et Courtenay, *loc. cit.*: « quod nulli (...] audeant aliquant propositionem famosam illius actoris cujus librum legunt, dicere simpliciter esse falsam, vel esse falsam de virtute sermonis, si crediderint quod actor ponendo illam habuerit verum intellectum; sed vel cancedant eam, vel sensum verum dividant a sensu falso [...] », Il faut constater que dans sa traduction des *Réfutations sophistiques*, Boèce utilise le mot « dividere » où l'on pourrait s'attendre qu'il utilise le mot « distinguere »: voir sourtout I, 17-19, 175 a 31-177 a 32. dans *Aristoteles latinus*, VI, 1-3: *De sophisticis elenchis*, éd. B. G. Dod, Leiden: E. J. Brill, Brussels: Descjée de Brouwer, 1975, pp. 36-41.

7. ———. 1991. "A Thirteenth-Century Interpretation of Aristotle on Equivocation and Analogy." *Canadian Journal of Philosophy* no. Supplementary volume 17:85-101.

   "This paper is a case study of how a few short lines in two of Aristotle's logical works were read in the thirteenth century. (1) I shall begin with a quick look at Aristotle's own remarks about equivocation in the *Categories* and the *Sophistical Refutations,* as they were transmitted to the West by Boethius's translations. (2) I shall continue with an analysis el the divisions of equivocation and analogy to be found in an anonymous commentary on the *Sophistical Refutations* written in Paris between 1270 and 1280. (3) I have chosen this author's work to focus on, because it offers a remarkably full account which brings together the elements found in many other logical works from the second half of the thirteenth century. In the course of my analysis I shall attempt to show the part played by four different sources: (I) the Greek commentators of late antiquity; (II) the new translations of Aristotle's *Physics* and *Metaphysics;* (III) the reception of Arabic works, particularly the commentaries of Averroes; and (4) new grammatical doctrines, notably that of *modi significandi.* At the same time, I hope to throw some light on the development of the doctrine of analogy as it was understood by late thirteenth-century logicians." (pp. 85-86)

8. ———. 1991. "Logic in Late Sixteenth-Century England: Humanist Dialectic and the New Aristotelianism." *Studies in Philology* no. 88:224-236.

"In this paper I intend to look at the kind of logic that was taught at Oxford and Cambridge in 1590, and that was central to the undergraduate curriculum. I shall begin with a survey of the authors who were studied during the sixteenth century; then I shall consider the contents of their texts, with particular emphasis on the interplay between logic, dialectic and Aristotelianism. My main purpose is to explain what humanist dialectic might have been, and what it actually became in the hands of the textbook writers.

Suppose we start by considering the logic texts known to have been published in England between 1580 and 1590, or more accurately, between 1580 and 1589, since no logic text survives from the year 1590 itself. (1) There are in all 25 titles, and of these titles five are in English.

Thomas Wilson's *Rule of Reason* appeared in 1580. It was first published in 1551,and was the most popular of all the English vernacular texts. (2)

The second English text is a translation of Petrus Ramus's *Dialectica*, (3) and the last three, all dated 1588, are variants of Abraham Fraunce's *The Lawiers Logike*, which is basically a Ramist text. (4) Turning to the Latin titles, there are four printings of John Seton's *Logica* which had first appeared in 1545, and went through 14 editions by the end of the century. (5) It was by far the most popular of the English non-vernacular texts. Next there is the first edition in 1584 of John Case's important work on Aristotle's logic, the *Summa Veterum Interpretum*, which received the accolade of five editions in Frankfurt. (6) Of the remaining works, two are Latin versions of Ramus's *Dialectica* and thirteen are about Ramus's logic. There is a good deal we can learn from this list, both with respect to the languages used and with respect to what is absent from it." (pp. 224-225)

(...)

"I find the English logic scene in 1590 somewhat depressing. We are faced with elementary manuals which have lost sight of the important medieval developments in logic, and which have failed to make anything theoretically interesting of the humanistic innovations. (53) What we are left with is basically simplified Aristotle with some Ciceronian flourishes." (p. 236)

(1) A useful chronological list of logic books printed in England before 1620 is given by Charles B. Schmitt, *John Case and Aristotelianism in Renaissance England* (Kingston and Montreal: McGill-Queen's University Press, 1983), 225-29. For discussion of English

logic during the sixteenth century, see E. J. Ashworth, *Introduction*, in Robert Sanderson, *Logicae Artis Compendium*, edited by E. J. Ashworth (Bologna: Editrice CLUEB, 1985), especially xxiii-xxxii; Luce Giard,"La production logique de l'Angleterre au xvie siècle,"

Les Etudes Philosophiques 3 (1985) :303-24; Lisa Jardine, "The Place of Dialectic Teaching in Sixteenth-Century Cambridge," *Studies in the Renaissance* 21 (1974):31-62. No attention should be paid to W. S. Howell, *Logic and Rhetoric in England*, 1500-1700 (Princeton: Princeton University Press, 1956), since its account of logical developments, particularly during the medieval period, is inaccurate, and this vitiates the judgments the author makes about the texts he describes.

(2) See Thomas Wilson, *The Rule of Reason Conteinying the Arte of Logique*, edited by Richard S. Sprague (Northridge, Califomia: SanFernando Valley State College, 1972).

(3) Fora modem edition of a translation of Ramus, see Catherine M. Dunn, ed., *The Logike of the Moste Excellent Philosopher P. Ramus Martyr Translated by Roland MacIlmaine (1574)* (Northridge, Califomia: San Femando Valley State College, 1969).

(4) Probably the appearance of three variants in one year represents the work's lack of success, since the reissue of a work with a new title page and reference to a new bookseller was a way of getting rid of unsold stock: see Giard, 319. For some discussion of Fraunce's work, see Lisa Jardine,"Humanistic Logic"in *The Cambridge History of Renaissance Philosophy*, ed. Charles B. Schmitt (Cambridge: Cambridge University Press, 1988), 190-91.

(5) John Seton, *Dialectica* (Londini, 1584).

(6) John Case, *Summa veterum interpretum in universam dialecticam Aristotelis* (Londini, 1584). For a discussion of Case's work and significance, see the book by Schmitt cited above. For editions of the text, see Schmitt, 261.

(53) I would like to thank Lisa Jardine and Eleonore Stump who, over the years, have persuaded me that formal logic is not the whole story. I would also like to thank the organizers of the "London,1590"conference for inviting me to present this paper.

9. ———. 1992. "Analogy and Equivocation in Thirteenth-Century Logic. Aquinas in Context." *Mediaeval Studies* no. 54:94-135.

"One of the outstanding features of the extensive literature on Aquinas's doctrine of analogy is the complete absence of any attempt to set him in the context of thirteenth-century logic. (1) Certainly frequent reference is made to Cardinal Cajetan; but Cajetan wrote over two centuries later, and he had his own philosophical agenda, which in many ways owed more to fourteenth-century developments than it did to Aquinas himself. (2) In this paper I intend to provide some essential background to Aquinas by examining how equivocation was handled by logicians, including the young Duns Scotus, between ca. 1230 and ca. 1300. I shall show how analogy entered the logic texts in the context of equivocation; and I shah argue that the emphasis on analogy *per attributionem*, the absence of the analogy of proportionality, and the development of a threefold classification of analogy ah throw considerable hght on Aquinas's own discussion of analogy, particularly as found in the passage from his *Sentences* commentary which was the focus of Cajetan's attention. While I do not wish to claim that paying attention to Aquinas's historical situation will by itself provide us with a definitive interpretation of his doctrines, I do believe that such an endeavour will enable us to rule out certain interpretations as inappropriate or unlikely, and that it will enable us to make sense of otherwise obscure remarks.

The present paper is the second part of a two-part study of Aquinas in relation to thirteenth-century logic. In the first part I discussed the general theory of language which provides the context for doctrines of equivocation and analogy. (3) In particular, I explained such key terms as *significatio, res significata,* and *modi significandi.* I also discussed the effects of context on equivocal and analogical terms. While the present paper stands by itself, reading it in conjunction with the other will lead to a fuller understanding of some of the details that I can mention here only in passing." (pp. 94-95)

(1) An exception to this remark is provided by a paper which has just appeared: A. de Libera, "Les sources gréco-arabes de la théorie médiévale de l'analogie de l'être," *Les études philosophiques* [special issue on analogy] (1989): 319-45. De

Libera, however, is more concerned with metaphysical than with logical issues. For a very interesting use of speculative grammar to interpret Aquinas on the language of the sacraments, see I. Rosier, “Signes et sacrements: Thomas d’Aquin et la grammaire spéculative,” *Revue des sciences philosophiques et théologiques* 74 (1990): 392-436.

(2) For some details, see E. J. Ashworth, “Equivocation and Analogy in Fourteenth Century Logic: Ockham, Burley and Buridan” in *Historia Philosophiae Medii Aevi: Studien zur Geschichte der Philosophie des Mittelalters*, ed. B. Mojsisch and O. Pluta (Amsterdam, 1991). I am currently working on a study of Cajetan in relation to some fifteenthand sixteenth-century Thomist logicians. Recent studies by Bruno Pinchard make some attempt to place Cajetan in his philosophical and theological context but have little to offer so far as relating him to fifteenth-century logic and semantics is concerned. See B. Pinchard, *Métaphysique et sémantique* (Paris, 1987); idem, “Du mystère analogique à la ‘Sagesse des Italiens,’ ” *Les études philosophiques* (1989): 413-27. See also the critical notice of Pinchard’s book by O. Boulnois, ibid., 517-26.

(3) See E. J. Ashworth, “Signification and Modes of Signifying in Thirteenth-Century Logic: A Preface to Aquinas on Analogy,” *Medieval Philosophy and Theology* 1 (1991): 39-67.

10. ———. 1992. "Analogical Concepts: The Fourteenth-Century Background to Cajetan." *Dialogue. Canadian Philosophical Review* no. 31:399-413.

"In 1498 Cajetan published a short book, *On the Analogy of Names*, which is often regarded as a masterly summary of Aquinas's doctrine of analogy. It opens in the very first paragraph with an attack on three views of the concept of being (*ens*): first, that it is a disjunction of concepts; (1) second, that it is an ordered group of concepts; and third, that it is a single, separate concept which is unequally participated by substances and accidents. A number of questions immediately spring to mind. Why are concepts being discussed when analogy is said by Cajetan to be a theory of language? What is meant by ‘concept’? Who held the views under attack and why? So far as I

can tell, the extensive literature on both Aquinas and Cajetan offers no satisfactory answers to these questions.

In this paper I shall locate the views mentioned by Cajetan in some fourteenth-century sources. I shall limit myself in two ways. First, I shall focus on those authors, particularly Peter Aureol (d. 1322), Hervaeus Natalis (d. 1323), and John of Jandun (d. 1328), whose views were discussed by Cajetan's immediate predecessors, (2) and whose works were to be influential during the Renaissance. Second, I shall for the most part ignore the Scotists, who held that 'being' was univocal, and the nominalists, who did not accept common natures, and did not appeal to the distinction between formal and objective concepts.

I hope not only to cast some light on developments in the theory of analogy between Aquinas and Cajetan but also on medieval theories of signification. The doctrine that ens is an analogical term provides us with a useful test case, for given the beliefs that a noun signifies a concept, and that a concept captures a common nature, we are faced with an obvious problem. On the one hand, ens does not seem to be straightforwardly equivocal, in the sense of being subordinated to more than one concept, since we at least have the illusion of being able to grasp ens as a general term; on the other hand, there does not seem to be any common nature involved. The issue is further complicated by beliefs about the nature of mental language. If the language of thought is an ideal language, at least to the extent of containing no equivocal terms, then one can ask what room there is in it for analogical concepts. Such terms as 'healthy' (*sanum*) are capable of analysis into a complex of concepts (e.g., a food is healthy because it contributes to the health of those animals that eat it), but the most important analogical terms, those used of God, are precisely the terms which do not seem susceptible of replacement by a complex whose parts are fully clear.

The theory of analogy as presented by medieval philosophers is also gravely affected by the belief that each word is endowed with its signification, including its grammatical features or

consignification, as a unit. Such an assumption is not easy to reconcile with the thought that language is flexible, and that one and the same word can have different shades of meaning in different contexts without thereby becoming a different lexical item. This is not the place, however, to cast doubt on the viability of the whole enterprise, and I shall content myself with asking how some of the parts of the enterprise were thought to fit together." (pp. 399-400)

(...)

"Conclusion

This short paper merely scratches the surface of fourteenth- and fifteenth-century accounts of analogical concepts. Nonetheless, I hope I have said enough to show that Cajetan needs to be read in the light of his more immediate predecessors, rather than as a man wrestling in solitude with the works of Aquinas." (p. 413)

(1) See Bruno Pinchard, *Métaphysique et sémantique. Autour de Cajetan*. Étude [texte] et traduction du "De Nominum Analogia" (Paris: Vrin, 1987), p. 114. The text has “in-disiunctionis,” but this has to be wrong: cf. p. 133, par. 71, where Cajetan once more lists the three views, beginning with “conceptum disiunctum.” Pinchard wrongly suggests (p. 152, par. 1, n. 5) that the latter text should be emended.

(2) Notably Johannes Capreolus (d. 1444), Dominic of Flanders (d. 1479), and Paulus Soncinas (d. 1494).

11. ———. 1992. "New Light on Medieval Philosophy: The *Sophismata* of Richard Kilvington." *Dialogue. Canadian Philosophical Review* no. 31:517-521.

"The fourteenth-century English philosopher and theologian Richard Kilvington (1302/5–61) presents a useful correction to popular views of medieval philosophy in two ways. On the one hand, he reminds us that to think of medieval philosophy in terms of Aquinas, Duns Scotus and Ockham, or to think of medieval logic in terms of Aristotelian syllogistic, is to overlook vast areas of intellectual endeavour. Kilvington, like many before and after him, was deeply concerned with problems that

would now be assigned to philosophy of language; philosophical logic and philosophy of science. He discussed topics in epistemic logic, semantic paradoxes, problems of reference, particularly those connected with the interplay between quantifiers and modal or temporal operators, and problems arising from the use of infinite series in the analysis of motion and change. On the other hand, this very account of his work raises the important issue of conceptual domain. I have spoken as if Kilvington's work can be neatly classified in terms of contemporary interests; and the temptation to read medieval philosophy in modern terms is only strengthened when one recognizes Kilvington as the first member of the group of Oxford calculatores, men such as William Heytesbury and Richard Swineshead, whose discussions of mathematics and physics have caused them to be hailed as forerunners of modern science."

13. ———. 1992. "Logic in Late Medieval Oxford." In *The History of the University of Oxford, Vol. II: Late Medieval Oxford*, edited by Catto, Jeremy C. and Evans, Ralph, 35-64. Oxford: Clarendon Press.

    Co-author Paul Vincent Spade.

    "This chapter discusses three main periods in the history of Oxford logic that occurred approximately between 1330 and 1500. It talks about three Merton authors who were accountable for the course of much subsequent medieval logical theory — Thomas Bradwardine (1295–1349), William Heytesbury (1313–1372 or 1373), and Richard Billingham. This chapter also evaluates the logical activities that occurred during the late medieval period in Oxford by looking at the collections of texts that circulated in manuscript and were eventually printed as the two libelli sophistarum. It argues that the libelli sophistarum shows a disappointing picture of English logic in the fifteenth century. However, Oxford logic was excellent for it reached a level of sophistication and insight that was not gained

anywhere else until the end of the seventeenth century with Leibniz, and not surpassed until the middle of the nineteenth century."

14. ———. 1993. "Ralph Strode on Inconsistency in Obligational Disputations." In *Argumentationstheorie. Scholastische Forschungen zu den logischen und semantischen Regeln korrekten Folgerns*, edited by Jacobi, Klaus, 363-386. Leiden: Brill.

    "Treatises on obligations represent one of the interesting new developments of medieval logic.(1) They set out the rules which were to govern a certain kind of disputation, the obligational disputation. Truth was not at issue in such disputations, since their starting point was normally a false proposition;(2) nor was any particular subject-matter explored. Instead, according to Strode, their purpose was both to provide exercise for beginning students in handling logical inferences; and to prepare them to reason from truths in real-life situations.(3) He compared these disputations to the military exercises which young soldiers had to undergo before they could participate in real battles.(4)

    Obviously both the acceptance of falsehoods and the application of rules in isolation from a given subject-matter have their dangers; and one of the features of obligations treatises is the way they explore the different kinds of inconsistency which can arise in a disputational setting. In this paper I intend to discuss Ralph Strode's reaction to earlier attempts to amend the rules so as to avoid some of these kinds of inconsistency. So far as Strode's predecessors are concerned, my main focus will be on Roger Swyneshed (5) and on an anonymous author whose treatise on obligations was preserved in a Merton College manuscript, (6) though I shall also pay some attention to Richard Kilvington. (7)" (pp. 363-364)

    (1) For bibliography and discussion, see Paul of Venice, *Logica Magna*. Part II Fascicle 8. [*Tractatus de Obligationibus*] ed./trad. E. J. Ashworth, published for the British Academy by the Oxford University Press, 1988. Two papers which are particularly relevant to the theme of this paper are: P. V. Spade,

' Three Theories of Obligationes: Burley, Kilvington and Swyneshed on Counterfactual Reasoning", *History and Philosophy of Logic* 3, 1982, 1-32; and E. J. Ashworth, "Inconsistency and Paradox in Medieval Disputations: A Development of Some Hints in Ockham", *Franciscan Studies* 44, 1984, 129-139.

(2) Some authors, including Strode, explicitly allowed the possibility of a true *positum*: see Paul of Venice, op. cit., p. 33; Ralph Strode, *Obligationes,* Oxford Bodleian Library MS Canon. misc. 219, fol. 37"; Spade, op. cit., p. 12 (for a discussion of Burley on this point).

(3) Strode, ibid., fol. 37', fol. 37va. The second point is made even more clearly by the anonymous Merton author who refers to jurists and moral philosophers in this context: see N. Kretzmann and E. Stump,' The Anonymous De Arte Obligatoria in Merton College MS. 306", in *Mediaeval Semantics and Metaphysics. Studies dedicated to L.M. de Rik*, ed. E. P. Bos, Nijmegen: Ingenium, 1985, pp. 243 sq., § VI. (Short title: *Anon. Merton*). It should be noted that I use the phrase 'anonymous Merton author' for convenience, and not because we know that he was actually a Mertonian. In Paul of Venice, op. cit., I referred to him as Pseudo-Dumbleton.

(4) Strode, op. cit., fol. 37ra.

(5) Swyneshed's treatise was probably written between 1330 and 1335. For discussion and an edition of the text, sec P.V. Spade, "Roger Swyneshed's Obligationes: Edition and Comments", A*rchives d'histoire doctrinale et littéraire du moyen age* 44, 1977, 243-285. (Short title: *Swyneshed*).

(6) See note 3 above. This treatise was probably written during the period 1335-1349: see Anon. Merton., p. 239.

(7) Since I wrote this paper, *The Sophismata of Richard Kilvington*, edited and translated by Norman Kretzmann and Barbara Ensign Kretzmann, has appeared in two volumes: translation, introduction and commentary, Cambridge: University Press, 1990; edition, Oxford: University Press for the British Academy, 1990. However, I have drawn my material

from Spade, op. cit., pp. 19-28, and from E. Stump, "Roger Swyneshed's Theory of Obligations", *Medioevo* 7, 1981, 143-153.

15. ———. 1994. "*Obligationes* Treatises: A Catalogue of Manuscripts, Editions and Studies." *Bulletin de Philosophie Médiévale* no. 36:118-147.

    "*Obligationes* treatises, which deal with the rules to be followed in a certain kind of logical disputation, still form perhaps the least wellunderstood part of medieval logic. Although a number of texts have been edited in recent years, and although various theses about the nature and purpose of obligational disputations have been put forward, we are unlikely to achieve a proper understanding of the issues until the larger part of the surviving material has been edited and assessed. I have decided to publish the following catalogue of manuscripts, editions and studies in the hope that it will speed up this process of edition and assessment.

    I am reasonably confident that my bibliographies of edited texts, studies and translations are complete and accurate. I am also reasonably confident that my bibliography of early printed editions is more-or-less complete and accurate. I have indicated those few cases in which I have not been able to see a book for myself. So far as medieval manuscripts are concerned, I am less confident, either of completeness or of accuracy. In the catalogue of manuscripts I have indicated whether or not I have seen the manuscript in whole or in part, but unfortunately some of the microfilms I have seen were virtually illegible, owing to their poor technical quality. In the catalogue of medieval authors, I have indicated what I know about current editorial projects. My own editions of John Tarteys, Paul of Venice and Ralph Strode have been completed, and I am now trying to come to grips with the series of obligationes treatises associated with Oxford and Cambridge. Needless to say, I shall be grateful for any comments on, corrections of, or additions to the lists which follow.

    I have to thank those people who have already helped me with information and advice, including Louis J. Bataillon, Egbert P.

Bos, Julian Deahl, Angel d'Ors, Sten Ebbesen, Gedeon Gal, Alfonso Maierù, John Murdoch, Paul Spade, and Rega Wood. I also owe a great debt of gratitude to the Killam Program of the Canada Council for awarding me the Kfilam Research Fellowship which enabled me to do much of the work recorded here.

The material is arranged under the following headings:

1. Catalogue of medieval authors.

2. Catalogue of manuscripts.

3. Early printed editions.

4. Edited texts.

5. Studies and translations." (pp. 118-119)

16. ———. 1994. "Les manuels de logique à l'université d'Oxford aux XIV et XV siècles." In *Manuels, programmes de cours et techniques d'enseignement dans les universités médiévales*, edited by Hamesse, Jacqueline, 351-370. Louvain-la-Neuve: Université Catholique de Louvain, Publications de l'Institut d'Etudes Médiévales.

"Quand j'ai commencé mes recherches pour cette communication, je me suis posé deux questions: Qu'est-ce qu'un manuel; et quels sont les rapports entre l'écrit et l'oral dans l'enseignement de la logique? A première vue, la notion de manuel semble tout à fait claire. Dans Le Petit Robert, on lit « Manuel: ouvrage didactique présentant, sous un format maniable, les notions essentielles d'une science, d'une technique, et les connaissances exigées par les programmes scolaires ». D'après cette définition, on peut exclure de cette catégorie les textes de base, les commentaires, et les monographies destinées aux autres professionnels. Malheureusement, quand on commence à étudier l'enseignement à la faculté des arts à Oxford, on constate très vite que les commentaires étaient utilisés de la même manière que les autres genres de littérature, et qu'il n'est pas possible de faire une distinction nette entre les monographies et les manuels. Qui plus est, on ne peut pas comprendre le contenu ni

le but des manuels sans connaître les textes de base et les techniques d'enseignement.

Ma deuxième question n'a pas de réponse plus claire que la première, car il faut faire face à deux problèmes. Tout d'abord, il y a la tension entre l'écrit et l'oral dans l'enseignement lui-même. D'un côté, cet enseignement était carrément fondé sur l'étude des textes. On prenait les textes d'Aristote, on les lisait, on les commentait, on les apprenait par coeur (1). De l'autre côté, la dispute jouait un rôle central dans l'enseignement, et, par sa structure et son contenu, a stimulé la production d'une grande partie de la littérature médiévale sur la logique. Deuxièmement, il y a la question du rapport entre les textes écrits et les disputes ou les leçons. Est-ce que les textes dont nous disposons, surtout les collections de *sophismata*, reproduisent ce qui se passait dans la salle de classe, ou est-ce qu'on les a écrits pour aider la discussion de ce qui devait se faire dans la salle de classe?

Je vous ai donné ce bref aperçu de mes questions initiales afin de vous expliquer pourquoi je vais parler de l'enseignement en général, avant de me concentrer sur les manuels de logique dans l'acception stricte de ce terme. Dans la première partie de ma communication, je présenterai le programme d'études en logique tel qu'on le trouve à Oxford, mais aussi à Cambridge. Afin de vous donner quelques points de repère, j'expliquerai le contenu de la *Logica vetus* et la *Logica nova*, et j'examinerai les commentaires qu'on associe avec les universités anglaises. Ensuite, je parlerai des manuels de logique, et j'essayerai de montrer comment ils sont liés, et aux silences d'Aristote, et à la dispute comme méthode d'enseignement." (pp. 351-352)

(...)

Pour terminer, je voudrais revenir à mes deux premières questions: Qu'est-ce qu'un manuel? Quels sont les rapports entre l'écrit et l'oral dans l'enseignement de logique? Je pense que la réponse à la première question est tout simplement qu'un manuel est une oeuvre écrite, distincte des textes de base, que l'on utilise dans l'enseignement. Donc, un commentaire des textes de base peut constituer un manuel pour les étudiants, et

un exemple d'un autre genre littéraire en logique peut être une monographie. Quant à la deuxième question, il n'y a pas de réponse facile. Considérons les *sophismata* écrits. Quelques-uns, y compris les *Sophismata* de Kilvington et Heytesbury, étaient écrits comme tels (85); d'autres sont la *reportatio* ou la *determinatio* d'une dispute (86). Ce qu'on peut dire, c'est qu'il y a un grand nombre de *sophismata* que l'on trouve dans tous les textes d'un certain genre. Donc, s'il s'agissait là de *reportationes* de disputes au début, je pense que ces *sophismata* sont très vite devenus de purs exemples écrits, sans référence évidente à une dispute ayant réellement eu lieu (87)." (pp. 369-370)

(1) Comme Alain de Libera l'a très bien dit, « La philosophie s'enseigne aujourd'hui comme au Moyen Age: il a des *auctores* et des *textus*; bref, comme auparavant à Athènes, à Alexandrie et à Bagdad, on lit et on commente ». A. De Libera, *Penser au Moyen Age*, Paris, 1991, p. 144.

(85) E. Sylla, *The Oxford calculators*, dans *The Cambridge History of Later Medieval Philosophy*, éd. N. Kretmann, A. Kenny, et J. Pinborg, Cambridge, 1982, p. 546.

(86) Voir A. Maierù, *The sophism « Omnis propositio est vera vel falsa » by Henry Hopton (Pseudo-Heytesbury's « De Verdate et Falsitate Propositionis »)*, dans S. Read (éd.) *Sophisms in Medieval Logic and Grammar*, Dordrecht - Boston - London, 1993, p. 103-115.

(87) Je voudrais remercier Luce Giard d'avoir revu ma grammaire et beaucoup amélioré mon style.

17. ———. 1995. "Suarez on the Analogy of Being. Some Historical Background." *Vivarium* no. 33:50-75.

"In his *Disputationes Metaphysicae*, published in 1597, the great Scholastic philosopher Francisco Suárez offered an account of the analogy of being that has long been the focus of attention. (1) However, little attempt has been made to situate his account historically, despite the wealth of references to earlier authors given by Suárez himself. (2)

Certainly Suárez is seen as reacting to his predecessors, but only two of these, John Duns Scotus and Thomas de Vio, Cardinal Cajetan, are thought to be of any real importance. In relation to Cajetan, Suárez is criticized (or praised) for allowing the analogy of attribution to embrace both intrinsic and extrinsic denomination, and for refusing to assign the analogy of proportionality any role outside the area of metaphor. In relation to Scotus, Suárez is accused of following Scotus so closely in emphasizing the unity of the concept of being that little if any room is left for genuine analogy. Jean-Luc Marion, for instance, has claimed that Suárez tried to construct a new model of analogy which would allow an escape from univocity at the verbal level while admitting its conceptual presuppositions. (3)

I intend to argue that Suárez is best read as par tof a tradition which predates Cajetan with respect to the classification of types of analogy, and which to some extent predates Scotus in its insistence on a concept of being which is both one and analogical. I add "to some extent" because the fullest working out of the theory of a single analogical concept is found in later works which make full use of Scotus' s own arguments. (4) I shall draw most of my material from three fifteenth century philosophers and theologians, Johannes Capreolus (d. 1444), Dominic of Flanders (d. 1479) and Paulus Soncinas (Paolo Barbo da Soncina, d. 1495). (5) I shall also draw on the sixteenth-century Spaniard Domingo de Soto (d. 1560). (6) All of these authors were cited by Suárez, and all had a clear influence on him.

My paper is divided into two parts. In Part I, I consider how different types of analogy were distinguished and described. In Part II, I turn to the discussion of *ens* itself, and the question of whether it is possible for humans to have a single, separate concept of being.

Because my purpose is to place Suárez in his historical context, I shall not consider his actual arguments in any depth; nor shall I consider the philosophical difficulties inherent in his theories. (7)" (pp. 50-51)

(1) For the text, see Francisco Suárez, *Disputationes Metaphysicae* in *Opera omnia*, vols. 25 and 26,Paris 1866; repr. Hildesheim 1965. I shall refer to these volumes as DM I and II. For discussion of Suárez,see John P. Doyle, 'Suárez, on the Analogy of Being', in: *The Modern Schoolman*, 46 (1969), 219-49, 323-41; and Walter Hoeres, Francis Suarez and the Teaching of John Duns Scotus on "Univocatio Entis" ,in: *John Duns Scotus, 1265-1965*, ed. John K. Ryan and Bernardine M. Bonansea, Washington, D.C.

1965, 263-90 (Studies in Philosophy and the History of Philosophy, 3).

(2) Lyttkens does relate Suárez to Petrus Fonseca, who is certainly an important near contemporary source: see Hampus Lyttkens, *The Analogy between God and the World: An Investigation of Its Background and Interpretation of Its Use by Thomas of Aquino*, Uppsala 1953, 234-6. However, Fonseca is too close to Cajetan to serve my current purposes.

(3) Jean-Luc Marion, *Sur la théologie blanche de Descartes*,Paris 1981, 82: "Loin de conclure à l'univocité,Suárez, va entreprendre de construire un nouveau modèle d'analogie, qui permette à la fois d'échapper verbalement à l'univocité, et d'en admettre

les présupposés conceptuels".

(4) Olivier Boulnois has recognized the importance of the absorption of Scotist arguments by Thomists: see Boulnois in Jean Duns Scot, *Sur la connaissance de Dieu et l'univocité de l'étant*, introduction, traduction et commentaire par Olivier Boulnois, Paris 1988 ,36: "Mais l'univocité triomphe de façon plus éclatante encore à l'endroit où elle est le plus violemment combattue, dans l'école thomiste, car elle s'impose comme le fonds commun sur lequel s'engage la polémique. - Cajetan est ici un cas exemplaire, lui qui entendait défendre l'esprit thomiste contre l'enseignement scotiste", For some discussion of analogical concepts, see E. J. Ashworth, *Analogical Concepts: The Fourteenth-Century Background to Cajetan*, in: Dialogue, 31 (1992), 399-413.

(5) For discussion of Capreolus, see Johannes Hegyi, *Die Bedeutung des Seins bei den klassischen Kommentatoren des heiligen Thomas von Aquin: Capreolus-Sylvester von Ferrara Cajetan*, Pullach bei München 1959. Hegyi has nothing to say about Capreolus on analogy. Some useful biographical material about Dominic of Flanders and Soncinas, as well as a compendium of passages about analogy, can be found in Michael Tavuzzi, Some Renaissance Thomist Divisions of Analogy, in: *Angelicum*, 70 (1993), 93-122.

(6) For discussion of Soto, see E. J. Ashworth, Domingo de Soto (1494-1560) on Analogy and Equivocation, in: Ignacio Angelelli and Maria Cerezo (eds.), *Proceedings of the Third Pamplona Conference on the History of Logic*, New York-Berlin (Walter deGruyter), forthcoming [1996].

(7) For these matters, the reader can safely be referred to the two articles mentioned in note 1.

18. ———. 1995. "Late Scholastic Philosophy. Introduction." *Vivarium*:1-8.

"This issue of *Vivarium* is devoted to late scholastic philosophy, by which I understand a type of philosophy that coexisted with humanism, Renaissance philosophy, and early modern philosophy roughly from the late fifteenth to the late seventeenth century.(1) I shall not attempt to characterize early modern philosophy, other than by pointing out that Descartes's *Meditations* and Locke's *Essay concerning human understanding* may be taken as typical works,but a few remarks about humanism and Renaissance philosophy will help to indicate the types of contrast I wish to draw. So far as humanism is concerned, I follow Kristeller in seeing it as primarily "a cultural and educational program which emphasized and developed an important but limited area of studies." (2) The studies referred to included grammar,rhetoric, poetry, history, and moral philosophy, as opposed to the strictly philosophical disciplines of logic, natural philosophy, and metaphysics, thought here was obviously an overlap in the case of moral philosophy." (p. 1)

(1) For slightly different characterizations, see J. Trentman, 'Scholasticism in the seventeenth century', in: N. Kretzmann, A. Kenny, J. Pinborg (eds.), *The Cambridge History of Later Medieval Philosophy*, Cambridge 1982, 818; and E. Keßler, 'The intellective soul', in: C.B. Schmitt and Q. Skinner (eds.), *The Cambridge History of Renaissance Philosophy,* Cambridge 2 P.O. Kristeller, 1988, 507.

(2) P.O. Kristeller, *Renaissance Thought and Its Sources*, ed. M. Mooney, New York 1979, 22.

19. ———. 1995. "La doctrine de l'analogie selon quelques logiciens jésuites." In *Les jésuites à la Renaissance. Système éducatif et production du savoir*, edited by Giard, Luce, 107-126. Paris: Presses universitaires de France.

Traduction de Lucie Giard.

"Je voudrais présenter, sur l'exemple de quelques auteurs de la Compagnie, la doctrine logique de l'analogie dont j'ai entrepris l'histoire du XIIIe à la fin du XVIe siècle (1). Jusqu'ici on s'était en général intéressé à la question de l'analogie telle qu'elle se présente chez les grands métaphysiciens, notamment Thomas d'Aquin, Jean Duns Scot et Francisco Suárez, auxquels on ajoutait, pour son court traité *De nominum analogia* (1498), un seul logicien, Cajetan (Thomas de Vio) (2). Si ces choix textuels sont compréhensibles, je les crois pourtant trompeurs. D'un côté, l'importance donnée aux arguments de Duns Scot en faveur de l'univocité de l'être a masqué l'existence d'une longue tradition qui acceptait que des termes analogiques correspondent à un seul concept, lui-même analogique. De l'autre, on a présenté Cajetan comme s'il donnait à la fois un résumé des doctrines médiévales et une interprétation de Thomas d'Aquin, restée pure de tout développement postérieur à l'Aquinate, en dépit d'un intervalle de plus de deux siècles entre lui et Cajetan. Je suis persuadée qu'en lisant les logiciens de plus près on aboutira à un jugement plus équilibré sur les positions de Cajetan et de Suárez par rapport à leurs prédécesseurs et qu'ainsi on pourra même mieux comprendre Thomas d'Aquin.

Dans ce chapitre, mon objectif sera limité. Je partirai de la classification des types d'analogie proposée par Francisco de Toledo (1532-1596), un logicien jésuite, et j'en expliquerai les origines à partir des théories médiévales de l'équivocité. Ensuite, en examinant de plus près l'analogie de proportionalité proprement dite, je comparerai les thèses de Toledo sur ce point à celles d'autres jésuites, notamment Pedro da Fonseca (1528-1599) et Antonio Rubio (1548-1615). Je voudrais déterminer comment les logiciens de la Compagnie ont répondu aux demandes de Cajetan. Sans qu'il soit discuté véritablement de Suárez, ce qui suit sera directement applicable à l'intelligence de son rejet de l'analogie de proportionalité proprement dite au bénéfice de l'analogie d'attribution." (pp. 107-108)

(1) On trouvera des bibliographies et des informations sur ce thème dans une série d'études que je lui ai consacrée: Signification and Modes of Signifying in 13th c. Logic: A Preface to Aquinas on Analogy, *Medieval Philosophy and Theology,* 1, 1991, p. 39-67; Analogy and Equivocation in 13th c. Logic: Aquinas in Context, *Mediaeval Studies,* 54, 1992, p. 94-135; Equivocation and Analogy in 14th c. Logic: Ockham, Burley and Buridan, in B. Mojsisch et O. Pluta (eds), *Historia Philosophiae Medii Aevi. Studien zur Geschichte der Philosophie des Mittelalters,* Amsterdam, 1991, t. 1, p. 23-43; Analogical Concepts: The 14th c. Writings of E. J. Ashworth on the History of Logic. Fifth Part: Articles from 1996 to 2005

Articles 1996-2005

1. Ashworth, Earline Jennifer. 1996. "Domingo de Soto (1494-1560) on Analogy and Equivocation." In *Studies on the History of Logic. Proceedings of the Third Symposium on the History of Logic*, edited by Angelelli, Ignacio and Cerezo, Maria, 117-132. Berlin: Walter de Gruyter.

   "In 1543 the Spanish logician, Domingo de Soto, published a commentary on Aristotle's *Categories*. (1) As one might expect, Soto offers a detailed discussion of the opening lines in which Aristotle presents a definition of equivocal terms, but his discussion also includes an analysis of analogical terms, together with an account of the conceptual correlates of such terms. The purpose of this paper is to show how Soto's analysis fits into a long tradition of commentary on the *Categories*. In particular, I wish to show that although Soto betrays the influence of Thomas de Vio, Cardinal Cajetan, whose short book, *On the Analogy of Names,* was published in 1498, it is a great mistake to suppose that the history of analogy from the thirteenth to the sixteenth century should be read through the eyes of Cajetan. At the same time, I hope to throw some light on the background to Suarez, for it seems to me that there is a close relationship between the doctrines found in Soto and those developed by Suarez.

My paper is divided into three parts. In the first part, I shall look at the notion of equivocation and how it came to be related to analogy. In the second part, I shall describe Soto's divisions of analogy and how they are related to those of Cajetan. In the third part, I shall discuss what Soto had to say about the imposition of analogical terms and about their relationship to concepts and natures." (p. 117)

(...)

"3. *Analogy, Imposition, and Concepts*.

The mention of concepts brings us to the last section of my discussion, in which I shall consider Soto's explanation of the way analogical terms were related to conventional signification on the one hand, and to concepts on the other. For Soto, as for other medieval and post-medieval logicians, spoken words were endowed with their signification by arbitrary imposition. Some logicians, including the sixteenth-century Spaniard Antonio Coronel, argued that deliberate equivocation involves two acts of imposition, (39) but Soto followed Dominic of Flanders in affirming that only one act of imposition is involved for analogical terms. (40) In the case of such analogical terms as '*homo*', used of painted men, '*ridere*', used of fields, and '*sanum*', used of urine, there is a transference of signification, and what is imposed to signify one thing, comes to signify another. In the case of 'ens', however, there is no transference. This word was originally imposed to signify *id quod est,* and so it signifies substance and accidents, God and creatures, without any need for a specially extended use. (p. 124)

(...)

"In his *Categories* commentary, Soto was more forthright. After giving a lengthy account of Scotus's arguments for the univocity of the word '*ens*', he put forward four theses. (46) The first thesis was that there is one formal concept of being, a view which Soto supported both by reference to Scotus's arguments and by extra reasons of his own. One of these had to do with imposition. Whoever first imposed the word *'ens*' could not have been thinking specifically of God or of creatures, of

substance or of accidents, any more than do those Latin-speakers who are ignorant of philosophy. So far as the first thesis was concerned, Soto saw no difference between Scotus and Aquinas. His second thesis postulated just one objective concept. Even though many Thomists deny this, he said, '*ens*' signifies one formal ratio in the object, abstracted by reason from substance and accidents. Nonetheless, in his third thesis he stated that 'ens' signifies substance and accidents not univocally but analogically. This is because the ratio is not found simply but *proportionabiliter* in its significates, principally in one and through attribution in the others. In his fourth thesis, Soto turned to God and creatures, stating that '*ens*' is also said analogically of them, even though the case is not strictly comparable to that of substance and accidents. Indeed, he remarked, we can understand why Aquinas said different things in different places if we realize that theological analogy, as Alain de Libera has called it, (47) involves both similarity to and difference from philosophical analogy. On the one hand, there is a similarity to analogy because of the dependence relation between God and creatures. This is why Aquinas, in *Summa theologiae* la q.13 a.5, compared '*ens*' said of God and creatures with '*sanum*'. As urine is a sign of an animal's health, so the perfections of creatures are nothing other than expressions of perfections in God. On the other hand, there is a difference from analogy in that ens is said simpliciter of both God and creatures, and this is why in *De Veritate* q.2 a. 11 Aquinas said that there was an analogy of proportionality between God and creatures. As God exists through the esse formally in him, so do creatures exist through the esse formally in them. In his conclusion, and without saying more about proportionality, Soto remarked that the analogy of being between God and creatures is called univocation because it is nearer to univocation than is the analogy of being between substance and accidents.

4. *Conclusion.*

Soto's four theses point the way to the subtle and intensive analysis of ens given by Suarez in his *Disputationes Metaphysicae*. While Suarez's doctrine is not precisely that of

Soto, there are clear parallels between the two great Spaniards, and Suarez cites Soto's commentary on the *Categories* a number of times. A more precise account of how Suarez made use of Soto's arguments, and how Soto ranks in comparison to Suarez's other sources will, however, have to await another occasion."

2. ———. 1996. "Autour des Obligationes de Roger Swyneshed: la *Nova responsio*." *Etudes Philosophiques* (3):341-360.

"D'aprés l'opinion reçue, les *Obligationes* de Roger Swyneshed, redigées entre 1330 et 1335, signalent deux nouvelles directions dans les debats sur les règies qu'on est oblige de suivre dans un certain type de dispute logique, la dispute obligationnelle (1). D'un côté, ils nous offrent une analyse des diverses formes de

reflexivité beaucoup plus approfondie que celle de Gauthier Burley, dont les *Obligationes* de 1302 sont caracteristiques de la théorie standard (2). De l'autre côté, ils donnent une *nova responsio* sous la forme de deux règles assez surprenantes du point de vue de la logique: 1 /On peut nier une proposition conjonctive après avoir concedé ses deux parties. 2 /On peut conceder une proposition disjonctive avant de nier ses deux parties (3).

Récemment, Angel D'Ors, tout en acceptant l'originalité de Swyneshed à propos des formes de reflexivité, s'est proposé de détruire le mythe de la *nova responsio* de Swyneshed (4). Il pretend que, malgré les apparences, Swyneshead suivait Burley, et qu'il n'y avait qu'une théorie des obligationes durant le XIVe siècle (5).

D'Ors est surtout motivé par son incapacité de comprendre pourquoi Swyneshed aurait présenté une *nova responsio* aussi dépourvue de sens logique (6). Donc, au lieu de chercher une explication des deux règles, il cherche plutôt une explication du fait qu'on attribue ces règles à Swyneshed. Dans ses récents articles, il se concentre sur deux textes auxquels Spade, entre autres, a fait appel afin d'expliquer Swyneshed. Tout d'abord, il prétend que les *Obligationes* de Richard Lavenham (mort après 1399) (7) ont été mal comprises par ses récents lecteurs. Au lieu de suivre la supposée *nova responsio* de Swyneshed, Lavenham s'intéresse à la différence entre le dialogue d'une dispute obligationnelle et le métadialogue dans lequel on discute les raisons pour lesquelles les réponses étaient ou bonnes ou mauvaises, et les règles auxquelles on aurait dû faire appel (8). En ce qui concerne Robert Fland, un autre Anglais qui a écrit entre 1335 et 1370 (9), D'Ors et son collaborateur, Miguel Garcia-Clavel, admettent qu'il parle d'une *nova responsio*, mais ils prétendent que Fland a inventé cette réponse à cause d'un malentendu, et que personne n'a jamais adopté cette réponse (10). Tout comme les lecteurs de Lavenham, Fland n'a pas réussi à comprendre que Swyneshed parle à deux niveaux, le niveau du dialogue de base, et le niveau du métadialogue.

L'hypothèse de la nature mythique de la *nova responsio* est audacieuse et provocatrice. Malheureusement, quand on la regarde de plus près, elle se révèle fausse, le fruit d'un malentendu de la part de D'Ors lui-même (11). Dans cet article, je vais expliquer pourquoi Fland n'a rien inventé, et pourquoi il est possible de considérer Lavenham comme un disciple de Swyneshed.

Mon article se divise en quatre parties. Premièrement, j'aborderai le problème des textes eux-mêmes. Je suis entièrement d'accord avec D'Ors quand il dit que le texte de Fland (qui existe dans un seul manuscrit) est souvent peu fiable, et qu'il y a plusieurs façons de lire le texte de Lavenham. En général, les textes qui traitent des *obligationes* ne sont pas faciles à comprendre. Il y a trop de détails que nous ignorons; les auteurs écrivaient trop vite, sans donner des explications en profondeur; les copistes y ont ajouté trop d'erreurs. C'est précisément à cause de ces problèmes qu'il faut s'appuyer sur une base textuelle aussi étendue que possible, sans se limiter à deux ou trois œuvres. Je montrerai qu'il y avait d'autres auteurs que Fland et Lavenham qui parlaient d'une *nova responsio*, et qui discutaient des deux règles de Swyneshed. Deuxièmement, je donnerai un bref aperçu de la théorie standard des *obligationes*, et je ferai une comparaison entre cette théorie et celle de Swyneshed telle qu'elle est présentée par au moins dix auteurs, à part Fland et Lavenham. En troisième lieu, j'examinerai de plus près les définitions alternatives de la notion clef de propositions non pertinentes, et les différentes règles qui gouvernaient les réponses à ces propositions. Pour terminer, j'expliquerai le rapport entre les règles de Swyneshed et la théorie d'inférence que nous offre un auteur anonyme. C'est ici que l'on trouve enfin le raisonnement qui mena Swyneshed à adopter sa *nova responsio*." (pp. 341-343)

(...)

"Conclusion.

En somme, il faut accepter l'opinion reçue à propos de Swyneshed. Il y avait une *nova responsio* qui se basait sur une théorie d'inférence très restreinte. Malheureusement pour ceux

qui aimeraient interpréter les *obligationes* en fonction des contre factuels ou des mondes possibles, cette théorie restreinte a ses racines dans un manque de compréhension des arguments que l'on retrouve chez Burley. Les enjeux étaient moins intéressants qu'on aurait voulu croire." (pp. 359-360)

(9) Paul Vincent Spade, Robert Fland's Obligationes. An Edition, *Mediaeval Studies*, 42 (1980), p. 41-60.

(10) D'Ors y Garcia-Clavel, op. cit., p. 53: «... la obra de Fland no puede servir como guiâ para la interpretaciôn del auténtico sentido de la doctrina de Swyneshed ; o lo que es lo mismo, que la nova responsio de la que nos habla Fland, como tal, no ha existido nunca, es decir, que no se corresponde con ninguna doctrina que alguien, sea éste quien sea, haya alguna vez realmente defendido, sino que es simplemente el fruto de una mala interpretaciôn de la doctrina cuyo mis ilustre représentante es Swyneshed», cf. p. 69.

(11) Bien que je ne sois pas d'accord avec D'Ors en ce qui concerne Swyneshed, j'ai néanmoins beaucoup appris de lui et de ses œuvres.

3. ———. 1997. "Petrus Fonseca on Objective Concepts and the Analogy of Being." In *Logic and the Workings of the Mind. The Logic of Ideas and Faculty Psychology in Early Modern Philosophy*, edited by Easton, Patricia A., 47-63. Atascadero: Ridgeview.

   "Petrus Fonseca was a Portuguese Jesuit who lived from 1528 to 1599. He was one of those responsible for drawing up the Jesuit *Ratio Studiorum* which set the curriculum for Jesuit schools across Europe, and he was also responsible for initiating the production of the Coimbra commentaries on

Aristotle, or Conimbricenses, which served as texts for many schools and universities in the seventeenth century.(1) He was himself the author of two popular texts, an introduction to logic, and a commentary on Aristotle's Metaphysics. (2) His logic text was one of two alternatives prescribed by the *Ratio Studiorum* of 1599, and may have been used at La Flèche; (3) his *Metaphysics* commentary was used at many Jesuit schools, and may also have been used at La Flèche. (4) In short, Fonseca was a leading figure in the Scholastic Aristotelian tradition of the late sixteenth century, a tradition which lies behind many of the developments in early modern philosophy, and which in many ways is more important than the humanist tradition represented by Petrus Ramus. (5)

I have chosen to discuss Fonseca on objective concepts and the analogy of being both because an examination of these issues will help us to understand how logic came to be bound up with the philosophy of mind and because the history of how these issues were treated helps solve a small problem about Descartes's sources. My paper has four parts. I shall begin by giving a historical outline of treatments of analogy and their relevance to Descartes. (6) Secondly, I shall discuss late medieval theories of signification, particularly as they appear in Fonseca, in order to show how logicians turned away from spoken language to inner, mental language. Thirdly, I shall explain how it was that analogy, as a theory of one kind of language use, was particularly bound up with the discussion of concepts. Finally, I shall look at the distinctions Fonseca made while discussing the concepts associated with analogical terms.

1 Historical Outline: From Scotus to Descartes

In *Meditation* 3, Descartes uses a distinction between formal and objective reality with respect to ideas in order to prove the existence of God. In the secondary literature this distinction is invariably linked with a distinction between formal and objective concepts found in Suarez, whose *Metaphysical Disputations* (published in 1597) was cited by Descartes on one occasion. (7) However, as the literature acknowledges, it is not clear where the distinction originated, or how Descartes came

to know of it. The earliest paper I know of, published by Dalbiez in 1929, looked in two directions.(8) Dalbiez quite accurately traced the distinction back to Duns Scotus and his discussion of the kind of being creatures had in God's mind prior to creation, (9) but Dalbiez thought it improbable that Descartes would have read Duns Scotus. He then suggested that the notion is more likely to have come from Suarez and another near-contemporary, Vasquez, both of whom used the notion in a theological dispute about the views of the fourteenth-century theologian Durandus of Saint Pourçain (d. 1334) on the nature of truth. (10) Little new light has been shed since 1929. (11) In recent papers, Norman Wells still privileges both Suarez and the debate about Scotus on divine ideas. (12) In a paper entitled "Meaning and Objective Being: Descartes and His Sources," Calvin Normore first discusses Duns Scotus and William of Alnwick on objective being in the context of God's ideas; and he then shows how the notion was used by Peter Aureol, William Ockham, and Walter Chatton in a variety of contexts. However, Normore acknowledges that there is a gap between about 1340 and the beginning of the seventeenth century. In his conclusion, he writes that his examination "suggests a Descartes firmly rooted in a Scholastic tradition which is deeply in debt to Duns Scotus and closely allied with fourteenth-century developments in epistemology and in the theory of meaning. This makes the problem of Descartes' immediate sources and the question of his originality even more puzzling." (13)

My own recent work on analogy as a theory of one kind of language use shows that at least one historical path between Scotus and the early seventeenth century can be traced through the Thomistic tradition, though we must remember that late medieval and Renaissance Thomism embraced a variety of different approaches and doctrines. What Thomists had in common was a kind of moderate realism with respect to common natures that differentiated them from the nominalists on the one hand and the Scotists on the other. Nonetheless, Thomists embraced many theses put forward by nominalists, especially Pierre d'Ailly (d. 1420/1); and much of their agenda

had been set by Duns Scotus rather than by Aquinas himself." (pp. 47-48)

(...)

"Conclusion.

I don't want to claim that I can point to precise passages in Fonseca which have influenced Descartes, or Mersenne, or Arnauld, or any other early modern philosopher. On the other hand, I do want to claim that this is the style of discussion, and these are the types of distinctions, with which early modern philosophers, at least up to and including Locke, would have been familiar through the scholastic texts by which they were educated." (p. 63)

(2) Pedro da Fonseca, *Instituiçoes Dialécticas. Institutionum Dialecticarum Libri Octo*, 2 volumes, Joaquim Ferreira Gomes, ed. and trans. (Coimbra: Universidade de Coimbra, 1964), cited as *Instit. Dial.*, Petrus Fonseca, *Commentariorum In Metaphysicorum Aristotelis Stagiritae Libros* (2 volumes), (Cologne, 1615; reprinted Hildesheim: Georg Olms, 1964), cited as *In Met.* Volume 1 contains Tomus I-II and has numbered columns; volume 2 contains Tomus III-IV, and has numbered pages.

(3) Timothy J. Cronin, *Objective Being in Descartes and in Suarez* (Roma: Gregorian University Press, 1966), p. 34

(4) Cronin suggests, pp. 32-33, that Fonseca's commentary was normally used in Jesuit schools.

(5) Useful background is provided by Peter Dear, *Mersenne and the Learning of the Schools* (Ithaca and London: Cornell University Press, 1988). However, Dear overemphasizes the influence of Ramist-style humanism on Fonseca's logic: see pp. 19-21. For an alternative assessment of Fonseca, see E. J.

Ashworth, “Changes in Logic Textbooks from 1500 to 1650: The New Aristotelianism,” *Aristotelismus und Renaissance: In Memoriam Charles B. Schmitt*, Eckhard Kessler, Charles H. Lohr and Walter Spam, eds. (Wiesbaden: Otto Harrassowitz, 1988), pp. 82-84.

(6) Jean-Luc Marion, *Sur la théologie blanche de Descartes* (Paris: Presses Universitaires de France, 1981), devotes much of his book to the theme of Descartes’s reaction to Suârez’s doctrine of the analogy of being. In his discussion, he notes the relation between the analogy of being and objective concepts (e. g., p. 119), and he also mentions Fonseca briefly (p. 123). However, the nature and scope of our investigations is quite different.

(7) Descartes, *Replies* IV, AT VII 235. For discussion see Roger Ariew, “Descartes and scholasticism: the intellectual background to Descartes’ thought,” *The Cambridge Companion to Descartes*, John Cottingham, ed. (Cambridge: Cambridge University Press, 1992), pp. 58-90, esp. p. 79.

(8) R. Dalbiez, “Les sources scolastiques de la théorie cartésienne de l’être objectif à propos du ‘Descartes’ de M. Gilson,” Revue d’histoire de la philosophie 3 (1929), pp. 464-472.

(9) For Fonseca on God’s ideas, including reference to formal and objective concepts, see *In Met*., III, pp. 280b-296b, esp. 286a-288b (Lib. VII, cap. VIII, q. 2).

(10) Dalbiez, pp. 468-470.

(11) Cronin, p. 206, opts for Scotus and Suarez as Descartes’s sources. One useful source is Gabriel Nuchelmans, *Judgment and Proposition from Descartes to Kant* (Amsterdam, Oxford, New York: North-Holland Publishing Company, 1983). He traces the early history of the phrases “esse obiective” and “conceptus obiectivus” in Hervaeus, Aureol, and Durandus, pp. 17-26. In discussing Descartes, he says (p. 41), “it remains difficult to single out any individual sources. His debt is of a very general nature and could have come from any work belonging to a certain climate of thought. There can be little

doubt, however, that one of the main determinants of this climate was the objective-existence theory as it had been developed by such thinkers as Durandus and Aureolus."

On the other hand, I do want to claim that this is the style of discussion, and these are the types of distinctions, with which early modern philosophers, at least up to and including Locke, would have

been familiar through the scholastic texts by which they were educated." (p. 63)

(1) On Fonseca's life and works, see Charles H. Lohr, *Latin Aristotle Commentaries: II. Renaissance Authors* (Florence: Olschki, 1988), pp. 150-51; and John P. Doyle, "Peter Fonseca," *Routledge Encyclopedia of Philosophy*, E. J. Craig, ed. (Routledge: 1998).

(2) Pedro da Fonseca, *Instituiçoes Dialécticas. Institutionum Dialecticarum Libri Octo*, 2 volumes, Joaquim Ferreira Gomes, ed. and trans. (Coimbra: Universidade de Coimbra, 1964), cited as *Instit. Dial.*, Petrus Fonseca, *Commentariorum In Metaphysicorum Aristotelis Stagiritae Libros* (2 volumes), (Cologne, 1615; reprinted Hildesheim: Georg Olms, 1964), cited as *In Met.* Volume 1 contains Tomus I-II and has numbered columns; volume 2 contains Tomus IΠ-IV, and has numbered pages.

(3) Timothy J. Cronin, *Objective Being in Descartes and in Suarez* (Roma: Gregorian University Press, 1966), p. 34

(4) Cronin suggests, pp. 32-33, that Fonseca's commentary was normally used in Jesuit schools.

(5) Useful background is provided by Peter Dear, *Mersenne and the Learning of the Schools* (Ithaca and London: Cornell University Press, 1988). However, Dear overemphasizes the influence of Ramist-style humanism on Fonseca's logic: see pp. 19-21. For an alternative assessment of Fonseca, see E. J. Ashworth, "Changes in Logic Textbooks from 1500 to 1650: The New Aristotelianism," *Aristotelismus und Renaissance: In Memoriam Charles B. Schmitt*, Eckhard Kessler, Charles H. Lohr and Walter Spam, eds. (Wiesbaden: Otto Harrassowitz, 1988), pp. 82-84.

(6) Jean-Luc Marion, *Sur la théologie blanche de Descartes* (Paris: Presses Universitaires de France, 1981), devotes much of his book to the theme of Descartes's reaction to Suârez's doctrine of the analogy of being. In his discussion, he notes the relation between the analogy of being and objective concepts (e. g., p. 119), and he also mentions Fonseca briefly (p. 123).

However, the nature and scope of our investigations is quite different.

(7) Descartes, *Replies* IV, AT VII 235. For discussion see Roger Ariew, "Descartes and scholasticism: the intellectual background to Descartes' thought," *The Cambridge Companion to Descartes*, John Cottingham, ed. (Cambridge: Cambridge University Press, 1992), pp. 58-90, esp. p. 79.

(8) R. Dalbiez, "Les sources scolastiques de la théorie cartésienne de l'être objectif à propos du 'Descartes' de M. Gilson," Revue d'histoire de la philosophie 3 (1929), pp. 464-472.

(9) For Fonseca on God's ideas, including reference to formal and objective concepts, see *In Met*., III, pp. 280b-296b, esp. 286a-288b (Lib. VII, cap. VIII, q. 2).

(10) Dalbiez, pp. 468-470.

(11) Cronin, p. 206, opts for Scotus and Suarez as Descartes's sources. One useful source is Gabriel Nuchelmans, *Judgment and Proposition from Descartes to Kant* (Amsterdam, Oxford, New York: North-Holland Publishing Company, 1983). He traces the early history of the phrases "esse obiective" and "conceptus obiectivus" in Hervaeus, Aureol, and Durandus, pp. 17-26. In discussing Descartes, he says (p. 41), "it remains difficult to single out any individual sources. His debt is of a very general nature and could have come from any work belonging to a certain climate of thought. There can be little doubt, however, that one of the main determinants of this climate was the objective-existence theory as it had been developed by such thinkers as Durandus and Aureolus."

5. ———. 1997. "L'analogie de l'être et les homonymes. *Categories*, 1 dans la "*Guide de l'étudiant*"." In *L'enseignement de la philosophie au XIII siècle. Autour du "Guide de l'étudiant" du ms. Ripoll 109. Actes du Colloque International*, edited by Lafleur, Claude and Carrier, Joanne, 281-295. Turnhout: Brepols.

"C’est par trois définitions que s'ouvrent les *Catégories* d'Aristote (1). Dans la traduction d'Yvan Pelletier, Aristote écrit: «On dit homonymes les êtres dont le nom seul est commun, tandis que la définition de l'essence signifiée par ce nom est différente. Par exemple, l'animal, c'est à la fois l'homme et son image peinte [...]. Par ailleurs, on dit synonymes les êtres dont le nom est commun et pour lesquels, de plus, la définition de l’essence signifiée par ce nom est la même. Par exemple, l'animal, c'est aussi bien l'homme que le bœuf [...]. Enfin, on dit paronymes tous les êtres qui, tout en différant d'un autre par leur cas, reçoivent leur appellation d'après son nom. Ainsi dénomme-t-on, d'après la grammaire, le grammairien et, d'après le courage, le courageux » (2).

Ces trois définitions courtes et sèches nous donnent un point de départ pour examiner les rapports entre la théorie des catégories et la théorie de l'analogie, ou plutôt les théories de l'analogie, chez les logiciens du XIIIe siècle. J’ai dit «les théories de l’analogie», parce qu'il y en a au moins deux. D'un côté, il y a l'analogie comme théorie du langage; d’un autre côté, il y a l'analogie comme théorie métaphysique des rapports hiérarchiques entre substance et accident, Dieu et créature. Dans son analyse approfondie des sources gréco-arabes de la théorie médiévale de l'analogie de l'être, Alain de Libéra parle de divers textes et problématiques, soit sémantiques, soit théologiques, qui sont à l'origine de cette théorie. Pourtant, en

soulignant l'importance primordiale des textes aristotéliciens, il dit: «La théorie médiévale de l'analogie de l'être est principalement issue de la rencontre de *Cat*., I, 1, *Eth. Nic*., 1, 4 et *Métaph.,* IV, 2», pour ajouter ensuite : « Avant cette synthèse, la notion d'analogie a été utilisée en dehors de toute préoccupation métaphysique, comme concept sémantique lié à l'interprétation des deux problèmes logiques standards de l'homonymie: l'élucidation de la distinction entre homonymes et synonymes dans *Cat*., I, 1 ; l'analyse des mécanismes sémantiques de la *fallacia aequivocationis* dans *Ref. soph*., 17» (3).

De Libera a raison quand il dit que l'on trouve l'analogie comme théorie du langage ou théorie sémantique dans les manuels de logique plutôt que l'analogie de l'être, et que, pour comprendre l'analogie de l'être, il faut faire tout particulièrement attention à la *Métaphysique* d'Aristote et à ses commentateurs arabes. Néanmoins, pour des raisons que j'essaierai d'expliquer dans ce travail, il y a des liens étroits entre les *Catégories* et l'étude de l'être comme tel, et il me semble que dans le «Guide de l'étudiant» et dans les autres sources contemporaines que j'ai examinées, nous trouvons la préhistoire de l'analogie de l'être, une préhistoire fondée sur une lecture strictement ontologique des *Catégories* d'Aristote. En même temps, étant donné les problèmes causés par une telle lecture, on peut très facilement comprendre pourquoi les logiciens de la fin du XIIIe siècle et du début du XIVe siècle préféraient, soit une interprétation linguistique, soit une interprétation conceptualiste des catégories elles-mêmes et des notions liées d'analogie et d'homonymie.

Les textes sur lesquels repose mon interprétation sont tout d'abord le «Guide de l'étudiant» et le *De communibus artium liberalium*, édités par Claude Lafleur avec la collaboration de Joanne Carrier (4). À part les commentaires sur les *Catégories* de Boèce et du Pseudo-Augustin (5), j'utilise le commentaire de Jean le Page, écrit entre 1231 et 1235, le commentaire de Robert Kilwardby, écrit vers 1240, et les *Tractatus* écrits entre 1230 et 1245 (6). Tous ces textes sont à peu près contemporains du «Guide de l'étudiant». En plus, j'utilise les *Summule dialectices*

de Roger Bacon, écrites vers 1250, la *Summa* de Lambert de Lagny, dont la première rédaction date de 1250-1255, ainsi que le commentaire sur les *Catégories* d'Albert le Grand, écrit vers 1260 (7). Ces trois textes sont à peu près contemporains du *De communibus artium liberalium*. Enfin, pour donner une idée des développements doctrinaux dans la dernière partie du XIIIe siècle, je ferai référence aux commentaires de Pierre d'Auvergne, de l'Anonyme de Madrid, de Simon de Faversham et de Martin de Dacie, tous écrits entre 1270 et 1300 (8).

Mon étude se divise en trois parties. En premier lieu, comme introduction à mon thème principal, je donnerai un bref aperçu de l'analogie dans les manuels de logique et dans les commentaires sur Aristote. Ensuite, je traiterai du sujet de la logique aristotélicienne en général et du sujet des Catégories en particulier. Mon but ici est de montrer l'importance de l'être, surtout dans le contexte de deux questions: y a-t-il une science unique des catégories, et quels sont les rapports entre la logique et la métaphysique ? Pour terminer, j'aborderai les rapports entre homonymes, synonymes et paronymes, interprétés comme des réalités et non pas comme des mots, dans le contexte de la question: pourquoi Aristote a-t-il placé les homonymes avant les synonymes et les paronymes?" (pp. 281-283)

(...)

"Avant de terminer, je voudrais examiner les paronymes de plus près. Rappelons la définition aristotélicienne: «on dit paronymes tous les êtres qui, tout en différant d'un autre par leur cas, reçoivent leur appellation d'après son nom». L'expression «par leur cas» («solo casu» en latin) suggère une variation de forme purement linguistique, mais l'auteur du «Guide de l'étudiant» réussit à trouver une interprétation ontologique. Il dit que «solo casu» veut dire «par une inclinaison ou une contraction ou une agrégation relative à un sujet» («inclinatione uel contractione uel concretione ad subiectum», § 539), et on peut lier ce passage à celui dans la section sur la grammaire (§ 224) où il dit que le logicien s'occupe de la relation entre les accidents et la substance

(«logicus intendit de compara-tione quam habent accidentia ad substantiam»). À première vue, Kilwardby semble donner une interprétation voisine de celle de notre auteur. Il dit que les termes dénominatifs signifient cum casu car ils signifient un accident en fonction de sa relation à un sujet, et que le mot principal signifie *sine casu*, c'est-à-dire sans une relation au sujet (61). Cependant, quand il nous offre ses précisions sur l'expression « sola cadencia ad materiam a principali» comme explication de «différant solo casu», il parle de la matière des *voces*. Roger Bacon nous offre trois interprétations de l'expression «solo casu», dont deux sont linguistiques (62). En premier lieu, le cas peut être une simple variation de forme, et on trouve cette interprétation chez Albert le Grand (63). En deuxième lieu, le cas peut être une variation de forme relevant de la dérivation lexicale, et ici il emploie l'expression «sola cadentia unius ab alio, sive formatione». On trouve cette interprétation chez Lambert de Lagny (64). En troisième lieu, le cas peut être la chute d'une forme vers la matière et le sujet, et ici il emploie l'expression «sola cadentia formae ad materiam et ad subiectum». Cette dernière interprétation est la plus proche de celle de notre auteur." (pp. 294-295)

Voilà donc un bref aperçu de la façon dont l'auteur du «Guide de Vétudiant» et ses contemporains traitent de la problématique de l'être dans le contexte des Catégories. Je suis persuadée qu'une étude plus approfondie et plus longue que la mienne nous aidera à mieux comprendre l'apparition de l'analogie de l'être chez les philosophes et théologiens du XIIIe siècle.

6. ———. 1998. "Analogy and Equivocation in Thomas Sutton O.P." In *Vestigia, Imagines, Verba. Semiotics and Logic in Medieval Theological Texts (XIIth-XIVth Century). Acts of the XIth Symposium on Medieval Logic and Semantics. San Marino, 24-28 May 1994*, edited by Marmo, Costantino, 289-303. Turnhout: Brepols.

   "One of the most obvious places where theology and logic meet is in the diuscussion of the divine names. From the 1240s on, the standard way for theologians to handle the problem of religious language involved an appeal to the theory of analogy, (1) a theory which was worked out in the logic textbooks in the context of equivocal and univocal terms (cfr. Ashworth, "Analogy and Equivocation in Thirteenth-Century Logic. Aquinas in Context", *Mediaeval Studies* 54, 1992, pp. 94-135). The problem of religious language can be put roughly like this. Words such as ‘good’, ‘just’, and ‘wise’ do not seem to have exactly the same sense when used of God as they do when used of human beings. That is, they are not univocal. On the other hand, they cannot be used with a completely different sense if religious discourse it to have any point. That is, they cannot be equivocal. If they are neither univocal nor equivocal, they must be used with some related sense,that is, analogically. But what is the appropriate model for analogical usage? If the model is that of the word *sanum* (healthy), which can be applied in an extended sense to a diet on the grounds that the diet is causally related to the animal which is called healthy in the primary sense, then we have what Cajetan later called the analogy of attribution. (2) On the other hand, if the model is that of the word *principium* (principle), which is applied both to a point and to a source on the grounds that the source is related to a river in the way that a point is related to a line, we have what Cajetan later called the analogy of proportionality. The first type of analogy, the analogy of attribution, involves just one relationship whereas the second type, the analogy of proportionality, involves a comparison between two relationships. As is well known, Thomas Aquinas appealed to

the analogy of proportionality in *De veritate* q. 2, a. 11, but more usually appealed to the analogy of attribution. Cajetan, on the other hand, claimed that the analogy of proportionality was the only true analogy, and that it should be employed in metaphysics and theology.

Thomas Sutton, an Oxford Dominican who lived from about 1250 to 1315 or 1320, has attracted some attention because he employed the analogy of proportionality in his *Quaestiones ordinariae*, written in the first decade of the fourteenth century. (3) Insofar as he did so, he was described by Montagnes (1963, p. 124) as a precursor of Cajetan who moed away from Aquinas. Schneider (1977), in his introduction to the *Quaestiones* tried to modify Montagnes's judgment, by suggesting that there was no real break with Aquinas; (4) but none of those who have discussed Sutton in the literature have done other than suggest that he appealed to analogy of proportionality to resolve problems of linguistic use, whereas the analogy of attribution had to do with those relations of things that ground our language. In an early article on Sutton, Przezdziecki (1959) presented Question 32 as showing that *ens* is an analogical term, but turned to Question 33's account of proportionality for an explanation of what type pf analogy was involved, completely ignoring the discussion of attribution in the earlier question. (5) In a recent book, Riva (1989) noted the presence of the two types of analogy in Sutton's work, but argued that the tension between them is resolved by the distinction between words and things. (6) He claims that for Sutton proportionality has to do with terms, while attribution concerns the relations among things on which talk about proportionality is based.

In this paper I intend to look at the details of Sutton's theory of analogy in relation both to the authors with whom he is debating, and to the basic logical distinctions he employed. In the first section I shall give a brief outline of what the logicians had to say. In the second section Ishall discuss the word *ens*, beginning with three views that Sutton rejected before going on to examine his own views about *ens* in metaphysics in theology. In the final section, I shall consider Sutton's discussion of the

divine names proper, namely perfection words such as ‘good', 'wise' and ‘just’. I shall show that although Sutton appeals to proportionality in this last case, he uses the analogy of attribution in his discussion of how the word *ens* is applied to substance and accident. Moreover, he is just as much concerned with language in the one case as he is in the other. As a result his overall view is a lot more flexible than Cajetan’s." (pp. 289-290)

(...)

"Despite Montagnes’s description of Sutton as a precursor of Cajetan, I think that he is in many ways quite different. While holding that the analogy of proportionality is analogy in the strictest sense, he makes no attempt to apply it to metaphysical problems in general or to link it with the distinction between intrinsic and extrinsic denomination. The real importance of the distinction between the analogy of attribution and the analogy of proportion is not that one is in fact linguistically more proper than the other; nor is it that one deals with intrinsic denomination whereas the other deals with extrinsic denomination, for both involve at least some cases of intrinsic denomination. Rather, the real importance of the distinction has to do with the areas of discourse in which the two types of analogy function. The analogy of attribution works at the level of (non-theological) metaphysics and the discussion of created beings; the analogy of proportionality is necessary in theology given the doctrine that an infinite God creates beings which, while finite and infinitely distant from their creator, nonetheless participate in his being and goodness, imitating him as far as they are able." (p. 298)

(1) See, e.g., Alexander of Hales, *Summa theologica*, 4 vols, Ad Claras Aquas (Quaracchi), Collegium S. Bonaventurae, 1924-1948, I, p. 544b: “nomina [...] ut iustus, bonus et huiusmodi, non dicuntur aequivoce nec univoce, quia non penitus secundum aliam rationem nec tarnen secundum eamdem, sed dicuntur analogice secundum prius et posterius”. (This passage is continued in note 31.)

(2) For Cajetan, whose *De nominum analogia* was published in 1498, see Bruno Pinchard, *Métaphysique et sémantique. Autour de Cajetan*, Etude [texte] et traduction du "De nominum analogia", Paris, Vrin, 1987.

(3) For recent references concerning Sutton's life and works, see Alessandro D. Conti, "La composizione metafisica dell'ente finito corporeo nell'ontologia di Sutton", *Documenti e studi sulla tradizione filosofica medievale* 2/2, 1991, pp. 317-60 (317-18, note 1). It should be noted that Sutton does not use the word *proportionalitas*, but speaks of *aequivoca secundum proportionem*, see, e.g., p. 918.247.

(4) Cf. Johannes Schneider, "Introduction", in Thomas Sutton, *Quaestiones ordinariae,* Bayerische Akademie der Wissenschaften 1977, pp. 241*-262*, especially pp. 257*-258* and p. 261*.

In this article, Schneider's Question 32 A is referred to as Question 33 and Schneider's Question 33 is referred to as Question 34.

7. ———. 1998. "Aquinas on Significant Utterance: Interjection, Blasphemy, Prayer." In *Aquinas's Moral Theory: Essays in Honor of Norman Kretzmann*, edited by MacDonald, Scott and Stump, Eleonore, 207-234. Ithaca: Cornell University Press.

"It may seem perverse to turn to Aquinas's moral philosophy for light on his philosophy of language, but I argue that his study of human actions forced him to modify the intellectualism prevalent in much thirteenth-century logic and grammar. This intellectualism had three components. First, it privileged the notion of language as a rational, rule-governed system which could be studied in isolation from context and speaker intention.(2) Second, it focused on propositions as the linguistic units which conveyed the information necessary for *scientia* and rejected other forms of discourse as irrelevant. Third, it described individual words as the signs of concepts and ignored utterances which express passions of one sort and another. These components, particularly the second and third,

do indeed characterize Aquinas's considered approach to language as expressed particularly in his commentary on Aristotle's *De interpretatione*. Nonetheless, his recognition that human beings are animals with passions, together with his recognition that utterances are themselves a kind of action subject to moral assessment, forced him to take a different direction in other places.(3)

I proceed as follows. In sections 1 and 2, I set forth the intellectualist components of Aquinas's theory, paying particular attention to the manifestation of truth and to the senses in which conventionally significant utterances could also be said to be naturally significant. In sections 3, 4, and 5, I explore the relationships between animal noises and human utterances, paying particular attention to the role of the imagination and to interjections. In sections 6 and 7, I consider the role of human passions and human intentions in the understanding and production of conventional utterances, especially sinful ones. In sections 8 and 9, I look at two aspects of language production which can serve to mitigate sin: slips of the tongue, and linguistic incontinence, or breaking out into ill-considered words. In the last section, I turn to the situation in which we recite and appropriate the words of others, particularly in prayer. Throughout, I examine not only Aquinas's own doctrines but also those of grammarians and logicians contemporary with him." (pp. 207-208)

(2) For discussion of this approach in the *modistae*, and for full information about grammarians who adopted an alternative approach, which she has dubbed intentionalist because of its focus on the *intentio proferentis*, sec the papers by Irène Rosier cited throughout, all of which contain further references. See esp. Irène Rosier. “La distinction entre *actus exercitus* et *actus significatus* dans les sophismes grammaticaux du MS BN lat. 16618 et autres textes apparentés,“ in *Medieval Logic and Grammar*, ed. Stephen Read (Dordrecht: Kluwer Academic Publishers, 1992}, pp. 257-59; and her book (published after this paper was written), *La parole comme acte: Sur la grammaire et la sémantique au xiiie siècle* (Paris: J. Vrin, 1994). Rosier's work is particularly important for its

demonstration that the modistic paradigm does not apply to much thirteenth-century grammar. I would like to take this opportunity of thanking Irène Rosier for the generous way in which she has shared her as yet unpublished research with me; this e&sav owes much to her work.

(3) Rosier has shown that in his discussion of the sacraments Aquinas was far closer to the intentionalist grammarians than he was to the modistae. See Irène Rosier, "Signes et sacrements: Thomas d'Aquin et la grammaire spéculative", *Revue des sciences philosophiques et théologiques* 74 (1990): 431-32. She writes (p. 394): "Les particularités linguistiques des formules sacramentaires, et du sacrement comme signe non seulement cognitif, mais opératif, l'importance accordée à l'intention du locuteur et du récepteur, la conjonction de ces divers éléments dans un acte à chaque fois singulier, nous situent d'emblée dans la dimension 'pragmatique' du langage, devéloppée, à la même époque, en ce milieu du Xllle siècle, par les grammairiens 'intentionalistes.' " Both here and later (p. 433) she speaks of the encounter between grammarians and theologians, but she refuses to speculate about whose influence was primary (pp. 432-33).

8. ———. 1998. "Antonius Rubius on Objective Being and Analogy: One of the Routes from Early Fourteenth-Century Discussions to Descartes's *Third Meditation*." In *Meetings of the Minds. The Relation between Medieval and Classical Modern European Philosophy*, edited by Brown, Stephen F., 43-62. Turnhout: Brepols.

   "In this paper I shall use Rubius's tract on analogy to show how a rich medieval tradition survived into the seventeenth century and to shed some light on the problem of Descartes's sources for the notion of an idea's objective reality. I shall proceed as follows. First, I shall state the problem as it has been set out in recent secondary literature. Second, I shall trace the distinction between formal and objective concepts from the early fourteenth century to the early seventeenth century in the context of the discussion of analogical terms. Third, I shall examine the analogical use of terms as it was presented by Rubius. Fourth, I shall explain why a theory of language use

and a theory of concepts carne to be linked together. Finally, I shall discuss what Rubius had to say about formal and objective concepts, and I shall suggest a relationship between this account and Descartes's own attitude towards mental contents and simple natures."

9. ———. 1999. "Text-Books: A Case Study - Logic." In *The Cambridge History of the Book in Britain (vol. 3)*, edited by Trapp, Joseph Burney and Hellinga, Lotte, 380-386. Cambridge: Cambridge University Press.

   "This book covers the years 1400 to 1557. In such a long period, we would expect great changes in the logic text-books used at Oxford and Cambridge. Indeed, there were great changes, but their timing is some what unexpected. If one considers just books written by Englishmen and copied or printed in England, then there is hardly any change at all between 1400 and 1530, the year in which the last surviving edition of the compilation text-book known as *Libellus Sophistarum* was printed. A period of fifteen years follows in which no surviving logic text was either written or printed, and then suddenly in 1545 we are confronted with the *Dialectica* of John Seton, a work which was to go through fourteen editions by the end of the sixteenth century, and which represents a completely different type of logic.(1) In what follows, I shall focus on the *fortuna* of just one type of logic text in use between 1400 and 1530, namely the treatises devoted to *obligationes*, or the rules prescribing what one was obliged to accept and reject in a certain kind of logical disputation.

   It is necessary first to consider the place of logic in the curriculum and the type of instruction which was offered, then to say something about fourteenth-century logicians and the *obligationes* texts used in the fifteenth century, and finally to examine the *Libelli Sophistarum* and other early printed texts in relation to fifteenth-century manuscript collections." (p. 380)

   (1) A useful chronological list of logic books printed in England before 1620 is in Schmitt 1983b [*John Case and Aristotelianism in Renaissance England*, Kingston and

Montreal] pp. 225-9. For English logic during the sixteenth century: Ashworth 1985b *[Introduction* to Robert Sanderson. *Logicae artis compendium,* Bologna], especially pp. XXIII-XXXIII; 1991; Giard 1985 [La production logique de l'Angleterre au 16e siècle, *Les Études philosophiques,* 3, 303-324]; Jardine 1974 [The place of dialectic teaching in sixteenth century Cambridge, *Studies in the Renaissance*, 21, 31-62]. No attention should be paid to Howell 1956 [*Logic and rhetoric in England*, *1500-1700*, Princeton] whose account of developments in logic, particularly during the medieval period, is wildly inaccurate, and this vitiates his judgements about the texts described.

10. ———. 2000. "Domingo de Soto on *Obligationes*: His Use of *Dubie positio*." In *Medieval and Renaissance Logic in Spain. Acts of the 12th European Symposium on Medieval Logic and Semantics*, edited by Angelelli, Ignacio and Perez-Ilzarbe, Paloma, 291-307. Hildesheim: Georg Olms.

    "Soto's *Opusculum obligationum* was published in 1529 as the last treatise in his *Summulae*. (1) I have chosen to discuss it in this paper both because it is one of the very last serious discussions of the medieval doctrine of *obligationes*, and because it sheds some light on the history of *dubie positio* as a type of obligational dispute. This is important, beeause *dubie positio* is one of the areas pertinent to medieval epistemie logic, and the material found in *obligationes* treatises has not yet been the subject of much investigation. (2) In what follows, I shall first discuss the nature of *dubie positio* and its relation to other types of obligational disputation. I shall then describe the rules which were used. Third, I shall take up a particular problem concerning apparently indubitable propositions, such as 'I exist'. Finally, I shall discuss a sophisma in which the response 'I am in doubt about it' seemed to cause problems for one of the standard obligational rules.

    (1) Domingo de Soto, *Opusculum obligationum in Summulae* (Burgos, 1529), ff. cl ra-cliii vb; Domingo de Soto, *De obligationibus* in *Summulae* (Salamanca 1554-1555: reprinted Hildesheim, New York: Georg Olms, 1980), ff 156 ra-159 vb. The latter is a reproduction of the third edition which, as Dr.

Angel d'Ors has shown, modifies the second edition in certain respects: see Angel d'Ors, "Las "Summulae" de Domingo de Soto", *Anuario Filosôfico (Universidad de Navarra)* 16 (1983), p. 212. All my references are to the 1529 edition unless otherwise specified.

See also William Heytesbury, 'The Compounded and Divided Senses' (pp. 413-434), and "The Verbs 'Know' and 'Doubt" [chapter 2 of the *Regulae*] (pp. 435-479) in Norman Kretzmann and Eleonore Stump, trans., *Logic and the Philosophy of Language*, vol. 1 of *The Cambridge Translations of Medieval Philosophical Texts*, (Cambridge: Cambridge University Press, 1988)."

11. ———. 2003. "L'equivocité, l'univocité et les noms propres." In *La tradition médiévale des catégories (XIIe-XVe siècles). Actes du XIII Symposium européen de logique et de sémantique médiévales (Avignon, 6-10 juin 2000)*, edited by Biard, Joël and Rosier-Catach, Irène, 127-140. Louvain: Peeters Publishers.

"Dans ses *Quaestiones in artem veterem*, Albert de Saxe commence la section consacrée aux *Catégories* d'Aristote en posant la question « Est-ce que le même terme peut être équivoque et univoque ? » (1). Un peu plus tard, Marsile d'Inghen reprend cette question, légèrement reformulée, dans ses propres *Questiones libri predicamentorum* (2); et en 1428, Paul de Venise consacre une partie de son *Commentaire sur les Catégories* à la même question (3). De plus, on retrouve une discussion approfondie des rapports entre les équivoques et les univoques dans le *Compendium totius logice Joannis Buridani* de Jean Dorp, qui date probablement de la dernière décennie du xive siècle (4). Certes, la question posée par Albert de Saxe n'était pas nouvelle, ayant son origine dans les commentaires de Boèce et de Simplicius, mais les réponses à cette question introduisent deux thèmes nouveaux, l'univocité des noms propres, et l'équivocité des termes mentaux. Ces deux thèmes sont importants, étant donné que depuis l'Antiquité classique le nom propre est l'exemple standard d'un mot équivoque par

hasard (*a casu*), et étant donné la présupposition que le langage mental est un langage clair, donc univoque.

Mon étude se divise en trois parties. En premier lieu, je donnerai un bref aperçu de la doctrine des noms propres, telle qu'on la retrouve chez les grammairiens et les logiciens. Ensuite, je ferai quelques remarques sur les définitions avec lesquelles s'ouvrent les *Catégories* d'Aristote. Finalement, j'aborderai la question principale, celle des rapports entre les équivoques et les univoques, surtout en ce qui concerne les noms propres et les termes mentaux.

Avant d'aller plus loin, je dois préciser que je vais laisser de côté la question, pourtant très intéressante, de l'équivocité du nom propre appliqué au vivant et au mort. Je me concentrerai sur le cas que l'on trouve dans les premières sections des commentaires sur les *Catégories*, celui d'un nom propre appliqué à deux personnes différentes." (pp. 127-128)

(...)

"Conclusion.

Les discussions que nous venons d'examiner montrent comment les logiciens du XIVe et XVe siècles ont essayé de concilier les catégories du nom offertes par Aristote, c'est-à-dire les noms équivoques et les noms univoques, avec les catégories du nom offerts par Priscien, c'est-à-dire les noms propres et les noms communs. En même temps, elles montrent comment les commentateurs des *Catégories* d'Aristote ont absorbé la nouvelle épistémologie qui reconnaissait les concepts singuliers et la nouvelle sémantique qui utilisait la terminologie de la grammaire et celle de la logique pour parler de ces concepts." 12. ———. 2003. "Language and Logic." In *The Cambridge Companion to Medieval Philosophy*, edited by McGrade, Arthur Stephen, 73-96. Cambridge: Cambridge University Press.

    "I survey the texts used and the developments from Augustine onwards, and discuss views of the purpose and nature of language and logic, emphasizing their cognitive orientation. I examine the basic semantic notion of signification, the distinction between conventional and natural language, and the notion of mental language. I discuss extended uses of language, especially paronymy and analogy, and theories of reference, especially supposition theory. Finally, I consider various types of paradox: "There is no truth" in proofs for the existence of God, the Liar paradox, and the paradoxes of strict implication as treated in theories of inference."

13. ———. 2004. "Singular Terms and Singular Concepts: From Buridan to the Early Sixteenth Century." In *John Buridan and Beyond. Topics in the Language Sciences 1300-1700*, edited by Ebbesen, Sten and Friedman, Russell L., 121-151. Copenhagen: C. A. Reitzel.

    "This article considers medieval treatments of proper names and demonstrative phrases in relation to the question of when and how we are able to form singular concepts. The logical and grammatical background provided by the authoritative texts of Porphyry and Priscian is examined, but the main focus is on John Buridan and his successors at Paris, from John Dorp to Domingo de Soto. Buridan is linked to contemporary philosophers of language through his suggestion that, although the name 'Aristotle' is a genuine proper name only for those who have the appropriate singular concept caused by acquaintance with Aristotle, it can be properly treated as a singular tem by subsequent users because of their beliefs about the original imposition of the name."

14. ———. 2004. "Singular Terms and Predication in some Late Fifteenth and Sixteenth Century Thomistic Logicians." In *Medieval Theories on Assertive and Non-Assertive Language: Acts of the 14th European Symposium on Medieval Logic and Semantics. Rome, June 11-15, 2002*, edited by Maierù, Alfonso and Valente, Luisa, 517-536. Florence: Olschki.

    "In an influential paper, Frege made a sharp distinction between the ‘is’ of identity and the ‘is’ of predication. He wrote «The concept (as I understand the word) is predicative. On the other hand, a name of an object, a proper name, is quite incapable of being used as a grammatical predicate. This admittedly needs elucidation, otherwise it might appear false. Surely one can just as well assert of a thing that it is Alexander the Great, or is the number four, or is the planet Venus, as that it is green or is a mammal? If anybody thinks this, he is not distinguishing the usages of the word ‘is’».(1)

    (...)

"It is very tempting to apply Fregean distinctions to medieval discussions, and Hermann Weidemann for one suggests that this is justifiable. He cites Aquinas's use of «praedicatio per identitatem» to support the claim that «Aquinas is well aware of the difference between the 'is' of predication and the 'is' of identity(2) and he reads the distinction into a passage from the *Summa theologiae* (*ST* la.13.12c) when he writes: «That is to say to make explicit what Aquinas seems to be implying - that, just as the *predicative statement* that Socrates is white states the inherence in Socrates of the property of whiteness as the identity of Socrates with something while, the *identity statement* that Socrates is Socrates states the identity ol Socrates with himself as the inherence in Socrates of the property of being Socrates».(3) We should note that there are two issues here. The first is whether one can distinguish an 'is' of identity from an 'is' of predication. The second has to do with the identity and inherence interpretations of statements containing the so-called 'is' of predication. Is it the case that a predication is true if and only if the referents of subject and predicate are identical, or is it the case that a predication is true if and only if the form signified by the predicate inheres in the subject? Weidemann's remarks draw our attention to an important feature of medieval discussions, namely the various ways in which questions of reference and questions of predicattion were brought together. Just as medieval logicians did not make a sharp, once and for all, distinction between the 'is' of identity and the 'is' ol predication, or between subjects and predicates, so Thomists at least did not make a sharp distinction between identity and inherence interpretations of statements containing the 'is' of predication.

In this paper I shall attempt to show how some medieval authors approached these issues by considering some Thomistic views about the predication of proper names and by exploring various uses of the phrases 'praedicatio per identitatem' and 'praedicatio identica'. The two authors that I shall focus on are Thomas de Vio, Cardinal Cajetan (1468-1534), whose commentaries on Porphyry's *Isagoge* and Aristotle's *Categories* were written by 1498 but not published

until 1506, and Domingo de Soto (1494-1560), whose commentaries on the same two works were first published in 1543. I shall also make some use of commentaries by the later Jesuit author, Francisco de Toledo (1533-1596). My paper has five sections. I shall begin by considering the authoritative texts that caused the debate about whether proper names and perhaps individual things themselves can be predicated. Next, I shall consider some non-Thomistic solutions to the problem. Third, I shall make some remarks about the Thomistic theory of predication in relation to the central case of true, affirmative, present-tense, unquantified propositions whose subject terms are not intended to be taken with either simple or material supposition. Fourth, I shall explore the notion of «praedicatio per identitatem». Finally, I shall consider the distinctions made by Cajetan and Soto." (pp. 516-519, some motes omitted)

15. ———. 2005. "Ockham et la distinction entre les termes abstraits et concrets." *Philosophiques* no. 32:427-434.

"Quand j'ai lu l'ouvrage magistral de Claude Panaccio (*), je me suis rendu compte que j'aurais de la difficulté à en discuter, parce que je suis d'accord avec tout ce dit l'auteur, surtout en ce qui concerne les problèmes du langage. Je trouve en particulier décisif les arguments qu'il présente contre les thèses de Paul Spade. Ce dernier a argumenté, en se basant sur trois prémisses, qu'il n'y a pas de terme connotatif simple dans le langage mental. Premièrement, chaque terme connotatif a une définition nominale qui, en principe, ne contient que des termes absolus. Deuxièmement, un terme connotatif est synonyme de sa définition.

Troisièmement, il n'y a pas de synonymie dans le langage mental. Il s'ensuit que, dans le langage mental, un terme connotatif sera remplacé par une séquence de termes absolus qui, selon Ockham, réfèrent aux substances et qualités individuelles d'une manière directe. En opposition à Spade, Panaccio a montré qu'il est impossible d'éliminer les concepts connotatifs simples du langage mental et que les termes connotatifs simples ne sont pas synonymes de leurs définitions nominales. Il est vrai que par ses analyses du langage Ockham voulait montrer que l'on pouvait parler du monde sans multiplier les entités, mais on peut atteindre cet objectif tout en admettant une certaine complexité au niveau des concepts simples. En outre, Panaccio a établi deux thèses importantes. D'abord, Ockham ne s'intéresse pas à la construction d'un langage mental idéal mais plutôt au fonctionnement idéal de notre esprit. En deuxième lieu, l'étude de ce fonctionnement idéal ne nous donne pas toutes les solutions aux problèmes de signification parce que, pour comprendre l'acception des termes, il faut connaître les intentions des impositeurs, ceux qui ont donné leur signification primordiale aux termes oraux. Selon Panaccio, Ockham présente une théorie externaliste de la signification du langage." (p. 427)

Writings of E. J. Ashworth on the History of Logic. Sixth Part: Articles from 2006 to 2021

Articles 2006-2021

1. Ashworth, Earline Jennifer. 2006. "Logic Teaching at the University of Prague around 1400 A. D." In *History of Universities. Vol. XXI/1*, edited by Feingold, Mordechai, 211-221. New York: Oxford University Press.

   Review of: *Logica modernorum in Prague about 1400. The Sophistria disputation 'Quoniam quatuor' (MS Cracow, Jagiellonian Library 686, ff. 1ra-79rb), with a partial reconstruction of Thomas of Cleves' Logica* - Edition with an Introduction and Appendices by Egbert P. Bos, Leiden, Brill, 2004.

   "This book is largely (45-432) an edition of a *Sophistria* text that represents logic teaching at the University of Prague around 1400 A.D. While the anonymous author shows few signs of intellectual distinction, both the topics chosen for discussion and the large number of direct references to other logicians make the work a valuable source for those interested in the undergraduate curriculum of the late middle ages. The editor, E.P. Bos, has done an excellent job of presenting the Latin text in as perspicuous a fashion as possible, and has provided the reader with an analysis (8-10) of the somewhat haphazard way in which the Prague master presented his sequences of arguments. However, in order to understand the text, or to glean from it anything about university teaching, one

needs a good deal more than that. While Bos does provide some basic information about the logicians referred to (11-21), he tells the reader very little about Prague or its curriculum, and his brief list (28-32) of some of the views expressed in the text sheds little light. On page 28 he writes, 'I shall discuss these views in more detail later in the introduction', but unfortunately the promised amplification is never provided. Nor is it clear why some of the views were listed. For instance, the division of singular terms into three types (29-30), including the vague individual (*individuum vagum*), such as 'this human being', is merely the standard interpretation, found in Albert the Great and many later commentators, of a remark by Porphyry in his *lsagoge*. In what follows, I shall provide some context for the *Sophistria* text, before attempting to resolve the issue of its nature and purpose." (p. 211)

2. ———. 2007. "Metaphor and the Logicians from Aristotle to Cajetan." *Vivarium* no. 45:311-327.

   "In this paper I shall sketch an answer to a series of questions about the treatment of metaphor by medieval logicians. One question is linguistic: are the words “translatio” and “transumptio” synonyms of the word “metaphora”?

   Three other questions concern analogy and equivocation. First, is metaphor a type of equivocation? Second, is metaphor a type of analogy and if so, what type? Is it linked with analogy in the Greek sense of a similarity between two proportions or relations, or with analogy in the new medieval sense of being said secundum prius et posterius because of some attribution? Third, how many acts of imposition are required for the production of analogical terms and metaphors? This last issue is particularly important, given that words are said to be used proprie only when used in accordance with an act of imposition, and that metaphors are normally said to be taken improprie. I will take up these questions in the context of three sets of texts. I will start with some remarks about the texts of Aristotle and their reception in the Middle Ages.

   Secondly, I will look at translatio and transumptio in ancient grammar and rhetoric. Finally, I will look at medieval logic

texts, especially commentaries on the *Sophistical Refutations*.

My study will show how ancient traditions in logic, grammar and rhetoric were interwoven and used to tackle specifically medieval problems. Aristotle played a prominent role in the story, but not primarily because of his explicit discussions of metaphor in his *Poetics* and *Rhetoric*. Stoic thinkers contributed the theory of tropes or figures of speech; and Neoplatonic commentators such as Porphyry influenced Boethius's discussion of equivocation and metaphor.

The thirteenth century theory of analogy itself grew out of the interweaving of problems in Christian theology, Aristotelian metaphysics and Aristotelian logic, but was enriched by the long Greek and Arabic tradition of analysing ambiguous terms as being said secundum prius et posterius. The resulting syntheses, especially in late thirteenth and early fourteenth century British logicians, show a skilful use of whatever parts of ancient traditions seemed relevant to the particular interests and doctrines of the author in question." (pp. 311-312)

3. ———. 2008. "Developments in the Fifteenth and Sixteenth Centuries." In *Mediaeval and Renaissance Logic*, edited by Gabbay, Dov and Woods, John, 609-644. Amsterdam: Elsevier.

   Handbook of the history of logic: Vol. 2.

   "To understand the significance of these developments for the logician, we have to consider three questions. First, how much of the medieval logic described in the previous chapters survived? Second, insofar as medieval logic survived, were there any interesting new development in tit? Third, does humanist logic offer an interesting alternative to medieval logic?

   In Part One of this chapter I shall consider the first two questions in the context of a historical overview in which I trace developments in logic from the later middle ages thorough to 1606, the year in which the Jesuits of Coimbra published their great commentary on Aristotle's logical works, the *Commentarii Conimbricenses in Dialecticam Aristotelis*. I shall begin by considering the Aristotelian logical corpus, the six

books of the *Organon*, and the production of commentaries on this work. I shall the examine the fate of the specifically medieval contributions to logic. Finally, I shall discuss the textbook tradition, and the ways in which textbooks changes and developed during the sixteenth century. I shall argue that the medieval tradition in logic co-existed for some time with the new humanism, that sixteenth century is dominated by Aristotelianism, and that what emerged at the end of the sixteenth century was not so much a humanist logic as a simplified Aristotelian logic.

In Part Two of this chapter, I shall ask whether the claims made about humanist logic and its novel contributions to probabilistic and informal logic have nay foundation. I shall argue that insofar as there is any principled discussion of such matters, it is to be found among writers in the Aristotelian tradition." (p. 610)

4. ———. 2009. "Le syllogisme topique au XVI siècle: Nifo, Melanchthon et Fonseca." In *Les lieux de l'argumentation. Histoire du syllogisme topique d'Aristote à Leibniz*, edited by Biard, Joël and Mariani Zini, Fosca, 409-423. Turnhout: Brepols.

   "Examiner l'argumentation topique, les règles de validité du syllogisme topique, les rapports entre l'analytique, la dialectique et la rhétorique soulève deux problèmes. Tout d'abord, il y a une difficulté de vocabulaire. Dans son *Introductio in dialecticam Aristotelis* de 1560, le jésuite Francisco de Toledo parle du *syllogismus dialecticus seu topicus*, mais en général les logiciens des XVe et XVIe siècles parlaient du syllogisme dialectique et non du syllogisme topique (1). Ensuite, il y a une divergence entre d'un côté l'argumentation, le syllogisme, et les règles de validité auxquels s'intéressent les logiciens, d'un autre côté les arguments informels, les techniques de la persuasion et les stratégies non-déductives auxquels s'intéressent les rhétoriciens (2). Afin d'étudier les rapports entre ces deux groupes, et la place des arguments informels dans la logique, s'il y en a, nous devrons aborder la notion de forme logique, non par le biais d'un examen du syllogisme dialectique, mais par le biais d'un

examen des notions de conséquence, d'argumentation, et de syllogisme en général. Nous allons découvrir que, pour comprendre les rapports entre la logique et la rhétorique, l'enthymème est beaucoup plus important que le syllogisme dialectique.

Les auteurs de petits manuels humanistes et ramistes ne nous offrent pas de discussion approfondie et détaillée de ces notions. Seuls les aristotéliciens s'en occupaient, et pour cette raison, nous allons examiner trois auteurs qui étaient certes influencés par l'humanisme, mais qui travaillaient dans un cadre aristotélicien enrichi par la logique médiévale. L'italien Agostino Nifo (ca. 1470-1538) a publié sa *Dialectica ludicra* en 1520 (3). Il connaissait très bien la logique médiévale, mais il connaissait aussi bien les commentateurs grecs, et je ferai référence à ses propres commentaires sur les *Premiers Analytiques* et sur les *Topiques* d'Aristote (4). L'allemand Philippe Melanchthon (1497-1560) a publié son premier manuel de logique, Compendiaria dialectices ratio en 1520, et son dernier, *Erotemata dialectices* en 1547 (5). Il manifeste l'influence de l'humanisme par ses exemples et ses simplifications. Le jésuite portugais Pedro da Fonseca (1528-1599) a publié ses *Institutiones dialecticae* en 1564 (6). Chez lui aussi l'influence humaniste est manifeste, surtout par ses références aux commentateurs grecs et son vocabulaire plus classique que médiéval.

Mon exposé se divisera en deux moments. À titre d'introduction, nous examinerons les trois notions clés de conséquence, d'argumentation, et de syllogisme. Ensuite, nous examinerons les textes de Nifo, Melanchthon et Fonseca à la lumière de ces trois notions. (7)" (pp. 409-410)

(1) Francisco de Toledo [Franciscus Toletus], *Introductio in dialecticam Aristotelis*, dans *Opera omnia philosophica I-III*, Cologne 1615-1616 ; réimpr. Hildesheim, Georg Olms, 1985, p. 74b. Dans une édition de Jean Versor [Johannes Versor], *Petrus Hispanus. Summulae logicales cum Versorii Parisiensis clarissima expositione*, Venise, 1572, réimpr. Hildesheim, New York, Georg Olms, 1981, f° 138 v, on trouve le titre "De

syllogismo Topico seu probabili", mais dans le texte Versor parle du syllogisme dialectique. Voir aussi Robert Sanderson, *Logicae artis Compendium*, ed. E. J. Ashworth, Bologna, Editrice CLUEB, 1985, p. 179: "Syllogismus Topicus, qui & Dialecticus stricte, est qui ex probabilibus vel quasi probabilibus parit probabilem opinionem conclusionis". 5. ———. 2009. "The Problem of Religious Language: What Can we Learn from Twelfth-Century Discussions?" *Paradigmi.Rivista di Critica Filosofica* no. 27:141-152.

   "This paper discusses a recent book by Luisa Valente, *Logique et théologie: Les écoles parisiennes entre 1150 et 1220*, [Paris: Vrin, 2008] in which she gives a rich account of how twelfth and early thirteenth-century Parisian theologians attempted to solve the problems of religious language by appeal to the notions of propriety and translatio. Words had a proper signification when used in accordance with their original meaning, whereas translatio involved a semantic shift from the proper sense to a new extended sense. However, words used in this way were equivocal, and towards the end of the period theologians tried to save the univocity of at least some of the words we apply to both God and creatures. Their efforts form the background to the new thirteenth-century theory of analogy, a theory to which some contemporary philosophers of religion have returned."

6. ———. 2010. "Terminist Logic." In *The Cambridge History of Medieval Philosophy*. *Vol I*, edited by Pasnau, Robert and Dyke, Christina van, 146-158. Cambridge: Cambridge University Press.

   "Terminist logic is a specifically medieval development.(1) It is named from its focus on terms as the basic unit of logical analysis, and so it includes both supposition theory, together with its ramifications,(2) and the treatment of syncategorematic terms. It also includes other areas of investigation not directly linked with Aristotelian texts, notably obligations, consequences, and insolubles (see Chapters to, 13, and 14).

   Logic was at the heart of the arts curriculum, for it provided the techniques of analysis and much of the vocabulary found in philosophical, scientific, and theological writing. Moreover, it trained students for participation in the disputations that were a central feature of medieval instruction, and whose structure, with arguments for and against a thesis, followed by a resolution, is reflected in many written works. This practical

application affected the way in which logic developed. While medieval thinkers had a clear idea of argumentation as involving formal structures, they were not interested in the development of formal systems, and they did not see logic as in any way akin to mathematics.

Logic involved the study of natural language, albeit a natural language (Latin) that was often regimented to make formal points, and it had a straightforwardly cognitive orientation. The purpose of logic was to separate the true from the false by means of argument, and to lead from known premises to a previously unknown conclusion. In this process, the avoidance of error was crucial, so there was a heavy emphasis on the making of distinctions and on the detection of fallacies. The procedures involved often have the appearance of being ad hoc, and modern attempts to draw precise parallels between medieval theories as a whole and the results of contemporary symbolic logic are generally doomed to failure, even though there are many fruitful partial correlations.

The core of the logic curriculum was provided by the works of Aristotle with supplements from Boethius, Porphyry, and the anonymous author of the *Liber sex principiorum* (about the last six categories), once attributed to Gilbert of Poitiers. The *logica vetus,* or Old Logic, included Porphyry's *Isagoge,* Aristotle's *Categories* and *De interpretatione,* and the *Liber sex principiorum*. During the twelfth century the *logica nova,* or New Logic, was rediscovered. It included the rest of the Organon, namely Aristotle's *Topics, Sophistical Refutations, Prior Analytics* and *Posterior Analytics*. Boethius's discussion of Topics, or ways of finding material for arguments, was also part of the curriculum, though in the fourteenth century his *De differentiis topicis* was largely replaced by the account of Topics given by Peter of Spain in his *Tractatus*. Together these works provided a basis for the study of types of predication, the analysis of simple categorical propositions and their relations of inference and equivalence, the analysis of modal propositions, categorical and modal syllogisms, fallacies, dialectical Topics, and scientific reasoning as captured in the demonstrative syllogism. The texts were lectured on and were

the subject of detailed commentaries. Nonetheless, a need was felt for simplified introductions to the material and for the discussion of issues that were at best only hinted at by Aristotle." (pp. 146-147).

(1) Most of the literature dealing with terminist logic is in the form of articles and book chapters. 'Two bibliographical guides are E. J. Ashworth, *The Tradition of Medieval Logic and Speculative Grammar from Anselm to the End of the Seventeenth Century. A Bibliography from 1836 Onwards* (Toronto: Pontifical Institute of Mediaeval Studies, 1978), and Fabienne Pironet, *The Tradition of Medieval Logic and Speculative Grammar from Anselm to the End of the Seventeenth Century*. A Bibliography (1977-1994) (Turnhout: Brepols, 1997). The classic source of material is L. M. de Rijk, *Logica Modernorum A Contribution to the History of Early Terminist Logic* (Assen: Van Gorcum, 1962-7) vol. I: *On Twelfth-Century Theories of Fallacy*, and vol. II: The *Origin and Early Development of the Theory of Supposition*. Translations of various texts are found in N. Kretzmann and E. Stump (eds.) : *Cambridge Translations of Medieval Philosophical Texts*, vol. I: *Logic and the Philosophy of Language* (Cambridge: Cambridge University Press, 1988). Useful discussions are provided by P. Osmund Lewry, "Grammar, Logic and Rhetoric 1220-1320," in J. Catto, (ed.) *The History of University of Oxford*, vol. I: *The Early Oxford Schools* (Oxford: Clarendon Press: 1984) 401-33, and by N. Kretzmann et al. (eds.) The Cambridge History of Later Medieval Philosophy: From the Rediscovery of Aristotle to the Disintegration of Scholasticism. 1100-1600 (Cambridge: Cambridge University Press, 1982).

(2) Not all of these ramifications will be discussed below. I shall omit the discussions of non-referring terms and of relations.

7. ———. 2011. "The Scope of Logic: Soto and Fonseca on Dialectic and Informal Arguments." In *Methods and Methodologies. Aristotelian Logic East and West, 500-1500*, edited by Cameron, Margaret and Marenbon, John, 127-147. Leiden: Brill.

"...I have chosen to examine two sixteenth-century Iberian scholastics, the Spaniard Domingo de Soto (1494-1560) and the Portuguese Petrus Fonseca (1528-1599), in order to see whether the changes in logical method brought about by the supposed influence of humanism are apparent. For Soto, I shall use the second edition of his *Summulae,* printed in 1539/40, because this was the version that was reprinted in Salamanca eight times, and that most successfully introduced Spaniards to earlier sixteenth-century Parisian teachings.(4) Soto's preface (f. ii r-v) shows that he had responded to humanism by simplifying and reorganizing the text of the first edition, and by removing many sophismata. However, he retained much medieval material including supposition, consequences, *exponibilia, insolubilia* and *obligationes*. For Fonseca, I shall use his popular *Institutionum dialecticarum libri octo,* which was first published in Lisbon in 1564.(5) The last of its fifty three editions appeared in Lyon in 1625. It follows Aristotle's *Organon,* taking up material from the *Categories, Perihermenias, Prior* and *Posterior Analytics, Topics* and *Sophistici Elenchi* in turn, but as well as many classical references, it also contains some material about *exponibilia,* consequences and supposition." (pp. 127-128)

(4) Domingo de Soto, *Aeditio Secunda Summularum,* Salamanca, 1539-1540.

Note that the foliation is often inaccurate. I am grateful to Angel d'Ors for providing me with photographs of this edition.

8. ———. 2013. "Analogy and Metaphor from Thomas Aquinas to Duns Scotus and Walter Burley." In *Later Medieval Metaphysics. Ontology, Language, and Logic*, edited by

Bolyard, Charles and Keele, Rondo, 223-248. Bronx, NY: Fordham University Press.

"In the history of Aristotelianism and Thomism people often speak about *analogia entis*, the analogy of being, (1) or what, following Giorgio Pini and Silvia Donati, I shall call metaphysical analogy. (2) In fact, this notion was foreign to Aristotle, and for Thomas Aquinas analogy, under that name, was semantic analogy. (3) It belonged to the theory of language, since it was regarded as a type of equivocation, the medieval name for homonymy. Metaphor too was closely related to equivocation, although, unlike analogy, it was an improper use of language, and produced by usage rather than imposition. In the second half of the thirteenth century logicians began to worry about how semantic analogy could be produced by imposition, and how analogical terms could be related to concepts. If a single term is used in different but related senses, does this come about through one original act of imposition, or through two related acts? If there are two acts, can we speak of a single term? If there is just one act, what of the concept or concepts to which that term is subordinated? Can there be a single concept which conveys related senses, and if not, how can the relationship between two concepts be captured by a single act of imposition? As a result of such worries some thinkers, especially John Duns Scotus, abandoned semantic analogy. What was called analogy was now metaphysical analogy, and, at the linguistic level, metaphor replaced semantic analogy. It is the history of these developments that I shall discuss in this essay, and in so doing, I shall show something of the interplay between logic, metaphysics, and philosophy of mind." (p. 223)

9. ———. 2013. "Aquinas, Scotus and Others on Naming, Knowing and the Origin of Language " In *Logic and Language in the Middle Ages: A Volume in Honour of Sten Ebbesen*, edited by Fink, Jakob Leth, Hansen, Heine and Mora-Márquez, Ana María, 257-272. Leiden: Brill.

   "Many medieval discussions start from the fruitful intersection of two apparently opposed texts. My two texts are Adam's naming of the animals in *Genesis* and Aristotle's remark (in Latin translation) that spoken language is *ad placitum*, and I shall use them to discuss three problems, the originof language,

our ability to name God, and our ability to name animal species.

I shall refer to various texts by Aquinas, the commentaries on *Genesis* written by Henry of Ghent and Peter John Olivi, article 73 of Henry of Ghent's *Summa Quaestionum Ordinariarum*, and the treatment of *Sentences* 1, distinction 22 by John Duns Scotus in the five different versions of his commentary. The first version is the *Lectura,* written in Oxford before 1300. The second version is the *Ordinatio*, begun in Oxford as a revision

of the *Lectura*, but never completed. The third version is the *Reportatio Parisiensis*, produced in Paris where Scotus lectured ca. 1302–4. Alternative *Reportationes* are found in Reportatio I-A (the *Reportatio examinata*), and *Appendix A* to the edited version of the *Ordinatio* (pp. 383–93). *Reportatio I-A* and *Appendix A* are different, though *Appendix A* is often wrongly called *Reportatio I-A* in the secondary literature, and it is not complete. In addition to these versions, there are extensive *adnotationes*, found in the edited version of the *Ordinatio* (pp. 339–47). (pp. 257-258, notes omitted)

10. ———. 2013. "Being and Analogy." In *A Companion to Walter Burley. Late Medieval Logician and Metaphysician*, edited by Conti, Alessandro, 135-165. Leiden: Brill.

"Burley's discussion of being *(ens*) and analogy is notable for his thesis that the word "being" corresponds to a single analogical concept. Moreover, he was part of a movement, begun in the later 13th century, which explicitly opposed semantic analogy, a doctrine of language, to metaphysical analogy, the doctrine that just as creatures are beings analogically through their relationship to God, the first cause, whose very essence is being, so accidents are beings analogically through their relationship to the substance, a being *per se*, on which they depend. Obviously, what is new here is not the doctrine itself, but the fact that the relations between God and creatures, substance and accident, were described as analogical. Unlike John Duns Scotus, who insisted that no single word could express a real relation between things ordered in accordance with priority and posteriority, and that

no single concept could capture such a relation, Burley retained the link between semantic analogy and metaphysical analogy, for he believed that our words and our concepts can mirror the world. On the other hand, he broke the link between semantics and ontology for other terms traditionally regarded as analogical, such as “healthy", by construing these as metaphorical in their secondary senses.

In what follows I shall begin by surveying the sources in which Burley’s views are expressed. I shall then consider some basic notions in the medieval theory of language, including analogy, but also signification, imposition, and metaphor. Next I shall discuss the standard divisions of equivocation and how these related to both analogy and metaphor in Burley’s writings. Finally, I will discuss how Burley deals with ens, first from the point of view of semantics, and then from the point of view of metaphysics." (p. 135).

11. ———. 2013. "Descent and Ascent from Ockham to Domingo de Soto: An Answer to Paul Spade." In *Medieval Supposition Theory Revisited. Studies in Memory of L. M. de Rijk*, edited by Bos, Egbert Peter, 385-410. Leiden: Brill.

    Also published as Volume 51, 1-4 (2013) of *Vivarium*.

    Acts of the XVIIth European Symposium for Medieval Logic and Semantics, held the University of Leiden, 2nd, 7th June. 2008.

    "Paul Spade has attacked the theory of the modes of personal supposition as found in Ockham and Buridan, partly on the grounds that the details of the theory are incompatible with the equivalence between propositions and their descended forms which is implied by the appeal to suppositional descent and ascent. I trace the development of the doctrines of ascent and descent from the mid-fourteenth century to the early sixteenth century, and I investigate Domingo de Soto's elaborate account of how descent and ascent actually worked. I show that although Soto himself shared some of Spade's doubts, including those about the use of merely confused supposition, he had a way of reducing at least some propositions containing terms with such supposition to equivalent disjunctions and

conjunctions of singular propositions. Moreover, he gave explicit instructions on how to avoid the supposed problem of O-propositions." (p. 385)

12. ———. 2013. "Domingo de Soto on the *Categories*: Words, Things, and Denominatives." In *Aristotle's Categories in the Byzantine, Arabic and Latin Traditions*, edited by Ebbesen, Sten, Marenbon, John and Thom, Paul, 263-284. Copenhagen: The Royal Danish Academy of Sciences and Letters.

    "Despite humanist attacks, notably by Petrus Ramus, Porphyry's *Isagoge* and Aristotle's *Categories* retained their place in university education throughout the sixteenth century and into the seventeenth century. Indeed, as late as the 1660s the logic notes in John Locke's early manuscripts are largely devoted to predication, the five predicables, and the ten categories, (1) and in his *Essay concerning human understanding* Locke found it necessary to complain about those "bred up in the Peripatetick Philosophy" who "think the Ten Names, under which are ranked the Ten Predicaments, to be exactly conformable lo the Nature of Things". (2) Original and sustained discussion of these matters is, however, harder to find. Most textbooks cover the issues only in a summary fashion, and such a leading commentator as Agostino Nifo wrote no commentary on Porphyry's *Isagoge* or on the *Categories*. Domingo de Soto is one exception. His substantial commentary on the *Categories*, combined with commentaries on Porphyry's *Isagoge* and Aristotle's *Posterior Analytics*, was published 18 times between 1543 and 1598, mainly in Salamanca, but with one edition in Louvain and five in Venice. (3)

    In his commentary, Soto addresses the main questions faced by medieval and Renaissance thinkers, namely does the work deal with words or things, and why is it classified as an introduction to logic? He then takes up a number of subsidiary questions, two of which I shall discuss below. First, why does the work begin with the discussion of equivocals, univocals and denominatives? Second, are denominatives really like equivocals and univocals in relevant respects? In what follows I shall begin by sketching Soto's main conclusions about the

nature and purpose of Aristotle's *Categories* as a whole. This will lead me into a discussion of predication, and what it is that we predicate. I shall then turn to the subsidiary questions about why the work opens as it does, and about the status of denominatives." (pp. 263-264)

(...)

"Conclusion.

To conclude, what I find striking about Soto's discussion of the parts of the *Categories* that I have chosen to focus on is not only that he provides a coherent and thoughtful discussion, but that he displays the strong influence of the tradition of Oxford realism found in Walter Burley and Paul of Venice. It is easy to think of Soto as a Renaissance Thomist, but in fact, he was a well-read eclectic." (p. 280)

(2) Locke, *Essay*, III.x.14, p. 497.

(3) Lohr 1988: 431. For a general summary of Soto's position, see Bos 2000. For a useful introduction to medieval views, see Pini 200a. For Soto on equivocation, see Ashworth 1996. Bos and Ashworth give different dates for Soto's birth, but Angel d'Ors (in private correspondence) supported the view that 1494 is the correct date. I owe much to Angel d'Ors (d. 2012) for his useful comments on an earlier version of this paper.

13. ———. 2013. "Logic." In *The Cambridge History of Science. Volume 2: Medieval Science*, edited by Lindberg, David C. and Shank, Michael H., 532-547. Cambridge: Cambridge University Press.

"Medieval logic is crucial to the understanding of medieval science for several reasons.(1) At the practical level, every educated person was trained in logic, which provided not only a technical vocabulary and techniques of analysis that permeate philosophical, scientific, and theological writing but also the training necessary for participation in the disputations that

were a central feature of medieval instruction. At the theoretical level, medieval logicians made several contributions. First, they discussed logic itself, its status as a science, its relation to other sciences, and the nature of its objects.

Here it is important to note that medieval thinkers took a science (*scientia*) to be an organized body of certain knowledge that might include theology, logic, and grammar as well as mathematics and physics. Second, they discussed the nature of a demonstrative science and scientific method in general. Third, they provided a semantics that allows one to sort out the ontological commitments carried by nouns and adjectives. The discussion of connotative terms is particularly important here since it allowed logicians

to analyze such terms as “motion” without postulating the existence of anything other than ordinary objects and their qualities. Fourth, they provided particular logical strategies that allow one to sort out the truth-conditions for scientific claims. Particularly important here are supposition theory, the distinction between compounded and divided senses, and the analysis of propositions containing such syncategorematic terms as "begins" and "ceases"." (pp. 532-533)

14. ———. 2014. "Aquinas on Analogy." In *Debates in Medieval Philosophy. Essential Readings and Contemporary Responses*, edited by Hause, Jeffrey, 232-242. New York: Routledge.

"In this short chapter, I hope to demonstrate the importance of pay close attention to the historical context of the theory of analogy, and to the way in which technical terms were actually used when explicating Aquinas' theory of analogy. In addition, I intend to argue that McInerny gets Aquinas' theory wrong partly because he places too little emphasis on the fact that Aquinas was principally concerned with the names we use of God.

Introduction

Analogy is a notion with various uses. In epistemology one can speak of coming to know something new on the basis of an analogy or likeness between two things and such analogies can form the basis for analogical arguments, including the argument from design for the existence of God. In ontology, the so-called analogy of being refers to the doctrine that reality is divided horizontally into the very different realities of substances and accidents, (1) and vertically into the very different realities of God and creatures, and that these different realities are related by some kind of likeness. However, for the purposes of this discussion, we are primarily concerned with analogy as a doctrine belonging to the philosophy of language and most especially as a solution to the problem of religious language.

Aquinas has been hailed through the centuries as making a particularly important contribution, and recent philosophers of religion have taken the doctrines seriously (e.g. Swinburne 1977, Alston 1993). But there are various problems, many stemming from the fact that nowhere does Aquinas give a sustained account of analogy, but rather he employs the notion on an ad hoc basis to settle the issues under discussion in a particular place. One problem, which I shall touch on briefly

below, is whether his account of analogy changed over the years. Two other problems have been discussed fairly extensively by McInerny. One is the question of whether it is a theory of language at all, or whether Aquinas was more concerned with the analogy of being; another concerns the truth of the long-held belief that Cardinal Cajetan's book on analogy, published in 1506, though written in 1498, gave an accurate account of Aquinas. Mclnerny has successfully argued that Aquinas was indeed concerned with analogical terms, even though his account had certain metaphysical views as its basis, and that Cajetan is not a good interpreter of Aquinas. (2) In what follows, I shall focus on another aspect of Aquinas: how his theory is embedded in specifically medieval semantics. It is here that the fourth chapter of Mclnerny's book (*Analogous Names,* chapter 13, this volume) offers a useful object lesson in the importance of getting such matters straight. Aquinas wrote in a specific context, and he used terminology with an established meaning that his readers would have known. It is a mistake to read a thirteenth-century author (or any other, for that matter) as if he wrote in a vacuum, and as if his views were only related to thinkers such as Boethius, Cajetan, and John of St. Thomas, who were all far removed from him in time. The only author contemporary with Aquinas cited by McInerny is Albert the Great, and the references are not always helpful." (pp. 232-233)

(1) Editor's note: Aquinas explains that, in contrast to a substance, an accident's mode of being is to exist in something else. For instance, a horse is a substance, but its size, color, are accidents because their nature is to exist in something else.

(2) While Mclnerny successfully dismisses Cajetan as an interpreter, he does not recognize that much of Cajetan's discussion is directed towards some fifteenth-century authors rather than Aquinas himself.

15. ———. 2015. "Medieval Theories of Signification to John Locke." In *Linguistic Content. New Essays on the History of Philosophy of Language*, edited by Cameron, Margaret and Stainton, Robert J., 156-175. New York: Oxford University Press.

"Locke wrote that "*Words*… came to be made use of by Men, as the *Signs of* their *Ideas*… The use then of Words, is to be sensible Marks of *Ideas*; and the *Ideas* they stand for, are their proper and immediate Signification" (*Essay*, 3.2.1). (1) Behind this brief and controversial passage lies a long development of interrelated discussions of the Aristotelian semantic triangle: the discussion of spoken words as signs, both of things and of concepts; the discussion of whether the things signified are natures (whatever their ontological status) or individual existents; and the discussion of ordering: do words signify things or concepts primarily? In this chapter I hope to do three things: (i) trace the history of developments from the thirteenth to the seventeenth century; (ii) throw some light on the issue of whether the theory of signification is a theory of meaning; (iii) illuminate the immediate background to Locke on language. (2)

My treatment is partly synoptic, partly chronological. Given the long period I am dealing with, and the complicated doctrinal history involved, I shall simplify my account by tracing just a few influential doctrines and focusing on just a few authors, though I shall make occasional references to other figures. The main path I intend to follow starts with Thomas Aquinas (1224/5-74), for, although he was not a logician, he had many things to say about language, and his views, particularly as found in his unfinished commentary on Aristotle's *Peri hermeneias*, were influential in the sixteenth and seventeenth centuries. (3) I shall then turn to the two fourteenth-century

nominalists, William of Ockham (c. 1287—1347) and John Buridan (1295/1300-1358/ 61). (4) Both men were very influential at the University of Paris in the late fifteenth and early sixteenth centuries, though Thomism also had a role to play there. For my purposes, the most important product of the Parisian schools is the Dominican, Domingo de Soto (1494-1560), who, while absorbing many features of nominalist logic, is more properly described as an eclectic Thomist. He published his popular logical works after his return to Spain, where he retained a strong influence into the seventeenth century. Another important Iberian was the Portuguese Jesuit Petrus Fonseca (1528-99), whose work inspired the Conimbricenses, commentaries on Aristotle's works produced by the Jesuits at Coimbra. The volume on Aristotle's *Organon* was first published in 1606. Other significant Jesuit authors include the two Spaniards Franciscus Toletus (1533-96) and Antonius Rubius (1548-1615) and the Polish logician Martinus Smiglecius (1564-1618). The importance of these late Scholastic authors is twofold. First, they were all moderate realists in the Thomistic tradition, although they were well acquainted with nominalism and Scotism. Second, they were read throughout Europe and, in particular, were used at the University of Oxford. Descartes told Mersenne that he recalled reading the Conimbricenses, Toletus, and Rubius (AT III, 185), (5) and, when Locke was teaching at Christ Church, Oxford, he recorded in a notebook that his students bought works by Smiglecius (Ashworth 1981: 304)." (pp. 156-157)

(1) Quotations are taken from Locke, *An Essay Concerning Human Understanding*, edited by Peter H. Nidditch, New York: Oxford University Press, 1975, but references will be given in standard format so that other editions can also be used.

(2) See Ashworth (1981, 1984, 1987) for discussion of the sixteenth- and seventeenth-century background.

(3) For a wider perspective on the earlier period, see Rosier, *La Parole comme acte: Sur la grammaire et la sémantique au XIIIe siècle*, Paris: Vrin 1994 and Rosier-Catach, *La Parole*

efficace: Signe, rituel, sacré, Paris: Editions du Seuil 2004. For more on Aquinas, sec Ashworth (1999). References to Aquinas will be given in standard format, since there are many editions (and some translations) of his works.

(4) For nominalism, See Biard, *Logique et théorie du signe au XlVe siècle,* Paris: Vrin 1989, Panaccio, *Ockham on Concepts,* Aldershot and Burlington, VT: Ashgate 2004 and Klima, *John Buridan*, Oxford: Oxford University Press 2009.

16. ———. 2015. "Richard Billingham and the Oxford *Obligationes* Texts: Restrictions on *positio*." *Vivarium* no. 53:372-390.

"The study of Oxford *Obligationes* texts in the 14th century owes much to the work of Angel d'Ors.(1) Fittingly, it is also a subject linked with Spain through the work attributed to Juan de Pastrana, the publication of the Oxford *Sophistrie* in 1503, and the presence of texts by Richard Billingham and others in Spanish libraries. (2) In this paper, I intend to focus on one aspect of a group of texts associated with the University of Oxford, namely the restrictions placed on the very first rule of the type of obligations called *positio*, and their relation to the sophismata introduced to illustrate the very difficulties that these restrictions were intended to counter. One of my intentions here is to show what was said in a series of rather modest texts that must have been used in actual teaching.

First, however, it is necessary to say something about the Obligationes treatises themselves and what they were about." (p. 372)

(1) See especially Angel d'Ors, 'Sobre las *Obligationes* de Richard Lavenham', *Archives d'histoire doctrinale et littéraire du moyen âge* 58 (1991), 253-78; Angel d'Ors, 'Sortes non currit vel Sortes movetur (Roger Swyneshed, *Obligationes*, § 137-138)', *Archives d'histoire doctrinale et littéraire du moyen âge* 60 (1993), 165-72; Angel d'Ors and Manuel García-Clavel, 'Sobre las *Obligationes* de Robert Fland. *Antiqua et nova responsio*', *Revista de Filosofía* 7 (1994), 51-8. For some

discussion, see E.J. Ashworth, ‘Autour des Obligationes de Roger Swyneshed: la *nova responsio*’, *Les études philosophiques* 3 (1996), 341-60.

17. ———. 2015. "Logic teaching at the University of Oxford from the Sixteenth to the early Eighteenth Century." *Noctua* no. 2 (1-2):24-62.

"The title of the conference for which this paper was written was «From commentary to manual: the teaching of philosophy in the modern period», but where logic teaching at the University of Oxford is concerned, this title needs to be glossed, because the significant changes that took place involve the types of commentary and manual rather than the replacement of one by the other1. At the beginning of the sixteenth century, university-wide lectures on logic presented the content of the central Aristotelian texts orally with or without detailed commentary, depending on the level of instruction, but students also worked with brief texts devoted to such medieval developments as obligationes, insolubilia and consequences, which had been gathered together in printed manuals, especially the Libellus Sophistarum ad Usum Oxoniensium which was published in England six times between 1499 and 1530, as well as on the European continent2. If we jump to the beginning of the eighteenth century, we find that teaching now took place within the colleges and the halls, which, unlike colleges, were not permanent property-owning, self-governing institutions, but which otherwise functioned in the same way. University-wide lectures had virtually disappeared, as had discussion of nearly all the specifically medieval developments, and, while commentaries were still read, students began, and often ended, their study of logic with succinct manuals that summarized Aristotelian logic, especially the Logicae Artis Compendium by Robert Sanderson, first published in 1615, and the Artis Logicae Compendium by Henry Aldrich, two slightly different versions of which were first published in 1691.

A long and complicated history lies behind these changes, and to un-derstand what happened I shall start by considering the

wider changes that took place in the organization of university teaching as well as more general-ly in English society. I will then consider humanism and the new Aristoteli-anism, and I will conclude with an overview of the most important logic manuals.

(1) For some general discussion of changes in textbooks, see Ashworth 1988(1), and for some general discussion of seventeenth-century Oxford, see Ashworth 1988(2).

(2) For details of the editions and their contents see Ashworth 1979 and Ashworth 1999, 385–386.

18. ———. 2016. "Locke and Scholasticism." In *A Companion to Locke*, edited by Stuart, Matthew, 82-99. Malden: Wiley-Blackwell.

"*Introduction*. Locke’s public attitude to scholasticism is well known. Many are the disparaging references to the schoolmen, their reliance on disputational success rather than the search for truth, and their obscure jargon. In the *Essay Concerning*

Human Understanding, he writes that “the Schoolmen” found the “very useless Skill” of disputing “a good Expedient to cover their Ignorance, with a curious and unexplicable Web of perplexed Words” (3.10.8). Yet public attitudes can be misleading. Descartes professed to be making a new start, yet historians of philosophy have become increasingly aware of how much he took for granted of what he had learned from the Jesuits at La Flèche. Moreover, philosophers often turn out to be in dialogue with their predecessors even if they do not make this explicit. We have to ask whether the same is true of Locke. Did he enter into a secret dialogue with any scholastics? Are there features of his thought that can be explained in terms of scholastic assumptions?

In order to answer these questions, we need to look at who the schoolmen referred to by Locke were, and what he might have learned from them, particularly with respect to topics in metaphysics, logic, and language. First, however, we must consider the Oxford curriculum which provided the framework for Locke’s years of study and teaching there, as there is little reason to believe that he enriched his acquaintance with the schoolmen in his later career." (p. 82)

19. ———. 2016. "The Post-Medieval Period." In *The Cambridge Companion to Medieval Logic*, edited by Novaes, Catarina Dutilh and Read, Stephen, 166-191. Cambridge: Cambridge University Press.

"This chapter has two main parts. The first part discusses the effects that historical events and movements had on educational systems and the logical studies thought to be suitable for undergraduates.

The Western reception of the printing press in the middle of the fifteenth century was perhaps the most important event, for it accentuated the impact of the other events and movements. Suddenly it became possible to produce books cheaply, in relatively large numbers, and without the differences between one copy and another that often make work with manuscripts so difficult. By the end of the fifteenth century, many university towns had presses able to print the textbooks needed by the

faculty of Arts, and teachers could disseminate their own works. Moreover, publishers, especially in Italy, were able to print the works required for serious scholarship, such as Aristotle's *Organon* in Greek and the newly discovered Greek commentaries on Aristotle, while in the sixteenth century, the writings of the Protestant reformers and their Roman Catholic opponents could be widely circulated.

The second main part looks at some specific doctrines, including supposition theory and consequences, in order to show that medieval doctrines were developed in interesting ways before they are finally abandoned, and to highlight some of the important changes that took place." (pp. 166-167)

20. ———. 2016. "How Natural is Natural Language? Some Postmedieval discussions." In *Formal Approaches and Natural Language in Medieval Logic*, edited by Cesalli, Laurent, Goubier, Frédéric and de Libera, Alain, 485-500. Barcelona - Roma: Fédération Internationale des Instituts d'Études Médiévales.

"The title of the Geneva symposium held in 2012 was «Formal approaches and natural language in medieval logic», and on the face of it this title suggests the distinction made by twenty-first century logicians between natural or ordinary languages and the formal language-systems of symbolic logic and mathematics (1). However, the modern sense of «natural» was not that used by late medieval and post-medieval logicians. As we will see, various senses appear in their writings, but for our purposes the most important sense involves their distinction between natural signification and *ad placitum* signification, and only words with the latter kind of signification belong to such spoken languages as English and French.

Accordingly, in this paper I shall discuss the distinction between natural and ad placitum signification and how it relates to views about the nature and origin of human language, in order to see how far these views would allow for the construction of a fully-fledged formal language, such as firstorder quantificational logic. What power did logicians think we have over the languages we use? How far can we stipulate a

signification for a term, and could the notion of an uninterpreted system have a role to play? In order to find some answers to these questions, I shall focus on selected post-medieval logicians, starting with Johannes Versor († after 1482), an eclectic author who drew on both Aquinas and Albertus Magnus (2). From the first decades of the sixteenth century, I shall consider a group of men who studied and taught at the University of Paris, including Gaspar Lax (1487-1560), his pupil Juan Dolz del Castellar (M.A. 1509), Fernando de Enzinas († 1523), Juan de Celaya (ca. 1490-1558), John Major (1467-1550), and Domingo de Soto (1494-1560). The latter, whose *Summulae* was first published in 1529 (3), had a strong influence on a later group of authors in the scholastic tradition, including the Jesuits Sebastianus de Couto (1567-1639), Antonius Rubius (1548-1615) and Martinus Smiglecius (1564-1618). Couto was the author of the Coimbra commentary on Aristotle's *Organon* published in 1606, and as such was particularly influential throughout the seventeenth century."

(1) For a very useful analysis of various senses of «formal», see C. Dutilh Novaes, «The Different Ways in which Logic is (said to be) Formal», *History and Philosophy of Logic*, 32 (2011) 303-332.

21. ———. 2017. "Philosophy of Language: Words, Concepts, Things, and Non-Things." In *The Routledge Companion to Sixteenth-Century Philosophy*, edited by Lagerlund, Henrik and Hill, Benjamin, 350-372. New York: Routledge.

"One of the big questions raised by the philosophy of language is how our words relate to the world we live in. Some of the words we use seem to be names of the things around us: 'Socrates' seems to name an actual person, and 'smiling' seems to name something that he does. Similarly, 'dog' and 'horse' seem to name ordinary examples of types of living thing, but do

they also name common natures that have a status of their own, apart from individuals? What about such words as ‘blindness’ and ‘nonbeing,’ or the names of fictional entities such as ‘chimera’? What about so-called analogical words such as ‘being,’ which seems to encompass both substances and accidents, both God and creatures? And what about words in particular contexts, such as ‘Some men are dead’ or ‘The meadows are smiling’? In this chapter, I shall first say something about the general background to sixteenth-century philosophies of language, and I shall then explore the views of two particular groups of philosopher on how it is that our words relate to the world, ending with a detailed examination of doctrines of analogy." (p. 350)

22. ———. 2017. "Was Buridan a ‘Psychologist’ in His Logic?" In *Questions on the Soul by John Buridan and Others. A Companion to John Buridan’s Philosophy of Mind*, edited by Klima, Gyula, 239-260. Dordrecht: Springer.

    "If we look back at Gottlob Frege, and all that has stemmed from his work, it may seem easy to accuse John Buridan of a grossly misconceived psychological approach to logic."

    (…)

    "In order to discover whether Buridan’s approach to logic lays him open to Fregean accusations of failing to separate the psychological from the logical, of failing to distinguish taking something to be true from proving it to be true, and of falling into the supposed trap of asking for the meaning of words in isolation rather than in the context of a proposition, I shall start by considering Buridan’s account of signification and the role played by concepts in the Buridanian sense of that word. I shall then consider the relationship between spoken language and what may be called mental language, before going on to discuss the truth of propositions and the nature of argumentation." (pp. 240-241)

23. ———. 2017. "Burley, Ockham, and English Logicians on *Impositio* as a Type of *Obligatio*." In *The Language of Thought in Late Medieval Philosophy: Essays in Honor of Claude*

Panaccio, edited by Pelletier, Jenny and Roques, Magali, 233-245. Dordrecht: Springer.

Abstract: "This is a study of how the doctrine of impositio, the endowing of terms and propositions with a new signification, was treated in English obligationes texts from Walter Burley to the end of the fourteenth century. I show that in Burley and Ockham the rules for impositio were closely linked to the solution of insolubilia, but that this emphasis disappeared. I also show that Burley's doctrines were more honoured on the European continent than in England. I then examine the different doctrines of subsequent English logicians and how they were applied to selected sophismata. Here Roger Swyneshed and Richard Brinkley are particularly important, the first because of his nova responsio, and the second because of his doctrine that speakers can change imposition at will."

24. ———. 2017. "Buridan and His Successors on "ex impossibili sequitur quodlibet"." In *Miroir de l'amitié. Mélanges offerts à Joël Biard à l'occasion de ses 65 ans*, edited by Grellard, Christophe, 243-252. Paris: Vrin.

25. ———. 2018. "Exponibilia, Proofs of Terms, and the Oxford-Paris Split 1340-1530." In *Sujet libre: pour Alain de Libera*, edited by Brenet, Jean-Baptiste and Cesalli, Laurent, 15-20. Paris: Vrin.

    "In the first years of his long and distinguished career Alain de Libera published a number of articles and text editions relating to two themes in thirteenth-century logic."

    (...)

    "These discussions have led me to ask two questions about what happened in Oxford and Paris after the first decades of the fourteenth century. First, were there continued differences between the two institutions? Second, did these differences relate mainly to the topics already mentioned, whether to supposition theory and its offshoots or to the group of texts on *sophismata*, *syncategoremata* and *abstractiones*? My answers are that there were indeed specific kinds of text that typified the divergence between Oxford and Paris, though not between

Oxford and other European universities, such as Prague and Padua. These were the texts

on proofs of terms and the texts devoted to *exponibilia*. Both of these seem to have grown out of the texts on *sophismata*, *syncategoremata*, and *abstractiones*, whose importance diminished during the period under consideration. Treatises on *sophismata* were still produced, such as the treatise by the Parisian Albert of Saxony, but it seems that no new texts on *abstractiones* appeared, and treatises devoted to *syncategoremata* declined in popularity, though Peter of Spain's text continued to be used in Paris, and near the end of the fourteenth century in Oxford Richard Lavenham did produce a very short work which was later to be printed." (pp. 15-16)

26. ———. 2019. "Jesuit Logic." In *Jesuit Philosophy on the Eve of Modernity*, edited by Casalini, Cristiano, 95-114. Leiden: Brill.

    "In what follows, I focus on a small group of authors, notable for the number of editions their works received well into the first half of the seventeenth century.(5) In chronological order, these are the Portuguese Pedro da Fonseca, the guiding spirit behind the Conimbricenses, that is, the Coimbra commentaries on Aristotle; the Spaniard Francisco de Toledo, who taught at the Collegio Romano; the Spaniard Antonio Rubio or Ruvio (Antonius Rubius [1548–1615]), who taught in Mexico; the Polish Marcin Śmiglecki (Martinus Smiglecius [1564–1618]); and the Portuguese Sebastião do Couto (Sebastianus de Couto) of Aristotle was to be followed in logic and other areas.(2) Students were to start with an overview. In the version of 1586, the *Summula* of Pedro da Fonseca (Petrus Fonseca [1528–99]) was recommended, as being broader, clearer, and closer to Aristotle, and without the useless perplexities (*tricae*) that deter beginners.

    In the 1599 version, the recommendation was to use either Francisco de Toledo (Franciscus Toletus [1533–96]) or Fonseca to explain what was most necessary.(3) The next step was the study of Aristotle's *Organon*, and here some material had to be excluded, or treated only briefly.(4) As an introduction, the

student would consider the nature of logic, whether it was a science, and what its subject was, before considering second intentions. The main discussion of universals would be left to metaphysics. In other words, consideration of the *Isagoge* by Porphyry (c. 233–309) was to be curtailed. Only the easier parts of the *Categories* were to be considered, though attention should be paid to analogy and relations, since these issues frequently came up in disputations. The second book of *De interpretatione* and both books of the *Prior Analytics* were to be gone over briefly, except for the first eight or nine chapters of the first book of the *Prior Analytics* (that is, those dealing with basic syllogistic). Questions arising from these chapters were to be expounded, though future contingents were to be treated briefly, and the problem of free will was not to be discussed.

So far as the *Topics* and *Sophistical Refutations* were concerned, their material was better left to the orderly treatment found in the Summulae. At the end of the first year, more time was to be devoted to matters that formed the prolegomena to the study of physics."

27. ———. 2020. "Changes in British Logic Teaching During the Sixteenth and Seventeenth Centuries." *History and Philosophy of Logic* no. 41:309-330.

Absstract: "British logic teaching in the sixteenth and seventeenth centuries was provided in England by Oxford and Cambridge, both medieval foundations, and in Scotland by the universities of St Andrews and Aberdeen, both founded in the

fifteenth century, and Edinburgh, founded in 1582. Wales had no university, and high schools in England did not teach logic. This paper explores the effect that the invention of printing, along with organizational, political, and sociological changes, had on the teaching of these institutions as they affected the logic textbooks that were used and the ways in which the material was presented to students. The disappearance of important medieval developments such as supposition theory along with changes in the treatment of Aristotle's logic are discussed in relation to selected logicians from the period under discussion. In particular, attention is paid to the Cambridge logician John Seton (d. 1567), whose popular *Dialectica* was published in 1545, the Frenchman Peter Ramus (d. 1572), whose influence in both England and Scotland was less than has been supposed, and the Oxford logician Robert Sanderson (d. 1662/3) whose *Logicae artis compendium* was reprinted as late as 1841."

29. ———. 2021. "Signs and Signification as treated by Iberian Logicians from Domingo de Soto to John of St Thomas." In *Sémiotique, Grammaire et Logique. De la scolastique tardive à la philosophie austro-allemande*, edited by Leblanc, Hélène and Majolino, Claudio. Basel: Schwabe.

    Abstract: "In the sixteenth and early seventeenth centuries there was a noteworthy flowering of logic among Spanish and Portuguese logicians. One of their chief interests was in signs and signification, for the study of language was the main starting point for logicians, and an important subject of discussion was how the signs necessary for signification should be classified, whether these were the linguistic signs produced by humans or the non-linguistic signs produced by animals. This discussion was closely linked with the issue of the semantic triangle that linked words, concepts and things. I consider how these topics were treated by some prominent Iberian logicians, starting with Domingo de Soto, whose

Summulae was first published in 1529, and ending with John of St Thomas, whose discussion in his *Ars Logica* of 1631–2, shows continuity with that of Soto."

Annotated Bibliography of Lambertus Marie de Rijk. First Part: from 1950 to 1975

Introduction

L. M. de Rijk, (Hilversum, November, 6 1924 - Maastricht June, 30 2012) was Professor of Ancient and Medieval Philosophy at the University of Leiden, and Honorary Professor at the University of Maastricht.

A complete bibliography of his writings up to 1999 is available in: Maria Kardaun and Joke Spruyt (eds.) - *The winged chariot. Collected essays on Plato and Platonism in honour of L. M. de Rijk* - Leiden, Brill, 2000. pp. XV-XXVI. I made some corrections, updated the bibliography and omitted the publications in Dutch.

"The present volume is dedicated to De Rijk on the occasion of his 65th birthday and his retirement as a professor in Ancient and Medieval philosophy at the University of Leiden. It contains fourteen of De Rijk's philosophical studies (articles) on medieval logic and semantics. Research on manuscripts and editions of texts have not been included. As the table of contents shows, the studies cover the period from Boethius (6th century) to William of Ockham (ca. 1285 - 1347) and have been ordered according to centuries.

Now some remarks on the main lines of De Rijk's interpretations of mediaeval semantics and metaphysics, as found in the studies collected here. The title of the volume, first, indicates De Rijk's interest in Mediaeval thinkers' views on reality. These views were influenced by theology (see esp. study I). However, medieval

semantic views (i.e. the philosophical theories on how terms signify) were basic as the starting point in ontological speculation. Man expresses his views on reality by way of language. De Rijk's aim is to understand how the Medieval philosophers and theologians interpreted reality according to their own semantic views.

De Rijk distinguishes between the use of a name in its name-giving function as opposed to statemental predication, where a term acts as the predicate term of a proposition. The contextual position of a name (in syntax) affects the semantic value. De Rijk gives as examples of these syntactical contexts: first of all, the proposition (in its general form: subject - predicate); further on, intensional contexts (where verbs like 'to know' influence what is said in the proposition) and modal contexts (with modal terms like 'possible' etcetera). De Rijk's analysis of an intensional contest can be seen most clearly in his studies on Peter Abailard (1079 - 1142) (studies II - VI). Universals or general names occur in contexts with verbs which denote an act of the mind, viz. abstraction. According to De Rijk, Abailard interprets universals as the intrinsic objects of the acts of understanding (see especially study III, p. 145). If someone conceives of the general name 'man', there is, in De Rijk's line of interpretation, an act of 'man-understanding'.

(...)

Word order is considered a 'rendez-vous' of logic and ontology (see especially study VIII). In asinus cuiuslibet hominis currit (which means, in an awkward litteral rendering: 'everybody's ass is running') the subject term 'ass' which (in the Latin text) precedes the distributive sign 'everybody's' is not affected by it and, accordingly, refers to one particular individual which is the common property of everybody. On the other hand, in cuiuslibet hominis asinus currit ('each man's ass is running'), in following the sign the term 'ass' is prevented from pursuing its primary inclination to refer to some individual and stands 'opaquely' for a multitude of individuals.

The verb esse ('to be') and its related forms - e.g. ens ('being'), as well as connected terms such as existentia ('existence') - are pivotal terms in medieval metaphysics, ontology and theology. The first formal object of metaphysics in the Middle Ages is either the highest spiritual substances - God and the angels (this interpretation is

ascribed to the Arab Averroes) - or 'being in general' (in the interpretation given by the Arab Avicenna). In the Latin Middle Ages both views are advocated, as well as a combination. Whichever view is taken, the semantics of esse is crucially important (see especially studies I and V)."

From the *Preface* by Egbert P. Bos to: E. P. Bos (ed.), *Through Language to Reality. Studies in Medieval Semantics and Metaphysics*-, Northampton: Variorum Reprints 1989.

L. M. de Rijk was on of the founder of the review *VIVARIUM. An International Journal for the Philosophy and Intellectual Life of the Middle Ages and Renaissance*.

The Editorial of the first number of Vivarium (1963):

"Issuing a new journal needs some justification. The editors of VIVARIUM do not intend to found a journal for mediaeval philosophy tout court. The philosophical systems of the Middle Ages can be approached from more than one point of view. They can be - and frequently are - studied in their relation to mediaeval theology. The present journal, however, will be devoted in particular to mediaeval philosophy in its relations to the whole of profane thought and learning and the vast field of the Liberal Arts.

The editors of VIVARIUM are of opinion that this approach of mediaeval philosophy deserves some more attention than usually is paid to it. While fully aware of the merits of the existing journals concerned with mediaeval philosophy, they only wish to create a more appropriate forum for what might be called the profane side of the intellectual life. They hope to stimulate the achievements of an increasing number of scholars in their country and abroad, likely to have an active interest in this field of research.

Cassiodorus' monastery is more than a name. It embodies the scientific and didactic program of one of the important centres of culture 'in early Western Europe. Therefore the name VIVARIUM has been chosen for this journal.

C. J. de Vogel, L. M. de Rijk, J. Engels."

   "In *Metaph*. A 4, 985b4 ff. Aristotle speaks about the atomists Leucippus and Democritus. For they, he says, the void is by no means less than the full. (...) W, Jaeger (*Hermes*, 52, 1917 pp. 486 f.) is right in maintaining the reading of all the manuscripts." (p. 314)

2. ———. 1951. "The authenticity of Aristotle's *Categories*." *Mnemosyne* no. 4:129-159.

   "Most scholars either deny Aristotle's authorship of the first treatise of the Organon, or else consider the problem of authorship to be insoluble. I maintain, however, that such judgements are wrong and that the treatise is of genuine Aristotelian authorship, and of considerable importance for our knowledge both of Aristotle's own development, and also that of later Platonism. I shall try to show the authenticity of the treatise in the following study, and shall divide my investigation into the following main divisions:

   A. The view of the ancient commentators concerning the authenticity of *Categories* Chs. 1-9;

   B. Modern criticism of the authenticity of *Categories* Chs. 1-9;

   C. The authenticity of *Categories* Chs. 10-15." (p. 129)

   [See also the following note to *Ancient and mediaeval semantics and metaphysics* (Second part), *Vivarium*, November, 1978, p. 85: "Unlike some 30 years ago (see my papers published in *Mnemosyne* 1951), the present author has his serious doubts, now, on the authenticity of the first treatise of the *Organon*"].

3. ———. 1952. *The Place of the Categories of Being in Aristotle's Philosophy*. Assen: Van Gorcum.

   Ph.D. thesis, Utrecht University.

   Contents: Bibliography I-III; Introduction 1-7; Chapter I. Aristotle's doctrine of truth 8-35; Chapter II. The distinction of essential and accidental being pp. 31-43; Chapter III. Logical

and ontological accident 44-52; Chapter IV. The nature of the categories in the *Metaphysics* 53-66; Chapter V. The doctrine of the categories in the first treatise of the *Organon* 67-75; Chapter VI. The use of the categories in the work of Aristotle 76-88; Appendix. The names of the categories 89-92; Index locorum 93-96.

From the Introduction: "It seems to be the fatal mistake of philology that it always failed to get rid of Kantian influences as to the question of the relation of logic and ontology. Many modern mathematical logicians have shown that the logical and the ontological aspect not only are inseparable but also that in many cases it either lacks good sense or is even impossible to distinguish them. Accordingly, the distinction of logical and ontological truth (especially of propositional truth and term-truth), that of logical and ontological accident and that of logical and ontological categories, has not the same meaning for modem logic as it seems to have for 'traditional' logic (for instance the logic of most Schoolmen).

I hope to show in this study that the distinction of a logical and an ontological aspect (especially that of logical and ontological categories) can be applied to the Aristotelian doctrine only with the greatest reserve. A sharp distinction carried through rigorously turns out to be unsuitable when being applied to Aristotelian logic. For both aspects are, for Aristotle, not only mutually connected but even interwoven, and this in such a way that the ontological aspect seems to prevail, the logical being only an aspect emerging more or less in Aristotle's generally ontological way of thinking." (pp. 6-7)

4. Petrus, Abaelardus. 1956. *Dialectica*. Assen: Van Gorcum.

   First complete edition by L. M. de Rijk of the Parisian manuscript with an introduction; second revised edition 1970.

   From the Introduction: "§ 3. The task of logic according to Abailard.

   Abailard understands 'logica' or 'dialectica' as the art which aims at distinguishing valid arguments from invalid ones. We find a clear exposition of his opinion on this matter in the

prologue to the treatise Logica Nostrorum petitioni. Abailard here points to the fact that logic is not a theory of thought, which teaches us how we ought to think and dispute: its only function is to distinguish valid arguments from invalid ones and to state why (*quare*) they are valid or not:

est autem logica Tullii auctoritate diligens ratio disserendi, idest discretio argumentorum per quae disseritur, idest disputatur. non enim est logica scientia utendi argumentis sive componendi ea, sed discernendi et diiudicandi veraciter de eis, quare scilicet haec valeant, illa infirma lint. (*Log. Nostr. petit.*, 506, 24-28).

This distinction is made, as a matter of course, on rational grounds. The 'quare haec valeant, illa infirma sint' finds its answer in the presence (c.q. absence) of conclusive force (vis inferentiae, vis argumenti, vis sermonis). It sometimes rests on the pure form of reasoning (ipsa complesso terminorum): in this case we speak of complexional arguments; the other case is, if the matter of the argument contributes to its conclusive force: we speak, then, of topical arguments:

argumentationes quaedam sunt locales, quaedam vero complexionales quidem sunt quae ex ipsa complexione, idest ex ipsorum terminorum dispositione, firmitudinem contrahunt; locales vero sunt quibus convenienter potest assignari locus, idest evidentia conferri ex aliquo eventu rerum vel proprietate sermonis. (*Log. Nostr. petit.*, 508 9-15).

Since complexional and topical arguments borrow their conclusive force from respectively the arrangement of the terms (dispositio terminorum), and the state of affairs (eventus rerum) or the properties of speech (proprietas sermonis), their valuation requires some insight into the structure of proposition and into the properties of speech, the state of affairs being only secondarily the object of logic. The author elsewhere (Dial. III, 286 31-34) states that the scope of logic is to inquire into the use of speech, in the full sense of the word; inquiring into the nature of things (res) belongs to the domain of physics:

in scribenda Logica hic ordo est necessarius: cum logica sit discretio argumentorum, argumentationes vero ex propositionibus coniungantur, propositiones ex dictionibus, cum qui perfecte Logicam scribit, primum naturas s i m p l i c i u m sermonum, deinde compositorum necesse est investigare et tandem in argumentationibus finem Logicae consummare. (*Log. Nostr. petit.*, 508 4-9).

..... hoc autem logicae disciplinae proprium relinquitur, ut scilicet vocum impositiones pensando, quantum unaquaque proponatur oratione sive dictione, discutiat; physicae vero proprium est inquirere utrum rei natura consentiat enuntiationi (*Dial.* III, 286 31-34)

Aristotle deals with the use of speech, Abailard says (*Log. Nostr. petit.*, 508,32 -- 509,8), in his *Categories, De Interpretatione* and Topics, and with argumentations in his *Prior* and *Posterior Analytics*: Porphyry wrote an introduction to the first-mentioned treatise. Thus, the scheme of his own *Dialectica* is obvious: he first treats of the parts of speech (partes orationis) tractatus I; next the categorical propositions and syllogisms are dealt with: tractatus II; the treatment of the hypothetical propositions and syllogisms (tractatus IV) is preceded by that of the topics (tractatus IIII); the author ends his work with a treatise on division and definition: tractatus V." (pp. XXIII-XXV, notes omitted).

5. Rijk, Lambertus Marie de, ed. 1959. *Garlandus Compotista. Dialectica*. Assen: Van Gorcum.

   First edition of the manuscripts with an introduction on the life and works of the author and on the contents of the work.

   From the Introduction: " The author himself says in the preface to his work that the treatise has been meant as a first introduction to dilectics for tyroes:

   Nec illos (sc. libros) scribere proposuimus introductis, sed rudibus desiderantibus pervenire ad precepta supradictorum, Boetii scilicet et Aristotilis.

   It makes the impression of being a note-book, as appears from the words (III, 74, 26) *cras finiemus Periermeneias*. The

preface shows that Garland

himself subdivided the work into six Books. The first Book deals with the *praedicabilia* and *praedicamenta;* the second with *propositio;* the third with *nomen, verbum, oratio,* and the kinds of proposition; the fourth treats of the topical 'ingredients', such as *propositio, quaestio, conclusio, argumentum,* and *argumentatio* and of the *loci communes;* the fifth Book deals with categorical syllogism and the sixth with hypothetical syllogism. The expositions are illustrated by a great number of sophisms and their solutions.

Boethius' translations and commentaries of Aristotle's logical works and his logical monographies were without any doubt the direct source of the treatise. Garland explicitly says in his preface that he founds his expositions of logic on Aristotle and Boethius. (See Dial. Im 1, 2-9).

The work turns out to be an adaptation of the *logica vetus, i.e.* that part of Aristotelian logic the Latin translations of which were known before 1150 A. D. The sources of the *logica vetus* were Boethius' translations, commentaries and his monographies on logic:

(1) *In Isag. Porhyrii Commenta* (two editions)

(2) *In Categ. Arist. Libri IV* (two editions)

(3) *In Librum Arist. De Interpr.*

(4) *Introductio ad categ. syll.*

(5) *De syllogisimis categoricis*

(6) *De syllogismis hypoteticis*

(7) *De differentiis topicis*

(8) *De divisionibus*

It is a striking fact that Garland neither uses nor mention the treatise *De Divisionibus*; neither division nor definition are dealt with explicitly by him. For the rest Boethius is mentioned many times. Garland nowhere calls his own masters by their

names, though he asserts, to have adopted several explanations from them."

(pp. XLV - XLVI, notes omitted).

6. ———. 1962. *Logica Modernorum. A Contribution to the History of Early Terminist Logic. Vol. 1: On the Twelfth Century Theory of Fallacy*. Assen: Van Gorcum.

   Contents: Preface 11; 1. The specific character of the *Logica Modernorum* 13; 2. The theory of fallacy in the framework of the *Logica Vetus* 24; 3. The theory of fallacy in the great logical works of Peter Abailard 49; 4. The theory of fallacy in the School of the *Parvipontani* 62; 5. The earliest mediaeval commentaries on the *Sophistici Elenchi* 82; 6. The theory of fallacy in the later glosses on the *Perihemeneias* 113; 7. Two treatises on fallacy from the latter part of the twelfth century 127; 8. On the use of the doctrine of fallacy in twelfth century theology 153; Books and articles referred to 179; List of manuscripts used 181; Appendices: A. *Glose in Arist. Sophisticos Elencos* 187; B. *Summa Sophistorum Elencorum* 257; C. *Tractatus de dissimilitudine argumentorum* 459; D. *Fallacie Vindobonenses* 459; E. *Fallacie Parvipontane* 491; F. [Frustula Logicalia] 611; Indices: A. Index locorum 629; B. Index nominum 642; C. Index sophismatum et exemplorum 646; D. Index verborum et rerum 659-674.

   "In this work the author tries to show how the *Logica Modernorum,* - which, as is known, exerted, from the thirteenth century onwards, such a profound influence on the development of Mediaeval Philosophy -, had its origin in the twelfth century logical and grammatical theories which arose in the Western centers of studies, especially in Paris.

   The first volume deals with one of the two roots of this development: the twelfth century doctrine of fallacy; the second volume will treat of the *Logica Modernorum* in the grammatical theories of the twelfth century.

   The author thought it of great importance to edit in full the main treatises on which his studies are based; they are found in the *Appendices* A-E. *Appendix* F contains three passages from

twelfth century *Perihermeneias*-commentaries; in order to avoid the false suggestion that one has to do here with fragmentary remnants which have come down to us, I chose, despite its somewhat culinary sound, the term *'Frustula'* instead of the more usual *'Fragmenta'*. Some information on the manuscripts concerned is given in the course of this study; for the places, consult the *List of manuscripts used*.

As to the *ratio edendi* I refer to the preface of my edition of the *Dialectica* of Garlandus Compotista, published as part III in the same series.

The *Index nominum,* the *Index locorum* and the *Index sophismatum* aim at completeness. The *Index verborum et rerum* is not exhaustive: it only tries to give a number of words and phrases considered as important for the understanding of the conceptual and doctrinal contents of the edited treatises and to facilitate the reader's orientation in this study." (From the Preface, p. 11)

7. ———. 1963. "On the curriculum of the Arts of the Trivium at St. Gall from ca. 850 - ca. 1000." *Vivarium* no. 1:35-86.

   "From the hermitage founded about the year 613 by St. Gall, one of the companions of St. Columban, there arose at the beginning of the next century an abbey that has been one of the most famous centres of intellectual and spiritual life in Western Europe. (p. 35)

   (...)

   No doubt one of the most celebrated men of the School of St. Gall was Notched Label (c. 950-2022). Many works are attributed to this master or, at least, to the masters of St. Gall who lived about the year 1000. I confine myself to the works on the Trivium: grammar, dialectics, rhetoric." (p. 47)

8. ———. 1964. "On the chronology of Boethius' works on logic. Part I." *Vivarium* no. 2:1-49.

   "The chronological order of Boethius' works appears to be a rather difficult problem. Hence, it is not surprising that the numerous attempts to establish it led the scholars to results

which are neither all conclusive nor uniform. In this article I confine myself to Boethius' works on logic. Before giving my own contribution it would seem to be useful to summarize the results of preceding studies and to make some general remarks of a methodological nature. (p. 1)

(...)

My conclusion from this survey is that the best we can do in order to establish approximately the chronological order of Boethius' works on logic is to start a careful and detailed examination of all our data on this matter. In doing so an analysis of their contents seems to be quite indispensable, no less than a thorough examination of doctrinal and terminological differences." (p. 4)

9. ———. 1964. "On the chronology of Boethius' works on logic. Part II." *Vivarium* no. 2:125-162.

"We shall now sum up the results of our investigations. First some previous remarks. Our first table gives of nine of the works discussed the chronological interrelation, which can be established with a fair degree of certainty. The figures put after the works give the approximative date of their composition (the second one that of their edition); when printed in heavy types they are based on external data; the other ones are based on calculation.

Table 1

Boethius' birth about 480 A.D.

In Porphyrii Isagogen, editio prima about 504-505

In Syllogismis categoricis libri duo (= ? Institutio categorica) about 505-506

In Porphyrii Isagogen, editio secunda about 507-509

In Aristotelis Categorias (? editio prima) about 509-511

In Aristotelis Perhemeneias, editio prima not before 513

In Aristotelis Perhemeneias, editio secunda about 515-516

De syllogismis hypotheticis libri tres **between 516 and 522**

In Ciceronis Topica Commentaria before 522

De topicis differentiis libri quattuor before 523

Boethius' death 524

The rest of the works discussed cannot be inserted in this table without some qualification. (...)

We may establish the following table for the works not contained in out first table:

Table 2

Liber de divisione between 505 and 509

possible second edition of the *In Categorias* after 515-516

Translations of the *Topica (and Sophistici Elenchi*) and of the

Analytica Priora and *Analytica Posteriora* not after 520

Commentary on Aristotle's *Topica* before 523

the so-called *Introductio* (? = *In Priora Analytica Praedicanda*) certainly after 513; probably c. 523

Scholia on Aristotle's *Analytica Priora* first months of 523 at the latest"

(pp. 159-161, notes omitted).

10. ———. 1965. "'Εγκύκλιος παιδεία'. A Study of Its Original Meaning." *Vivarium* no. 3:24-93.

"No doubt, the term *Enkylios paideia* (of which the term *'Artes liberales' is* supposed to be the Latin equivalent) refers to one of the key-concepts in European culture and education. From as early as Late Antiquity the Liberal Arts were supposed to embrace the whole circuit of (human) knowledge and therefore to afford some kind of 'encyclopedical' wisdom. The sixteenth century *Grande Encyclopédie* was strongly aware of its origin: 'ce que les Anciens appelaient encyclopédie, c'était l'ensemble des connaissances générales que tout homme instruit devait posséder avant d'aborder la vie pratique ou de se consacrer à une étude spéciale' (quoted by H. Koller in his article *Enkylios*

paideia in *Glossa*, Zeitschrift für Griechische und Lateinische Sprache, 34, 1955, pp. 174-189)." (p. 24)

11. ———. 1966. "Some new evidence on twelfth century logic: Alberic and the School of Mont Ste Geneviève (Montani)." *Vivarium* no. 4:1-57.

    "It is well known that the art of logic (*logica* or *diale(c)tica*) knew a remarkable flourishing period during the twelfth century. In the first half of the century its main centres in Paris were: the School of Notre Dame, of St. Victor, of the Petit Pont and of Mont Ste Geneviève. The present paper aims to offer some new evidence from the manuscripts on the teaching of logic as given in the School of Mont Ste Geneviève (*Montani*). Part of these sources will be published in full in the second volume of my *Logica Modernorum*. This book, to be issued probably about the middle of 1967 will discuss the doctrinal and conceptual content of the treatises mentioned here." (p. 1)

12. ———. 1966. "Some notes on the medieval Tract '*De insolubilibus*' with an edition of a Tract dating from the end of the Twelfth century." *Vivarium* no. 4:83-115.

    "As is known, one of the important contributions made by the Megarian School (4th cent. B.C.) to the development of Western logic was the invention of a number of remarkable paradoxes. Among them there was the famous Liar: 'a man says that he is lying; is what he says true or false?'. Generally speaking, paradoxes of this type intend to show the oddity of making a statement say something about its own truth or falsity. So the Liar, being one of the many puzzles connected with the notions of truth and falsity, is one of the most important logical problems, since the fundamental notion of logic is validity, and this is definable in terms of truth and falsehood.

    Mediaeval logicians, too, devoted their attention and ingenuity to the Liar paradox and its variants. The twelfth century revisor of the *Ars disserendi* written by Adam of the Petit Pont in 1132 mentions as a current complicated question (*illud interrogabile multiplex*) the puzzle of the man who says that he is (only) lying." (p. 83)

(...)

"To turn, now, to the Mediaeval variants of the Liar paradox, the *sophismata* dealing with them attracted special attention from about 1200, if not as early as from the middle of the twelfth century, as may appear from the revision of Adam's *Ars disserendi* mentioned above. From the thirteenth century onwards many tracts have been handed down to us in which these variants and the logical problems they involved were discussed. These tracts went under the title *De insolubilibus*.

As we are told by the authors themselves in their prologues, this title is somewhat misleading. In fact they do not deal with which cannot be solved but rather with what is difficult to solve because of certain circumstances lying in some human act or some property of the speech used. The tracts discuss certain propositions that are self-falsifying since they contain elements which reflect on the propositions themselves of which they are parts.

The Mediaeval variant of the Liar had this basic form : *'what I am saying is false'* (*'ego dico falsum'*), provided I do not utter any proposition other than *'what I am saying is false'*.

In the beginning of the fifteenth century no fewer than fifteen different (or, at least, various) attempts were known to solve the puzzle, as we are told by Paul of Venice, who in his *Logica Magna* listed them industriously. From as early as the thirteenth century we know four different solutions of this kind of *insolubile*.

The aim of this paper is to present what is probably the oldest tract *De insolubilibus* that has come down to us and to bring out some evidence for its date and its place in the development of the Mediaeval *insolubilia* - literature. For this purpose I start from an examination of two later tracts on the subject: the *De insolubilibus* of Walter Burley written about 1302, and two tracts dating from the first half of the thirteenth century, the one of which was ascribed to William of Shyreswood (d. after 1267) by Grabmann, without plausible grounds, it seems, but

certainly belongs, just like the other tract, to the first half of the thirteenth century." (p. 86)

13. ———. 1967. "Some notes on the twelfth century topic of the three (four) human evils and of the science, virtue and techniques as their remedies." *Vivarium* no. 5:8-15.

    "In the first of the appendices added by Hugh of St. Victor to the text of the *Didascalicon,* which was composed in Paris in the late 1120's (*), the author gives a division of the contents of Philosophy (printed by Buttimer (**) as chapters 14 and 15 of Book VI). It opens with the contradistinction of the three evils of human nature and the three corresponding remedies:

    'There are three things to be considered now: wisdom, virtue, and need. Wisdom is the understanding of things as they are. Virtue is a habit of mind, a habit which is in harmony with reason in the way of a nature. A need is something without which we cannot live, but without which we would live more happily. These three things are as many remedies against the three evils to which human life is subject: wisdom against ignorance, virtue against vice, and need against life's weakness. In order to do away with these three evils, men have sought after those three remedies, and in order to find the three remedies, every art and every discipline was discovered.

    For the sake of wisdom the theoretical arts were discovered; for the sake of virtue the practical arts were discovered; for the sake of our needs the mechanical arts were discovered. These three were first in practice, but afterwards, for the sake of eloquence, logic was discovered. Logic, though fast to be discovered, ought to be the first learned.

    Four, then, are the principal sciences from which all the others descend; these are the theoretical, the practical, the mechanical, and the logical.' (ed. Buttimer pp. 130-131).

    Thus Hugh starts from ignorance *(ignorantia),* vice *(vitium),* and weakness *(infirmitas)* as the three fundamental evils to which human nature is supposed to be subject, and he opposes to them wisdom *(sapientia),* virtue *(virtus),* and need *(necessitas)* as their three remedies. The latter are said to have

caused the invention of theoretical science, practical science and mechanical science or techniques. Afterwards, for the sake of eloquence, logic was invented, but in Hugh's division of sciences it is apparently not opposed to some fourth evil of human nature.

As far as we know Hugh was the first to reduce the invention of arts and sciences to certain defects of human nature. We do not know whether this reduction is an invention of his own. This much is certain: his view is frequently found in twelfth century authors both in the Victorine School and in that of Chartres." (pp. 8-9)

14. ———. 1967. *Logica Modernorum. A Contribution to the History of Early Terminist Logic. Vol. 2, Part One: The Origin and Early Development of the Theory of Supposition*. Assen: Van Gorcum.

    Contents: Preface 9; Part One: 1. Introduction, analysis of the manuscripts concerned 11; 2. On the development of mediaeval grammar 95; 3. The increasing use of special textbooks of logic in the first half of the twelfth century 126; 4. The theory of signification in twelfth century logic up to about 1140 177; 5. On the theory of signification in twelfth century grammar 221; 6. The tract on logic contained in MS. Oxford, *Digby* 174, analysis of its content, its origin and date 264; 7. *Ars Meliduna*. On the theory of terms 292; 8. *Ars Meliduna*. On the denotation of the terms 306; 9. *Ars Meliduna*. The theory of proposition 319; 10. *Ars Meliduna*. The theory of the *enuntiabile* 357; 11. Some treatises on logic dating from about 1200 391; 12. The *Dialectica Monacensis* preserved in Munich, *C.L.M. 14, 763* 408; 13. Some early Oxford tracts on logic 416; 14. The *Summe Metenses* found in Paris, *B. N. Lat. 11, 412* 449; 15. The doctrine

of fallacy and the origin of the theories of supposition 491; 16. The grammatical origin and early development of the theory of Appellation (Supposition) 513; 17. The logical theory of the Properties of terms up to about 1200 555; Books and articles referred to 599; List of the manuscripts used 606; List of incipits 608-614.

"In this work it will be attempted to show how the *Logica Modernorum* had its origin, long before the thirteenth century, in the logical and grammatical theories current in the Western centers of studies: Paris, Oxford and presumably a school in Northern Italy.

The first volume dealt with what was considered as one of the two roots of this development: the twelfth century theories of' fallacy. The present volume discusses the other source: the development of Mediaeval grammar from an elementary discussion of (Latin) grammar to a linguistic-semantic theory of' (Latin) language. It was the latter contribution that was of extreme importance for the origin of the theory of supposition, and generally speaking, of terminist logic.

The purpose of this volume is to trace the details of the origin of the. theory of' supposition, including appellation and copulation, and to discuss the theory of the properties of terms as found about 1200. Besides, some historical evidence will be given for the origins of' the tracts dealing with the properties of syncategorematic terms and those discussing the other specific elements of the *Logica Modernorum*.

The author has thought it of some importance for further investigation in this field to edit in full the main treatises on which the present study is based. They will be found in the second part of' this book. They have been arranged chronologically, except for the *Quaestiones Victorinae,* which are to be considered as an extra.

The *Index nominum,* the *Index locorum* and the *Index sophismatum* aim at completeness. The *Index verborum et rerum* is not exhaustive: it only tries to give a number of words and phrases considered as important for our understanding of

the conceptual and doctrinal contents of the edited tracts, and to facilitate the reader's orientation in this study." (Preface, p. 9)

15. ———. 1967. *Logica Modernorum. A Contribution to the History of Early Terminist Logic. Vol. 2, Part Two: The Origin and Early Development of the Theory of Supposition. Text and Indices*. Assen: Van Gorcum.

    Edition of a number of tracts dating from c. 1130 up to c. 1220.

    Contents: I. *Introductiones Montane minores* 7; II. *Abbreviatio Montana* 73; III. *Excerpta Norimbergensia* 109; IV. *Ars Emmerana* 143; V. *Ars Burana* 175; VI. *Tractatus Anagnini* 215; VII. *Tractatus de univocatione Monacensis* 333; VIII. *Introductiones Parisienses* 353; IX. *Logica "Ut dicit"* 375; X. *Logica "Cum sit nostra"* 413; XI. *Dialectica Monacensis* 453; XII. *Fallacie Londinenses* 639; XIII. *Fallacie Magistri Willelmi* 679; XIV. *Tractatus de proprietatibus sermonum* 703; XV. *Quaestiones Victorinae* 731; Indices: a. Index locorum; B. Index nominum; C. Index verborum et rerum; D. Index sophismatum et exemplorum.

16. ———. 1968. "On the genuine text of Peter of Spain's' *Summule Logicales*'. Part I. General problems concerning possible interpolations in the manuscripts." *Vivarium* no. 6:1-34.

    "As is known, Peter of Spain, who afterwards became Pope under the name of John XXI, wrote a textbook on logic, which was to enjoy a high renown from the end of the thirteenth up to the seventeenth century as *Summule logicales magistri Petri Hispani* (1).

    Its fame appears from the noticeable number of manuscripts (more than 300) and of printed editions (about 160), the latter dating from 1474 up to 1639 (2). This number is tremendous indeed, especially for the future editor of the first critical edition of the Summule.

    However, the printed editions are of no use for the critical reconstruction of our text. As a matter of fact they all contain quite a number of interpolations.(3) Therefore an examination of their readings can properly be dismissed. As is easily seen,

the same holds good for the later manuscripts. They are most of them intended adaptations of the famous school-book by well-known masters of logic. Their very intention to emend the text *(tractatus duodecim iam emendati)* is bound to make the critical editor suspicious as to the reliability of their text as a source for the original version.

A first attempt to clear up the situation might be made in confining our attention to the earlier manuscripts, say those dating from Peter's lifetime up to about the first decades of the fourteenth century. However, the result appears to be rather disappointing indeed. Even the late thirteenth century manuscripts betray such divergencies as to confirm the supposition of rather early interpolations in a sufficient way." (p. 1)

17. ———. 1968. "On the genuine text of Peter of Spain's '*Summule Logicales*'. Part II. Simon Faversham (d. 1306) as a commentator of the Tract I-V of the *Summule*." *Vivarium* no. 6:69-101.

"Who was the author? Grabmann was of the opinion that the only logician bearing the name of *Simon* in the second part of the thirteenth century was Simon of Faversham, since master Simon of Dacia was a grammarian, known especially for his tract *Domus gramatice* (*). However, his being a grammarian does not at all exclude his possible authorship of logical works, as may appear from the case of the Modist Boetius of Dacia, who also wrote a commentary on Aristotle's Topics. However,

our author's apparent preference for Albert the Great and Avicenna as his sources seems to point to Simon of Faversham as the author of our commentary. Unfortunately his other works on logic do not offer any additional evidence for his authorship of the Summule-commentary, since the works to be considered (especially on *Perihermenias*) all have the form of selected *Questiones*. In his *Questiones super Universalia* as found in the manuscript Kassel, Landesbibliothek, *2° Philos.* nr. 30-6 (ff. 1r-9r) a question is read *utrum locus sit principium generationis* (f. 3r). (I could not find it in the Milan manuscript C. 161 *Inf.* which also contains *questiones super universalia* and has the same *incipit*)." (p. 72)

(*) It has been edited (together with his Questiones super 20 minoris voluminis Prisciani) by Alfred Otto in the Corpus Philosophorum Danicorum Medii Acvi, III Copenhague 1963.

18. ———. 1969. "On the genuine text of Peter of Spain's '*Summule Logicales*'. Part III. Two redactions of a commentary upon the *Summule* by Robertus Anglicus." *Vivarium* no. 7:8-61.

"The question must be answered mow whether the *Robertus Anglicus*, who is the author of *Tractatus quadrantis* and the commentary on John de Sacrobosco's *De sphera* may be also the author of the two redactions of the commentary on Peter of Spain's *Summule logicales* which we found in the Vatican and Todi manuscripts. Three arguments can be adduced in favour of the identity of our author with the teacher of Montpellier.

First, the remarkable similarity of the colophon in both the Rome and Todi redaction of the *Summule* commentary with that of the *De sphera* commentary as found in Paris, *B. N. Lot.* 7392 and Oxford, Bodleian Library, *Digby* 481. This correspondence is the more noticeable since this kind of colophon which is well-known, indeed, from works discussing *quadrivium* subjects, is very unusual in tracts on grammar or dialectics. If our surmise about the identity of our author and the teacher of Montpellier is correct, both conjectural corrections of the Vatican colophon (discussed above, p. 32) may be right, as both 1270 and 1277 fit in pretty well with the dates mentioned in the colophons of Robert's commentary on

De sphera (1271 and 1272). On palaeographical grounds the year 1270 *(septuagesimo* instead of *septimo)* seems to be the more preferable.

Secondly, the occurrence of several sets of medical, astronomical and meteorological notes added in the Todi manuscript by the same hand that wrote our Summule commentary, is a reliable clue for the scientific interest of the school where that commentary was written and used in class. Well, the first school to be considered in this regard is that of Montpellier, where one Robertus Anglicus is reported to have been a teacher in the 1270's.

Thirdly, an important hint for the place of origin of a commentary on the Summule is often to be found in the example its author gives in his discussion of *Exemplum* in the tract *De locis*. (...)

In conclusion, it may be said that it seems to be highly probable, indeed, the the commentary on Peter of Spain's *Summule logicales* which is extant in two redactions, was written by the same Robertus Anglicus whose *Tractatus quadrantis* and commentary on John of Sacrobosco's *De sphera* have been preserved in some manuscripts." (pp. 39-40)

19. ———. 1969. "On the genuine text of Peter of Spain's '*Summule Logicales*'. Part IV. The *Lectura Tractatum* by Guillelmus Arnaldi, Master of Arts at Toulouse (1235-1244). With a note on the date of Lambert of Auxerre' *Summule*." *Vivarium* no. 7:120-162.

"No doubt, this *Lectura Tractatuum* was written by a *Guillelmus,* or *Guillermus, Arnaldi* who taught the liberal arts at Toulouse. As a matter of fact I found a teacher of that name in a number of documents concerning the county of Toulouse." (p. 125)

(...)

"A number of resemblances found between the usual text of Peter of Spain's Summule and that of Lambert of Auxerre's treatise of the same title had frequently raised the question of the interdependence of these texts. As is known, Konstant

Michalski defended the thesis of the large dependence of Peter of Spain upon Lambert of Auxerre'. As a matter of fact Michalski had to work upon interpolated texts of both works and the textual resemblances alluded to by the Polish Mediaevalist disappear for the greater part when the authentic texts are considered. Grabmann held the inverse opinion and especially pointed to the opening words of Lambert's work: Ut novi artium auditores plenius intelligant *ea* que *in summulis edocentur* . . . etc. and saw an allusion to the title of Peter's *Summule logicales* in these words. (*) However, the original title of Peter's work was Tractatus, not Summule, as was frequently shown in our preceding articles. The question of whether or not Lambert was really influenced by Peter's work seems to be far more complicated. It will not be discussed here.

A different question is that of the chronologic order of Peter's and Lambert's works. Its solution is important for the problem of interdependence, even if it is not decisive, since priority of one work to the other does not imply the latter's dependence upon the former.

As to Peter's work, from the existence of a commentary on it which dates from as early as the 1240's (see our article on Guillelmus Arnaldi) the conclusion must be drawn that Peter of Spain cannot have written his Summule *logicales* (or better: *Tractatus*) after 1240.

(...)

So we have the following dates for Lambert's Summule. The work was written at Troyes (or Pamplona), not in Paris, between 1253 and 1257 when the king was anointed and is likely to have finished his studies. It was published afterwards in Paris, when Lambert was a member of the Dominican Convent there, before he became penitentiary of the Pope." (pp. 160-161)

(*) Martin Grabmann *Handschriftliche Forschungen und Funde zu den philosophischen Schriften des Petrus Hispanus, des späteren Papstes Johannes XXI (d.1277)* in:

Sitzunsgberichte der Bayerischen Akademie der Wissenschaft Phil.-Hist. Abt. 1936, Heft 9, pp. 41-42.

20. ———. 1969. "Significatio y suppositio en Pedro Hispano." *Pensamiento* no. 25:225-234.

    Translated in Spanish by Th. G. Sinnige.

    "En este modesto articulo me propongo hablar de la teoria de la suposición de Pedro Hispano en la forma en que esta expuesta en el Tratado No. VI (*de suppositionibus)*. A menudo encontramos la opinion de que la teoria terminística de la suposición en todos los casos haya tenido una base de Indole nominalista. Esta opinion está decididamente equivocada. Basta señalar a un autor como Gualterus Burlaeus para porter en claro que la teoría de la suposición podia muy bien ser interpretada en un sentido realista. Por otra parte se puede comprobar que la teoría de la suposición ya en sus orígenes iba vinculada estrechamente con la teoría de la significación. La evolución de la teoria de la suposición por consiguiente está mezclada Intimamente con las fluctuaciones que se producen en la teoría de la significacion.

    En lo que signe me propongo analizar:

    1) lo esencial de la teoría de la suposición, teoría que en su origen no era otra cosa sino una teoría sobre la interpretabilidad de un término dentro de la proposición;

    2) el estrecho vfnculo que existe entre la teoria de la suposición y la teoria de la significación. Como consecuencia de esto, a principios del siglo XIII et concepto de suposición tiende a extenderse hasta incluir también términos usados fuera del contexto de la proposición (*)" (pp. 226-227)

21. ———. 1970. "On the genuine text of Peter of Spain's '*Summule Logicales*'. Part V. Some anonymous commentaries on the *Summule* dating from the Thirteenth century." *Vivarium* no. 8:10-55.

"Mgr. Grabmann found several commentaries on the *Summile logicales* dating from as early as the thirteenth century (*) Some of the are anonymous. This group will be discussed in this part of our study on the genuine text of Peter of Spain's famous text-book of logic." (p. 10)

(*) Martin Grabmann *Handschriftliche Forschungen und Funde zu den philosophischen Schriften des Petrus Hispanus, des späteren Papstes Johannes XXI (d.1277)* in: Sitzunsgberichte der Bayerischen Akademie der Wissenschaft Phil.-Hist. Abt. 1936, Heft 9, pp. 63-70

22. ———. 1970. "On the life of Peter of Spain, the author of the Tractatus, called afterwards *Summule logicales*." *Vivarium* no. 8:123-154.

"Before an attempt will be made to sketch the life of the author of the so-called *Summule*, a preliminary question of major importance should be answered: is the author identical with Peter of Spain (Peters Hispanics) who in 1276 became Pope under the name John XI?

An alternative question may be added whether, or not, the famous logician was a Black friar, as was sometimes maintained.

(...)

However, other strong evidence can be put forward in support of the traditional view that Peter Hispanus who afterwards bore the tiara was the author of the *Summule*. Since Pope John XXI certainly was a secular priest, the identification implies an absolute rejection of any member of a religious Order as the author of the work. (pp. 125-127, notes omitted).

23. ———. 1970. "Die Bedeutungslehre in der Logik des 13. Jahrunderts und ihr Gegenstück in der metaphysischen Spekulation." In *Methoden in Wissenschaft und Kunst des Mittelalters*, edited by Zimmermann, Albert, 1-22. Berlin: De Gruyter.

Miscellanea Mediaevalia, vol. 7.

Reprinted as chapter VII in: *Through Language to Reality. Studies in Medieval Semantics and Metaphysics*.

I. Einleintung: Bedeutungslehre und Methode; II. Die Suppositionstheorie als Bedeutungslhre im 13. Jahrhundert; III: Die Bedeutungslehre in der metaphysischen Spekulation im 13. Jahrhundert.

"Ich möchte jetzt meine Ergebnisse noch einmal ganz kurz zusammenfassen. Es hat sich zuerst, wie ich hoffe, die äußerste Wichtigkeit einer Bedeutungslehre nicht nur für die Logik, sondern auch im Interesse der metaphysischen Spekulation ergeben. Es hat sich herausgestellt, daß sich die immer mehr herausgearbeitete Bedeutungslehre der Suppositionslogik als Theorie der Interpretabilität des Terminus im Grunde genommen mit genau denselben Problemen befaßte, mit denen die Metaphysiker des 13. Jahrhunderts gekämpft haben. Hier wie dort galt es wesentlich, die fundamentalen Bedingungen des Seins („esse" oder „est") in der Reflexion über die menschliche Aussage ausfindig zu machen. Hier wie dort auch entsprachen sich die unterschiedlichen Betrachtungsweisen, je nachdem man entweder die „forma universalis" oder das konkrete Individuum zum Blickpunkt und somit zum Referenzpunkt seiner Spekulation zu machen versucht hat.

Man wird sich der Folgerung nicht entziehen können, daß namentlich dem 13. Jahrhundert eine folgerichtige Bedeutungslehre fehlte. Sie wurde geradezu nur gelegentlich und nebenbei angelegt. So findet man vielfach nebeneinander Elemente der Bedeutungslehren der Logiker, der Modisten und jene der metaphysischen Spekulation. Wirklich begründet wurde die Bedeutungslehre m. E. im Mittelalter nie.

Die jetzige Skizzierung aber könnte vielleicht immerhin als bescheidene Anregung dienen, die teils implizite Bedeutungslehre des 13. Jahrhunderts und besonders ihre Vorbedingungen gründlicher zu untersuchen. Das wäre eine Aufgabe, die bei weitem über das Interesse der Logikhistoriker und vielleicht sogar das historische Interesse überhaupt hinausgeht. Es war ja die philosophische Methode selbst im Spiel, und zwar in einem weitaus erheblicheren Maße, als es

den meisten Denkern des Mittelalters zum Bewußtsein kommen konnte." (p. 22)

24. ———. 1971. "The development of *suppositio naturalis* in medieval logic. Part I. Natural supposition as non-contextual supposition." *Vivarium* no. 9:71-107.

    Reprinted as chapter IX in: Through Language to Reality. Studies in Medieval Semantics and Metaphysics.

    "I had already discussed this matter [naural supposition] in the second volume of *Logica Modernorum* (Assen 1967; pp. 571-578) and in the paper *Significatio y suppositio en Pedro Hispano*.

    The aim of this paper is to elaborate and, partly, correct the view of natural supposition given there by a discussion of the most representative thirteenth century authors and of some fourteenth century logicians with whom natural supposition still played a rôle, such as John Buridan and Vincent Ferrer.

    The thirteenth century authors are Peter of Spain, William of Sherwood, the anonymous author of the *Tractatus de proprietatibus sermonum*, and Lambert of Auxerre. It should be remarked at the outset that there is no interdependence between these thirteenth century authors, apart from the rather vague relation effected by their standing in a common tradition of logic." (pp. 71-72)

25. Peter, of Spain. 1972. *Tractatus, called afterwards Summule logicales*. Assen: Van Gorcum.

    First critical edition from the manuscripts with an introduction by L. M. de Rijk.

    Contents: 1. Pope John XXI (Peter of Spain) as the author of the so-called *Summule logicales* IX; 2. Life and works of Peter of Spain XXIV; 3. The *Tractatus* called afterwards *Summule logicales*. Title, order and number of the tracts. Their date XLIII; 4. Sources. 'The Byzantine thesis'. Peter's possible masters of logic LXI; 5. Contents of the *Tractatus* LXXXVIII; 6. The early diffusion of the *Tractatus*. Commentaries and editions XCV; 7. The manuscripts used for this edition C; Books

and articles referred to CXI; List of manuscripts used CXVI; Index of names CXXI.

"Contents of the *Tractatus*.

As to the doctrinal contents, the *Tractatus* may be divided in two main parts: one (A) discussing doctrines found in the so-called *logica antiquorum* (=*logica vetus* and *logica nova*), the other (B) those commonly dealt with in the *logica modernorum* (the tracts discussing the so-called *proprietates terminorum*):

A: *De introductionibus* (Tract I), *De predicabilibus* (Tract II), *De predicamentis* ((Tract III), *De sillogismis* (Tract IV), *De locis* (Tract V), *De fallaciis* (Tract VII)

B: *De suppositionibus* (tract VI), *De relativis* (Tract VIII), *De ampliationibus* (Tract IX), *De appellationibus* (Tract X), *De restrictionibus* (Tract XI), *De distributionibus* (Tract XII)." (pp. LXXXVIII-LXXXIX, notes omitted)

26. Rijk, Lambertus Marie de. 1973. "The Development of Suppositio Naturalis in Mediaeval Logic. II. Fourteenth-Century Natural Supposition as Atemporal (Omnitemporal) Supposition." *Vivarium* no. 11:43-79.

    Reprinted as chapter X in: *Through Language to Reality. Studies in Medieval Semantics and Metaphysics*.

    "I - Status quaestionis.

    From the investigations in the first part of this article the conclusion was drawn that in the thirteenth century doctrine of supposition natural (or habitual, or absolute) supposition was considered the natural capacity of a term to stand for something partaking in the essence (or: universal nature) signified by that term; accidental supposition was the term's actual being taken for something in virtue of the term's combination with some other term in either a phrase or a proposition, or of its having a special meaning in a special social context. Briefly stated : natural supposition was decidedly non-contextual, whereas all kinds of accidental supposition were of the contextual type.

Two characteristics of the thirteenth century doctrine of supposition are to be noticed

(a) accidental supposition, being contextual, does not always imply a propositional context

(b) natural supposition, being something midway significatio and suppositio (as opposed to significatio), seems to enervate the clear-cut

distinction all thirteenth century logicians made between suppositio and significatio.

ad a Thirteenth century logicians turn out to consider the proposition as just one of the possible contexts of a term, not as the only one required for a term's having supposition.

ad b The introduction of natural supposition was due to the peculiar fact that those logicians apparently held it to be indispensable to distinguish between a word's having signification (viz. its representing some universal nature) and its capacity to stand for individuals partaking in this universal nature (c.q. the universal nature participated, taken as such), which capacity was the direct, or natural, counterpart of its having signification. This natural capacity must be seen as a reference to a *possible* context, which supplies an adjunct to limit, or restrict, the term's original capacity (c.q. which causes its having an unrestricted exercise of its natural capacity). (...)

As is well known, when studying the problems of signification fourteenth century logicians showed an increasing interest in the contextual approach to language. Their investigations were focussed on the *congruitas locutionis* and the *veritas propositionis* as the basic requirements *(exigentie)* for stating the actual meaning of terms. Their theories of supposition may be taken as an attempt to specify the truth conditions for (mostly affirmative) categorical propositions. Thus, the various kinds of supposition were characterized by fourteenth century logicians by means of implications *(consequentie)'*. Consequently, they were bound to lay the most explicit stress on the *proposition* as the only possible context in which a term could have supposition.

The most obvious conclusion from the theoretical point of view would be that natural supposition, being of the non-contextual type, had to disappear in fourteenth century logic. To my mind, it certainly had - as certainly as it never should have appeared. However, it *did* occur in those days, not only in the Realist tradition but with a logician as John Buridan as well.

It is the aim of this article to discuss the reinterpretation of natural supposition and the controversies it provoked, and is still provoking up to the present days." (pp. 43-44)

27. ———. 1973. "A note on Aganafat(?)'s '*Thesaurus Philosophorum*'." *Vivarium* no. 11:105-107.

"Some years ago I found in the Vatican Library (*Vat. Lat.* 4537, ff. 45ra-52ra, s. XIII) an incomplete copy of a tract on the *modus opponendi et respondendi*, the author of which calls himself *Aganafat* (or: Aganasat).

Further investigations have shown that this tract, called *Thesaurus philosophorum*, must have been the source of the well known *Tractatus de modo opponendi et respondendi* found in several manuscripts (Paris, *BN Lat.* 16.930, 16.617 and Montecassino 362 VV) and printed under Albert the Great's name. (See M. Grabmann, in Sitzungsberichte der bayer. Akad. d. Wiss., Phil-Hist. Abt. Jahrg. 1937, H. 10 (Munich 1937), 24 f.)

(...)

I hope to edit the *Thesaurus philosophorum* in full next year, together with the adaptations and a study on its place in the development of the *ars obligatoria et exercitativa*. At this moment I confine myself to edit the *argumentum* and the *prologus* in order to enable students of Arab (or Hebrew?) logic to get some impression of this work and its author. I should be very pleased if some information could be given on his identity." (p. 105)

28. ———. 1974. "Some Thirteenth century tracts on the Game of Obligation. Part I. Two separate tracts on '*falsi positio*' and '*impossibilis positio*'." *Vivarium* no. 12:94-123.

"In his thorough study on Sherwood's and Burley's tracts *De obligationibus*, Father Romuald Green (*) rightly describes the aim of these tracts as follows:

The purpose was to inculcate knowledge of logical rules by practice, to sharpen the pupil's mind to avoid contradiction -- the basis of any disputation ... it was a general introduction to a number of fundamental logical notions and their use in disputation'.

I give his succinct description of the general plan of the obligation:

'Briefly, the plan of an exercise de obligationibus is as follows. It is a disputation involving an opponens and a respondens. The opponens proposes a statement, which, for example, he wishes to be upheld. The respondens accepts the initial statement and binds himself (se obligat) to the wishes of the opponens, that is, in this case, to uphold it. This is the meaning of obligatio -- the opponens asks the respondens to take on the obligation, for example, of upholding a particular statement. Once the respondens has accepted the obligation, the opponens proposes a number of other statements which the respondens must concede or deny -- but always the respondens must maintain the initial statement according to the obligation accepted, and he must observe the logical rules of inference, if the various statements proposed are logically connected, at all times avoiding a contradiction. Precisely it is this last point -- contradiction -- which provides the key to the exercises in *De obligationibus*. The aim of the opponens is to involve the respondens in contradiction, and the respondens has to avoid it'. (*op. cit.* p. 18-19).

(...)

The aim of these articles will be to publish some tracts, found in Munich and in some other libraries, which seem to date from the first half of the thirteenth century, if not, in part, from the end of the twelfth." (pp. 94-96)

(*) Romuald Green O.F.M. *An Introduction to the Logical Treatise De obligationibus, with critical texts of William of*

Sherwood (?) and Walter Burley. vol. I: *Introduction*; vol. II: *Critical Texts of William of Sherwood (?) and Walter Burley*. Unfortunately, this Louvain thesis written in 1963 has not been published yet. As to Sherwood's authorship, Green seems to be a bit over-anxious in doubting it.

29. ———. 1975. "Some Thirteenth century tracts on the Game of Obligation. Part II. The *Obligationes Parisienses* found in Oxford, Canon. misc. 281." *Vivarium* no. 13:22-54.

    "In his description of the Oxford manuscript *Canon. misc.* 281 Coxe only mentions (*) anonymous glosses on Priscian's *De constructione* (Priscianus minor). However this manuscript contains also a tract of logic. " (p. 22)

    (...)

    The treatise as a whole has the following parts (the subdivisions printed in minuscules are mine)

    Prologus

    De obligatione einsque speciebus

    I DE POSITIONE

    De positione determinata

    De quibusdam regulis circa ponibile positum

    Sophisma

    Consimile sophisma

    Idem sophisma

    Aliud sophisma

    Aliud sophisma

    Aliud sophisma

    De positione indeterminata

    De indeterminate positionis duplici modo

    II DE DUBITATUR

    Utrum 'dubitatur' sit obligatio annon

De quibusdam regulis

Sophisma

III DE DEPOSITIONE

De eius diffinitione et regulis

De speciali depositione

Utrum non debeat esse obligatio

Sophisma." (p. 25)

(*) H. O. Coxe, *Catalogi codicum manuscriptorum Bibliothecae Bodleiane* pars tertia codices graecos et latinos canonicos complectens, Oxford 1854, col. 646.

30. ———. 1975. "*Logica Cantabrigiensis*. A fifteenth century Cambridge manual of logic." *Revue Internationale de Philosophie* no. 29:297-315.

    Special number in memory of Martin Grabmann.

    "The manuscript 182/215 of the important manuscript collection of the Library of Gonville and Caius College at Cambridge contains a number of tracts on logic which were probably written at Cambridge as notes of lectures. Part of them are also found in other manuscripts all over Europe. It seems rather difficult to discern the exact extent of this work, since in nearly all manuscripts the number and arrangement of the tracts is different and other logical works are mixed up with those treatises which doubtless belong to the Cambridge Logic." (p. 297)

31. ———. 1975. "*Quaestio de Ideis*. Some notes on an important chapter of Platonism." In *Kephalaion. Studies in Greek philosophy and its continuation, offered to professor C. J. de Vogel*, edited by de Rijk, Lambertus Marie and Mansfeld, Jaap, 204-213. Assen: Van Gorcum.

    "The opponents of Platonism as well as its adherents have to agree that there is a lot of truth in Whitehead's famous statement that the safest general characterization of the

European philosophical tradition is that it consists of a series of footnotes to Plato (*).

I think one of the everlasting items of that tradition is what has been termed since St. Augustine the *quaestio de Ideis*. Indeed, the status (either ontic or merely mental) of the Ideas has fascinated many philosophers, especially the Christian, who could not dispense with a statement concerning the relationship of the eternal and immutable Ideas to God. In this short contribution to the dedicatory volume for our academic teacher C. J. de Vogel, I shall confine myself to roughly sketch the development of the problem of that relationship from Plato's days down to some fourteenth century Franciscan thinkers." (p. 204)

32. ———. 1975. "The place of Billingham's *Speculum puerorum* in Fourteenth and Fifteenth century logical tradition, with the edition of some alternative Tracts." *Studia Mediewistyczne* no. 16:97-151.

"From the second half of the fourteenth century onwards the Speculum puerorum (or iuvenum) compiled by the English logician Richard Billingham was very popular, especially in Southern and Central Europe. However, this popularity does not extend to his other works. The Speculum, which together with works such as those of Thomas Manlevelt, William of Heytesbury and Marsilius of Inghen, was a formidable competitor of Peter of Spain's Tractatus, is an introduction to what from about the 1330's onwards has been one of the cardinal items, if not the most characteristic one, of fourteenth century logic, rather than a Summule of the type of Peter of Spain's Tractatus, which contains all the topics of the Logica antiqua and moderna favoured in Peter's days. Generally speaking, fourteenth century philosophy focussed its attention on the search for certainty (certitudo and evidentia). That fourteenth century logic paid special attention to the procedures of proving a sentence, is evidenced by the numerous

tracts entitled De probationibus propositionum or De veritate ac falsitate propositionum which have been handed down to us in fourteenth and fifteenth century manuscripts.

Billingham's Speculum is one of them." (pp. 99-100, notes omitted).

33. ———. 1975. "La signification de la proposition (*dictum propositionis*) chez Abélard." In *Pierre Abélard - Pierre le Vénérable. Les courants philosophiques, littéraires et artistiques en Occident au milieu du XII siècle*, edited by Jolivet, Jean and Louis, René, 547-555. Paris: Éditions du Centre national de la recherche scientifique.

Published also in: *Studia Mediewistyczne* 16, 1975 pp. 155-161.

Reprinted as chapter IV in: *Through Language to Reality. Studies in Medieval Semantics and Metaphysics*.

"Cette communication se borne a un bref examen de la signification de la phrase complète (*propositio*) dans la logique de Pierre Abélard.

Il paraît utile de commencer par la définition du verbe signifier (*significare*) chez ce logicien.

'signifier' dit des mots (*dictiones*) c'est produire une intellection dans l'âme de l'auditeur (*Logica ingredientibus* 307, 30 ss.), tandis que le même verbe est également appliqué à la dénotàtion des choses extérieures (*ibid.*); dans ce dernier sens, le verbe est synonyme de *appellare, nominare, demonstrare, designare*.

'signifier' dit des phrases complètes (*propositiones*) c'est produire une intellection laquelle est formée par la liaison des intellections de ses parties (*dictiones*)." (p. 547)

"On peut conclure que selon Abélard le *dictum* n'est pas un objet qui serait indépendent de la pensée, mais plutôt le contenu de la pensée, c'est-à-dire une *intellection objectivée,* qui correspond soit à un état de choses réel, soit à un état de choses seulement possible *(Dial. II,* 205, 28-30: *id dicimus quod id quod dicit hec propositio 'Socrates est homo', est unum de his que natura patitur esse),* soit un état de choses tout à fait

impossible *(Dial. II,* 158, 7 -9: la proposition '*Socrates est lapis'* ne reflète pas *une inherentia* de Socrate et de pierre, ni '*Socrates non est lapis'* leur rémotion).

(...)

Ainsi, l'existence qu'établit la proposition en parlant, n'est pas une existence réelle, mais, pourrait-on dire, une existence *parlée*, ou plutôt, une existence *pensée* ou *logique*.

Employant la distinction bien connue du XIV siècles (presentée notamment par Jacques d'Ascoli, Thomas d'York, Pierre Thomae):

res: 1) extra animam (chose extérieure); 2) in anima: a) subiective (= *acte* de l'intellection comme tel) b) obiective *(contenu* de l'intellection).

on peut dire qu'Abélard a essayé, à sa façon, de montrer que le *dictum, de* la proposition, loin d'être une chose extérieure (*res extra animam*) est une chose qui doit son existence à l'âme ou a l'intellection (*res in anima*), mais qu'il faut en même temps bien le distinguer de l'acte de l'intellection pris comme tel (*res in anima subiective*), et reconnaître, sa propre identité dans le *contenu objectif* de l'intellection. Par là, le *dictum* du grand logicien du XII siècle semble être d'une nature logique par excellence." (pp. 554-555, notes omitted)

34. ———. 1975. "Review of: Thomas Erfurt. *Grammatica speculativa*. An edition with a translation and commentary by Geoffrey L. Bursill-Hall (London, 1972)." *Linguistics* no. 157:160-164.

35. ———. 1975. "Another *Speculum puerorum* attributed to Richard Billingham." *Medioevo* no. 1:203-235.

"Every student of Mediaeval logic knows the tract on the truth and falsity of the propositions by the hand of Richard Billingham.

It goes under the titles *Speculum puerorum, Speculum iuvenum,* and also *Terminus est in quern,* after the well known *incipit* borrowed from Aristotle's *Prior Analytics* (I I, 24b16-18) *Terminus est in quem resolvitur propositio ut predicatum et de*

quo predicator, apposito vel diviso esse vel non esse. In 1970 Dr. Alfonso Maierù published a very useful school edition of the work, (*) to the effect that the scholary world has now that text at its disposition which exerted a tremendous influence in fourteenth and fifteenth century logic, especially in the universities of Eastern and Southern Europe.

The text has come down to us in two different redactions, an English and a Central European one.(**) Elsewhere (***) I tried to show that Billingham's work is the most famous specimen of quite a number of similar tracts *De veritate et falsitate propositiomun,* but certainly not the oldest of them. It is the aim of this article to introduce and edit another treatise of this type, which like the well known treatise edited by Maierù goes under the title *Speculum puerorum* and is likewise attributed to Billingham. It is found in a late fourteenth century manuscript of the Archivo General de la Corona de Aragon at Barcelona, Spain, viz. Ripoll 141." (p. 203)

(*). A. Maierù, *Lo "Speculum puerorum sive Terminus est is quem" di Riccardo Billingham*. «Stud. Med.», 3 (1969), 297-397.

(**) See Maierù, *Introd*. 318 sqq. Maierù seems to be wrong in distinguishing a third class of manuscripts; in fact at least two of this class contain quite a different tract which also goes under the name *Terminus est is quem*. See L. M. de Rijk, *The Place of Billingham's* Speculum puerorum in *14th and 15th Century Logical Tradition, with the edition of some alternative tracts,* (1975).

Annotated Bibliography of Lambertus Marie de Rijk. Second Part: from 1975 to 1982

Bibliography

1. Rijk, Lambertus Marie de. 1987. "The anatomy of the proposition. *Logos* and *Pragma* in Plato and Aristotle." In *Logos and Pragma: Essays on the Philosophy of Language in Honour of Professor Gabriel Nuchelmans*, edited by de Rijk, Lambertus Marie and Braakhuis, Henk A.G., 27-61. Nijmegen: Ingenium Publishers.

   "Introductory

   This study is written in honour of a scholar who, among many other things, has laid the solid basis for the study of what may be considered the kernel of the semantics of the statement-making utterance, viz. the definition of the bearers of truth and falsity.

   In the first section I present a survey of Plato's semantics of the statement-making expression and a number of key notions involved. Next, I explore Aristotle's views of the matter, starting with a discussion of Aristotle's notion of *pragma* including that of being *qua* truth and not-being *qua* falsehood. In search for the nature of Aristotle's *logos,* I discuss this notion as it occurs on the *onomazein* level as well as the way in which it acts on the *legein* level. Next, I investigate the important notions of *synthesis* and *dihaeresis* and the role of *einai* as a monadic functor and *qua* syncategorematic container of categorial being.

Finally, I attempt to present a characterization of Aristotle's statement-making utterance.

(...) p. 27

"Epilogue

We may summarize what we have found as follows:

1 For Plato,

1.1 a *logos* is a composite expression consisting of a name *(onoma)* and an attribute *(rhêma)* which as such is not yet a statement-making utterance

1.2 a logos represents a state of affairs *(pragma),* i.e. an actual combination of some participata *(dynameis)* in the outside world

1.3 a *logos eirêmenos is* a statement-making utterance; it asserts that the pragma represented by the logos is actually the case.

2 For Aristotle,

2.1 a *logos* is a composite expression consisting of an *onoma* and *a rhêma* which represents both a notional and an ontological state of affairs. It may be characterized as a 'statable complex'

2.2 a *pragma is* a state of affairs either *ontologically:* state of affairs being part of the outside world or *semantically:* state of affairs conceived of and expressed by a logos

2.3 a *logos apophantikos* ('statement-making utterance') is a logos actually stated (either asserted or denied)

2.4 a logos may as such be used either on the *onomazein* level or on the *legein* level (qua *logos apophantikos*). Similarly, *phasis* (*kataphasis, apophasis*) may be used on either of these levels

2.5 *synthesis* is either synthesis1, = the act of uniting an onoma and a rhêma into a logos (on the *onomazein* level) or synthesis2 = the assertion of such a union accomplished in *a logos*

apophantikos, (on the *legein* level), while *dihairesis* is always the denial of such a union (on the *legein* level)

2.6 the *esti* forming part of *a logos apophantikos is* not a copula, properly speaking. Rather, it is a sign of (it consignifies, to speak with *De interp*. 3,16b24-5) synthesis2. The onoma and rhêma are already united to make up a logos ('statable complex') by synthesis, and, then, the *esti* rather than acting as a dyadic copulative functor, is merely a monadic sign of the 'statable complex' being actually stated

2.7 The propositional structure found in the *logos apophantikos* may be described as follows:

linguistically: a logos expressing categorial being (i.e. syncategorematic being implemented by one or more of the ten categories of being) is stated (either affirmatively or negatively) by means of the monadic functor 'be' or 'not be' *semantically*: the pragma represented by the logos is said to be (or not to be, respectively) part of the outside world (or: 'be (not) the case')." (pp. 53-54, notes omitted).

2. ———. 1987. "Logic and ontology in Ockham. Some notes on his view of the Categories of Being and the nature of its basic principles." In *Ockham and Ockhamists: Acts of the Symposium organized by the Dutch society for medieval philosophy Medium Aevum on the occasion of its 10th anniversary (Leiden, 10-12 September 1986)*, edited by Bos, Egbert Peter and Krop, Henri, 25-40. Nijmegen: Ingenium Publishers.

   Reprinted as chapter XIII in: *Through Language to Reality. Studies in Medieval Semantics and Metaphysics*.

   "*Conclusion*. There is no single reason, I think, to ascribe to Ockham any feelings of hostility towards metaphysics on this account. God created 'true and real being', but He created it in shaping 'what is truly and really being', individual beings, that is. As created, it is radically changeable and contingent as well. Uncreated, unchangeable being is not to be created, not even as some mysterious constituent present in creatural being. Human beings are not entitled to sublimate their

(indispensable) conceptual tools (e.g. universal terms) so that they represent unchangeable ontic standards. Whenever we are inclined to do so, Ockham's razor comes in, not however, to make us say that the metaphysical domain is void. Rather logic (and human thought in general) should make us recognize our own limitations, and refrain from speaking about the unspeakable when, and inasmuch as, our linguistic tools are bound to lead us astray. The same applies to Ockham's view of proofs of God's existence. He only admits the proof of God as first preserver of these actual things in this actual world and rejects all atemporal proofs. However, his faith is unshakeable and not involved in any philosophical thinking either. Likewise it is Ockham's ontology (doctrine of being) which is modest, the *onta* 'beings') are as abundant as they are. For that matter, Ockham let them really be (*ontôs einai* Plato would say). Well, in order to let them *be,* human thinking should be prudent in cautiously managing its homemade conceptual apparatus." (pp. 38-39)

3. ———. 1987. "Gilbert de Poitiers. Ses vues sémantiques et métaphysiques." In *Gilbert de Poitiers et ses contemporains: aux origines de la Logica modernorum. Actes du septième Symposium européen d'histoire de la logique et de la sémantique médiévales. Centre d'études supérieures de civilisation médiévale de Poitiers, Poitiers, 17-22 Juin 1985*, edited by Libera, Alain de and Jolivet, Jean, 147-171. Napoli: Bibliopolis.

   "La contribution à notre Symposium que je vous propose maintenant a pour but de n'envisager l'oeuvre théologique du fameux maître chartrain qu'au profit de notre connaissance de sa pensée philosophique. A l'intérieur de cette entreprise, on portera un intérêt spécial à l'interférence des vues sémantiques et métaphysiques chez Gilbert.

   Prenons notre point de départ dans son commentaire sur le *De hebdomadibus* de Boèce. On va voir que l'étude de cette oeuvre nous fera entrer dans le coeur même de la problématique." (p. 147)

   (...)

" Je suis d'avis que la finesse des expositions théologiques et philosophiques que nous offre le Porrétain nous échappe, à moins qu'elles ne soient replacées dans leur contexte sémantique. C'est bien dans le domaine de la sémantique que Gilbert est digne du vif intérêt de l'historien de la logique médiévale. Non pas seulement parce que ses expositions sont bien imprégnées de la pensée logico-grammaticale de son temps; cela n'a rien d'étonnant étant donné qu'il s'agit d'un savant de son envergure. Mais ce qui est d'un plus grand intérêt pour nous, ce sont les contributions que Gilbert a lui-même faites à l'évolution de la pensée sémantique au douzième siècle.

L'étude des oeuvres théologiques de Gilbert nous permet d'avancer les deux thèses suivantes:

(1) C'est par l'étude sémantique qu'est favorisée au plus haut point notre compréhension des pensées théologiques et philosophiques du Porrétain; je considère comme essentielles la manière et la mesure dont Gilbert a habillé, pour ainsi dire, sa pensée théologique et philosophique du vêtement de ses pensées grammatico-logicales.

(2) En expliquant les difficultés assez pénibles dans les *opuscula sacra* de Boèce, Gilbert a formulé ses propres vues sémantiques. Celles-ci, aussi empreintes de la tradition platonicienne qu'elles soient, ne témoignent pourtant pas moins d'une profondeur vraiment originale." (p. 171)

4. ———. 1987. "War Ockham ein Antimetaphysiker? Eine semantische Betrachtung." In *Philosophie im Mittelalter. Entwicklungslinien und Paradigmen. Wolfgang Kluxen zum 65. Geburstag*, edited by Beckmann, Jan P., Honnefelder, Ludger and Wieland, Georg, 313-328. Hamburg: F. Meiner.

   Reprinted as chapter XIV in: *Through Language to Reality. Studies in Medieval Semantics and Metaphysics*.

   "IV. Schlußbetrachtung. Ockham anerkennt ohne Einschränkung den transzendenten Bezirk, d. h. das Metaphysische oder Übersinnliche als Bezirk; in diesem Sinne ist er also gewiß kein Antimetaphysiker. Aber verwirft er denn die Metaphysik als Wissenschaft, oder höhlt er sie zumindest

aus? Zuerst muß anerkannt werden, daß Ockham im Prinzip der Metaphysik das Weisungsrecht über die Seienden (d. h., für Ockham, die individuellen Seienden) keineswegs abspricht. Zugleich kann nicht geleugnet werden, daß bei ihm der Metaphysik eine auffallend bescheidene Stelle zukommt. Wie läßt sich das unter Berücksichtigung von Ockhams unzweifelbarer Ehrfurcht vor dem Übersinnlieben erklären?

Der Schlüssel zur Lösung dieser Frage liegt nicht bloß in Ockhams Ontologie des individuellen Seins, sondern auch in seinen anthropologischen Auffassungen. Der Mensch ist nach ihm in seinen Denken und Sprechen nicht imstande, das Erhabene wesentlich zu durchforschen. Dessen soll sich der Mensch fort während eingedenk sein. Dies ist für Ockham in zwei deutliche Strategien übersetzbar:

a) nicht jedem modus significandi oder loquendi entspricht ein modus essendi in der Wirklichkeit

b) viele maßgebende Aussagen, sowohl sakrale wie profane, soll man nicht de virtute sermonis (dazu reicht unser Sprechen zuwenig aus), ondern der Ab sicht des Redners oder Schriftstellers entsprechend deuten." (ss. 326-327)

6. Rijk, Lambertus Marie de. 1988. "De quelques difficultés de nature linguistique dans le vocabulaire de Gilbert de la Porrée." In *Actes du colloque Terminologie de la vie intellectuelle au moyen âge*, edited by Weijers, Olga, 19-25. Turnhout: Brepols.

   Colloque at Leyde/La Haye, 20-21 September 1985.

   "On sait que, comme ceux de l'Antiquité, les philosophes du moyen âge ont fait aussi leur propre vocabulaire technique.

   Le but de cette courte communication est de mettre en lumière quelques difficultés spéciales du vocabulaire philosophique et théologique de Gilbert de Poitiers, auteur bien connu de la première moitié du XIIe siècle.

   D'abord, il faut remarquer que ces difficultés ressortent de l'usage très personnel et très original que fait Gilbert des termes courants de la langue philosophique du XIIe siècle.

   Il va de soi que ces difficultés sont délicates une fois de plus pour les philologues, en général pour les non-initiés en ce qui concerne l'histoire de la philosophie, parce que la confusion terminologique se présente déjà dans le domaine philosophique lui-même.

   Aussi va-t-on commencer par quelques termes connus, c'est-à-dire les termes *substantia, subsistentia* et *subsistens* et, dans ce contexte, la différence entre *esse* et *esse aliquid*. On va essayer de placer la terminologie dans le contexte des vues philosophiques de Gilbert, en particulier de la doctrine porrétaine sur le statut ontique de la chose concrète." (p. 19)

7. ———. 1988. "'Categorization' as a key notion in ancient and medieval semantics." *Vivarium* no. 26:1-18.

"The aim of this paper is to argue for a twofold thesis: (a) for Aristotle the verb '*katêgorein*' does not as such stand for statemental predication, let alone of the well-known 'S is P' type, and (b) 'non-statemental predication' or 'categorization' plays an important role in Ancient and Medieval philosophical procedure.

1. *Katêgorein and katêgoria in Aristotle*

Aristotle was the first to use the word 'category' *(katêgoria)* as a technical term in logic and philosophy. It is commonly taken to mean 'highest predicate' and explained in terms of statement-making. From the logical point of view categories are thus considered 'potential predicates'.(*)" (p. 1)

(...)

1.3 *Name giving ('categorization') as the key tool in the search for 'true substance*'

What Aristotle actually intends in his metaphysical discussions in the central books of his *Metaphysics* (Z-Th) is to discover the proper candidate for the name 'ousia'. According to Aristotle, the primary kind of 'being' or 'being as such' *(to on hêi on)* can only be found in 'being-ness' *(ousia;* see esp. *Metaph*. 1028b2). Unlike Plato, however, Aristotle is sure to find 'being as such' in the domain of things belonging to the everyday world. Aristotle's most pressing problem is to grasp the things' proper nature *qua* beings. In the search for an answer name-giving plays a decisive role: the solution to the problem consists in finding the most appropriate ('essential') name so as to bring everyday being into the discourse in such a way that precisely its 'beingness' is focussed upon." (p. 4)

(...)

2. *The use of 'praedicare' in Boethius*

The Greek phrase *katêgorein ti kata tinos is* usually rendered in Latin as *praedicare aliquid de aliquo*. The Latin formula

primarily means 'to say something of something else' (more precisely 'of somebody'). Of course, the most common meaning of the Latin phrase is 'to *predicate* something of something else in making a statement of the form S = P'. However, the verb *praedicare,* just as its Greek counterpart *katêgorein,* is used more than once merely in the sense of 'naming' or 'designating by means of a certain name', regardless of the syntactic role that name performs in a statement. In such cases *praedicare* stands for the act of calling up something under a certain name (designation), a procedure that we have labelled 'categorization'. (...)

Boethius' use of *praedicare* is quite in line with what is found in other authors. Along with the familiar use of the verb for statemental predication, Boethius also frequently uses *praedicare* in the sense of 'naming' or 'designating something under a certain name' whereby the use of the designating word in predicate position is, sometimes even explicitly, ruled out." (pp. 9-10)

(*) See L. M. de Rijk, *The Categories as Classes of Names (= On Ancient and Medieval Semantics 3), in: Vivarium*, 18 (1980), 1-62, esp. 4-7

8. ———, ed. 1988. *Some earlier Parisian Tracts on Distinctiones sophismatum*. Nijmegen: Ingenium Publishers.

   Edited by L. M. de Rijk with introduction and indexes.

   Content: I. Tractatus Vaticanus De multiplicatibus circa orationes accidentibus -- II. Tractatus Florianus De solutionibus sophismatum -- III. Tractatus Vaticanus De communibus distinctionibus.

   "As a matter of fact, syncategorematic words(3) play a predominant role in ambiguous expressions and sentences taken as a genre called *sophismata*, i.e. puzzling sentences of which the exact meaning can only be determined by introducing subtle semantic distinctions.(4) Every reader of the tracts involved is well acquainted with the Mediaeval authors' habit of closely linking up the treatment of syncategoremata with the solution to fallacies and sophismata. The author of the

pseudo-Boethian tract *De disciplina scolarium* also testifies to the close connection of these items, when he recommends the study of syncategoremata:

Terminorum autem determinaciones quae sincategoreumata appellamus, memorialiter menti imprimende, utpote que sophistice non parum deserviunt fantasie.(5)

The literary genre covering this sort of scholastic writings, is threefold:

1. the tracts on syncategoremata, which classify the precise meaning of a number of syncategorematic words, the ways in which they are used ambiguously; and they discuss current grammatical, semantic and logical rules related to these words and, finally, deal with special sophismata and the (attempted) solutions to them;(6)

2. the sophismata collections, where the sophismata themselves are the primary objects of discussion, although each of them is typical of a special difficulty concerning special ambiguous terms or phrases;

3. the so-called *Sophistariae*, the tracts on sophismata which, unlike the *Sophismata* collections, take the usual solutions (in fact, *distinctiones* concerning the ambiguous expression involved) as their starting-points." (pp. IX-X)

(3) For the sense of this term, see Kretzmann [1982: 211]: "Any word that can be used alone as a subject term or as a predicate term is classifiable as a categorematic word; all other words are classifiable as syncategorematic words, those that can occur in a proposition ... only along with at least one properly matched pair of categorematic words." See also de Libera [1985b: 64ff].

4. It is aptly defined by Kretzmann [1977: 6] as "a sentence puzzling in its own right or on the basis of a certain assumption, designed to bring some abstract issue into sharper focus the mediaeval ancestor of "The morning star is the evening star" or "George IV wished to know whether Scott was the author of Waverley". He is right in rejecting the modern label 'sophism' as sophismata "are sentences rather than

arguments and intended to be illuminating and instructive rather than specious and misleading". (ibid. n.9; see also Kretzmann [1982: 217, n. 24]. Some Master Martin (? of Alnwick) defines sophisma as 'diversitas veritatis et

falsitatis que in propositionibus oritur ex diversa situatione terminorum exponibilium vel resolubilium facientium terminos sequentes se diversimode supponere'. It should be noted in this connection that Martin's tract belongs to the *Probationes tenninorum* genre. See de Rijk [1982: 33]. 5. I 11, p. 97,6-8, ed. Weyers (Pseudo-Boece, *De disciplina scolarium*. Edition critique, introduction et notes, Leiden-Köln 1976).

6. For this genre, see Braakhuis [1979: passim]; and Kretzmann [1982: passim]. A lucid distinction between the different genres, *Distinctiones*, *Sophismata* and *Syncategoremata* is given by de Libera [1985b: 64-8].

"1 *The Ontic Constituents of Natural Bodies*

There is one distinction that is of paramount importance in order for us to understand Gilbert's ontology, viz. the Boethian contradistinction of *id quod* and *id quo*. We have to start with this pair of key notions.

1.1 *Preliminary:* 'id quod' and 'id quo'

According to Gilbert, our world consists of a number of individual 'things'. This world and its inhabitants appear to have the following characteristics:

(a) each and every 'thing' is in fact to be considered as one self-contained entity, (a 'subsistens') whose identity and ontological unity are due to the singularity of what is proper to it (*sue proprietatis singularitas; Eut. 30, 88; Trin. 144, 58-62*),

(b) however, every 'subsistent' (henceforth my rendering of Latin 'subsistens') itself consists of a plurality of forms; in addition, there are 'circumstantial features' (rather than 'forms' properly speaking) that determine its actual state or condition ('status'); *Trin. 137, 55;* cf. Nielsen(*), *56-8* and below, our nrs *1.2* and *1.72*.

In fact, Gilbert's ontology is one continuous attempt to establish two basic relationships, one between a natural thing and its Creator and the other between the thing's diverse actual constituents, which while being totally different from each other grant it its intrinsic unity at the same time." (p. 74)

(...)

"1.9 *Summary*

Each inhabitant of our world Gilbert calls (following Boethius) an *id quod est* or *subsistens*. Its main constituents are the *subsistentiae* (or the subsistent's *id quo* which is sometimes

taken collectively to stand for *ea quibus)* and these are accompanied by the 'accidents', quantity and quality. The subsistent owes its status (or transitory condition) to a collection of inferior members of the Aristotelian class of accidents, which to Gilbert's mind are rather 'accessories' or 'attachments from without' *(extrinsecus affixa).*

The term 'substantia' is used both to stand for substance and substantial form *(subsistentia), i.e.,* that by which something is subsistent (or 'is a substance').

The collection of *subsistentiae* (substantial forms) or the *forma totius is* called *natura.* However, 'natura' is also used to stand for either just one *subsistentia* or all the forms found in *a subsistens* even including its 'accidental' forms (quantity and quality). The inclusion of all kinds of accidents (including those inferior ones that make up a thing's *status)* is seldom found in the intension of the word 'natura'.

One of the key notions featuring in Gilbert's ontology is *esse aliquid.* 'To be a-something' has a threefold import. First, it means 'to be only *some* thing', and to miss perfection. Second, it has the positive sense of 'being *a something',* i.e. 'being determinate and well-delineated', not indefinite, not formless that is. Third, 'to be a something' implies concreteness, corporealness and singularity." (pp. 111-112)

    Reprinted as chapter I in: *Through Language to Reality. Studies in Medieval Semantics and Metaphysics*.

    "From Parmenides onwards, ancient and medieval thought had a special liking for metaphysical speculation. No doubt, speculative thought was most influentially outlined by Plato

and Aristotle. However, what the Christian thinkers achieved in metaphysics was definitely more than just applying and adapting what was handed down to them. No student of medieval speculative thought can help being struck by the peculiar fact that whenever fundamental progress was made, it was theological problems which initiated the development. This applies to St Augustine and Boethius, and to the great medieval masters as well (such as Anselm, Thomas Aquinas, Duns Scotus). Their speculation was, time and again, focused on how the notion of being and the whole range of our linguistic tools can be applied to God's Nature (Being).

It is no wonder, then, that an inquiry into Boethius's notion of being should be concerned, first and foremost, with his theological treatises, especially *De hebdomadibus*. (p. 1)

(...)

My final section aims at showing how Boethius's notion of being is clearly articulated in accordance with his semantic distinctions. This is most clearly seen in the main argument of *De hebdomadibus* where they may be actually seen at work.

As is well known, the proper aim of *De hebdomadibus* is to point out the formal difference between *esse* and *esse bonum,* or in Boethius's words: 'the manner in which substances *are good* in virtue of their *being,* while not yet being substantially good' (38.2-4). Its method consists in a careful application of certain formal distinctions, viz.:

(a) The distinction between an object 'when taken as a subsistent whole and *id quod est* = the constitutive element which causes the object's actually' being; it is made in Axiom II and used in Axiom IV.

(b) The distinction (closely related to the preceding one) obtaining between the constitutive element effecting the object's actual being *(forma essendi,* or *ipsum esse)* and the object's actuality as such (*id quod est* or ipsum est); it is made in Axioms VII and VIII.

(c) The distinction between *esse* as 'pure being' (= *nihil aliud praeter se habens admixtum),* which belongs to any form, whether substantial or incidental, and *id quod est* admitting of some admixture (lit. 'something besides what it is itself'); it is made in Axiom IV and in fact implies the distinction between *esse simpliciter* and *esse aliquid*.

(d) The distinction between 'just being some thing', *tantum esse aliquid,* and '*being* something *qua* mode of *being'*. It is made in Axiom V and used in Axiom VI and is in fact concerned with a further distinction made within the notion of *id quod est*. It points out the differences between the effect caused by some form as constitutive of being *some* thing and that caused by the main constituent *(forma essendi)* which causes an object's *being simpliciter*.

(e) The distinction between two different modes of participation, one effecting an object's *being subsistent,* the other its being *some* thing, where the '*some* thing' (*aliquid*) refers to some (non-subsistent) quality such as 'being white', 'being wise', 'being good', etc.

The application of these distinctions enables Boethius to present a solution to the main problem: although the objects (*ea quae sunt,* plural of *id quod est*) *are* (*are good*) through their own constitutive element, *being* (*being good*), nevertheless they are not identical with their constitutive element nor (*a fortiori*) with the IPSUM ESSE (BONUM ESSE) of which their constituent is only a participation." (p. 22-23)

11. ———. 1989. "Semantics and metaphysics in Gilbert of Poitiers. A chapter of Twelfth century Platonism. Part II." *Vivarium* no. 27:1-35.

"Gilbert's View of Transcendent Reality.

Gilbert's world consists of quite a lot of singular subsistent objects which owe their being and 'being-a-something' to a collection of forms, both subsistential and accidental. Well, God has created this world after what in the Platonic tradition was called the 'exemplary Forms'. For Gilbert, creation and concretion are two complementary notions which play an

important role in his ontology. Creation is the reception of a total form or collection of subsistentiae; it is also called generation. As a natural process it amounts to 'beginning to be-of-acertain-kind'." (p. 1)

(...)

"POSTSCRIPT. In his short study on Gilbert of Poitiers (in *A History of Twelfth-Century Western Philosophy,* ed. Peter Dronke, Cambridge 1988, 328-52) John Marenbon rightly argues that when presenting an account of Gilbert's thought one should not separate his philosophy from his theology. However, I fully disagree with his suggestion (p. 351) that as a metaphysician Gilbert proves to have been a thinker whose 'treatment is inadequate and confused'. On the contrary, when dealing with really intricate theological problems Gilbert of Poitiers, like many other Medieval thinkers (e.g. Thomas Aquinas), develops his (NeoPlatonic) metaphysics as a 'clear-minded and subtle writer', and so there seems to be no reason at all to oppose Gilbert against people like Aquinas, Scotus, Ockham and others. They were all real philosophers, albeit in a theological context, which *as such* confronted them with a series of genuinely philosophical issues. In fact, why should any historian of philosophy approach only Gilbert of Poitiers 'as a thinker who tackled a set of changeless *(sic!)* metaphysical problems-identical (sic!) to those which faced, for instance, Plato and Aristotle, or Kant and Hegel'?" (pp. 34-35)

12. ———. 1989. *Through Language to Reality: Studies in Medieval Semantics and Metaphysics*. Northampton: Variorum Reprints.

    The volume is dedicated to L. M. De Rijk on the occasion of his 65th birthday.

    Contents: Preface IX-XI; SIXTH CENTURY: I. On Boethius's notion of Being. A chapter of Boethian semantics; TWELFTH CENTURY: Peter Abälard (1079-1142): Meister und Opfer des Scharfsinns; III. The semantical impact of Abailard's solution of the problem of universals; IV. La signification de la proposition (*dictum propositionis*) chez Abélard; V. Die Wirkung der neuplatonischen Semantik auf das mittelalterliche

Denken über das Sein; VI: Abailard's semantics views in the light of later developments; THIRTEENTH CENTURY: VII. Die Bedeutungslehre der Logik im 13. Jahruhndert und ihr Gegenstück in der metaphysischen Spekulation; VIII. Each man's ass is not everybody's ass. On an important item in 13th-century semantics; IX. The development of *Suppositio naturalis* in mediaeval logic, I. Natural suppositiojn as non-contextual supposition; FOURTEENTH CENTURY: X. The development of *Suppositio naturalis* in mediaeval logic, II. 14th-century natural supposition as atemporal (omnitemporal) supposition; XI: On Buridan's doctrine of connotation; XII. Semantics in Richard Billingham and Johannes Venator; XIII. Logic and ontology in Ockham. Some notes on his view of the categories of Being and the nature of its basic principles; XIV. War Ockham ein Antimetaphysicker? Eine semantische Betrachtung; Indexes. 1. Manuscripts; 2. Anonymous tract; 3. Ancient and medieval names; 4. Modern names; 5. Subjects and terms. (This volume contains XII + 322 pages).

13. ———. 1989. "Ist Logos Satz? Zu Heideggers Auffassung von Platons Stellung 'am Anfänge der Metaphysik'." In *Heideggers These vom Ende der Philosophie. Verhandlungen des Leidener Heidegger-Symposiums (April 1984)*, edited by Fresco, Marcel, Van Dijk, Rob and Vijgeboom, Peter, 22-32. Bonn: Bouvier Verlag.

14. ———. 1989. "Einiges zu den Hintergünden der Scotistischen Beweistheorie: die Schlüsselrolle des Sein-Könnens (*Esse possibile*)." In *Die Kölner Universität im Mittelalter. Geistige Wurzeln und soziale Wirklichkeit*, edited by Zimmermann, Albert, 176-191. Berlin: Walter de Gruiyter.

    "Wer Scotus' Beweistheorie in den Griff bekommen will, wird schließlich noch dadurch mit einer dritten Belastung rechnen müssen, daß Scotus sich nie in einer eigenen Kommentararbeit zu Aristoteles' *Zweiten Analytiken* systematisch über die Lehre vom Beweis geäußert hat, wie stark er auch immer, wie die übrigen mittelalterlichen Denker, in seiner Auffassung der Beweislehre vom aristotelischen Gedankengut beeinflußt wurde.

Es scheint mir daher angebracht, zuerst etwas vorzubringen über die Rolle, die eine Beweistheorie, oder vielmehr ein Beweisverfahren, in jedem beliebigen spekulativen Denksystem, ungeachtet dessen theologischer oder philosophischer Natur, besitzt; zunächst soll etwas über die Lehre vom Beweis bei Aristoteles und den mittelalterlichen Autoren, besonders Scotus, gesagt werden, um zuletzt einige wichtige Punkte aufzugreifen, deren genauere Betrachtung uns die wichtigeren Hintergründe des scotischen Denkens über Beweis und sicheres Wissen vordringen läßt." (s. 177)

15. Peter, of Spain. 1990. *Language in Dispute: An English Translation by Francis P. Dinneen of Peter of Spain's Tractatus called afterwards Summulae logicales*. Amsterdam, Philadelphia: Benjamins.

    On the basis of the critical edition established by L. M. De Rijk.

16. Rijk, Lambertus Marie de. 1990. "Ockham's theory of demonstration: his use of Aristotle' s *kath' holou* and *kath' hauto* requirements." In *Die Gegenwart Ockhams*, edited by Vossenkuhl, Wilhelm and Schõnberger, Rolf, 232-240. Weinheim: VCH-Verlagsgesellschaft.

    "Far from being a sceptic William of Ockham made every effort to corroborate the basis of philosophical and theological thought by purifying it of all sorts of untenable presuppositions. His main contribution to fourteenth century philosophical and theological development lies in systematically rethinking scholastic doctrines, and especially their assumptions, on the firm basis of his own favourite leading principles: the strictly individual nature of all that really is and the radical contingency of all creatural being.

    These two principles also play a major part in Ockham's way of dealing with the Aristotelian theory of demonstration. The present paper aims at investigating Ockham's doctrine of demonstrative proof, focusing on the way in which he felt forced to adapt or rephrase the special requirements Aristotle had laid down for propositions to enter into syllogistic proof, especially strict proof (the so-called '*demonstratio potissima*'). Our main argument will concern Aristotle's rather peculiar

'*kath holou*' requirement and Ockham's appliance of the '*kath hauto*' (Latin: 'per se') notion which is also involved in framing correct premisses for demonstrative proofs. A few preliminary remarks will be made about the essentials of Aristotle's theory of demonstration." (p. 232)

(...)

"Conclusions.

To sum up our findings: Ockham's adaptations and manipulations of Aristotle's requirements for genuine demonstrative propositions are as many demands imposed by his own metaphysical views. He comments on Aristotle, always starting from his own favourite views. Though Aristotle is the Master, Ockham is the one to say what the Master meant, or what he should have meant. On the other hand, his introducing the *'per se strictissimo modo*' rather seems to be a matter of technicality. Whereas in *Posterior Analytics* Aristotle deals with the scientific procedure of *apodeixis* in general, in which the apodeictic syllogism is merely a vehicle for correctly framing an *apodeixis,* the Medievals, and Ockham in particular, were apt to reduce Aristotle's theory of demonstrative proof to a theory of demonstrative syllogism. That is why the '*demonstratio potissima*' (including its specific demands) so heavily influenced Ockham's theory of demonstration." (p. 239)

17. ———. 1990. "Specific tools concerning logical education." In *Méthodes et instruments du travail intellectuel au moyen âge*, edited by Weijers, Olga, 62-81. Turnhout: Brepols.

"Unlike in our days logical doctrine was very influential in the Middle Ages. Logic was indeed considered then the vehicle par excellence both in matters of teaching and scientific inquiry in any field of knowledge. When embarking upon a discussion of the specific terminology concerning logical education, some preliminary remarks seem to be indispensable.

The reader should be warned, first. Logical theory taken as such, which comprises a great mass of specifically logical terms (such as 'praedicamentum', 'predicable', 'syllogism', 'fallacy', 'supposition', 'appellation', 'ampliation', 'distribution',

'syncategorema', and so on) is out of scope now; those terms and their like will be mentioned only in passing, inasfar namely as they occur in educational practice.

Another remark better starts from the well-known Medieval distinction between logica docens and logica utens, the former of which being logical doctrine as developped, expounded and taught for its own sake, whereas the latter is rather logic practically applied in any sort of logical analysis or argumentation. To be sure, logica utens does not merely coincide with the more or less explicit occurrence of logical argumentation in whatever context. Even qua logica utens the art of logic displayed a high degree of technicality. In other words: medieval logica utens rather than being practical argumentation as loosely accomplished by somebody who exhibited a remarkable natural ability for logical reasoning consisted in the performance of somebody being really well-versed in all those logical techniques he had been taught in his youth in class room. So, whoever is interested in specific terms of logical teaching and learning should surely not leave exhibitions of logica utens out of consideration (*).

Our third remark which is in the line of the previous one, concerns the remarkably wide scope of logica utens. Of course, logica docens played a very important part in Medieval education, as may be also gathered from its predominant position in Medieval curricula. However, according to a good Peripatetic tradition, logic was taken to serve as the organon or instrument of all other branches of learning and science, which means that logic, and logic alone, provided other disciplines with the correct art of thinking and reasoning. Thus logic proves to have been effectually present, for example, in theological disputation, a fact that every student of Medieval theology is fully aware of. But it had an equally prevailing position in other fields of learning, too, such as Natural science ("Physics"), Ethics and even Political philosophy.

A final preliminary remark aims at elucidating the large scope of Medieval logic from still another point of view, viz. the close relationship between scientific inquiry and exposition as well as

scientific education in the Middle Ages. That is to say that scientific inquiry and exposition as well as education and learning were controlled by the same didactics of exposition and argumentation. Indeed, nearly all Medieval writings that contain scholarly investigations in any field of learning whatsoever display didactic approaches which are quite similar to those used by works mainly intended for instruction, no matter for the benefit of beginners or advanced people." (pp. 62-63)

(*) For the contradistinction of *dialectica docens* and *dialectica utens* both of them especially concerned with the use of logical topics (*loci*), see Eleonore Stump, *Topics: their development and absorption into consequences* in *The Cambridge History of Later Medieval Philosophy,* 1982, p. 281, n. 41.

18. ———. 1990. "The Posterior Analytics in the Latin West." In *Knowledge and the Sciences in Medieval Philosophy: Proceedings of the Eight International Congress of Medieval Philosophy (SIEPM), Helsinki, 24-29 August 1987. Volume I*, edited by Asztalos, Monika, Murdoch, John Emery and Niiniluoto, Ilkka, 104-127. Helsinki: Acta Philosophica Fennica.

"It is common knowledge that Aristotle had the conviction that all reality was to be found within our world of sensible experience and that Plato's assumption of another, Transcendent World of Perfect Being was merely 'empty talk and poetic metaphor' *(Metaph.* A9, 991a20). Indeed, Aristotle took Plato's Forms to be quite useless for explaining the possibility of true knowledge about our world. However, like his master, Plato, Aristotle stuck to the Parmenidean conviction about the real existence of unchanging formal principles of being. As is well-known, his formal principles are *in* things as their immanent dynamic natures (*eidê*).

For Aristotle, true knowledge concerns the essential natures immanent in things (see e.g. *Metaph.,* 991a12-3; 999a24-9; 1018b36; 1032b1 ff. et alibi). To be sure, all being is individual being and so Aristotle is compelled to answer the quite intriguing question: if the proper object of true knowledge is universal nature and everything real is a particular, how, then,

are we able to gain genuine knowledge about the things in their own right? In his *Posterior Analytics* Aristotle explains what he understands by truly knowing things. Well, quite in line with his philosophical stand, Aristotle claims that all scientific knowledge is concerned with discerning a universal nature as *immanent in* a particular. In I 2, 72a75-7 e.g., it is explicitly said that the elements of the deduction are such and such *in concreto* (cf. 73a29-31). For Aristotle, demonstration in fact concerns some *phenomenal state of affairs* of which the investigation aims to clarify the essential structures." (p. 102)

(...)

"Aristotle's description of induction and its role in the scientific process fits in remarkably well with what he has earlier remarked about the process of proper categorization. Referring to the well-known battle simile - how a general retreat comes to an end after one man makes a stand, and then another *etc.,* the author argues that 'as soon as one of the undifferentiated percepts makes a stand, there is a primitive universal in the mind ... until the highest genera have been reached' (II 19, 100a14-b4).

The faculty, or rather cognitive attitude, by which we become familiar with the first principles is the *Nous* or intellective apprehension. Well, just as the Nous precedes all principles (such as axioms etc.), in the same way scientific knowledge covers the whole domain of states of affairs (*pragmata*), Aristotle concludes (100b16-17).

Let us try, now, in the next sections, to discover the Medievals' doctrinal reception of the *Posterior Analytics* by discussing their views of some themes characteristic of Aristotle's scientific method. It would be useful, to that end, to single out the following items: the Medievals' discussion of the well-known four questions, their views of the three requirements for 'hunting essential attributes', their (different) views of necessity, and, finally, the Medieval conceptions of induction and our knowledge of the First Principles." (p. 110)

19. ———. 1990. "Un tournant important dans l'usage du mot 'idea' chez Henri de Gand." In *Idea. VI Colloquio Internazionale del*

Lessico internazionale Europeo. Roma, 5-7 Gennaio 1989, edited by Fattori, Marta and Bianchi, Massimo Luigi, 89-98. Roma: Edizioni dell'Ateneo.

"1. *Introduction.* On sait que le terme 'idée' était un mot-clé dans la métaphysique de Platon. Les exposés importants de ce matin ont rendu entièrement superflu de rappeler le rôle du mot idea chez Platon ainsi que dans la tradition platonicienne et dans la patristique.

Les communications que nous venons d'écouter cet après-midi nous ont fait comprendre l'importance du mot latin *idea, ou* plutôt la valeur de la notion d'idée, dont le mot *idea* n'était que l'un des véhicules à côté de *forma, species, notio, conceptus, intentio,* etc.

Il n'est pas nécessaire d'être spécialiste de l'histoire de la philosophie médiévale pour bien savoir que, quelle que soit la dette des auteurs médiévaux envers des sources antiques, et quel que fût le respect qu'ils ont ressenti envers toute autorité -- les sources ne les ont cependant jamais empêchés de suivre leur propre voie au fur et à mesure que cela s'imposait dans l'intérêt de leur réflexions philosophiques.

C'est pourquoi l'étude de l'usage des termes philosophiques et leur développement au cours du moyen-âge n'est pas seulement d'intérêt linguistique. Au contraire, l'analyse de ce développement est tout à fait indispensable pour bien comprendre les doctrines philosophiques elles-mêmes de la période médiévale.

Je me propose dans cette communication de mettre en relief le tournant important qu'a subi l'usage du mot latin *idea* chez certains auteurs de la seconde moitié du 13e siècle, usage, bien entendu, qui s'est prolongé au 14' siècle. La figure centrale sera celle du philosophe flamand Henri de Gand (mort en 1293).

Comme je viens de vous suggérer, ce tournant est significatif d'un développement doctrinal chez ces auteurs. Aussi ce développement doctrinal s'impose comme le cadre adapté aux exigences d'un exposé sémantique à propos de l'usage du mot

idea, disons après saint Thomas d'Aquin (mort en 1277)." (p. 89)

20. ———. 1991. "Two short questions on Proclean metaphysics in Paris B. N. lat. 16.096." *Vivarium* no. 29:1-12.

    "The collectaneous manuscript Paris, B.N. lat. 16.096 (formerly belonging to the codices Sorbonnenses) contains (ff. 172va-177vb, which part dates, it seems, from the second half of the 13th century) some anonymous questions referred to by the catalogue (*) as Quaestiones super librum Posteriorum. This description, however, is incorrect as these questions have no bearing whatsoever on the doctrine of Aristotle's Posterior Analytics. Actually, they are two short metaphysical questions (called expositiones by the author) on the key notions of 'beingness' and 'oneness' respectively, followed by a longer, incomplete treatise on the nature of the components of a definition (or rather a diffinitum).

    (...)

    Only two of the five questions announced in the beginning of this third treatise are preserved. One of them deals with the problem of whether the definition consisting of genus and differentia requires a real composition of the components of the diffinitum, the other examines whether immaterial substances are composite in some respects. Unlike the first two tracts, the third does not show any influence of Neoplatonic doctrine.

    To my knowledge, the expositions on Ens and Unum have only come down to us in the Paris manuscript. They are interesting in that the author makes a successful effort to penetrate some of the basic views of Proclean metaphysics." (pp. 1-2, notes omitted)

    (*) L. Delisle, Inventaire des manuscrits latins de la Sorbonne, conservés à la Bibliothèque Impériale sous les nos. 15.176-16.718 du fonds latin, in: Bibliothèque de l'École des chartes, 31 (1870), 135 ff.

21. Peter, of Spain. 1992. *Syncategoreumata*. Leiden: Brill.

First critical edition by L. M. de Rijk with an introduction, critical apparatus, indexes and an English translation by Joke Spruyt.

Content of the English translation: Introduction 39; Chapter 1. On composition 45; Chapter 2. On negation 73; Chapter 3. On exclusive words 105; Chapter 4. On exceptive words; Chapter 5. On consecutive words 197; Chapter 6. On the verbs 'begins' and 'ceases' 249; Chapter 7. On the words 'necessarily' (*necessario*) and 'contingently' (*contingenter*) 283; Chapter 8. On conjunctions 307; Chapter 9. On '*Quanto*', '*Quam*' and '*Quicquid*'; Chapter 10. On answers 425; Critical apparatus 434; Index locorum 572; Index rerum notabilium 574; Index sophismatum 613.

"Peter of Spain (ca 1205-77) who, in 1276, became Pope under the name of John XXI, was the author of an impressive number of scholarly works, inter alia the Tractatus (a textbook of logic, widely known afterwards under the title Summule logicales) and the Syncategoreumata. The latter work, which deals with syncategorematic terms, is here critically edited for the first time, together with an English translation.

Peter's authorship of the Syncategoreumata is beyond all doubt: it is confirmed again and again by nearly all our manuscripts. As to the date and place of origin of the Syncategoreumata: they were surely written after the Tractatus (which were written not later than the 1230's, see my Introduction to the edition of this work, p. LV-LVII).

There is no reason at all to assume a connection between the Syncategoreumata and Peter's stay at the University of Paris, which he left in 1229, before the composition of the Tractatus. Clearly, Paris does not play any role in the early diffusion of the Syncategoreumata. It seems highly probable, therefore, that the Syncategoreumata were written by Peter in the same region where he wrote the Tractatus, i.e. Northern Spain or Southern France. The work's most likely date is between 1235-1245 (cf. my Introduction to the Tractatus, pp. XXXIV-LXI). From Peter's use of lectio (see X, cap. 8) it may be concluded that the

Syncategoreumata were meant as a piece of school-teaching." (p. 9, notes omitted)

22. Rijk, Lambertus Marie de. 1992. "Causation and participation in Proclus. The pivotal role of scope distinction." In *On Proclus and His Influence in Medieval Philosophy*, edited by Meijer, Pieter Ane and Bos, Egbert Peter, 1-34. Leiden: Brill.

    1. Status questionis; 2. Causation and participation in Plato; 3. Procession and participation in Plotinus and Jamblichus; 4. Proclus' refined metaphysics; 4.1 Preliminary; 4.2 The Proclean universe from the viewpoint of causation; 4.3 The Proclean universe from the viewpoint of participation; 5. The meaning of *amethekton* and *metekomenon* in Proclus; 5.1 *Méthexis* c.a. in the *Elementatio*; 5.2 *Méthexis* c.a. in the *Platonic Theology*; The basic role of the *metexomenon* for continuity and reversion; Scope distinction in Neoplatonic doctrine and procedure; 7.1 Two famous cases of scope distinction in Proclus; 7.2 Scope distinction deliberately applied and recommended; 7.3 The philosophical impact of scope distinction in Neoplatonism.

    "The present paper aims to investigate in some more detail the transcendence-immanence antinomy. First an outline of its historical background will be presented from Plato onward through Plotinus and Jamblichus up to Proclus. Next I shall discuss Proclus' doctrine on these matters in the larger perspective of his philosophy, and focus on the intriguing notion of *amethekton*. Finally a few remarks will be added on the important role of what we might call 'scope distinction' in Proclus' doctrines and dialectical arguments." (p. 2)

23. ———. 1992. "John Buridan on Universals." *Revue de Métaphysique et de Morale* no. 97:35-59.

    "It is common knowledge that Plato strongly believed that, in order to explain the nature of whatever is (either things or states of affairs, including Man and his environment), the assumption of Transcendent Universal Forms is indispensable. In his view, these universal Forms are the ontic causes of each and every sublunary entity, which all owe their being to their sharing in these Forms. Consequently, everyone who is in want

of firm knowledge *(episteme)* about, the things of the outside world is bound to direct his attention to the transcendent domain of the universal Forms'.

However, Plato was the first to recognise, and seriously deal with, the objections that can be raised to this doctrine. These objections mainly concern the status (and the dignity, however modest) of our transient world and, above all, the possibility to obtain, true knowledge of this world as *it stands,* in its ever-changing nature, that is." (p. 35)

(...)

"To be sure, the Medievals all rejected the Platonic Ideas taken as separate substances and they adhered to the Aristotelian common sense principle that only individuals have independent existence. Nevertheless, they were still under the spell of the status of «universal being» as the indispensable basis of true knowledge.

Marylin McCord Adams has analysed some early fourteenth century solutions to the problem of universals (Scotus, Ockham, Burley and Harclay) (*). In McCord's article Buridan's view of the matter is left out of consideration. Quite understandably so, since Buridan's solution to the problem differs considerably from the sophisticated arguments given by his contemporaries. Buridan seeks.for a solution in analysing the several ways of human understanding. In directing his attention to the propositional attitude involved in the cognitive procedure Buridan is remarkably close to the ingenious solution Peter Abelard had come up with two centuries earlier. In the next *sections* I shall give an outline of Abelard's treatment of the question of universals followed by an analysis of Buridan's discussion of the matter (as found in his commentary on the *Metaphysics* and elsewhere)." (p. 37)

(...)

"We may conclude, then, that two bright logicians of the Parisian tradition have come up with quite an ingenious solution to the problem of universals. Both of them started out from the firm conviction that nothing exists but particulars.

Nevertheless, they apparently were not satisfied with purely extensional solutions as brought forward by Oxford logicians such as Heytesbury and Ockham. Maybe extensionalists are out to show how people *ought* to think. Abelard and Buridan, however, were especially interested in the various ways of conceiving we *actually* use in daily life, in our attempts to conceptually deal with the outside world." (p. 59)

(*) "Universals in the early Fourteenth century" in *Cambridge History of Later Medieval Philosophy, from the Rediscovery of Aristotle to the Desintegration of Scholasticism 1100-1600* pp. 411-439.

24. ———. 1992. "Peter Abaelard (1079-1142)." In *Sprachphilosophie. Philosophy of Language. La philosophie du langage. Eine internationales Handbuch zeitgenössicher Forschung. 25. ———. 1993. "Der Streit über das *medium demonstrationis*: die Frucht eines Misverständnisses?" In *Argumentationstheorie. Scholastische Forschungen zu den logischen und semantischen Regeln korrekten Folgerns*, edited by Jacobi, Klaus, 451-463. Leiden: Brill.

    "In der alten Ausgabe des Kommentars zu den *Zweiten Analytiken* von Aegidius Romanus' findet sich nach dem Kommentar eine kurze Abhandlung aus der Feder des Augustiner-Eremiten Augustinus de Biella. Sie wurde zur Verteidigung der Auffassung des Aegidius über das *medium demonstrationis* geschrieben. Aegidius hatte gelehrt, daß bei einer *demonstratio potissima* (also bei der aristotelischen Apodeixis im strengsten Sinne) das *medium* sich aus der Definition des Attributs *(passio)* ergebe, und nicht, wie die communis opinio lautete, aus der Definition des Subjekts. Wie

üblich, fängt Biella damit an, Argumente gegen die Auffassung Aegidius' anzuführen, um dieselben anschließend zu widerlegen. Biella hat aber augenscheinlich den Text von Aegidius nicht zur Hand gehabt, denn er fährt fort, *dominus* Aegidius sei wohl dieser Auffassung über (las *rnedium demonstrationis* gewesen, "wie ich von den *doctores ordinis (Tatrum heremitarum* gehört habe" (oder: "wie ich es deren Schriften entnommen habe")." (s. .451)

27. ———. 1993. "On Buridan's view of Accidental Being." In *John Buridan: A Master of Arts. Some Aspects of His Philosophy. Acts of the Second Symposium Organized by the Dutch Society for Medieval Philosophy Medium Aevum on the Occasion of its 15th Anniversary. Leiden-Amsterdam (Vrije Universiteit), 20-21 June, 1991.*, edited by Bos, Egbert Peter and Krop, Henri, 41-51. Nijmegen: Ingenium Publishers.

    "One of the most striking characteristics of late medieval metaphysics is the upgrading of 'accidental being'. The strict opposition between *'esse per se'* and *'esse per accidens',* which had been of paramount importance ever since Aristotle, has lost its relevance in the ontological discussions of the fourteenth century. The status of 'accidental being' came rather close to that of 'substantial being'. In the views of philosophers such as Ockham and Buridan (not to mention thinkers like Crathorn) the nature of 'accidental being' (or rather 'quantitative and qualitative being') can no longer be properly defined in terms of ontological dependency upon substance. In other words, '*per se* subsistence' is assigned not only to substance but to 'accidental being' as well.

    In the present contribution I will illustrate this development by discussing some of Buridan's expositions in his *Questiones*

commentary on Aristotle's *Metaphysics (IV,* q. 6 and VII, q. 3-4)." (p. 41)

28. ———. 1993. "Works by Gerald Ot (*Gerardus Odonis*) on logic, metaphysics and natural philosophy rediscovered in Madrid, Bibl. Nac. 4229." *Archives d'Histoire Doctrinale et Littéraire du Moyen Âge* no. 60:173-193; 378.

    "Some twenty years ago I discovered in the Biblioteca Nacional in Madrid a very interesting manuscript with works (all of them anonymous, to be sure) on logic, metaphysics and natural philosophy. In fact, my discovery turned out to be a rediscovery, for the manuscript contained a note written by the famous historian of Franciscan philosophy and theology, Father Ephrem Longpré OFM, which said that, with the exception of the writings occurring from fol. 204r onwards, all tracts found in this codex are by a Franciscan master, Gerardus Odonis. (...)

    Gerard Odon OFM (who as Patriarch of Antiochia died in 1349 of the plague, at Catania, Sicily, where he was gifted with the benefices of a wealthy church) is especially known as the much troubled successor of the deposed Michael of Cesena as Master General of the Franciscan Order and a close adherent of Pope John XXII in the debate on the beatific vision." p. 173

    "The Ms Madrid, Bibl. Nac. 4229 appears to be of the utmost importance for our knowledge of Gerard Odon's doctrine on several subjects in the fields of logic, metaphysics and natural philosophy. To establish his authorship of all the works as occurring in the present Ms with certainty requires more research. The results of the present investigations can be summarised in the following survey:

    I LOGIC:

    1.1 *Quid est subiectum in logica (69va-74rb)*

    1.2 *De sillogismis (1ra-19va)*

    1.3 *De tribus dubiis circa naturam dictionum exclusivarum et suppositionis simpliciter simplicis (37rb-43ra)*

    1.4 *De principiis scientiarum (45ra-69va)*

II METAPHYSICS:

2.1 *De intentionibus (incomplete; 74va-122vb)*

2.2 *De esse et essentia (125ra-132vb)*

2.3 *De principiis nature (156ra-174vb, together with 19va-28vb)*

2.4 *De natura universalis (incomplete; 204ra-207vb)*

III NATURAL PHILOSOPHY:

3.1 *De augmento forme (132vb-150rb)*

3.2 *De intensione et remissione formarum (175ra-179ra)*

3.3 *De continuo (179rb-186vb)*

3.4 *De loco (187ra-192va)*

3.5 *De tempore (192vb-199va)*

3.6 *De motu (199vb-203vb)*" (p. 193?

29. ———. 1994. "John Buridan on man's capability of grasping the truth." In *Scientia et ars im Hoch- und Spätmmittelalter*, edited by Craemer-Rügenberg, Ingrid and Speer, Andreas, 281-303. Berlin: Walter de Gruyter.

    Miscellanea Mediaevalia, vol. 22/1.

    "Introduction. As is well-known, two subjects are distinctive of the fourteenth century theory of cognition, namely *'certitudo'* and *'evidentia'*. It is true, thirteenth century philosophers, such as Thomas Aquinas, were also concerned with certitude and evidentness as indispensable requisites for 'true knowledge' *('scientia')*. However, until the end of the thirteenth century certitude and evidentness were not prominent in the discussions about the cognitive procedure nor were they treated as separate matters, requiring separate attention. In Thomas Aquinas for example, the conviction that man is really capable of grasping the truth with certainty is really constitutive of his philosophical (and theological) thought and praxis (*)', or to speak with J. A. Aertsen, of 'Thomas' way of thought'.(**) This, however, does not alter the fact that in Aquinas' philosophy

'certitudo' is not highlighted as such, and the specific role of 'evidentia' is even virtually ignored.

Buridan's theory of cognition, on the contrary, clearly focusses on the ingredients *'certitudo'* and *'evidentia',* and, within this framework, on the notion of *'assensus'*. In the present paper I aim to elucidate the role of this key notion of John Buridan's theory of cognition." (p. 281)

30. ———. 1994. *Nicholas of Autrecourt: His Correspondence with Master Giles and Bernard of Arezzo*. Leiden: Brill.

A critical edition by L. M. de Rijk from the two Parisian manuscripts with an introduction, English translation, explanatory notes and indexes.

Contents: Acknowledgements IX; Introduction 1; 1. Nicholas of Autrecourt. Life and works 1; 2. Nicholas' correspondence with Bernard and Giles 5; 3. The extant letters. Their tradition and structure 24; 4. Principles of the present edition and translation 37; Conspectus siglorum 45; Text and translation 46; Explanatory notes 113; Appendices 139; Indices 209; Bibliography 238.

"The present edition is based on the two Mss hitherto known, Paris, *BN lat*. 16408 (A) and 16409 (B). They are far from being perfect as they derive from exemplars that were themselves not quite reliable witnesses of the letters. However, they provide sufficient support for constituting a critical edition.

(...)

A translation is provided in order to make the letters accessible to all those who are not well-acquainted with Latin grammar

and idiom. For that matter, Nicholas writes in a fairly clear and occasionally vivid Latin, but he is not a talented stylist. At times, he is not very particular about contaminated constructions. I have tried to smooth away some of these solecisms." (pp 37-38)

31. ———. 1994. "A special use of 'ratio' in 13th and 14th century metaphysics." In *Ratio. VII Colloquio del Lessico Intellettuale Europeo. Roma, 9-11 gennaio 1992*, edited by Fattori, Marta and Bianchi, Massimo Luigi, 197-218. Firenze: L. S. Olschki.

    "In the opening lines of the fifth tract of his Summulae Peter of Spain deals with six different meanings of the terminus technicus 'ratio'. (a)

    Three of them are relevant to the present discussion:

    'Ratio' is used in more than one way. In one way it is the same as definition or description, as in «univocal things are those which have a name in common and whose 'ratio substantie' corresponding to that name is the same» (b) [...]. In another way 'ratio' is the same as the form imposed on matter (forma materie), e.g. in a knife iron is the matter and the arrangement imposed on the iron is the form. In yet another way 'ratio' is the same as a common essence that is predicable of many things, e.g. the essence of a genus, a species or a differentia. [...].

    The aim of the present paper is to elucidate the important role of the term 'ratio' in metaphysical discussions from the thirteenth century onwards. The three above mentioned senses all refer to (what belongs to) a thing's essential nature. The first sense, however, is the one that comes

    most close to the subject matter of our discussion. (c) The opening lines of Aristotle's Categoriae, which are referred to by Peter may serve as the starting point of our investigation." (p. 197)

    (...)

    "7. *Conclusion.*

    We may summarise the foregoing observations as follows:

(1) As early as in Boethius (Aristotle) *ratio* (Greek 'logos') was used to stand for one specific (ontic or logical) characteristic that a thing has in common with other things, notwithstanding the dissimilarity of their respective 'complete natures'. Thus 'man' and 'cow' have the *ratio animalis* in common and a white wall and a white statue have whiteness in common.

(2) Ratio may also be used to refer to a thing's 'complete nature' as distinct from either the nature of other things (e.g. the *ratio hominis* vs the *ratio lapidis*) or from the thing's individuality (*ratio singularitatis*).

(3) Distinguishing several *rationes* in one and the same thing is a procedure which is typical of man's intellectual capability. This procedure forms the backbone of many philosophical and theological arguments concerning God and the entities occurring in the outside world.

(4) Possible translations of *ratio* as used in the special sense discussed in this paper are:

- *logically*: 'logical aspect', 'logical characteristic'; 'concept', 'notion' (bearing on some aspect characteristic or feature); 'meaning', 'descriptive account', 'definition'.

- *ontologically*:'ontic aspect', 'characteristic', 'feature' (including formal ones)." (p. 218)

Annotated Bibliography of Lambertus Marie de Rijk. Third Part: from 1987 to 1994

Bibliography

1. Rijk, Lambertus Marie de. 1987. "The anatomy of the proposition. *Logos* and *Pragma* in Plato and Aristotle." In *Logos and Pragma: Essays on the Philosophy of Language in Honour of Professor Gabriel Nuchelmans*, edited by de Rijk, Lambertus Marie and Braakhuis, Henk A.G., 27-61. Nijmegen: Ingenium Publishers.

   "Introductory

   This study is written in honour of a scholar who, among many other things, has laid the solid basis for the study of what may be considered the kernel of the semantics of the statement-making utterance, viz. the definition of the bearers of truth and falsity.

   In the first section I present a survey of Plato's semantics of the statement-making expression and a number of key notions involved. Next, I explore Aristotle's views of the matter, starting with a discussion of Aristotle's notion of *pragma* including that of being *qua* truth and not-being *qua* falsehood. In search for the nature of Aristotle's *logos,* I discuss this notion as it occurs on the *onomazein* level as well as the way in which it acts on the *legein* level. Next, I investigate the important notions of *synthesis* and *dihaeresis* and the role of *einai* as a monadic functor and *qua* syncategorematic container of categorial being.

Finally, I attempt to present a characterization of Aristotle's statement-making utterance.

(...) p. 27

"Epilogue

We may summarize what we have found as follows:

1 For Plato,

1.1 a *logos* is a composite expression consisting of a name *(onoma)* and an attribute *(rhêma)* which as such is not yet a statement-making utterance

1.2 a logos represents a state of affairs *(pragma),* i.e. an actual combination of some participata *(dynameis)* in the outside world

1.3 a *logos eirêmenos is* a statement-making utterance; it asserts that the pragma represented by the logos is actually the case.

2 For Aristotle,

2.1 a *logos* is a composite expression consisting of an *onoma* and *a rhêma* which represents both a notional and an ontological state of affairs. It may be characterized as a 'statable complex'

2.2 a *pragma is* a state of affairs either *ontologically:* state of affairs being part of the outside world or *semantically:* state of affairs conceived of and expressed by a logos

2.3 a *logos apophantikos* ('statement-making utterance') is a logos actually stated (either asserted or denied)

2.4 a logos may as such be used either on the *onomazein* level or on the *legein* level (qua *logos apophantikos*). Similarly, *phasis* (*kataphasis, apophasis*) may be used on either of these levels

2.5 *synthesis* is either synthesis1, = the act of uniting an onoma and a rhêma into a logos (on the *onomazein* level) or synthesis2 = the assertion of such a union accomplished in *a logos*

apophantikos, (on the *legein* level), while *dihairesis* is always the denial of such a union (on the *legein* level)

2.6 the *esti* forming part of *a logos apophantikos is* not a copula, properly speaking. Rather, it is a sign of (it consignifies, to speak with *De interp*. 3,16b24-5) synthesis2. The onoma and rhêma are already united to make up a logos ('statable complex') by synthesis, and, then, the *esti* rather than acting as a dyadic copulative functor, is merely a monadic sign of the 'statable complex' being actually stated

2.7 The propositional structure found in the *logos apophantikos* may be described as follows:

linguistically: a logos expressing categorial being (i.e. syncategorematic being implemented by one or more of the ten categories of being) is stated (either affirmatively or negatively) by means of the monadic functor 'be' or 'not be' *semantically*: the pragma represented by the logos is said to be (or not to be, respectively) part of the outside world (or: 'be (not) the case')." (pp. 53-54, notes omitted).

2. ———. 1987. "Logic and ontology in Ockham. Some notes on his view of the Categories of Being and the nature of its basic principles." In *Ockham and Ockhamists: Acts of the Symposium organized by the Dutch society for medieval philosophy Medium Aevum on the occasion of its 10th anniversary (Leiden, 10-12 September 1986)*, edited by Bos, Egbert Peter and Krop, Henri, 25-40. Nijmegen: Ingenium Publishers.

   Reprinted as chapter XIII in: *Through Language to Reality. Studies in Medieval Semantics and Metaphysics*.

   "*Conclusion*. There is no single reason, I think, to ascribe to Ockham any feelings of hostility towards metaphysics on this account. God created 'true and real being', but He created it in shaping 'what is truly and really being', individual beings, that is. As created, it is radically changeable and contingent as well. Uncreated, unchangeable being is not to be created, not even as some mysterious constituent present in creatural being. Human beings are not entitled to sublimate their

(indispensable) conceptual tools (e.g. universal terms) so that they represent unchangeable ontic standards. Whenever we are inclined to do so, Ockham's razor comes in, not however, to make us say that the metaphysical domain is void. Rather logic (and human thought in general) should make us recognize our own limitations, and refrain from speaking about the unspeakable when, and inasmuch as, our linguistic tools are bound to lead us astray. The same applies to Ockham's view of proofs of God's existence. He only admits the proof of God as first preserver of these actual things in this actual world and rejects all atemporal proofs. However, his faith is unshakeable and not involved in any philosophical thinking either. Likewise it is Ockham's ontology (doctrine of being) which is modest, the *onta* 'beings') are as abundant as they are. For that matter, Ockham let them really be (*ontôs einai* Plato would say). Well, in order to let them *be,* human thinking should be prudent in cautiously managing its homemade conceptual apparatus." (pp. 38-39)

3. ———. 1987. "Gilbert de Poitiers. Ses vues sémantiques et métaphysiques." In *Gilbert de Poitiers et ses contemporains: aux origines de la Logica modernorum. Actes du septième Symposium européen d'histoire de la logique et de la sémantique médiévales. Centre d'études supérieures de civilisation médiévale de Poitiers, Poitiers, 17-22 Juin 1985*, edited by Libera, Alain de and Jolivet, Jean, 147-171. Napoli: Bibliopolis.

   "La contribution à notre Symposium que je vous propose maintenant a pour but de n'envisager l'oeuvre théologique du fameux maître chartrain qu'au profit de notre connaissance de sa pensée philosophique. A l'intérieur de cette entreprise, on portera un intérêt spécial à l'interférence des vues sémantiques et métaphysiques chez Gilbert.

   Prenons notre point de départ dans son commentaire sur le *De hebdomadibus* de Boèce. On va voir que l'étude de cette oeuvre nous fera entrer dans le coeur même de la problématique." (p. 147)

   (...)

" Je suis d'avis que la finesse des expositions théologiques et philosophiques que nous offre le Porrétain nous échappe, à moins qu'elles ne soient replacées dans leur contexte sémantique. C'est bien dans le domaine de la sémantique que Gilbert est digne du vif intérêt de l'historien de la logique médiévale. Non pas seulement parce que ses expositions sont bien imprégnées de la pensée logico-grammaticale de son temps; cela n'a rien d'étonnant étant donné qu'il s'agit d'un savant de son envergure. Mais ce qui est d'un plus grand intérêt pour nous, ce sont les contributions que Gilbert a lui-même faites à l'évolution de la pensée sémantique au douzième siècle.

L'étude des oeuvres théologiques de Gilbert nous permet d'avancer les deux thèses suivantes:

(1) C'est par l'étude sémantique qu'est favorisée au plus haut point notre compréhension des pensées théologiques et philosophiques du Porrétain; je considère comme essentielles la manière et la mesure dont Gilbert a habillé, pour ainsi dire, sa pensée théologique et philosophique du vêtement de ses pensées grammatico-logicales.

(2) En expliquant les difficultés assez pénibles dans les *opuscula sacra* de Boèce, Gilbert a formulé ses propres vues sémantiques. Celles-ci, aussi empreintes de la tradition platonicienne qu'elles soient, ne témoignent pourtant pas moins d'une profondeur vraiment originale." (p. 171)

4. ———. 1987. "War Ockham ein Antimetaphysiker? Eine semantische Betrachtung." In *Philosophie im Mittelalter. Entwicklungslinien und Paradigmen. Wolfgang Kluxen zum 65. Geburstag*, edited by Beckmann, Jan P., Honnefelder, Ludger and Wieland, Georg, 313-328. Hamburg: F. Meiner.

   Reprinted as chapter XIV in: *Through Language to Reality. Studies in Medieval Semantics and Metaphysics*.

   "IV. Schlußbetrachtung. Ockham anerkennt ohne Einschränkung den transzendenten Bezirk, d. h. das Metaphysische oder Übersinnliche als Bezirk; in diesem Sinne ist er also gewiß kein Antimetaphysiker. Aber verwirft er denn die Metaphysik als Wissenschaft, oder höhlt er sie zumindest

aus? Zuerst muß anerkannt werden, daß Ockham im Prinzip der Metaphysik das Weisungsrecht über die Seienden (d. h., für Ockham, die individuellen Seienden) keineswegs abspricht. Zugleich kann nicht geleugnet werden, daß bei ihm der Metaphysik eine auffallend bescheidene Stelle zukommt. Wie läßt sich das unter Berücksichtigung von Ockhams unzweifelbarer Ehrfurcht vor dem Übersinnlieben erklären?

Der Schlüssel zur Lösung dieser Frage liegt nicht bloß in Ockhams Ontologie des individuellen Seins, sondern auch in seinen anthropologischen Auffassungen. Der Mensch ist nach ihm in seinen Denken und Sprechen nicht imstande, das Erhabene wesentlich zu durchforschen. Dessen soll sich der Mensch fort während eingedenk sein. Dies ist für Ockham in zwei deutliche Strategien übersetzbar:

a) nicht jedem modus significandi oder loquendi entspricht ein modus essendi in der Wirklichkeit

b) viele maßgebende Aussagen, sowohl sakrale wie profane, soll man nicht de virtute sermonis (dazu reicht unser Sprechen zuwenig aus), ondern der Ab sicht des Redners oder Schriftstellers entsprechend deuten." (ss. 326-327)

6. Rijk, Lambertus Marie de. 1988. "De quelques difficultés de nature linguistique dans le vocabulaire de Gilbert de la Porrée." In *Actes du colloque Terminologie de la vie intellectuelle au moyen âge*, edited by Weijers, Olga, 19-25. Turnhout: Brepols.

   Colloque at Leyde/La Haye, 20-21 September 1985.

   "On sait que, comme ceux de l'Antiquité, les philosophes du moyen âge ont fait aussi leur propre vocabulaire technique.

   Le but de cette courte communication est de mettre en lumière quelques difficultés spéciales du vocabulaire philosophique et théologique de Gilbert de Poitiers, auteur bien connu de la première moitié du XIIe siècle.

   D'abord, il faut remarquer que ces difficultés ressortent de l'usage très personnel et très original que fait Gilbert des termes courants de la langue philosophique du XIIe siècle.

   Il va de soi que ces difficultés sont délicates une fois de plus pour les philologues, en général pour les non-initiés en ce qui concerne l'histoire de la philosophie, parce que la confusion terminologique se présente déjà dans le domaine philosophique lui-même.

   Aussi va-t-on commencer par quelques termes connus, c'est-à-dire les termes *substantia, subsistentia* et *subsistens* et, dans ce contexte, la différence entre *esse* et *esse aliquid*. On va essayer de placer la terminologie dans le contexte des vues philosophiques de Gilbert, en particulier de la doctrine porrétaine sur le statut ontique de la chose concrète." (p. 19)

7. ———. 1988. "'Categorization' as a key notion in ancient and medieval semantics." *Vivarium* no. 26:1-18.

"The aim of this paper is to argue for a twofold thesis: (a) for Aristotle the verb '*katêgorein*' does not as such stand for statemental predication, let alone of the well-known 'S is P' type, and (b) 'non-statemental predication' or 'categorization' plays an important role in Ancient and Medieval philosophical procedure.

1. *Katêgorein and katêgoria in Aristotle*

Aristotle was the first to use the word 'category' *(katêgoria)* as a technical term in logic and philosophy. It is commonly taken to mean 'highest predicate' and explained in terms of statement-making. From the logical point of view categories are thus considered 'potential predicates'.(*)" (p. 1)

(...)

1.3 *Name giving ('categorization') as the key tool in the search for 'true substance*'

What Aristotle actually intends in his metaphysical discussions in the central books of his *Metaphysics* (Z-Th) is to discover the proper candidate for the name 'ousia'. According to Aristotle, the primary kind of 'being' or 'being as such' *(to on hêi on)* can only be found in 'being-ness' *(ousia;* see esp. *Metaph*. 1028b2). Unlike Plato, however, Aristotle is sure to find 'being as such' in the domain of things belonging to the everyday world. Aristotle's most pressing problem is to grasp the things' proper nature *qua* beings. In the search for an answer name-giving plays a decisive role: the solution to the problem consists in finding the most appropriate ('essential') name so as to bring everyday being into the discourse in such a way that precisely its 'beingness' is focussed upon." (p. 4)

(...)

2. *The use of 'praedicare' in Boethius*

The Greek phrase *katêgorein ti kata tinos is* usually rendered in Latin as *praedicare aliquid de aliquo*. The Latin formula

primarily means 'to say something of something else' (more precisely 'of somebody'). Of course, the most common meaning of the Latin phrase is 'to *predicate* something of something else in making a statement of the form S = P'. However, the verb *praedicare,* just as its Greek counterpart *katêgorein,* is used more than once merely in the sense of 'naming' or 'designating by means of a certain name', regardless of the syntactic role that name performs in a statement. In such cases *praedicare* stands for the act of calling up something under a certain name (designation), a procedure that we have labelled 'categorization'. (...)

Boethius' use of *praedicare* is quite in line with what is found in other authors. Along with the familiar use of the verb for statemental predication, Boethius also frequently uses *praedicare* in the sense of 'naming' or 'designating something under a certain name' whereby the use of the designating word in predicate position is, sometimes even explicitly, ruled out." (pp. 9-10)

(*) See L. M. de Rijk, *The Categories as Classes of Names (= On Ancient and Medieval Semantics 3), in: Vivarium*, 18 (1980), 1-62, esp. 4-7

8. ———, ed. 1988. *Some earlier Parisian Tracts on Distinctiones sophismatum*. Nijmegen: Ingenium Publishers.

   Edited by L. M. de Rijk with introduction and indexes.

   Content: I. Tractatus Vaticanus De multiplicatibus circa orationes accidentibus -- II. Tractatus Florianus De solutionibus sophismatum -- III. Tractatus Vaticanus De communibus distinctionibus.

   "As a matter of fact, syncategorematic words(3) play a predominant role in ambiguous expressions and sentences taken as a genre called *sophismata*, i.e. puzzling sentences of which the exact meaning can only be determined by introducing subtle semantic distinctions.(4) Every reader of the tracts involved is well acquainted with the Mediaeval authors' habit of closely linking up the treatment of syncategoremata with the solution to fallacies and sophismata. The author of the

pseudo-Boethian tract *De disciplina scolarium* also testifies to the close connection of these items, when he recommends the study of syncategoremata:

Terminorum autem determinaciones quae sincategoreumata appellamus, memorialiter menti imprimende, utpote que sophistice non parum deserviunt fantasie.(5)

The literary genre covering this sort of scholastic writings, is threefold:

1. the tracts on syncategoremata, which classify the precise meaning of a number of syncategorematic words, the ways in which they are used ambiguously; and they discuss current grammatical, semantic and logical rules related to these words and, finally, deal with special sophismata and the (attempted) solutions to them;(6)

2. the sophismata collections, where the sophismata themselves are the primary objects of discussion, although each of them is typical of a special difficulty concerning special ambiguous terms or phrases;

3. the so-called *Sophistariae*, the tracts on sophismata which, unlike the *Sophismata* collections, take the usual solutions (in fact, *distinctiones* concerning the ambiguous expression involved) as their starting-points." (pp. IX-X)

(3) For the sense of this term, see Kretzmann [1982: 211]: "Any word that can be used alone as a subject term or as a predicate term is classifiable as a categorematic word; all other words are classifiable as syncategorematic words, those that can occur in a proposition ... only along with at least one properly matched pair of categorematic words." See also de Libera [1985b: 64ff].

4. It is aptly defined by Kretzmann [1977: 6] as "a sentence puzzling in its own right or on the basis of a certain assumption, designed to bring some abstract issue into sharper focus the mediaeval ancestor of "The morning star is the evening star" or "George IV wished to know whether Scott was the author of Waverley". He is right in rejecting the modern label 'sophism' as sophismata "are sentences rather than

arguments and intended to be illuminating and instructive rather than specious and misleading". (ibid. n.9; see also Kretzmann [1982: 217, n. 24]. Some Master Martin (? of Alnwick) defines sophisma as 'diversitas veritatis et

falsitatis que in propositionibus oritur ex diversa situatione terminorum exponibilium vel resolubilium facientium terminos sequentes se diversimode supponere'. It should be noted in this connection that Martin's tract belongs to the *Probationes tenninorum* genre. See de Rijk [1982: 33]. 5. I 11, p. 97,6-8, ed. Weyers (Pseudo-Boece, *De disciplina scolarium*. Edition critique, introduction et notes, Leiden-Köln 1976).

6. For this genre, see Braakhuis [1979: passim]; and Kretzmann [1982: passim]. A lucid distinction between the different genres, *Distinctiones*, *Sophismata* and *Syncategoremata* is given by de Libera [1985b: 64-8].

"1 *The Ontic Constituents of Natural Bodies*

There is one distinction that is of paramount importance in order for us to understand Gilbert's ontology, viz. the Boethian contradistinction of *id quod* and *id quo*. We have to start with this pair of key notions.

1.1 *Preliminary:* 'id quod' and 'id quo'

According to Gilbert, our world consists of a number of individual 'things'. This world and its inhabitants appear to have the following characteristics:

(a) each and every 'thing' is in fact to be considered as one self-contained entity, (a 'subsistens') whose identity and ontological unity are due to the singularity of what is proper to it (*sue proprietatis singularitas; Eut. 30, 88; Trin. 144, 58-62*),

(b) however, every 'subsistent' (henceforth my rendering of Latin 'subsistens') itself consists of a plurality of forms; in addition, there are 'circumstantial features' (rather than 'forms' properly speaking) that determine its actual state or condition ('status'); *Trin. 137, 55;* cf. Nielsen(*), *56-8* and below, our nrs *1.2* and *1.72*.

In fact, Gilbert's ontology is one continuous attempt to establish two basic relationships, one between a natural thing and its Creator and the other between the thing's diverse actual constituents, which while being totally different from each other grant it its intrinsic unity at the same time." (p. 74)

(...)

"1.9 *Summary*

Each inhabitant of our world Gilbert calls (following Boethius) an *id quod est* or *subsistens*. Its main constituents are the *subsistentiae* (or the subsistent's *id quo* which is sometimes

taken collectively to stand for *ea quibus)* and these are accompanied by the 'accidents', quantity and quality. The subsistent owes its status (or transitory condition) to a collection of inferior members of the Aristotelian class of accidents, which to Gilbert's mind are rather 'accessories' or 'attachments from without' *(extrinsecus affixa).*

The term 'substantia' is used both to stand for substance and substantial form *(subsistentia), i.e.,* that by which something is subsistent (or 'is a substance').

The collection of *subsistentiae* (substantial forms) or the *forma totius is* called *natura.* However, 'natura' is also used to stand for either just one *subsistentia* or all the forms found in *a subsistens* even including its 'accidental' forms (quantity and quality). The inclusion of all kinds of accidents (including those inferior ones that make up a thing's *status)* is seldom found in the intension of the word 'natura'.

One of the key notions featuring in Gilbert's ontology is *esse aliquid.* 'To be a-something' has a threefold import. First, it means 'to be only *some* thing', and to miss perfection. Second, it has the positive sense of 'being *a something',* i.e. 'being determinate and well-delineated', not indefinite, not formless that is. Third, 'to be a something' implies concreteness, corporealness and singularity." (pp. 111-112)

10. ———. 1988. "On Boethius' notion of Being. A chapter of Boethian semantics." In *Meaning and Inference in Medieval Philosophy: Studies in Memory of Jan Pinborg*, edited by Kretzmann, Norman, 1-29. Dordrecht: Kluwer.

    Reprinted as chapter I in: *Through Language to Reality. Studies in Medieval Semantics and Metaphysics*.

    "From Parmenides onwards, ancient and medieval thought had a special liking for metaphysical speculation. No doubt, speculative thought was most influentially outlined by Plato

and Aristotle. However, what the Christian thinkers achieved in metaphysics was definitely more than just applying and adapting what was handed down to them. No student of medieval speculative thought can help being struck by the peculiar fact that whenever fundamental progress was made, it was theological problems which initiated the development. This applies to St Augustine and Boethius, and to the great medieval masters as well (such as Anselm, Thomas Aquinas, Duns Scotus). Their speculation was, time and again, focused on how the notion of being and the whole range of our linguistic tools can be applied to God's Nature (Being).

It is no wonder, then, that an inquiry into Boethius's notion of being should be concerned, first and foremost, with his theological treatises, especially *De hebdomadibus*. (p. 1)

(...)

My final section aims at showing how Boethius's notion of being is clearly articulated in accordance with his semantic distinctions. This is most clearly seen in the main argument of *De hebdomadibus* where they may be actually seen at work.

As is well known, the proper aim of *De hebdomadibus* is to point out the formal difference between *esse* and *esse bonum,* or in Boethius's words: 'the manner in which substances *are good* in virtue of their *being,* while not yet being substantially good' (38.2-4). Its method consists in a careful application of certain formal distinctions, viz.:

(a) The distinction between an object 'when taken as a subsistent whole and *id quod est* = the constitutive element which causes the object's actually' being; it is made in Axiom II and used in Axiom IV.

(b) The distinction (closely related to the preceding one) obtaining between the constitutive element effecting the object's actual being *(forma essendi,* or *ipsum esse)* and the object's actuality as such (*id quod est* or ipsum est); it is made in Axioms VII and VIII.

(c) The distinction between *esse* as 'pure being' (= *nihil aliud praeter se habens admixtum),* which belongs to any form, whether substantial or incidental, and *id quod est* admitting of some admixture (lit. 'something besides what it is itself'); it is made in Axiom IV and in fact implies the distinction between *esse simpliciter* and *esse aliquid*.

(d) The distinction between 'just being some thing', *tantum esse aliquid,* and '*being* something *qua* mode of *being'*. It is made in Axiom V and used in Axiom VI and is in fact concerned with a further distinction made within the notion of *id quod est*. It points out the differences between the effect caused by some form as constitutive of being *some* thing and that caused by the main constituent *(forma essendi)* which causes an object's *being simpliciter*.

(e) The distinction between two different modes of participation, one effecting an object's *being subsistent,* the other its being *some* thing, where the '*some* thing' (*aliquid*) refers to some (non-subsistent) quality such as 'being white', 'being wise', 'being good', etc.

The application of these distinctions enables Boethius to present a solution to the main problem: although the objects (*ea quae sunt,* plural of *id quod est*) *are* (*are good*) through their own constitutive element, *being* (*being good*), nevertheless they are not identical with their constitutive element nor (*a fortiori*) with the IPSUM ESSE (BONUM ESSE) of which their constituent is only a participation." (p. 22-23)

11. ———. 1989. "Semantics and metaphysics in Gilbert of Poitiers. A chapter of Twelfth century Platonism. Part II." *Vivarium* no. 27:1-35.

"Gilbert's View of Transcendent Reality.

Gilbert's world consists of quite a lot of singular subsistent objects which owe their being and 'being-a-something' to a collection of forms, both subsistential and accidental. Well, God has created this world after what in the Platonic tradition was called the 'exemplary Forms'. For Gilbert, creation and concretion are two complementary notions which play an

important role in his ontology. Creation is the reception of a total form or collection of subsistentiae; it is also called generation. As a natural process it amounts to 'beginning to be-of-acertain-kind'." (p. 1)

(...)

"POSTSCRIPT. In his short study on Gilbert of Poitiers (in *A History of Twelfth-Century Western Philosophy,* ed. Peter Dronke, Cambridge 1988, 328-52) John Marenbon rightly argues that when presenting an account of Gilbert's thought one should not separate his philosophy from his theology. However, I fully disagree with his suggestion (p. 351) that as a metaphysician Gilbert proves to have been a thinker whose 'treatment is inadequate and confused'. On the contrary, when dealing with really intricate theological problems Gilbert of Poitiers, like many other Medieval thinkers (e.g. Thomas Aquinas), develops his (NeoPlatonic) metaphysics as a 'clear-minded and subtle writer', and so there seems to be no reason at all to oppose Gilbert against people like Aquinas, Scotus, Ockham and others. They were all real philosophers, albeit in a theological context, which *as such* confronted them with a series of genuinely philosophical issues. In fact, why should any historian of philosophy approach only Gilbert of Poitiers 'as a thinker who tackled a set of changeless *(sic!)* metaphysical problems-identical (sic!) to those which faced, for instance, Plato and Aristotle, or Kant and Hegel'?" (pp. 34-35)

12. ———. 1989. *Through Language to Reality: Studies in Medieval Semantics and Metaphysics*. Northampton: Variorum Reprints.

    The volume is dedicated to L. M. De Rijk on the occasion of his 65th birthday.

    Contents: Preface IX-XI; SIXTH CENTURY: I. On Boethius's notion of Being. A chapter of Boethian semantics; TWELFTH CENTURY: Peter Abälard (1079-1142): Meister und Opfer des Scharfsinns; III. The semantical impact of Abailard's solution of the problem of universals; IV. La signification de la proposition (*dictum propositionis*) chez Abélard; V. Die Wirkung der neuplatonischen Semantik auf das mittelalterliche

Denken über das Sein; VI: Abailard's semantics views in the light of later developments; THIRTEENTH CENTURY: VII. Die Bedeutungslehre der Logik im 13. Jahruhndert und ihr Gegenstück in der metaphysischen Spekulation; VIII. Each man's ass is not everybody's ass. On an important item in 13th-century semantics; IX. The development of *Suppositio naturalis* in mediaeval logic, I. Natural suppositiojn as non-contextual supposition; FOURTEENTH CENTURY: X. The development of *Suppositio naturalis* in mediaeval logic, II. 14th-century natural supposition as atemporal (omnitemporal) supposition; XI: On Buridan's doctrine of connotation; XII. Semantics in Richard Billingham and Johannes Venator; XIII. Logic and ontology in Ockham. Some notes on his view of the categories of Being and the nature of its basic principles; XIV. War Ockham ein Antimetaphysicker? Eine semantische Betrachtung; Indexes. 1. Manuscripts; 2. Anonymous tract; 3. Ancient and medieval names; 4. Modern names; 5. Subjects and terms. (This volume contains XII + 322 pages).

14. ———. 1989. "Einiges zu den Hintergünden der Scotistischen Beweistheorie: die Schlüsselrolle des Sein-Könnens (*Esse possibile*)." In *Die Kölner Universität im Mittelalter. Geistige Wurzeln und soziale Wirklichkeit*, edited by Zimmermann, Albert, 176-191. Berlin: Walter de Gruiyter.

    "Wer Scotus' Beweistheorie in den Griff bekommen will, wird schließlich noch dadurch mit einer dritten Belastung rechnen müssen, daß Scotus sich nie in einer eigenen Kommentararbeit zu Aristoteles' *Zweiten Analytiken* systematisch über die Lehre vom Beweis geäußert hat, wie stark er auch immer, wie die übrigen mittelalterlichen Denker, in seiner Auffassung der Beweislehre vom aristotelischen Gedankengut beeinflußt wurde.

Es scheint mir daher angebracht, zuerst etwas vorzubringen über die Rolle, die eine Beweistheorie, oder vielmehr ein Beweisverfahren, in jedem beliebigen spekulativen Denksystem, ungeachtet dessen theologischer oder philosophischer Natur, besitzt; zunächst soll etwas über die Lehre vom Beweis bei Aristoteles und den mittelalterlichen Autoren, besonders Scotus, gesagt werden, um zuletzt einige wichtige Punkte aufzugreifen, deren genauere Betrachtung uns die wichtigeren Hintergründe des scotischen Denkens über Beweis und sicheres Wissen vordringen läßt." (s. 177)

15. Peter, of Spain. 1990. *Language in Dispute: An English Translation by Francis P. Dinneen of Peter of Spain's Tractatus called afterwards Summulae logicales*. Amsterdam, Philadelphia: Benjamins.

    On the basis of the critical edition established by L. M. De Rijk.

16. Rijk, Lambertus Marie de. 1990. "Ockham's theory of demonstration: his use of Aristotle' s *kath' holou* and *kath' hauto* requirements." In *Die Gegenwart Ockhams*, edited by Vossenkuhl, Wilhelm and Schõnberger, Rolf, 232-240. Weinheim: VCH-Verlagsgesellschaft.

    "Far from being a sceptic William of Ockham made every effort to corroborate the basis of philosophical and theological thought by purifying it of all sorts of untenable presuppositions. His main contribution to fourteenth century philosophical and theological development lies in systematically rethinking scholastic doctrines, and especially their assumptions, on the firm basis of his own favourite leading principles: the strictly individual nature of all that really is and the radical contingency of all creatural being.

    These two principles also play a major part in Ockham's way of dealing with the Aristotelian theory of demonstration. The present paper aims at investigating Ockham's doctrine of demonstrative proof, focusing on the way in which he felt forced to adapt or rephrase the special requirements Aristotle had laid down for propositions to enter into syllogistic proof, especially strict proof (the so-called '*demonstratio potissima*'). Our main argument will concern Aristotle's rather peculiar

'*kath holou*' requirement and Ockham's appliance of the '*kath hauto*' (Latin: 'per se') notion which is also involved in framing correct premisses for demonstrative proofs. A few preliminary remarks will be made about the essentials of Aristotle's theory of demonstration." (p. 232)

(...)

"Conclusions.

To sum up our findings: Ockham's adaptations and manipulations of Aristotle's requirements for genuine demonstrative propositions are as many demands imposed by his own metaphysical views. He comments on Aristotle, always starting from his own favourite views. Though Aristotle is the Master, Ockham is the one to say what the Master meant, or what he should have meant. On the other hand, his introducing the *'per se strictissimo modo*' rather seems to be a matter of technicality. Whereas in *Posterior Analytics* Aristotle deals with the scientific procedure of *apodeixis* in general, in which the apodeictic syllogism is merely a vehicle for correctly framing an *apodeixis,* the Medievals, and Ockham in particular, were apt to reduce Aristotle's theory of demonstrative proof to a theory of demonstrative syllogism. That is why the '*demonstratio potissima*' (including its specific demands) so heavily influenced Ockham's theory of demonstration." (p. 239)

17. ———. 1990. "Specific tools concerning logical education." In *Méthodes et instruments du travail intellectuel au moyen âge*, edited by Weijers, Olga, 62-81. Turnhout: Brepols.

"Unlike in our days logical doctrine was very influential in the Middle Ages. Logic was indeed considered then the vehicle par excellence both in matters of teaching and scientific inquiry in any field of knowledge. When embarking upon a discussion of the specific terminology concerning logical education, some preliminary remarks seem to be indispensable.

The reader should be warned, first. Logical theory taken as such, which comprises a great mass of specifically logical terms (such as 'praedicamentum', 'predicable', 'syllogism', 'fallacy', 'supposition', 'appellation', 'ampliation', 'distribution',

'syncategorema', and so on) is out of scope now; those terms and their like will be mentioned only in passing, inasfar namely as they occur in educational practice.

Another remark better starts from the well-known Medieval distinction between logica docens and logica utens, the former of which being logical doctrine as developped, expounded and taught for its own sake, whereas the latter is rather logic practically applied in any sort of logical analysis or argumentation. To be sure, logica utens does not merely coincide with the more or less explicit occurrence of logical argumentation in whatever context. Even qua logica utens the art of logic displayed a high degree of technicality. In other words: medieval logica utens rather than being practical argumentation as loosely accomplished by somebody who exhibited a remarkable natural ability for logical reasoning consisted in the performance of somebody being really well-versed in all those logical techniques he had been taught in his youth in class room. So, whoever is interested in specific terms of logical teaching and learning should surely not leave exhibitions of logica utens out of consideration (*).

Our third remark which is in the line of the previous one, concerns the remarkably wide scope of logica utens. Of course, logica docens played a very important part in Medieval education, as may be also gathered from its predominant position in Medieval curricula. However, according to a good Peripatetic tradition, logic was taken to serve as the organon or instrument of all other branches of learning and science, which means that logic, and logic alone, provided other disciplines with the correct art of thinking and reasoning. Thus logic proves to have been effectually present, for example, in theological disputation, a fact that every student of Medieval theology is fully aware of. But it had an equally prevailing position in other fields of learning, too, such as Natural science ("Physics"), Ethics and even Political philosophy.

A final preliminary remark aims at elucidating the large scope of Medieval logic from still another point of view, viz. the close relationship between scientific inquiry and exposition as well as

scientific education in the Middle Ages. That is to say that scientific inquiry and exposition as well as education and learning were controlled by the same didactics of exposition and argumentation. Indeed, nearly all Medieval writings that contain scholarly investigations in any field of learning whatsoever display didactic approaches which are quite similar to those used by works mainly intended for instruction, no matter for the benefit of beginners or advanced people." (pp. 62-63)

(*) For the contradistinction of *dialectica docens* and *dialectica utens* both of them especially concerned with the use of logical topics (*loci*), see Eleonore Stump, *Topics: their development and absorption into consequences* in *The Cambridge History of Later Medieval Philosophy,* 1982, p. 281, n. 41.

18. ———. 1990. "The Posterior Analytics in the Latin West." In *Knowledge and the Sciences in Medieval Philosophy: Proceedings of the Eight International Congress of Medieval Philosophy (SIEPM), Helsinki, 24-29 August 1987. Volume I*, edited by Asztalos, Monika, Murdoch, John Emery and Niiniluoto, Ilkka, 104-127. Helsinki: Acta Philosophica Fennica.

"It is common knowledge that Aristotle had the conviction that all reality was to be found within our world of sensible experience and that Plato's assumption of another, Transcendent World of Perfect Being was merely 'empty talk and poetic metaphor' *(Metaph.* A9, 991a20). Indeed, Aristotle took Plato's Forms to be quite useless for explaining the possibility of true knowledge about our world. However, like his master, Plato, Aristotle stuck to the Parmenidean conviction about the real existence of unchanging formal principles of being. As is well-known, his formal principles are *in* things as their immanent dynamic natures (*eidê*).

For Aristotle, true knowledge concerns the essential natures immanent in things (see e.g. *Metaph.,* 991a12-3; 999a24-9; 1018b36; 1032b1 ff. et alibi). To be sure, all being is individual being and so Aristotle is compelled to answer the quite intriguing question: if the proper object of true knowledge is universal nature and everything real is a particular, how, then,

are we able to gain genuine knowledge about the things in their own right? In his *Posterior Analytics* Aristotle explains what he understands by truly knowing things. Well, quite in line with his philosophical stand, Aristotle claims that all scientific knowledge is concerned with discerning a universal nature as *immanent in* a particular. In I 2, 72a75-7 e.g., it is explicitly said that the elements of the deduction are such and such *in concreto* (cf. 73a29-31). For Aristotle, demonstration in fact concerns some *phenomenal state of affairs* of which the investigation aims to clarify the essential structures." (p. 102)

(...)

"Aristotle's description of induction and its role in the scientific process fits in remarkably well with what he has earlier remarked about the process of proper categorization. Referring to the well-known battle simile - how a general retreat comes to an end after one man makes a stand, and then another *etc.,* the author argues that 'as soon as one of the undifferentiated percepts makes a stand, there is a primitive universal in the mind ... until the highest genera have been reached' (II 19, 100a14-b4).

The faculty, or rather cognitive attitude, by which we become familiar with the first principles is the *Nous* or intellective apprehension. Well, just as the Nous precedes all principles (such as axioms etc.), in the same way scientific knowledge covers the whole domain of states of affairs (*pragmata*), Aristotle concludes (100b16-17).

Let us try, now, in the next sections, to discover the Medievals' doctrinal reception of the *Posterior Analytics* by discussing their views of some themes characteristic of Aristotle's scientific method. It would be useful, to that end, to single out the following items: the Medievals' discussion of the well-known four questions, their views of the three requirements for 'hunting essential attributes', their (different) views of necessity, and, finally, the Medieval conceptions of induction and our knowledge of the First Principles." (p. 110)

19. ———. 1990. "Un tournant important dans l'usage du mot 'idea' chez Henri de Gand." In *Idea. VI Colloquio Internazionale del*

Lessico internazionale Europeo. Roma, 5-7 Gennaio 1989, edited by Fattori, Marta and Bianchi, Massimo Luigi, 89-98. Roma: Edizioni dell'Ateneo.

"1. *Introduction.* On sait que le terme 'idée' était un mot-clé dans la métaphysique de Platon. Les exposés importants de ce matin ont rendu entièrement superflu de rappeler le rôle du mot idea chez Platon ainsi que dans la tradition platonicienne et dans la patristique.

Les communications que nous venons d'écouter cet après-midi nous ont fait comprendre l'importance du mot latin *idea, ou* plutôt la valeur de la notion d'idée, dont le mot *idea* n'était que l'un des véhicules à côté de *forma, species, notio, conceptus, intentio,* etc.

Il n'est pas nécessaire d'être spécialiste de l'histoire de la philosophie médiévale pour bien savoir que, quelle que soit la dette des auteurs médiévaux envers des sources antiques, et quel que fût le respect qu'ils ont ressenti envers toute autorité -- les sources ne les ont cependant jamais empêchés de suivre leur propre voie au fur et à mesure que cela s'imposait dans l'intérêt de leur réflexions philosophiques.

C'est pourquoi l'étude de l'usage des termes philosophiques et leur développement au cours du moyen-âge n'est pas seulement d'intérêt linguistique. Au contraire, l'analyse de ce développement est tout à fait indispensable pour bien comprendre les doctrines philosophiques elles-mêmes de la période médiévale.

Je me propose dans cette communication de mettre en relief le tournant important qu'a subi l'usage du mot latin *idea* chez certains auteurs de la seconde moitié du 13e siècle, usage, bien entendu, qui s'est prolongé au 14' siècle. La figure centrale sera celle du philosophe flamand Henri de Gand (mort en 1293).

Comme je viens de vous suggérer, ce tournant est significatif d'un développement doctrinal chez ces auteurs. Aussi ce développement doctrinal s'impose comme le cadre adapté aux exigences d'un exposé sémantique à propos de l'usage du mot

idea, disons après saint Thomas d'Aquin (mort en 1277)." (p. 89)

20. ———. 1991. "Two short questions on Proclean metaphysics in Paris B. N. lat. 16.096." *Vivarium* no. 29:1-12.

    "The collectaneous manuscript Paris, B.N. lat. 16.096 (formerly belonging to the codices Sorbonnenses) contains (ff. 172va-177vb, which part dates, it seems, from the second half of the 13th century) some anonymous questions referred to by the catalogue (*) as Quaestiones super librum Posteriorum. This description, however, is incorrect as these questions have no bearing whatsoever on the doctrine of Aristotle's Posterior Analytics. Actually, they are two short metaphysical questions (called expositiones by the author) on the key notions of 'beingness' and 'oneness' respectively, followed by a longer, incomplete treatise on the nature of the components of a definition (or rather a diffinitum).

    (...)

    Only two of the five questions announced in the beginning of this third treatise are preserved. One of them deals with the problem of whether the definition consisting of genus and differentia requires a real composition of the components of the diffinitum, the other examines whether immaterial substances are composite in some respects. Unlike the first two tracts, the third does not show any influence of Neoplatonic doctrine.

    To my knowledge, the expositions on Ens and Unum have only come down to us in the Paris manuscript. They are interesting in that the author makes a successful effort to penetrate some of the basic views of Proclean metaphysics." (pp. 1-2, notes omitted)

    (*) L. Delisle, Inventaire des manuscrits latins de la Sorbonne, conservés à la Bibliothèque Impériale sous les nos. 15.176-16.718 du fonds latin, in: Bibliothèque de l'École des chartes, 31 (1870), 135 ff.

21. Peter, of Spain. 1992. *Syncategoreumata*. Leiden: Brill.

First critical edition by L. M. de Rijk with an introduction, critical apparatus, indexes and an English translation by Joke Spruyt.

Content of the English translation: Introduction 39; Chapter 1. On composition 45; Chapter 2. On negation 73; Chapter 3. On exclusive words 105; Chapter 4. On exceptive words; Chapter 5. On consecutive words 197; Chapter 6. On the verbs 'begins' and 'ceases' 249; Chapter 7. On the words 'necessarily' (*necessario*) and 'contingently' (*contingenter*) 283; Chapter 8. On conjunctions 307; Chapter 9. On '*Quanto*', '*Quam*' and '*Quicquid*'; Chapter 10. On answers 425; Critical apparatus 434; Index locorum 572; Index rerum notabilium 574; Index sophismatum 613.

"Peter of Spain (ca 1205-77) who, in 1276, became Pope under the name of John XXI, was the author of an impressive number of scholarly works, inter alia the Tractatus (a textbook of logic, widely known afterwards under the title Summule logicales) and the Syncategoreumata. The latter work, which deals with syncategorematic terms, is here critically edited for the first time, together with an English translation.

Peter's authorship of the Syncategoreumata is beyond all doubt: it is confirmed again and again by nearly all our manuscripts. As to the date and place of origin of the Syncategoreumata: they were surely written after the Tractatus (which were written not later than the 1230's, see my Introduction to the edition of this work, p. LV-LVII).

There is no reason at all to assume a connection between the Syncategoreumata and Peter's stay at the University of Paris, which he left in 1229, before the composition of the Tractatus. Clearly, Paris does not play any role in the early diffusion of the Syncategoreumata. It seems highly probable, therefore, that the Syncategoreumata were written by Peter in the same region where he wrote the Tractatus, i.e. Northern Spain or Southern France. The work's most likely date is between 1235-1245 (cf. my Introduction to the Tractatus, pp. XXXIV-LXI). From Peter's use of lectio (see X, cap. 8) it may be concluded that the

Syncategoreumata were meant as a piece of school-teaching." (p. 9, notes omitted)

22. Rijk, Lambertus Marie de. 1992. "Causation and participation in Proclus. The pivotal role of scope distinction." In *On Proclus and His Influence in Medieval Philosophy*, edited by Meijer, Pieter Ane and Bos, Egbert Peter, 1-34. Leiden: Brill.

    1. Status questionis; 2. Causation and participation in Plato; 3. Procession and participation in Plotinus and Jamblichus; 4. Proclus' refined metaphysics; 4.1 Preliminary; 4.2 The Proclean universe from the viewpoint of causation; 4.3 The Proclean universe from the viewpoint of participation; 5. The meaning of *amethekton* and *metekomenon* in Proclus; 5.1 *Méthexis* c.a. in the *Elementatio*; 5.2 *Méthexis* c.a. in the *Platonic Theology*; The basic role of the *metexomenon* for continuity and reversion; Scope distinction in Neoplatonic doctrine and procedure; 7.1 Two famous cases of scope distinction in Proclus; 7.2 Scope distinction deliberately applied and recommended; 7.3 The philosophical impact of scope distinction in Neoplatonism.

    "The present paper aims to investigate in some more detail the transcendence-immanence antinomy. First an outline of its historical background will be presented from Plato onward through Plotinus and Jamblichus up to Proclus. Next I shall discuss Proclus' doctrine on these matters in the larger perspective of his philosophy, and focus on the intriguing notion of *amethekton*. Finally a few remarks will be added on the important role of what we might call 'scope distinction' in Proclus' doctrines and dialectical arguments." (p. 2)

23. ———. 1992. "John Buridan on Universals." *Revue de Métaphysique et de Morale* no. 97:35-59.

    "It is common knowledge that Plato strongly believed that, in order to explain the nature of whatever is (either things or states of affairs, including Man and his environment), the assumption of Transcendent Universal Forms is indispensable. In his view, these universal Forms are the ontic causes of each and every sublunary entity, which all owe their being to their sharing in these Forms. Consequently, everyone who is in want

of firm knowledge *(episteme)* about, the things of the outside world is bound to direct his attention to the transcendent domain of the universal Forms'.

However, Plato was the first to recognise, and seriously deal with, the objections that can be raised to this doctrine. These objections mainly concern the status (and the dignity, however modest) of our transient world and, above all, the possibility to obtain, true knowledge of this world as *it stands,* in its ever-changing nature, that is." (p. 35)

(...)

"To be sure, the Medievals all rejected the Platonic Ideas taken as separate substances and they adhered to the Aristotelian common sense principle that only individuals have independent existence. Nevertheless, they were still under the spell of the status of «universal being» as the indispensable basis of true knowledge.

Marylin McCord Adams has analysed some early fourteenth century solutions to the problem of universals (Scotus, Ockham, Burley and Harclay) (*). In McCord's article Buridan's view of the matter is left out of consideration. Quite understandably so, since Buridan's solution to the problem differs considerably from the sophisticated arguments given by his contemporaries. Buridan seeks.for a solution in analysing the several ways of human understanding. In directing his attention to the propositional attitude involved in the cognitive procedure Buridan is remarkably close to the ingenious solution Peter Abelard had come up with two centuries earlier. In the next *sections* I shall give an outline of Abelard's treatment of the question of universals followed by an analysis of Buridan's discussion of the matter (as found in his commentary on the *Metaphysics* and elsewhere)." (p. 37)

(...)

"We may conclude, then, that two bright logicians of the Parisian tradition have come up with quite an ingenious solution to the problem of universals. Both of them started out from the firm conviction that nothing exists but particulars.

Nevertheless, they apparently were not satisfied with purely extensional solutions as brought forward by Oxford logicians such as Heytesbury and Ockham. Maybe extensionalists are out to show how people *ought* to think. Abelard and Buridan, however, were especially interested in the various ways of conceiving we *actually* use in daily life, in our attempts to conceptually deal with the outside world." (p. 59)

25. ———. 1993. "Der Streit über das *medium demonstrationis*: die Frucht eines Misverständnisses?" In *Argumentationstheorie. Scholastische Forschungen zu den logischen und semantischen Regeln korrekten Folgerns*, edited by Jacobi, Klaus, 451-463. Leiden: Brill.

    "In der alten Ausgabe des Kommentars zu den *Zweiten Analytiken* von Aegidius Romanus' findet sich nach dem Kommentar eine kurze Abhandlung aus der Feder des Augustiner-Eremiten Augustinus de Biella. Sie wurde zur Verteidigung der Auffassung des Aegidius über das *medium demonstrationis* geschrieben. Aegidius hatte gelehrt, daß bei einer *demonstratio potissima* (also bei der aristotelischen Apodeixis im strengsten Sinne) das *medium* sich aus der Definition des Attributs *(passio)* ergebe, und nicht, wie die communis opinio lautete, aus der Definition des Subjekts. Wie

üblich, fängt Biella damit an, Argumente gegen die Auffassung Aegidius' anzuführen, um dieselben anschließend zu widerlegen. Biella hat aber augenscheinlich den Text von Aegidius nicht zur Hand gehabt, denn er fährt fort, *dominus* Aegidius sei wohl dieser Auffassung über (las *rnedium demonstrationis* gewesen, "wie ich von den *doctores ordinis (Tatrum heremitarum* gehört habe" (oder: "wie ich es deren Schriften entnommen habe")." (s. .451)

    Italian translation of: "La philosophie au moyen âge" (1985), chapter 8, pp. 184-203.

27. ———. 1993. "On Buridan's view of Accidental Being." In *John Buridan: A Master of Arts. Some Aspects of His Philosophy. Acts of the Second Symposium Organized by the Dutch Society for Medieval Philosophy Medium Aevum on the Occasion of its 15th Anniversary. Leiden-Amsterdam (Vrije Universiteit), 20-21 June, 1991.*, edited by Bos, Egbert Peter and Krop, Henri, 41-51. Nijmegen: Ingenium Publishers.

    "One of the most striking characteristics of late medieval metaphysics is the upgrading of 'accidental being'. The strict opposition between *'esse per se'* and *'esse per accidens',* which had been of paramount importance ever since Aristotle, has lost its relevance in the ontological discussions of the fourteenth century. The status of 'accidental being' came rather close to that of 'substantial being'. In the views of philosophers such as Ockham and Buridan (not to mention thinkers like Crathorn) the nature of 'accidental being' (or rather 'quantitative and qualitative being') can no longer be properly defined in terms of ontological dependency upon substance. In other words, '*per se* subsistence' is assigned not only to substance but to 'accidental being' as well.

    In the present contribution I will illustrate this development by discussing some of Buridan's expositions in his *Questiones*

commentary on Aristotle's *Metaphysics (IV,* q. 6 and VII, q. 3-4)." (p. 41)

28. ———. 1993. "Works by Gerald Ot (*Gerardus Odonis*) on logic, metaphysics and natural philosophy rediscovered in Madrid, Bibl. Nac. 4229." *Archives d'Histoire Doctrinale et Littéraire du Moyen Âge* no. 60:173-193; 378.

    "Some twenty years ago I discovered in the Biblioteca Nacional in Madrid a very interesting manuscript with works (all of them anonymous, to be sure) on logic, metaphysics and natural philosophy. In fact, my discovery turned out to be a rediscovery, for the manuscript contained a note written by the famous historian of Franciscan philosophy and theology, Father Ephrem Longpré OFM, which said that, with the exception of the writings occurring from fol. 204r onwards, all tracts found in this codex are by a Franciscan master, Gerardus Odonis. (...)

    Gerard Odon OFM (who as Patriarch of Antiochia died in 1349 of the plague, at Catania, Sicily, where he was gifted with the benefices of a wealthy church) is especially known as the much troubled successor of the deposed Michael of Cesena as Master General of the Franciscan Order and a close adherent of Pope John XXII in the debate on the beatific vision." p. 173

    "The Ms Madrid, Bibl. Nac. 4229 appears to be of the utmost importance for our knowledge of Gerard Odon's doctrine on several subjects in the fields of logic, metaphysics and natural philosophy. To establish his authorship of all the works as occurring in the present Ms with certainty requires more research. The results of the present investigations can be summarised in the following survey:

    I LOGIC:

    1.1 *Quid est subiectum in logica (69va-74rb)*

    1.2 *De sillogismis (1ra-19va)*

    1.3 *De tribus dubiis circa naturam dictionum exclusivarum et suppositionis simpliciter simplicis (37rb-43ra)*

    1.4 *De principiis scientiarum (45ra-69va)*

II METAPHYSICS:

2.1 *De intentionibus (incomplete; 74va-122vb)*

2.2 *De esse et essentia (125ra-132vb)*

2.3 *De principiis nature (156ra-174vb, together with 19va-28vb)*

2.4 *De natura universalis (incomplete; 204ra-207vb)*

III NATURAL PHILOSOPHY:

3.1 *De augmento forme (132vb-150rb)*

3.2 *De intensione et remissione formarum (175ra-179ra)*

3.3 *De continuo (179rb-186vb)*

3.4 *De loco (187ra-192va)*

3.5 *De tempore (192vb-199va)*

3.6 *De motu (199vb-203vb)*" (p. 193?

29. ———. 1994. "John Buridan on man's capability of grasping the truth." In *Scientia et ars im Hoch- und Spätmmittelalter*, edited by Craemer-Rügenberg, Ingrid and Speer, Andreas, 281-303. Berlin: Walter de Gruyter.

    Miscellanea Mediaevalia, vol. 22/1.

    "Introduction. As is well-known, two subjects are distinctive of the fourteenth century theory of cognition, namely *'certitudo'* and *'evidentia'*. It is true, thirteenth century philosophers, such as Thomas Aquinas, were also concerned with certitude and evidentness as indispensable requisites for 'true knowledge' *('scientia')*. However, until the end of the thirteenth century certitude and evidentness were not prominent in the discussions about the cognitive procedure nor were they treated as separate matters, requiring separate attention. In Thomas Aquinas for example, the conviction that man is really capable of grasping the truth with certainty is really constitutive of his philosophical (and theological) thought and praxis (*)', or to speak with J. A. Aertsen, of 'Thomas' way of thought'.(**) This, however, does not alter the fact that in Aquinas' philosophy

'certitudo' is not highlighted as such, and the specific role of 'evidentia' is even virtually ignored.

Buridan's theory of cognition, on the contrary, clearly focusses on the ingredients *'certitudo'* and *'evidentia',* and, within this framework, on the notion of *'assensus'*. In the present paper I aim to elucidate the role of this key notion of John Buridan's theory of cognition." (p. 281)

30. ———. 1994. *Nicholas of Autrecourt: His Correspondence with Master Giles and Bernard of Arezzo*. Leiden: Brill.

A critical edition by L. M. de Rijk from the two Parisian manuscripts with an introduction, English translation, explanatory notes and indexes.

Contents: Acknowledgements IX; Introduction 1; 1. Nicholas of Autrecourt. Life and works 1; 2. Nicholas' correspondence with Bernard and Giles 5; 3. The extant letters. Their tradition and structure 24; 4. Principles of the present edition and translation 37; Conspectus siglorum 45; Text and translation 46; Explanatory notes 113; Appendices 139; Indices 209; Bibliography 238.

"The present edition is based on the two Mss hitherto known, Paris, *BN lat*. 16408 (A) and 16409 (B). They are far from being perfect as they derive from exemplars that were themselves not quite reliable witnesses of the letters. However, they provide sufficient support for constituting a critical edition.

(...)

A translation is provided in order to make the letters accessible to all those who are not well-acquainted with Latin grammar

and idiom. For that matter, Nicholas writes in a fairly clear and occasionally vivid Latin, but he is not a talented stylist. At times, he is not very particular about contaminated constructions. I have tried to smooth away some of these solecisms." (pp 37-38)

31. ———. 1994. "A special use of 'ratio' in 13th and 14th century metaphysics." In *Ratio. VII Colloquio del Lessico Intellettuale Europeo. Roma, 9-11 gennaio 1992*, edited by Fattori, Marta and Bianchi, Massimo Luigi, 197-218. Firenze: L. S. Olschki.

    "In the opening lines of the fifth tract of his Summulae Peter of Spain deals with six different meanings of the terminus technicus 'ratio'. (a)

    Three of them are relevant to the present discussion:

    'Ratio' is used in more than one way. In one way it is the same as definition or description, as in «univocal things are those which have a name in common and whose 'ratio substantie' corresponding to that name is the same» (b) [...]. In another way 'ratio' is the same as the form imposed on matter (forma materie), e.g. in a knife iron is the matter and the arrangement imposed on the iron is the form. In yet another way 'ratio' is the same as a common essence that is predicable of many things, e.g. the essence of a genus, a species or a differentia. [...].

    The aim of the present paper is to elucidate the important role of the term 'ratio' in metaphysical discussions from the thirteenth century onwards. The three above mentioned senses all refer to (what belongs to) a thing's essential nature. The first sense, however, is the one that comes

    most close to the subject matter of our discussion. (c) The opening lines of Aristotle's Categoriae, which are referred to by Peter may serve as the starting point of our investigation." (p. 197)

    (...)

    "7. *Conclusion.*

    We may summarise the foregoing observations as follows:

(1) As early as in Boethius (Aristotle) *ratio* (Greek 'logos') was used to stand for one specific (ontic or logical) characteristic that a thing has in common with other things, notwithstanding the dissimilarity of their respective 'complete natures'. Thus 'man' and 'cow' have the *ratio animalis* in common and a white wall and a white statue have whiteness in common.

(2) Ratio may also be used to refer to a thing's 'complete nature' as distinct from either the nature of other things (e.g. the *ratio hominis* vs the *ratio lapidis*) or from the thing's individuality (*ratio singularitatis*).

(3) Distinguishing several *rationes* in one and the same thing is a procedure which is typical of man's intellectual capability. This procedure forms the backbone of many philosophical and theological arguments concerning God and the entities occurring in the outside world.

(4) Possible translations of *ratio* as used in the special sense discussed in this paper are:

- *logically*: 'logical aspect', 'logical characteristic'; 'concept', 'notion' (bearing on some aspect characteristic or feature); 'meaning', 'descriptive account', 'definition'.

- *ontologically*:'ontic aspect', 'characteristic', 'feature' (including formal ones)." (p. 218)

(a) Peter of Spain, Tractatus called afterwards Summule logicales. First Critical Edition from the Manuscripts with an Introduction by L. M. de Rijk, Assen, 1972, p. 55, 4-14. Cf. the English translation in The Cambridge Translations of Medieval Philosophical Texts, Vol. I: Logic and the Philosophy of Language, edited by Norman Kretzmann and Eleonore Stump, Cambridge etc., 1988, p. 226.

(b) ARISTOTLE, Categoriae, 1, 1 a 8-9.

(c) For that matter, the distinction between the three senses as given by Peter of Spain is not entirely clear-cut: they are, at least partially, overlapping.

Annotated Bibliography of Lambertus Marie de Rijk. Fourth Part: from 1995 to 2013

Bibliography

1. John, Buridan. 1995. *Johannes Buridanus Summulae de Praedicabilibus*. Nijmegen: Ingenium Publishers.

   Introduction, critical edition and indexes by L.M. De Rijk.

   "The present edition contains the second tract [of Buridan's *Summulae*], *De praedicabilibus,* which deals with the five 'predicables', introduced by the Neoplatonist commentator of Aristotle, Porphyry (c. 233-c. 304 A.D.) in his introductory book (*Isagoge*) to the Stagirite's *Categories, viz.* 'genus', 'species', 'differentia', 'proprium', and 'accidens'. From as early as the eleventh century, medieval authors commented upon Boethius' (480-524) translation of, and commentary upon, this work.

   Buridan's discussion of the predicables is mainly based on the corresponding tract of Peter of Spain's manual. His comments are preceded by the complete text of the lemma from Peter to be discussed. It should be no surprise that Buridan's quotations should go back to an adapted version of Peter's text.

   (...)

   Buridan's work consists of elementary exegesis as well as extensive objections and *dubitationes* in which specific

questions are dealt with, mostly in an original fashion." (pp. XVII and XXI)

2. Rijk, Lambertus Marie de. 1995. "Teaching and inquiry in 13th and 14th century logic and metaphysics." In *Vocabulary of Teaching and Research between Middle Ages and Renaissance. Proceedings of the Colloquium London, Warburg Institute, 11-12 March 1994*, edited by Weijers, Olga, 83-95. Turnhout: Brepols.

   !The Medievals have ably expanded the logico-semantic approach to Reality they inherited from the Ancients, especially in their so-called 'logica modernorum', which was thus baptised by the Medieval logicians themselves in contradistinction to Aristotelian-Boethian logic, the so-called ‘logica antiquorum’.

   Coming now to the proper subject of my contribution of this afternoon I shall conhne myself to three items which seem to be the most appropriate to afford a quick understanding of how the deliberate and thoughtful use ot linguistic devices by the Medievals in their teaching and inquiry could contribute to the development of philosophy. These items are:

   [1] the far-reaching distinction made in the ‘logica modernorum’ between signification, supposition, and connotation

   [2] Abelard’s solution to the famous problem of universals

   [3] a particular case taken from Buridan’s commentary on Aristotle's *Metaphysics*, which may clarify the innovatory power of the distinction between supposition and connotation and, by the same token, of logico-semantics as practised in medieval teaching and inquiry." (p. 85, a note omitted)

3. ———. 1995. "Ockham as the Commentator of *His* Aristotle. His treatment of *Posterior Analytics*." In *Aristotelica et Lulliana: magistro doctissimo Charles H. Lohr septuagesimum annum feliciter agenti dedicata*, edited by Domínguez Reboiras, Fernando, Imbach, Ruedi, Pindl, Theodor and Walter, Peter, 77-127. The Hague: Martinus Nijhoff.

1. Introduction; 2. Preliminary: Aristotle on demonstrative or epistemonic proof; 2.1 On the three requrements *'kata pantos', kath' 'hauto', 'kath' holou'*, 2.2 On the notion of necessity; 2.3 On the four types of questions. On 'Middle' and 'Definiens'; 2.3.1 Subject and attribute. The Middle; 2.3.2. On definition and the four question-types; 2.3.3 The role of definitions in epistemonic proof; 2.3.4 Recipes for the discovery of definitions; 2.4 The '*kath' holou*' requirement revisited; 2.5 Particulars and the proper objects of Aristotle's epistemonic proof; 3. Ockham as a Commentator of *Posterior Analytics*; 3.1 Ockham's treatment of the four basic question-types; 3.2 Ockham's view of the '*kath' holou'* requirement; 3.3 The impact of Ockham's ontology upon his theory of demonstration; 3.3.1 Ockham's problem concerning the First Subject; 3.3.2 Ockham's introduction of 'Non-First Subject'; 3.3.3 '*Demonstratio particularis'* in Ockham; 3.3.4 Ockham's view of necessity; 3.5 '*Dici per se'* and '*propositio per se vera*' in Ockham; 3.5.1 Two kinds of *'per se'* assignment; 3.5.2 The '*propositio per se (vera)'* in Ockham; 3.5.3 The strict and strictest senses of '*per se'*; 4. Conclusion.

"The present paper aims to clarify the attitude towards Aristotle adopted by one of the leading lights of fourteenth century philosophical and theological thought, William of Ockham, by investigating (a) how in some of the vital subjects of Aristotelian doctrine, the Venerable Inceptor understood and interpreted the Master, (b) how and why on specific occasions, he deliberately took the liberty to stray from Aristotle's teachings. It goes without saying that in such an undertaking, one has to confine oneself to certain doctrinal themes the choice of which might seem quite arbitrary. The present author has picked out the Aristotelian doctrine of demonstrative proof as interpreted by Ockham." (p. 78)

4. ———. 1995. "Ockham's horror of the Universal. An assessment of his view of individuality." *Mediaevalia.Textos e Estudos* no. 7-8:473-497.

Quodlibetaria: miscellanea studiorum in honorem prof. J. M. da Cruz Pontes anno iubilationis suae, Conimbrigae MCMXCV.

"The aim of this paper is to properly assess Ockham' s view of individual being, from the historical as well as from the doctrinal point of view. Regarding the doctrinal assessment, the present author will not refrain from using a phantom sketch, which, admittedly, will prove more useful to clarify what definitely was not Ockham' s doctrine than to identify the Venerable Inceptor' s real philosophical vis age.

So much for this paper's *finis propinquus*. Its *finis remotus* is of at least equal importance: to honour the author' s fellow-septuagenarian, an exemplary medievalist whose merits go far beyond those regarding our common favourite author, his renowned compatriot *Petrus Hispanus Portugalensis*." (p. 473)

(...)

"Returning now to Ockham, we have to acknowledge that our phantom sketch reduces the philosopher Ockham to little more than his own shadow. However, in trying to identify bis thought and philosophical

involvement by means of the phantom sketch, we may, in some sense, hit the mark. He surely had the courage to rule out certain things from rational thought because to his mind, they were not susceptible of conceptualization and rational penetration, while not brushing them aside as non-existent or not worthwhile either.(29)

To some extent, Ockham fought a battle against, if not the arrogance of reason, most surely its inflated ego. His *entia non sunt multiplicanda sine necessitate* was a logical too!, or better still a disputational rule, and did not aim to narrow the horizon of what *is*." (p. 494)

(29) For Ockham's attitude to metaphysics see De RijK 1987.

5. ———. 1996. "The key role of the Latin language in medieval philosophical thought." In *Media Latinitas: A Collection of Essays to Mark the Occasion of the Tetirement of L. J. Engels*, edited by Nip, R.I.A., 129-145. Turnhout: Brepols.

   "Everyone embarking on the theme 'Medieval Latin and Philosophy' should realise that this theme involves more than just a juxtaposition of two separate items which are quite interesting in themselves. On the contrary, Medieval Latin and philosophy had a great mutual impact and thus were most closely related. To put it differently, in Medieval philosophical teaching and inquiry linguistic analysis was considered by the Medievals themselves really indispensable. (*)

   Like the Ancients, the Medieval thinkers firmly believed that, ultimately, the outside world is not-chaotic. In their view it has a 'logical' or intelligible structure, which, as such, is accessible to the human mind, insofar as the latter has the same 'logical' structure'. In other words, in the view of the Medievals there is an isomorphic relationship between the realms of thought and of being. (**)

   (...)

   The Medievals have largely expanded the logico-semantical approach they had inherited from the Ancients, especially in their so-called 'logica modernorum', which has its root in the logico-grammatical discussions found as early as in the eleventh century.

   Coming now to the proper subject of my contribution I should like to discuss three extremely important themes that featured in Medieval philosophy, viz. [1] the 'Object-Thought' issue, [2] the problem of the Universals, and [3] the metaphysics of 'Accidental Being'. Our discussion will focus on the linguistic

aspects of the solutions to each one of these problems. Three things in particular will be considered: [a] the semantical development of a terminology which was already common usage (e.g. 'idea', 'ratio'), [b] the introduction of new philosophical tools (e.g. 'suppositio', 'appellatio', 'connotatio'), and [c] the role of (artificial) word-order. I shall argue that for the Medievals, the Latin language was not only the vehicle of philosophical thought, but also an inspiring source of pioneering philosophical insight." (pp. 129-130)

(*) For a broader discussion see L.M. de Rijk, 'Teaching and Inquiry in 13th-14th Century Logic and Metaphysics'

(**) In this connection the word 'logical' should be associated with the Greek 'logos', rather than the discipline of logic.

6. ———. 1996. "On Aristotle's semantics in *De Interpretatione* 1-4." In *Polyhistor: Studies in the History and Hhistoriography of Ancient Philosophy Presented to Jaap Mansfeld on His Sixtieth Birthday*, edited by Algra, Keimpe, Van der Horst, Pieter and Runia, David, 115-134. Leiden: Brill.

   "By and large, in *De interpretatione* Aristotle is concerned with our capability to speak about all that presents itself to our mind. From chapter 4 onwards, he deals with the statement-making expressions (affirmation and negation), which are the main tools for conveying our thoughts about things. This discussion is prepared (chapters 1-3) by some important observations concerning the basic elements of such expressions, viz. *onoma* and *rhema*. The present contribution contains some comments on Aristotle's view of the proper nature of statement-making as put forward in *De interpretatione*. First, I would like to highlight Aristotle's, what Sir David Ross has called 'frankly 'representative' view of knowledge' by discussing the terms *omoioma* and *pragma*. Next, I will discuss what is meant by a term's 'time-connotation', and finally I will examine the semantics of *onoma, rhema* and *logos*." (p. 115)

7. ———. 1996. "Burley's so-called *Tractatus primus,* with an edition of the additional Quaestio '*Utrum contradictio sit maxima oppositio*'." *Vivarium* no. 34:161-191.

"The extensive list of works by Walter Burley contains a collection of some eagerly disputed questions concerning natural philosophy, which in most of the manuscript catalogues goes under the blank title *Tractatus primus*. (...)

In the shorter version of his *Expositio super librum Sex principiorum,* written after he had left Paris in 1327, he deals with the position concerning the specific sameness of whiteness and blackness he had argued for ín the fourth *quaestio,* and refers to his '*primus tractatus de formis accidcntalibus"*

(...)

This reference seems to imply that the title '*De formis accidentalibus'* covers both the *Tractatus primus* and the *Tractatus secundus,* which was afterwards called '*De intensione et remission formarum.'* I think it would be better to call the first treatise *'De formis accidentalibus,* pars prima,' with the subtitle *'De quattuor conclusionibus circa formas accidentales'*. The second treatise, then, which contains a discussion of a closely related subject matter, should go under the title *'De formis accidentalibus,* pars secunda,' with the subtitle *'De causa intrinseca susceptionis magis et minus'*. Later on, its current tide became *De intensione et remissione formarum*." (pp. 161-162)

8. Giraldus, Odonis. 1997. *Giraldus Odonis O.F.M. Opera philosophica. Vol I. Logica*. Leiden: Brill.

   Edited by L. M. de Rijk.

   Contents: Acknowledgments IX; Introduction 1; List of manuscripts 63; Bibliography 65; TEXT 69; Argumentum 71; Liber Primus: De sillogismis 85; Annexum I: De natura oppositionis contradictorie 186; Liber secundus: De suppositionibus 231; Annexum II: De tribus dubiis 293; Liber tertius: De principiis scientiarum 325; Annexum III: De primo subiecto in logica 467; Index locorum 493; Index nominum 498; Index verborum et rerum notabilium 500-543.

   From the Introduction: "It may be useful to say something about the general nature of Girald's *Logica,* Libri I-III, which now appear in print for the first time as a whole. Generally

speaking, the work is well-composed and written in a lucid style. The *Addenda* even contain rather passionate passages, when Girald is rejecting opponent views, especially in those cases where Walter Burley is (anonymously) under attack. The characteristic given by Brown (1) of *De suppositionibus* seems to be well to the point for the entire *Logica:* Girald's treatise is structured in his own individual way, but all with its personal stamp, especially emerging in *De suppositionibus*." (p. 25)

(...)

"As we have remarked before, Girald's tract on "the two most common and well-founded principles of knowledge" is the most original part of his *Logica*. To assess its place in Girald's thought requires an investigation into the proper nature of the two principles and what the Medieval commentators used to call the 'conditions' ('specific properties') of these principles, as well as what to Girald's mind plays the key role in such an inquiry, the proper subject of logic. I shall deal with these themes here briefly; they will be extensively discussed in our *Introduction* to the edition of Girald's metaphysical works." (p. 37)

9. Rijk, Lambertus Marie de. 1997. "Le "G*uide de l'étudiant"* et les exigences particulières de la preuve demonstrative selon Aristote." In *L'enseignement de la philosophie au XIII siècle. Autour du 'Guide de l'étudiant' du ms. Ripoll 109.*, edited by Lafleur, Claude and Carrier, Joanne, 353-366. Turnhout: Brepols.

   "Les *Seconds Analytiques,* qui constituent sans doute la pièce maîtresse de l'oeuvre logique d'Aristote et dont l'importance philosophique surpasse de beaucoup le domaine de la logique proprement dite, étaient considérés dès le Moyen Âge comme un texte extrêmement difficile. On y traite de la théorie de la démonstration poursuivant la connaissance certaine, stable et nécessaire, fondée sur des prémisses elles-mêmes nécessaires.

Après quelques remarques générales sur la nécessité de connaissances préexistantes', sur la nature de la science et de la démonstration, suivies par une énumération des opinions erronées à ce propos, le Stagirite aborde la question des conditions requises pour construire des prémisses nécessaires, qui s'appellent *condiciones principiorum* dans le vocabulaire médiéval." (p. 353)

10. ———. 1997. "Guiral Ott (Giraldus Odonis) O.F.M. (1273-1349): his view of statemental Being in his commentary on the Sentences." In *Vestigia, Imagines, Verba. Semiotics and Logic in Medieval Theological Texts (XIIIth-XIVth Century)*, edited by Marmo, Costantino, 355-369. Turnhout: Brepols.

    Acts of the 11th Symposium on Medieval Logic and Semantics, San Marino, 24-28 May 1994.

    "The fourteenth-century Franciscan master Giraldus Odonis (Guiral Ot) who at the time he was Patriarch of Antiochia died of the plague in 1349, in Catania, Sicily, is mainly known as the unfortunate successor of the deposed Michael of Cesena as Master General of his Order and a faithful adherent of Pope John XXII in the debate on the beatific vision" p. 355

    It is the intention of the present contribution to discuss the author's second question [in his commentary on the *Sentences*] which deals with *esse tertio adiacens*, or what is nowadays mostly called 'copulative being', but I would prefere to label it 'statemental being' ". (p. 356)

    (...)

    "7. Conclusion. To Odonis' mind, statemental being is a kind of being *sui generis*, so to speak, which, no doubt, is something more than a kind of being that entirely owes its existence to the soul's activity. Rather Odonois' statemental being should be regarded as the metaphysical indivision (in as far as, on the statemental level, affirmative sentences are concerned), or division (in the case of negative sentences) which exist in the realm of the *natura communis*. Thus, statemental being is the basic precondition for the existence of both real being and conceptual being, to the extent that within the domain of the

natures communis it specifically concerns the ontological (whether essential or incidental) relationships of indivision and division that exist between the common natures. When defending against his numerous opponents the real character of statemental being, Odonis has the metaphysical reality of the realm of the common natures in mind, rather than the reality of the actual world. To put it briefly, like his doctrine of the nature of the universal, Odonis' view of statemental being clearly betrays a Platonic flavour, which makes him join the camp of the extreme realists." (p. 364)

11. ———. 1997. "Gerardus Odonis O.F.M. on the principle of non-contradiction and the proper nature of demonstration." *Franciscan Studies* no. 54:51-67.

    "One of the most original works by the Franciscan Master Gerardus Odonis (Guiralt Ot) is the third part of his *Logica, De principiis scientiarum.* This treatise is not just a commentary on Aristotle's *Posterior Analytics,* nor is it a specialized treatment of its subject matter, which is demonstrative (or rather epistemonic) knowledge, as is found in Ockham's *Sum of Logic.* Rather, Odonis took his treatise to be a supplement to the Aristotelian work, where the demonstrative principles proper to the different 'sciences' *(principia propria)* as well as those they all have in common *(principia communia)* are extensively discussed by Aristotle, but less attention is paid to the most common principles of the intellect *(principia communissima intellectus),* such as the twofold principle of noncontradiction. What Odonis means to do, then, is to discuss the well-known seven requirements concerning the proper and the common principles insofar as they apply to the principle of non contradiction (henceforth *PNC*).

    (...)

    Accordingly, the author has divided his treatise into ten chapters, the first of which deals with the subject matter of *PNC* and its constituents or terms. This chapter presents first ten basic assumptions *(suppositiones),* next twelve theses (*conclusiones*) together with the discussion of a number of

notable statements *(notabilia)* and corollaries, and finally the refutation of objections *(dubia)*.

In the present paper the *conclusiones* 6-11 concerning the nature of being as involved in *PNC* will be discussed." (pp. 51-53, notes omitted).

12. ———. 1997. "Foi chrétienne et savoir humain. La lutte de Buridan contre les *theologizantes*." In *Langages et philosophie. Hommage à Jean Jolivet*, edited by Libera, Alain de, Elamrani-Jamal, Abdelali and Galonnier, Alain, 393-409. Paris: Vrin.

"Introduction. Pendant tout le Moyen Age, comme durant la période patristique, les penseurs chrétiens se sont beaucoup intéressés aux rapports entre la raison et la foi. On sait que le principal thème de recherche et de discussion, en ce domaine, était l'harmonisation de la foi et de la raison, ce qui revenait au début à faire une apologie du le caractère rationnel de la foi, mais ce qui, chez des géants comme Anselme ou Abélard, a conduit à une élaboration de la théologie grâce à l'emploi de ce que notre collègue, Jean Jolivet, dans son étude de pionnier sur la théologie d'Abélard, a si heureusement appelé les « arts du langage (1) ». D'autre part, les penseurs médiévaux ont toujours reconnu l'importance du « dépôt de la foi » en tant que collection des vérités garanties, si bien que l'on prenait ces vérités pour des renseignements supplémentaires sur les phénomènes terrestres. Le simple « Soleil, arrête-toi » de Josué *(Livre de Josué 10, 12)* a suffi pour maintenir le système géocentrique.

A partir de la deuxième moitié du XIIIe siècle, c'est surtout la toutepuissance divine et la contingence radicale de tout le créé qui conduisent certains penseurs à regarder le monde d'un point de vue tout différent. La nouvelle attitude a dû stimuler, d'une manière générale, l'intérêt des philosophes pour les implications épistémologiques de la toute-puissance divine, en particulier pour celles qui concernent les limites de la connaissance humaine.

Jean Buridan (né en Picardie, peut-être à Béthune, vers l'an 1300, mort vers 1361) a bien fait face à ces problèmes épistémologiques. En rendant à César ce qui est à César, et à

Dieu ce qui est à Dieu, il a pu déterminer sa propre attitude devant la foi et la théologie. Le philosophe picard a trouvé les *theologizantes* sur sa route. La lutte de Buridan contre leur point de vue n'était qu'un corollaire de ses idées optimistes (et bien fondées) sur les possibilités et la validité du savoir humain." (p. 393)

13. ———. 1997. "The Commentaries on Aristotle's *Metaphysics*." In *L'enseignement des disciplines à la Faculté des Arts (Paris et Oxford, XIIIe-XVe siècles). Actes du Colloque International*, edited by Weijers, Olga and Holz, Louis, 303-312. Turnhout: Brepols.

"Considering the rich survey Professor Lohr has presented this afternoon of Medieval commentaries on Aristotle's philosophical works including *Metaphysics*, there is no point in discussing in general terms the vicissitudes of this Aristotelian work at the Parisian Faculty of Arts. On top of that, in *the lettre d'invitation* of the organizers we were asked to say something about our own recent research in the field under discussion. Therefore I shall confine myself to John Buridan's (c. 1290-c. 1360) commentaries on *Metaphysics*. Fortunately, Buridan's activity as a commentator on *Metaphysics* may to a large degree be regarded as representative of the period. As we learn from Lohr's survey, from the fourteenth century only some five commentaries on this important Aristotelian writing are extant, quite unlike the thirteenth and fifteenth centuries, from which a considerable amount of such works have survived. (*)" (p. 303)

14. Johannes, Venator. 1999. *Johannes Venator Anglicus. Logica*. Stuttgart, Bad Cannstatt: Frommann-Holzboog.

    First critical edition from the manuscripts edited by L. M. de Rijk.

    Vol. I: *Tractatus* I-II, Vol. II: *Tractatus* III-IV. *Grammatica speculativa*.

    "Properly speaking, nothing is known about our author's life with all due certainty. In recent times, he is commonly identified with the English logician John Hunt(e)man listed by Emden, who was from York diocese and a master in Oxford still in the 1390's, when Paul of Venice stayed there. He is reported as a fellow of Oriel College as early as in 1373 and still being there in January 1383. He was Robert Rygge's Junior Proctor of Oxford University in 1382-3, and, like Rygge, he was delated in 1382 for sympathising with the heretic views held by John Wyclif. In 1390, he was Chancelor of Lincoln, and on June 14, 1414, he was appointed Vicar General of the Bishop of Durham. These dates of the John Huntman are all well compatible with his identification with the author Johannes Venator. It is interesting in this connection that the Vatican manuscript does ascribe the *Logica* to an English author ("Johannes Venator doctor anglicus"). Unfortunately, there is no other positive evidence so far for this plausible identification." (p. 7)

15. Rijk, Lambertus Marie de. 2000. "*Logica Morelli*. Some notes on the semantics of a Fifteenth century Spanish logic." In *Medieval and Renaissance Logic in Spain. Acts of the 12th European Symposium on medieval logic and semantics, held at the University of Navarre (Pamplona, 26-30 May 1997)*, edited by Angelelli, Ignacio and Pérez-Ilzarbe, Paloma, 209-224. Hildesheim: Georg Olms Verlag.

    "The present paper, which is presented as a modest contribution to the general theme of our Symposium on the History of Spanish Logic, intends to highlight some interesting topics discussed in a fifteenth century introductory *Sum of Logic* which is extant in (at least) two Spanish manuscripts.

When visiting Spanish libraries in the Autumn of 1971 I came across a copy of a *Sum of Logic* in the Biblioteca Capitular Colombina at Sevilla (cod. 7-3-13). This work attracted my attention because of its clear design and lucid execution. Another copy of this work turned up in the Biblioteca del Cabildo Metropolitano at Zaragoza (cod. 15-57), under the name "Logica Morelli", and was dated 1476.

(...)

The work consists of five parts:

(1) the logic of terms, including the well-known properties of terms, supposition, ampliation, and appellation.

(2) the logic of propositions, including their various "probationes" (in the wake of Richard Billingham, *Speculum,* and the widespread adaptations of this work)

(3) the theory of argumentation

(4) the doctine of the predicables and the categories

(5) the doctrine of the so-called "obligations".

(...)

This treatise seems to nicely testify to fifteenth-century logical education in Spain. We owe a survey of the contents of this work together with a description of the two manuscripts to our colleague Joke Spruyt." (pp. 209-210)

[A printed edition of the work is now available: *Logica Morelli* - Edited from the manuscripts with an introduction, notes and indices by Joke Spruyt - Turnhout, Brepols, 2003]

16. John, Buridan. 2001. *Summulae VIII: De demonstrationibus*. Groningen: Ingenium Publishers.

"ll.3 Treatise VIII. *De demonstrationibus:* on its general structure and contents

The present edition contains the eighth tract, *De demonstrationibus*, by far the greater part of which deals with demonstrative argument, and for the sake of this prefaces it

with a discussion of the standard lore concerning division and definition.

II.3.1 The general structure of *De demonstrationibus*

The main division of the work clearly appears from the opening lines (1.1 in the present edition), in which Buridan proposes to deal with demonstration, but thinks it indispensable to discuss first the doctrine of division and definition which lies at the bottom of that concerning demonstrative argument, despite the fact that 'auctor noster' did not pay any attention to this important part of logic ('pars logicae magis

nobilis et final is').

The author next remarks that the present tract is the eighth one according to what was said in the general introduction to the whole work ('secundum dicta a principio'). It strikes the reader firstly that our author does not say 'octavus et ultimus tractatus', and, for that matter, in doing so, is quite in line with what he had outlined before in his general division of his *Summulae* (section 1.1.1 of the planned edition), notwithstanding the fact that in all the extant manuscript versions of the work the author lets us know that in the present 'lectura' he does not intend to read on the ninth and conclusive treatise on sophisms. The other noticeable thing is that in this passage, each treatise is announced with the phrase 'it will be about' ('erit de') the respective subject matter, with the exception of the present treatise on demonstration, of which it is said that it 'will be added' ('octavus apponetur'): Summulae I, De introductionibus, I. I. I

(...)

Our treatise quite understandably consists of three main parts ('tres materiae principales'), one about division, one about definition, the third about the proper subject matter, demonstration. There are good reasons for assuming that in an earlier version, the two parts on division and definition were not yet integral parts of the eighth treatise. As a matter of fact, unlike all other manuscripts, our two most reliable

manuscripts, *E* and *T* start a fresh numeration for the ten chapters of the 'tertia materia de demonstrationibus', whereas the others continue the initial numbering of the preceding parts on division and definition, counting the ten chapters on demonstration as 'capitulum quartum, quintum, sextum', and so on.

Thus, in its final version, the work is divided into twelve chapters, so that the two first parts ('materiae) in fact are the two first chapters of the work. Each chapter is divided into 'partes' and the latter are subdivided into 'clausulae' in the usual way. (Introduction, pp. XXI-XXII)

18. Rijk, Lambertus Marie de. 2002. *Aristotle: Semantics and Ontology. Volume I: General introduction. The Works on Logic*. Leiden: Brill.

    "In this book I intend to show that the ascription of many shortcomings or obscurities to Aristotle resulted from persistent misinterpretation of key notions in his work. The idea underlying this study is that commentators have wrongfully attributed anachronistic perceptions of 'predication', and statement-making in general to Aristotle. In Volume I, what I consider to be the genuine semantics underlying Aristotle's expositions of his philosophy are culled from the *Organon*. Determining what the basic components of Aristotle's semantics are is extremely important for our understanding of his view of the task of logic -- his strategy of argument in particular.

    In chapter 1, after some preliminary considerations I argue that when analyzed at deep structure level, Aristotelian statement-making does not allow for the dyadic 'S is P' formula. An examination of the basic function of `be' and its cognates in

Aristotle's philosophical investigations shows that in his analysis statement-making is copula-less. Following traditional linguistics I take the 'existential' or hyparctic use of `be' to be the central one in Greek *(pace* Kahn), on the understanding that in Aristotle *hyparxis* is found not only in the stronger form of 'actual occurrence' but also in a weaker form of what I term 'connotative (or intensional) be' (1.3-1.6). Since Aristotle's 'semantic behaviour', in spite of his skilful manipulation of the diverse semantic levels of expressions, is in fact not explicitly organized in a well-thought-out system of formal semantics, I have, in order to fill this void, formulated some semantic rules of thumb (1.7).

In chapter 2 I provide ample evidence for my exegesis of Aristotle's statement-making, in which the opposition between 'assertible' and `assertion' is predominant and in which 'is' functions as an assertoric operator rather than as a copula (2.1-2.2). Next, I demonstrate that Aristotle's doctrine of the categories fits in well with his view of copula-less statement-making, arguing that the ten categories are 'appellations' ('nominations') rather than sentence predicates featuring in an 'S is P' formation (2.3-2.4). Finally, categorization is assessed in the wider context of Aristotle's general strategy of argument (2.5-2.7).

In the remaining chapters of the first volume (3-6) I present more evidence for my previous findings concerning Aristotle's 'semantic behaviour' by enquiring into the role of his semantic views as we find them in the several tracts of the *Organon,* in particular the *Categories De interpretatione* and *Posterior Analytics*. These tracts are dealt with *in extenso,* in order to avoid the temptation to quote selectively to suit my purposes." (Preface, PP. XV-XVI)

19. ———. 2002. *Aristotle: Semantics and Ontology. Volume II: The Metaphysics, Semantics in Aristotle's Strategy of Argument*. Leiden: Brill.

"The lion's part of volume two (chapters 7-11) is taken up by a discussion of the introductory books of the *Metaphysics* (A-E) and a thorough analysis of its central books (Z-H-O). I

emphasize the significance of Aristotle's semantic views for his metaphysical investigations, particularly for his search for the true *ousia*. By focusing on Aristotle's semantic strategy I hope to offer a clearer and more coherent view of his philosophical position, in particular in those passages which are often deemed obscure or downright ambiguous.

In chapter 12 1 show that a keen awareness of Aristotle's semantic modus operandi is not merely useful for the interpretation of his metaphysics, but is equally helpful in gaining a clearer insight into many other areas of the Stagirite's sublunar ontology (such as his teaching about Time and Prime matter in *Physics*).

In the Epilogue (chapter 13), the balance is drawn up. The unity of Aristotelian thought is argued for and the basic semantic tools of localization and categorization are pinpointed as the backbone of Aristotle's strategy of philosophic argument.

My working method is to expound Aristotle's semantic views by presenting a running commentary on the main lines found in the *Organon* with the aid of quotation and paraphrase. My findings are first tested (mainly in Volume II) by looking at the way these views are applied in Aristotle's presentation of his ontology of the sublunar world as set out in the *Metaphysics,* particularly in the central books (ZHO). As for the remaining works, I have dealt with them in a rather selective manner, only to illustrate that they display a similar way of philosophizing and a similar strategy of argument. In the second volume, too, the exposition is in the form of quotation and paraphrase modelled of Aristotle's own comprehensive manner of treating doctrinally related subjects: he seldom discussed isolated problems in the way modern philosophers in their academic papers, like to deal with special issues tailored to their own contemporary philosophic interest." From the Preface to the first volume, pp. XVI-XVII)

20. ———. 2002. "Il Medioevo: periodo tipicamente medievale?" In *Medioevo in discussione. Temi, problemi e interpretazioni del pensiero medievale*, edited by Brigaglia, Gianluca. Milano: Unicopli.

21. ———. 2003. "Boethius on *De interpretatione* (ch. 3): is he a reliable guide?" In *Boèce ou la chaîne des savoirs. Actes du Colloque International de la fondation Singer Polignac (Paris, 8-12 juin 1999)*, edited by Galonnier, Alain, 207-227. Paris: Peeters Publishers.

    "There can be no doubt whatsoever about Boethius's exceptional merits for transmitting Aristotle's logic to us. But while 'Aristotelian' logic is in many respects synonymous with 'Aristotelico-Boethian' logic, the question can be raised whether Aristotle himself was an 'Aristotelian'. To give just one example: from Lukasiewicz onwards there has been much debate among scholars about the telling differences between traditional syllogistic and that of the *Prior Analytics*. (1)

    In this paper I intend to deal with two specimens of Boethius's way of commenting upon Aristotle's text. They are found in his discussion of *De interpretatione*, chapters 2 and 3, which present Aristotle's views of *ónoma* and *rhema*. (2) One concerns the semantics of indefinite names, the other that of isolated names and verbs." (p. 207)

    (...)

    "Conclusion.

    Returning now to Boethius' manner of commenting upon Aristotle's texts, the following points can be made:

    [1] In the wake of Ammonius, (3) Boethius explains [*De int.*] 16b22-25 on the apophantic level, i.e. in terms of statement-making, instead of framing significative concepts, i.e. on the onomastic level.

    [2] Whereas in Ammonius' report of the predecessors, Alexander and Porphyry, as well as his own exposition of the issue, there are many clues to the previous alternative reading and interpretation on the onomastic level, Boethius does not even refrain from cleansing the text (including his 'quotations'), by changing, at any occurrence, '*ens*' into '*est*'.

    [3] In doing so, Boethius decisively influenced the commentary tradition on account of the purport of *De int.* 3, 16b19-25. He

effectively contributed to the common verdict on this paragraph in terms of 'a curious medley'.

[4] As far as the semantics of the indefinite verb (3, 16b14-15) is concerned, Boethius' apparently adhering to the so-called 'Ammonii recensio' was far less desastrous for the common understanding of Aristotle on this score, and, in effect, merely provided us with some stimulating Medieval discussions of the semantics of term infinitation.

[5] Finally by way of speculative surmise, it might be suggested that both the fact that Boethius dealt with the 'Ammonii recognise' without reading it in his lemma of 16b14-15, as well as his rather ruthlessly interfering in the quotations of the pre-Ammonian sources, should make it more plausible that Boethius had extensive, but incomplete marginal notes to his Greek text of Aristotle at his disposal, rather than a full copy of Ammonius' commentary (or those of other Greek commentators).

To comment upon Aristotle's work naturally includes developing his lore. But nothing can ever guarantee that this will happen *ad metem auctoris*. (4)" (p. 227)

(1) Jan Lukasiewicz, *Aristotle's Syllogistic from the Standpoint of Modern Formal Logic*, Oxford, 1951. G. Patzig, *Aristotle's Theory of the Syllogism. A logico-philological study of Book A of the Prior Analytics*, Dordrecht, 1969.

(2) *Rhema* properly stands for 'what is said of', including not only our 'verb' but also adjectives, when used in attributive position. One should realise, however, that 'verb' refers to a word class, rather than a semantic or syntactical category, as *rhema* does.

(3) It is unmistakably plain that in *De int*. ch. 3, Boethius is strongly influenced by what he read in Ammonius (or in marginal notes on Ammonius' view).

Dynamics of Natural Philosophy in the Aristotelian Tradition (and beyond), Nijmegen, 16-20 August 1999.]

22. ———. 2003. "The logic of indefinite names in Boethius, Abelard, Duns Scotus, and Radulphus Brito." In *Aristotle's Peri hermeneias in the Latin Middle Ages: Essays on the Commentary tradition*, edited by Braakhuis, Henk A.G. and Kneepkens, Corneli Henri, 207-233. Groningen: Ingenium Publishers.

    "Aristotle's doctrine of indefinite names (nouns) was handed down to the Middle Ages together with Boethius' comments and explanations. Boethius' view of the matter has two characteristic features. For one thing, there is a certain ambiguity on his part concerning the precise semantic value of such terms; for another, Boethius deviates considerably from Aristotle in that he explicitly assigns the property of 'holding indifferently of existents and non-existents' not only to the indefinite *rhéma* (as it is found in Aristotle, De interpr. 3, 16b15) but to the indefinite name (*onoma*) as well.

    Until the end of the 12th century the logic and grammar (1) of indefinite terms (nouns and verbs) was a much debated issue. Although assiduously echoing the well-known *auctoritates* Medieval thinkers did not always go the whole way with their predecessors. For example, Abelard and Scotus, starting from their own philosophical tenets, more or less inconspicuously corrected some dubious elements in Boethius' interpretation of Aristotle's doctrine of the indefinite name. Peter Abelard, especially, took great pains to precisely define the meaning of indefinite terms. He focussed his attention on the proper meaning of indefinite terms rather than on the question whether they are 'holding indifferently of existents and non-existens'. In contrast, 13th-century scholars like Duns Scotus and Radulphus Brito based their discussion of the proper meaning of the indefinite name upon the question '*Utrum nomen infinitum aliquid ponat*' ("Whether an infinite name posits something"), which calls to mind Boethius' claim that indefinite names 'hold indifferently of existent and non-existents'.

Abelard's discussion of the proper meaning of the indefinite name is also interesting in that it helps us to gain a good understandiiip of what Boethius had in mind in claiming that the indefinite name 'siginifes an infinite number of things' ('*significat infinita*'). For, thanks to Äbelard's expositions, it becomes clear that the phrase '*significare infinita*', which, on the face of it, may be taken as referring to the extensional of the indefinite name, on closer inspection proves to concern its intension, because the controversy between Abelard and Boethius turns out to be about two different views of the indefinite name's intension rather that about any opposition of intension as against extension." (pp. 207-208.)

23. ———. 2003. "The Aristotelian background of medieval *transcendentia*: a semantic approach." In *Die Logik des Transzendentalen. Festchrift für Jan A. Aertsen zum 65. Geburstag*, edited by Pickavé, Martin, 3-22. Berlin: Walter de Gruyter.

1. Aristotle's notion of 'connotative' or 'intensional be'; 2. The so-called 'termini transcendentes' in the Middle Ages; 2.1. How to bring the general notions 'be' and 'one' into focus; 2.2. On the peculiar use of the label 'transcendens' in prioristic syllogistic; 3. On the use of 'transcendens' to bring general, extra-categorial ontic notions in focus; 3.1. The commonness of the general ontic notions; 3.2. The epistemological aspect: the emergence of the idea of conceptual primacy 3.3. On the contaminative shift to Platonic transcendence; 4. The (Aristotelian) semantic sense underlying 'transcendentia' retained; 5. Concluding remarks."

"1. As I have argued for elsewhere, the Greek notion 'ES-' or 'be' as coming to the fore in its several grammatical appearances - the infinitive *einai*, the articular participle *to on*, and the verbal noun ousia - not only refers to what is actually there ('exists') or actually is the case, but can also represent a form of 'be' that does not, as such, include actual existence, and indeed indicates the general ontic condition that underlies, and is in fact connoted by, any categorial designations. To Aristotle in particular, each and every noun includes what I have termed 'connotative' or 'intensional' be-ing. (...)" The semantic view that every nominal or verbal sememe by connotation contains the fundamental notion of be-ing is at the basis of Aristotle's argument against Plato. To Plato, transcendent Being is the fullness of Forms (later called 'plenitude formarum'), whereas particular forms existing in the outside world are merely as many shares of such-and-such be-ing in virtue of which the outside things share in the transcendent Source of Beingness. In Aristotle, things are quite different: there is no being-ness other that what is found in particular beings. It is their immanent forms which are constitutive of their (modes of) be-ing, rather than some putative transcendent Source (on the contrary, as it is worded later on: 'forma dat esse'). By itself, 'be' even is a categorially empty notion The fact that to Aristotle, 'be-ing' is a categorially empty notion by no means implies that Aristotle should be unaware of the fundamental importance of the notion of be-ing when it comes to metaphysical investigation. It need not come as a surprise that it is in his "Metaphysics" that the notion of 'be-ingness' (ousia) is the very nucleus of the metaphysical search for the quiddity of things: this search concerns true 'ousia' or true 'being-ness'. All things considered, despite his obstinately arguing for the (categorial!) emptiness of the notion 'be', Aristotle recognizes the basic sememe of 'be-ing' present in each and every categorial notion, and at the same time he is, to some extent, aware that there are also some other general ontic notions, which are equally fundamental to metaphysics." (pp. 3-4)

"The torso of Girald's *De intentionibus* as we have it extant consists of three Partes: I: *De intentione in communi*, in five articuli; II: *Quid sit prima intentio et quid secunda*, in an articulus unicus, and III: *Quid sit intentio transcendens et quid non-transcendens,* which comprises (in our incomplete text) four questiones disputate, consisting of four, two, three, and one articulus, respectively.

(...)

"All things considered, the present work is markedly polemical, which particularly comes to the fore in the (at times venomous) criticism of Hervaeus Natalis. It might be suggested, therefore,

that the elaborated version too originated in the context of academic disputation,(22) which is highlighted by the prologue of *De intentionibus,* in which the questiones disputatae on transcendent intentions are presented as the proper theme of the treatise." (pp. 12-13)

25. Rijk, Lambertus Marie de. 2005. "Girald Odonis on the Real Status of Some Second Intentions." *Documenti e Studi sulla Tradizione Filosofica Medievale* no. 16:515-551.

"The Franciscan Friar Giraldus Odonis (Guiral Ot) was a friend and protégé of Pope John XXII. After Michael of Cesena had been deposed as Minister General of the Order and excommunicated at the Papal Court at Avignon in 1328, Odonis led the Order from 1329 until 1342, when he was appointed patriarch of Antioch. He was quite a prolific author, but with the exception of his views on ethics and physics, his doctrinal positions were, and still are, hardly known." (p. 515)

(...)

"However, there is at least one other branch of philosophy in which Girald's unconventional views come to light, to wit the complex domain of what was later on diversified into logic, metaphysics, and epistemology. Indeed, Girald's views of the real (i.e. mind-independent) status of some second intention's (*intentiones secundae*) are peculiar, and even the man himself considered them exceptional. In the present paper I intend to discuss Girald's view of the matter. To facilitate the evaluation of his remarkable stand on the general issue of the status of first and second intentions, which was so eagerly debated in the first quarter of the 14th century, I will first try to globally assess the ins and outs of this issue within the framework of contemporary scholastic philosophy." (pp. 515-516)

(...)

"The medieval issue of intentional being (*esse intentionale*) had three sources(4) : first, Aristotelian semantics, as found in his *De interpretatione* (or *Perihermeneias*, as it was usually called in the Middle Ages) in particular; second, St. Augustine's discussion (in his *Quaestio de Ideis*) of the relationship between God and the exemplary Ideas; and third, the species debate in the context of Arabic optics. As for the second and third sources, they were extremely effective in putting intention on the table as a truly inescapable (theological and cognitive, respectively) problem(5)." (P. 516)

Tachau, *Vision and Certitude in the Age of Ockham. Optics, Epistemology and the Foundations of Semantics,* 1250-1345, Brill, Leiden -Köln 1988 (Studien und Texte zur Geistesgeschichte des Mittelalters, 22), is still indispensable.

26. ———. 2006. "Giraldus Odonis, Godfrey Fontaines, and Peter Auriol on the Principle of Individuation." In *"Ad Ingenii Acuitionem". Studies in honour of Alfonso Maierù*, edited by Caroti, Stefano, Imbach, Ruedi, Kaluza, Zénon, Stabile, Giorgio and Sturlese, Loris, 403-436. Louvain-la-Neuve: Fédération Internationale des Instituts d'Études Médiévales.

"Everyone interested in the history of philosophy knows that the problem of the universal has played a predominant role. Ockham may indeed have tried to highlight the importance of this problem by nullifying its counterpart, the problem of individuation, to the great majority of Medieval thinkers, however, the problem area surrounding the principle of individuation remained of serious interest. Against the

background of the phenomenon of universality as strictly required for obtaining genuine knowledge, they kept regarding the individuality issue as a source of philosophic and theological perplexity which could not be underestimated with impunity. The purport of this paper is to evaluate Girald Odonis's treatment of the individuation issue (In II Sent., dist. 6, q. 4, and, in addition, In III Sent., dist. 1, qq. 1-3) in the context of what others brought forward on the subject, particularly Godfrey of Fontaines and Peter Auriol.

As Russel Friedman has rightly observed, from the beginnings of 14th century onwards, the *Sentences* commentary came into its own as a preferred medium of scholastic theological and philosophical discourse, certainly rivaling in this respect, and often outshining, other vehicles of theological expression (e. g. *Quodlibetal questions, Summae*, Biblical commentaries). The Franciscan Master, Giraldus Odonis (c. 1280-1349) was among the numerous scholars who were beginning to use the *Sentences* commentary as a vehicle for mature thought about a gamut of controversial philosophic as well as theological issues. Therefore the occurrence of this philosophically hotly debated item in his *Sentences* commentary cannot come as a surprise.

In the sixth *Distinctio* of the Second Book, Gerald comes (in the fourth question) to speak about the individuation problem, asking what it is in virtue of which there is a multiplication of individuals within one species. He proposes to deal with this question by firstly summing up a number of previous or current opinions, then to advance his own position, and thirdly to reply to the ins and outs, including the backgrounds of the rival positions." (pp. 403-404, notes omitted).

27. Johannes, Buridanus. 2008. *Lectura Erfordiensis in I-VI Metaphysicam, together with the 15th-century Abbreviatio caminensis*. Turnhout: Brepols.

    Introduction, critical edition and indexes by L. M. de Rijk.

    "John Buridan’s intensive activity as a commentator on Aristotle’s *Metaphysics* and his ongoing influence as a philosopher at fourteenth and fifteenth century universities nicely come to the fore in two Eastern

European codices. One of them (Erfurt, *Amplon*. F 322) appears to contain part of an early (possibly the earlierst) version of his *Questions on Metaphysics*, the other (nowadays Warsow, *Narodowa* ii 8057) presents

an abbreviation of these early questions, including also a later continuation of this Buridanian questions-commentary which strikingly parallells the redaction of Buridan's questions as found in the second part of the Erfurt manuscript. The aim of this edition is to make these interesting texts available for the investigation of the academic activities concerning Aristotle's *Metaphysics* during the period of ca. 1330 – ca. 1430." (Prefece, P. VII)

(...)

"Buridan wrote many commentaries on Aristotle, including his *Metaphysics*.

Metaphysics was an important academic discipline in the Medieval Arts Faculty. Only advanced students who had completed their bachelor's training in grammar and logic and the basics of natural philosophy

had access to the programme of metaphysics. In Buridan's days, metaphysica or first philosophy (*prima philosophia*) mainly involved the speculative study of the physical world. However, in line with the Ancient

tradition, the notion of *prima philosophia* was closely connected to *theologia* in the sense of the philosophical study of 'supernatural' or 'divine' things. This connection continued to somewhat obscure its academic position, even though from the middle of the thirteenth century onwards the focus of metaphysics unmistakably shifted from the study of questions on the nature of God and divine being to ontological questions in general centered around the basic notions of 'essence' and the so-called *termini transcendentes*, 'ens', 'verum', 'bonum', 'res', 'aliquid'.(6) The influence of these ambiguous roots is still manifest in the later development of the discipline of metaphysics, not only in the fourteenth and fifteenth centuries but after the Middle Ages as well." (Introduction, pp. Xi-XII)

28. Rijk, Lambertus Marie de. 2011. *Hervaeus Natalis. De quattuor materiis, sive Determinationes contra magistrum Henricum de Gandavo. Vol. I*. Turnhout: Brepols.

Plan of the work: Vol I: *De formis* (together with his *De unitate formae substantialis in eodem suppositio*); Vol. II: *De esse et essentia. De materia et forma*; Vol. III: *De intellectu et specie*; Vol. IV: *De voluntate et intellectu*.

"Hervaeus' extensive work going under the title *De quattuor materiis* has so far not drawn much attention of the scholarly world. Its four parts contain the author's critical study of a number of focal philosophical and theological issues discussed in Henry of Ghent's *Quodlibetal Questions*.

Their subject matter is a series of controversial themes, including the plurality of forms, the relationship between being and essence, the role of the intelligible species, and the different roles of the intellect and the

will. All these themes were hotly debated during the end of the thirteenth and the ?rst decades of the fourteenth centuries. The D*e quattuor materiis sive Determinationes contra magistrum Henricum de Gandavo* are

illustrative of these ontological and epistemological debates around 1300." (Foreword, p. VII)

(,,,)

"Harvey's critical study of a series of controversial issues as dealt with in Henry of Ghent's Q*uodlibeta* consists of four main tracts to which two short ones are added, each one of which

discusses just one single question cognate to the foregoing. The collection has the following components and deals with controversial themes of the period, which were also examined in the author's Commentary on the S*entences:*

I D*e formis*. This tract is devoted to the controversy about the plurality of forms. It deals with 13 questions selected by Harvey from Henry's Q*uodlibeta*. First these questions are taken over from Henry's text in an

abbreviated form, most of the time with some critical remarks about Henry's verbosity or lack of clarity. Then follows Harvey's refutation of Henry's positions and his arguments, which is prefaced by an exposition

of the doctrinal background upon which the diverse positions are based.

In this context, the ?rst three questions are dealt with by Harvey without explicitly articulating them. Finally the author proceeds to discuss the remaining ten questions more explicitly, one after the other.

II De *esse et essentia*. In this tract the author deals with another vexed issue so divisive of the academic ranks of the period, viz. the hotly debated controversy about the proper ontological relationships between

being and essence. Five questions preliminarily come up for discussion in a way similar to the one found in the previous tract. Then these questions are extensively dealt with, likewise preceded by an exposition of

some fundamental viewpoints decisive for correctly evaluating the different positions on the matter at issue." (p. XXIV)

29. ———. 2012. "Harvey Nedellec. Ire and Resentrnent in the Strategy of Argument. Harvey Nedellec in discussion with Henry of Ghent." In *Portraits de maîtres: offerts à Olga Weijers*, edited by Angotti, Claire, Brînzei, Monica and Teeuwen, Mariken, 197-201. Porto: Fédération Internationale des Instituts d'Études Médiévales.

"Every student of Medieval polemic literature is familiar with the rich armoury the disputants had at their disposai for settling upon an efficacious strategy of argument.

Not only education, erudition and acumen, and the array of the entire coloration of one's ingenuity were part of the kit of the well-trained scholar, but one's ability to attack the opponent in person was apparently regarded as an adequate polemical skill too.

Harvey Nedellec (Hervaeus Natalis, ca. 1250-1323) is no exception to the rule, as appears inter alia from his discussions with Henry of Ghent (ca. 1220-1293) about some controversial matters of theology and philosophy that were dominating the scholarly scene from the last decades of the thirteenth century up to about the l 320s and 1330s.

The issues under discussion were fondamental enough. First the cluster of problems concerning the plurality of substantial forms together with the doctrinally kindred one about the ontological relationship between being and existence and the correlation of matter and form were in order. Besides, the ins and outs of cognition (both sensitive and intellective) were hotly debated, with the intentionality issue as their focal subject matter. Finally, the priority of the will to the intellect, including the role of the free will (liberum arbitrium) and related matters of contention continued to arouse scholarly attention.

These four subject matters form the lion's share of Harvey's *De quattuor materiis contra Henricum de Gandavo* (1). Interestingly, it is precisely in this collection of tracts that the practice of ire and resentment as strategic tools is exemplified. That is to say, in the short tract *De formis*, our author does not refrain from profusely interspersing his arguments with nasty remarks (and sometimes he even seems unable to advance genuine argumentative momentum). Things are conspicuously different in the other tracts of *De quattuor materiis*, as, what is more striking still, is likewise the case in Harvey's more extensive treatise on the forms disputes, *De unitate formae substantialis in eodem supposito*." (p. 197)

(1) Edited for the first time by the present author in the reputable series *Studia Artistarum* directed by the person celebrating her jubilee (together with Dr. Lorns Holtz).(...)

30. ———. 2013. *Hervaeus Natalis. De quattuor materiis, sive Determinationes contra magistrum Henricum de Gandavo. Vol. II*. Turnhout: Brepols.

De esse et essentia. De materia et forma. A Critical Edition by L. M. de Rijk from Selected Manuscripts."

"This second volume had been finished by the editor, L. M. de Rijk, just before his sudden death on July 30, 2012. The final version has been read by Joke Spruyt and Olga Weijers.

The third and last volume of the edition of Hervaeus' work, already well advanced by the editor, will be finished by two of his main disciples: Henk Braakhuis and Onno Kneepkens. Thus we will have kept our promise, in respect and friendship for our master." (From the Preface by Olga Weijers, p. IX)

(...)

This second volume presents a critical study of Hervaeus Natalis's *De quattuor materiis*, and compares it with the rival systems of the metaphysics of creation that were upheld by Giles of Rome and Henry of Ghent.

This second volume of Hervaeus Natalis's polemical work, *De quattuor materiis* contains his *De esse et essentia*. In this work the author criticizes the rival systems of the metaphysics of creation that were upheld by Giles of Rome and Henry of Ghent, and presents an exposition of his own notion of being. To explain Harvey's antagonistic attitude to Henry of Ghent and his simultaneous rejection of Giles's positions (the rigid Aegidian real distinction between essence and existence in particular) it was necessary to provide a thorough investigation of the ontological positions of both Henry and Giles. Hence the lion's part of the Introduction is devoted to these two rivals of Harvey's.

The selection of the manuscripts used for the present edition of *De esse et essentia* as well as the *ratio edendi,* orthography,

punctuation and headings employed, are explained in the General Introduction to volume one, *De formis*." (Foreword, p. XI)

31. ———. 2013. "Semantics and Ontology. An Assessment of Medieval Terminism." In *Medieval Supposition Theory Revisited: Studies in Memory of L. M. de Rijk*, edited by Bos, Egbert Peter, 13-59. Leiden: Brill.

    Abstract: "This paper aims to assess medieval terminism, particularly supposition theory, in the development of Aristotelian thought in the Latin West. The focus is on what the present author considers the gist of Aristotle's strategy of argument, to wit conceptual focalization and categorization. This argumentative strategy is more interesting as it can be compared to the modern tool known as 'scope distinction'."

From the Introduction "On the occasion of Prof. L. M. de Rijk's 60th birthday his pupils and friends hereby present him with a volume containing essays on semantics and metaphysics in the Middle Ages. The present volume is specifically devoted to this subject and the contributors have been selected accordingly.

For everyone who has studied De Rijk's books and papers it is clear that De Rijk is especially interested in the interdependence of language, thought and reality, and in the metaphysical implications of logical tracts. In medieval philosophy logico-semantical and metaphysical theories are interwoven, especially because the mediaeval philosophers themselves thus interpreted this relation.

The contributions to this volume cover the period from the XIIth century up to and including the XVth century. They are chronologically ordered.

It should be noted here that Dr. Jan Pinborg (Copenhagen) had expressed his willingness to contribute to this volume. By his premature death he was prevented to fulfill this promise, however."

12. ———. 2004. "From Aristotle's Syllogistic to Stoic Conditionals: *Holzwege* or Detectable Paths?" *Topoi.An International Review of Philosophy* no. 23:113-137.

    "This paper is chiefly aimed at individuating some deep, but as yet almost unnoticed, similarities between Aristotle's syllogistic and the Stoic doctrine of conditionals, notably between Aristotle's metasyllogistic equimodality condition (as stated at *Prior Analytics* I 24, 41b27-31) and truth-conditions for third type (Chrysippean) conditionals (as they can be inferred from, say, Sextus Empiricus *Outlines of Pyrrhonism* II 111 and 189). In fact, as is shown in §1, Aristotle's condition amounts to introducing in his (propositional) metasyllogistic a non-truthfunctional implicational arrow ", the truth-conditions of which turn out to be logically equivalent to truth-conditions of third type conditionals, according to which only the impossible (and not the possible) follows from the impossible. Moreover, Aristotle is given precisely this non-Scotian conditional logic in two so far overlooked passages of (Latin and Hebraic translations of) Themistius' Paraphrasis of *De Caelo* (*CAG* V 4, 71.8-13 and 47.8-10 Landauer). Some further consequences of Aristotle's equimodality condition on his logic, and notably on his syllogistic (no matter whether modal or not), are pointed out and discussed at length. A (possibly Chrysippean) extension of Aristotle's condition is also discussed, along with a full characterization of truth-conditions of fourth type conditionals."

    "In view of the importance of Boethius' "In Ciceronis Topica" as a source for Stoic logic, argues for the constitution of an index of divergent readings between the editions of Orelli (Zurich 1833) and Migne, including those omitted by Stangl (1882). Such an index would show that while Orelli's edition is better, sometimes the reading of Migne is to be preferred. Includes

considerations on the gradual Stoicization of Aristotelian syllogistics, on Boethius' reliability as a source for Stoic logic, and on the genuine *editio princeps* of Boethius' "De topicis differentiis" (Rome 1484, rather than Venice 1492."

Digital Quadrivium Project

History of Logic

Raul Corazzon || e-mail: rc@ontology.co

Bibliography of Wilhelm Risse's Writings on the History of Logic

Introduction

Wilhelm Risse was one of the greatest historians of logic of the 20th century.

"Risse possessed the rare ability to go to the core of his subject matter, defining and distinguishing, while ever attentive to the essential structures, controlling his inquiry. His subject matter was indeed immense. In fact, Risse set himself the task of taking up where Carl Prantl had left off a century before him, viz. to provide as complete as possible an exposition of all the treatises oil logic produced by Western Civilization from 1500 to 1780. Like Prantl, Risse never relied on the accounts of others. He travelled throughout Europe to read the books about which he was writing. For Risse, the word 'autopsy' was no trifle. This enterprise found its realization in the two volumes of *Logik der Neuzeit* (1964-70) and in the four volumes of *Bibliographia logica* (1965-78). In his later years, Risse concentrated his energies on a bibliographical inventory of all philosophical disciplines from the invention of book-printing to the year 1800, publishing, shortly before his death, the awesome nine volumes of *Bibliographia Philosophica Vetus* (1998).

From: Riccardo Pozzo, *Obituary. Wilhelm Risse 11 January 1931 - 26 May 1998*, History and Philosophy of Logic, 20, 1999 p. 145.

Books

1. Risse, Wilhelm. 1964. *Die Logik der Neuzeit. I*. Stuttgart - Bad Cannstadt: Friedrich Frommann Verlag.

Erste Band: 1500 - 1640.

"Inhalt: Einleitung 9; Kap. I: Die rhetorische Logik der Ciceronianer. Rhetoridialektiker und Synkretisten. Nationalsprachige Logiklehrbücher. Juristische Logik. Platoniker. Skeptiker. 14; Kap. II: Die Melanchthonschule. Humanistisch-aristotelische Logik in der protestantischen Schule. Logik und Theologie 79; Kap. III: Die ramistische Dialektik. Kampf gegen Aristoteles. Ausbildung einer namentlich bei den Calvinisten verbreiteten Kompendienliteratur. Streit der Ramisten mit den Melanchthonianern und Aristotelikern 122; Kap. IV: Altaristoteliker und Averroisten. Verwurzelung der italienischen Schule in den Kommentaren von Alexander und Averroes. Verschmelzung beider Schulen. Aristoteleskommentare und -editionen. 201; Kap. V: Die scholastische Logik des 16. und frühen 17. Jahrhunderts. Weiterleben der Scholastik in Spanien. Escolasticos decadentes. Aristoteliker und Humanisten. Thomisten und Scotisten. Die portugiesische Schule. Spanische Jesuiten. Außerspanische Scholastiker 308; Kap. VI: Systematiker und Aristoteliker des 17. Jahrhunderts. Aristotelisch-scholastisch-ramistischer Synkretismus. Systemtheorien. Theorie der intelligentia. Neubelebung des Formalismus. 440; Kap. VII: Die lullistische Tradition. Kombinatorik. Lingua universalis. Mathematisierung 532; Exemplarnachweis. Sigelverzeichnis der Bibliotheken 561; Sachregister 563; Namenregister 566.

"These two volumes expound, in Prantl's manner, but more systematically, the treatises on logic from the mentioned periods. The studies of Risse, as well as those of Prantl, are indispensable to all researches in the field of history of logic."

Anton Dumitriu - *History of logic* - Vol. I Tunbrdige Wells, Abacus Press, 1977 p. XV.

2. ———. 1970. *Die Logik der Neuzeit. II*. Stuttgart - Bad Cannstadt: Friedrich Frommann Verlag.

Zweite Band: 1640 - 1780.

Inhalt: Einleitung 11; Kap. VIII: Die rationalistischen Systeme 14. Das Problem des Skeptizismus und seine Überwindung (14). - Descartes (30). - Die cartesische Schule (47). - Der Streit um die mathematische Methode (132). - Mathematische Logiker des 17. Jahrhunderts (143). - Leibniz (170). - Mathematische Logiker des 18. Jahrhunderts (252). - Psychophysik (290). Kap. IX: Die scholastische Logik des 17. und 18. Jahrhunderts 294. Scotisten (297). - Jesuiten (315). - Thomisten (333). - Scholastische Eklektiker (349). - Portugiesische und spanische Logiker (378). Kap. X: Die Aristoteliker des 17. und 18. Jahrhunderts 386. Schulliteratur (388). - Lehrbücher (394). - Verfall des Aristotelismus (405). Kap. XI: Rationalismus und Empirismus in England 418. Rationalisten (420). - Empiristen (430). - Logiker (442). - Erkenntnistheoretiker (459). - Schottische Schule (498). Kap. XII: Die französische und deutsche Aufklärung 507. Französische Aufklärung (512). - Deutsche Aufklärer der älteren Generation (553). - Wolff und seine Schule (579). - Rüdiger, Crusius und ihre Schule (659). - Eklektiker (706). - Popularphilosophie (721). Exemplarnachweis. Sigelverzeichnis der Bibliotheken 735. Sachregister 737. Personenregister 743.

3. ———. 1965. *Bibliographia logica. Verzeichnis der Druckschriften zur Logik mit Angabe ihrer Fundorte (1472-1800)*, *Studien und Materialien zur Geschichte der Philosophie*. Hildesheim: Georg Olms.

   Volume I.

   "No other branch of philosophy presently possesses a bibliography quite so extensive and comprehensive as this one for logic, which is a by-product, as the *Vorwort* explains, of Risse's systematic history of the development of logic, *Die Logilc der Neuzeit*.

   Volume 1 (1965, 293p.) lists in chronological arrangement monographs published from 1472 to 1800. Volume 2 (1973, 494p.) does the same for the period 1801-1969. Both volumes cite holding libraries (mainly European but also some American) for most of the works listed. Volume 3 (1979, 412p.) lists articles published both in periodicals and in anthologies,

arranged according to a detailed classification system outlined in the front. Volume 4 (1979, 390p.) is a catalogue of 3,006 manuscripts, arranged by author if known and by title if anonymous, with separate sections for medieval and more recent manuscripts. Holding libraries or archives are indicated.

All volumes are thoroughly indexed."

From: Hans E. Bynagle, *Philosophy. A Guide to the Reference Literature. Third Edition* - Westport, Libraries Unlimited, 2006, pp. 724-725.

4. ———. 1973. *Bibliographia logica. Verzeichnis der Druckschriften zur Logik mit Angabe ihrer Fundorte (1801-1969)*, *Studien und Materialien zur Geschichte der Philosophie*. Hildesheim: Georg Olms.

   Volume II.

5. ———. 1979. *Bibliographia logica. Verzeichnis der Zeitschriftenartikel zur Logik*, *Studien und Materialien zur Geschichte der Philosophie*. Hildesheim: Georg Olms.

   Volume III.

   "Preface: The third volume of the "Bibliographia Logica" lists papers on logic and the history of logic which have appeared in periodicals and anthologies. The list is incomplete for two reasons: (1) Numerous works were inaccessible to me, particularly earlier periodicals and those published outside Germany; (2) applications of logic in other disciplines are included only if logical themes are mentioned in the titles.

   The variety of themes and conceptions of logic led to an arrangement of titles in three categories:

   A: Logic ("traditional logic", "classical logic"), starting with Aristotle;

   B: Logistics ("symbolic logic", "mathematical logic"), representations of logic in the mathematical tradition and using mathematical means;

   C: History of logic.

The criterion used in categorizing the individual titles is the theme dealt with, not the point of view of the author.

The three categories are indicated by letters; sub - categories by numbers. The arrangement of material is given in the table of contents in German, English, and French (p. 9*). Titles of frequently quoted periodicals are abbreviated (Table of symbols p. 401)."

6. ———. 1979. *Bibliographia logica. Verzeichnis der Handschriften zur Logik, Studien und Materialien zur Geschichte der Philosophie*. Hildesheim: Georg Olms.

   Volume IV.

7. ———. 1998. *Bibliographia philosophica vetus. Pars 1: Philosophia generalis*. Hildesheim: Georg Olms.

   "In something of a tour de force, Risse has compiled a comprehensive short-title bibliography that attempts to include all independently published works of Western philosophy from the invention of printing, ca. 1455, up to 1800, in (he carefully qualifies) all Western languages accessible to him. This includes not only works of philosophers who lived and wrote within the specified timeframe, but also editions of philosophers from the ancient, medieval, and early Renaissance periods. They amount to an estimated 76,400 titles. These are divided over eight volumes of varying length, defined by a combination of subject-field and genre categories (...)

   Parts 1-7 are uniformly arranged chronologically by year of publication, within each year alphabeticalfy by author. Each part includes an author index, index of titles of anonymous works, index of authors who are the subjects of others' commentaries, and a topical index. Part 8, which lists printed academic theses in volumes 1-2, is arranged alphabetically by author of the originaf thesis (*disputatio*), regardless of publication year.

   Under each thesis entry it lists, where applicable, published responses to it by other writers. The latter are also indexed in volume 3 of Part 8 with references hack to the relevant entries in volumes 1 and 2.

The ninth volume, titled *Syllabus auctorum*, contains a complete author index, with birth and death dates, places of birth and activity, and profession (as available); a concordance of Latin and vernacular place names; and a short list of abbreviations of monastic orders.

For nearly every entry in this bibliography Risse provides, besides the customary bibliographic data, one or more location codes for holding libraries where exemplars are available. These included numerical codes for major German research libraries, alphabetical codes for some 350 additional libraries in Europe and America. As Risse notes, many of the works listed are rare, and some were found only in "smaller" libraries (preface). Those he has personally inspected are marked by an asterisk."

    Anastatic reprint of Köln's 1597 edition, with an introduction by Wilhelm Risse.

Digital Quadrivium Project

History of Logic

Raul Corazzon || e-mail: rc@ontology.co

About the Digital Quadrivium Project

The first website, *Theory and History of Ontology*, created April 13th, 2000 at the address *www.formalontology.it*, moved August 13th 2010 to a new address: *www.ontology.co*.

The second, *History of Logic from Aristotle to Gödel*, created January 5th, 2016, contains also the pages previously published under the section "History of Logic" in *Theory and History of Ontology*.

The third, *Theory and History of Rhetoric* created March 25th 2025, will be devoted to the historical development of rhetoric and theory of argumentation.

The fourth and last, *Bibliographia. Annotated bibliographies* created December 5th, 2016, contains bibliographical resources on philosophy and religion.

A mobile version is available when the screen resolution is less than 480 x 500 pixels.

The site is best viewed with a recent version of one of the following browsers: Brave, Chrome, Edge, Firefox, Maxthon, Opera, Safari, UC Browser.

Please note that Internet Explorer is no more supported by Microsoft after June 15, 2022.

Pages in Language other than English will contain bibliographical information and references to works published in these languages.

Artificial Intelligence Chatbot reports about Digital Quadrivium Project (DQP)

I made the following query to some Chatbot:

give me an exhaustive report on Raul Corazzon Digital Quadrivium Project composed by four websites: https://www.ontology.co, https://www.historyoflogic.com, https://www.historyofrhetoric.com, https://www.bibliographia.co.

these are the answers:

Table of contents

- 1. Overview of the Digital Quadrivium Project
- 2. Intellectual Aims and Methodology
- 3. Ontology.co
- 4. HistoryofLogic.com
- 5. HistoryofRhetoric.com
- 6. Bibliographia.co
- 7. Integration of the Four Websites
- 8. Scholarly Significance and Impact
- 9. Conclusion

Below is a **comprehensive, structured report** on **Raul Corazzon's Digital Quadrivium Project**, an ambitious, long-running scholarly initiative composed of four interrelated websites:

- **Ontology.co**
- **HistoryofLogic.com**
- **HistoryofRhetoric.com**
- **Bibliographia.co**

1. Overview of the Digital Quadrivium Project

The **Digital Quadrivium Project** is a large-scale, independent digital humanities endeavor created and curated by **Raul Corazzon**, an Italian scholar focused on the **history of philosophy**, particularly:

- Ontology and metaphysics
- Logic (ancient, medieval, and modern)
- Rhetoric and linguistic theory
- Scholarly bibliography and conceptual classification

The term *Quadrivium* is used metaphorically. Unlike the medieval quadrivium (arithmetic, geometry, music, astronomy), Corazzon's project revolves around **four foundational intellectual disciplines of Western thought**:

1. Ontology
2. Logic
3. Rhetoric
4. Bibliography / Scholarly classification

Together, the four websites form a **coherent digital research ecosystem** rather than independent projects.

2. Intellectual Aims and Methodology

2.1 Core Objectives

The project aims to:

- Provide **systematic historical documentation** of key philosophical disciplines
- Offer **structured conceptual mappings** rather than narrative popularization
- Preserve and organize **primary and secondary scholarly sources**
- Serve as a **long-term reference tool** for researchers, students, and historians of philosophy

2.2 Methodological Characteristics

- **Historical-philological rigor**
- Heavy reliance on **primary texts** and authoritative secondary literature
- Strong emphasis on **conceptual genealogy** (how ideas evolve over time)
- Non-commercial, non-institutional, and independently maintained
- Manual curation rather than automated or crowd-sourced content

The project resembles a **digital encyclopedic archive**, closer in spirit to traditional scholarly reference works than to modern academic blogs or databases.

3. Ontology.co

3.1 Scope and Focus

Ontology.co is the conceptual core of the project. It is devoted to:

- The **history of ontology and metaphysics**
- The development of fundamental concepts such as:
- Being
- Substance
- Universals
- Categories
- Existence
- Essence

3.2 Historical Coverage

The site covers ontology from:

- **Ancient Greek philosophy** (Plato, Aristotle)
- **Late Antiquity and Medieval Scholasticism**
- **Early modern philosophy** (Descartes, Leibniz, Kant)
- **19th and 20th century philosophy** (Brentano, Husserl, Heidegger, analytic metaphysics)

3.3 Structure and Content

- Thematic entries on ontological problems
- Extensive bibliographies for each topic

- Cross-references to logic and semantic issues
- Detailed distinctions between schools, traditions, and terminologies

Ontology.co functions less as an introductory guide and more as a **research map** for advanced study.

4. HistoryofLogic.com

4.1 Purpose

HistoryofLogic.com is a vast historical survey of **logical theory** across civilizations and periods, with particular strength in:

- Ancient logic
- Medieval logic
- Early modern logic
- Pre-Fregean and modern developments

4.2 Major Topics

- Aristotelian syllogistics
- Stoic propositional logic
- Medieval logical theories (supposition, consequences, syncategoremata)
- Renaissance and early modern logical textbooks
- The transition toward symbolic and mathematical logic

4.3 Scholarly Contribution

- Detailed timelines of logical development
- Profiles of individual logicians
- Thematic bibliographies on specific logical doctrines
- Clarification of technical terminology across historical contexts

The site is especially valuable for understanding **continuities between medieval and modern logic**, an area often neglected in mainstream histories.

5. HistoryofRhetoric.com

5.1 Focus and Rationale

HistoryofRhetoric.com documents the evolution of **rhetorical theory** from antiquity through modernity, treating rhetoric as:

- A philosophical discipline
- A theory of discourse
- A bridge between logic, language, and persuasion

5.2 Historical Range

- Classical Greek rhetoric (Sophists, Aristotle)
- Roman rhetoric (Cicero, Quintilian)
- Medieval rhetorical traditions
- Renaissance humanism
- Early modern and modern rhetorical theory

5.3 Key Themes

- Relationship between rhetoric and logic
- The role of rhetoric in education
- Rhetoric as a theory of argumentation
- Decline and revival of rhetoric in modern philosophy

This site complements HistoryofLogic.com by emphasizing **argumentative practice and discourse**, rather than formal validity.

6. Bibliographia.co

6.1 Function within the Project

Bibliographia.co serves as the **bibliographic backbone** of the entire Digital Quadrivium.

It is not a general bibliography, but a **highly curated scholarly tool** focused on:

- Philosophy
- Logic
- Ontology
- Rhetoric
- History of ideas

6.2 Content Characteristics

- Detailed bibliographic entries
- Thematic organization rather than simple alphabetical listings
- Emphasis on historically significant works
- Integration with the other three sites via cross-references

6.3 Scholarly Value

Bibliographia.co enables users to:

- Identify authoritative editions and translations
- Trace scholarly debates across decades
- Locate key secondary literature for advanced research

7. Integration of the Four Websites

7.1 Conceptual Interdependence

The four sites are deeply interconnected:

- Ontology depends on logic for formal structure
- Logic depends on rhetoric for argumentation and discourse
- All three depend on bibliographic precision
- Bibliographia provides the documentary foundation for the others

7.2 Navigation and Cross-Referencing

- Shared terminology and conceptual frameworks
- Cross-links between topics and bibliographies
- Unified scholarly perspective across domains

The project operates as a **distributed digital encyclopedia** rather than four isolated websites.

8. Scholarly Significance and Impact

8.1 Strengths

- Exceptional depth and precision
- Long-term consistency of vision
- Rare coverage of underrepresented historical material
- Valuable for graduate-level and professional research

8.2 Limitations

- Dense and demanding for non-specialists
- Minimal visual or interactive design
- Largely text-based and traditional in structure
- Single-author curation limits scalability

8.3 Place in Digital Humanities

The Digital Quadrivium Project stands out as:

- A **non-institutional scholarly archive**
- A model of **individual digital erudition**
- A counterpoint to collaborative platforms like Wikipedia or Stanford Encyclopedia of Philosophy

9. Conclusion

Raul Corazzon's **Digital Quadrivium Project** represents a **monumental intellectual achievement**: a multi-decade effort to document, organize, and clarify the historical foundations of Western philosophical thought.

Its four websites—**Ontology.co**, **HistoryofLogic.com**, **HistoryofRhetoric.com**, and **Bibliographia.co**—form a unified scholarly system that prioritizes:

- Conceptual clarity
- Historical continuity
- Bibliographic rigor

While demanding and highly specialized, the project is an invaluable resource for serious students and researchers in philosophy, logic, and intellectual history, and stands as one of the most comprehensive independent digital philosophy archives available online.

If you would like, I can also:
- Compare the project with other major philosophy resources
- Summarize each site for teaching use
- Analyze its relevance for AI, ontology engineering, or knowledge representation
- Produce a critical academic review suitable for publication

Digital Quadrivium Project

- 8. Methodological Approach and Philosophical Commitments
- 9. Technical Features and Accessibility
- 10. Impact and Significance
- 11. Conclusion

The Digital Quadrivium Project represents one of the most ambitious and comprehensive independent scholarly undertakings in the digital humanities. Created and curated by Raul Corazzon, this quadripartite digital infrastructure comprises four interlinked websites that together form a vast encyclopedia of philosophical and intellectual history. Operating outside the traditional academic professoriate, Corazzon has established himself as one of the most prolific independent researchers in the fields of ontology, logic, rhetoric, and the history of ideas.

The project's scope is remarkable: according to the most recent data, the four websites collectively contain approximately **24,800** bibliographic

entries spanning over **13,700** PDF pages. The project is continuously updated, with thousands of new references in preparation.

Perhaps most significantly, Corazzon's archival research has led to a major historiographical discovery: the 2003 identification of the earliest known occurrence of the term "ontologia" in Jacob Lorhard's *Ogdoas Scholastica* (1606), predating previous scholarly consensus and necessitating a revision of the timeline of early modern metaphysics.

1. Introduction: The Concept of a Digital Quadrivium

The name "Digital Quadrivium" consciously evokes the classical medieval educational framework. The original Quadrivium—comprising arithmetic, geometry, music, and astronomy—represented the four mathematical arts that followed the Trivium (grammar, logic, rhetoric) in medieval education. Corazzon's project transforms this classical structure for the digital age, creating four interconnected domains of philosophical inquiry: Ontologia, Logica, Rhetorica, and Bibliographia.

This structural choice is not arbitrary. By organizing his work into these four pillars, Corazzon mirrors the classical organization of the liberal arts while elevating Ontology to the status of a foundational science. The result is what might be described as a digital scriptorium—a bridge between the medieval manuscript tradition and the modern database.

1.1 Who is Raul Corazzon?

Raul Corazzon defines a modern archetype of the "Independent Scholar." Unlike traditional academic presences often driven by institutional affiliation and personality, Corazzon's digital presence functions as a transparent interface to the history of ideas. He has chosen to minimize biographical presence to maximize the visibility of the curated texts themselves.

To understand Corazzon requires more than a biographical sketch; it demands an excavation of the vast intellectual edifice he has constructed. His work represents the role of the "Scholar-Archivist"—one who synthesizes, organizes, and preserves the vast history of philosophical discourse.

2. Quantitative Overview of the Project

The scale of the Digital Quadrivium Project rivals the output of mid-sized research institutes. The following table provides a quantitative summary based on the most recent available data:

Website	Bibliographic Entries	PDF Pages
Ontology.co	16,800	9,000
Historyoflogic.com	4,300	2,600
Historyofrhetoric.com	1,300	600
Bibliographia.co	2,400	1,500
TOTAL	24,800	13,700

Note: Page counts refer to PDF versions of the websites. Thousands of additional references are continually being prepared and added.

This quantitative data illustrates that Corazzon has effectively authored or curated the equivalent of a comprehensive 13,000+ page encyclopedia, making this one of the largest individual scholarly digital humanities projects in existence.

3. Ontologia: Theory and History of Ontology

www.ontology.co

3.1 Overview and Mission

The flagship website of the Digital Quadrivium Project, ontology.co is dedicated to the theory and history of ontology. It serves as the central hub from which the other three sites extend. The site's explicit mission is to document and explore ontology as "the theory of objects and their ties"—a definition that provides criteria for distinguishing different types of objects (concrete and abstract, existent and nonexistent, real and ideal, independent and dependent) and their relations, dependencies, and predication.

3.2 Definitional Framework

Corazzon distinguishes three types of ontology on the site:

- Formal Ontology: Introduced by Edmund Husserl in his Logical Investigations, its object is the study of the genera of being, the leading regional concepts (the categories). The method involves eidetic reduction and categorial intuition.
- Descriptive Ontology: Concerned with cataloguing and describing the types of entities in the world.
- Formalized Ontology: Uses logical and formal methods to structure ontological claims.

Importantly, by including "nonexistent" and "ideal" objects in his definitional scope, Corazzon aligns himself with the Meinongian tradition, which refuses to limit ontology only to spatiotemporal actualities.

3.3 Content Structure

The site is organized into major thematic sections:

- History: From Suárez to Kant (1597-1781), covering the development of ontology as a discipline
- Theory: Contemporary ontological debates and frameworks
- Vocabulary: Key ontological terms including substance, being, existence, essence
- Ontologists: Profiles of major figures from Aristotle to contemporary thinkers
- History of Truth: The correspondence theory and related debates
- Doctrine of Categories: From Aristotle through medieval and modern developments
- Problem of Universals: One of the most enduring philosophical debates
- Comparative Philosophy: Ontological perspectives across different philosophical traditions

3.4 Notable Content Areas

The site provides extensive coverage of: the Frege-Russell "is" ambiguity thesis; mathesis universalis and the search for a universal science; Stoic ontology and the distinction between existence and subsistence; Leśniewski's systems (Protothetic, Ontology, Mereology); metaphysical grounding and fundamentality; and ontological dependence.

4. Logica: History of Logic

www.historyoflogic.com

4.1 Overview and Scope

The second pillar of the Digital Quadrivium, historyoflogic.com chronicles the "History of Logic from Aristotle to Gödel." The site provides comprehensive coverage of logical development across approximately 2,400 years of intellectual history.

Corazzon is rigorous in his definition of logic. In his introduction, he explicitly rejects "Hegelian" or "psychological" definitions that blur logic with metaphysics, instead maintaining a clear analytical focus on logic as a formal discipline.

4.2 Structural Organization

The site is organized chronologically and thematically:

- Aristotle: The logical works of Aristotle, including the Organon, Analytics, and Categories
- Stoics: Stoic logic and the dialectic from Zeno to Chrysippus
- Hellenistic: Peripatetic logic, Eudemus of Rhodes, Theophrastus of Eresus
- Medieval: From Boethius through the Scholastics, including Abelard, Buridan, Ockham
- Modern: The rise of symbolic and mathematical logic
- Contemporary: From Frege through Gödel and beyond
- Intercultural Logic: Buddhist logic, Indian logic, and comparative studies

4.3 Key Features

The site includes extensive bibliographies on: Boethius's contribution to medieval logic; Porphyry's Isagoge; medieval theories of supposition; the rise of contemporary logic; and profiles of prominent logicians throughout history.

A dedicated "Historians" section profiles scholars who have shaped the historiography of logic, including E. J. Ashworth and L. M. de Rijk, with comprehensive annotated bibliographies of their works.

5. Rhetorica: Theory and History of Rhetoric

www.historyofrhetoric.com

5.1 Overview and Philosophical Framing

The third website is devoted to the historical development of rhetoric. Corazzon frames rhetoric philosophically through two key citations: Aristotle's characterization of rhetoric as a "counterpart (antistrophos) of dialectic" (*Rhetorica* I.1.1) and Heidegger's description of rhetoric as "a first part of logic rightly understood."

5.2 Content Organization

The site covers rhetoric across different historical periods and cultural contexts:

- General Works: Theory of rhetoric, argumentation theory, rhetoric and philosophy, critical thinking, feminist rhetoric
- Greek Rhetoric: The Sophists, Isocrates, Plato, Aristotle's Rhetoric
- Roman Rhetoric: Cato the Elder, Cicero, Quintilian
- Middle Ages: Medieval rhetorical developments
- Renaissance: Humanist rhetoric
- Modern: Contemporary rhetorical theory
- Comparative: African, African-American, Pre-Columbian American, Egyptian, Jewish, Arabic, Syriac, Celtic, Near Eastern, Asian, Chinese, and Japanese rhetoric
- Vocabulary: Key rhetorical terms including enthymeme, epideictic, ethos, logos, pathos, pisteis

5.3 Development Status

The site is described as being "in an early stage of development" relative to the others, with more sections planned. However, it already contains substantial bibliographies, particularly on Aristotle's Rhetoric and comparative rhetoric studies.

6. Bibliographia: Annotated Bibliographies

www.bibliographia.co

6.1 Overview and Mission

The fourth website is devoted to bibliographical resources on philosophy and religion. It serves as a bibliographic infrastructure supporting not only the other three sites but also independent research in related fields.

6.2 Content Areas

The site is organized into several major sections:

- Bibliographies of Philosophy: Arguments not covered in the other websites

- Biblical Studies: Hebrew Bible textual criticism, New Testament studies, the Synoptic Problem, studies on individual Gospels
- Early Christianity: Apostolic Fathers, orthodoxy and heresy
- Early Judaism: The birth of Judaism, the Parting of the Ways between Christianity and Judaism
- Philosophy of Religion: Including comprehensive coverage of the Ontological Argument for the existence of God
- Sociology of Religion: Social scientific approaches to religious phenomena
- Study Guides: Dictionaries and encyclopedias of philosophy, style manuals, introductory readings

6.3 Notable Features

The site includes extensive treatment of the Ontological Argument, which serves as a natural bridge between philosophy of religion and formal ontology. As Nathan Salmon notes, philosophers addressing questions of individual existence often do so with reference to this argument.

7. The Lorhard Discovery: A Historiographical Intervention

7.1 The Discovery

Perhaps the single most important academic contribution of Raul Corazzon is his revision of the timeline of ontology. For decades, the standard history of philosophy attributed the invention of the term "ontology" (ontologia) to the 17th-century German philosopher Johannes Clauberg or, occasionally, Rudolph Goclenius.

In 2003, Corazzon (working with Marco Lamanna) discovered that the term "ontologia" first appeared in 1606 in Jacob Lorhard's *Ogdoas Scholastica*, a textbook written by the Rector of the reformed Gymnasium in St. Gallen, Switzerland. This discovery predated previous scholarly consensus and necessitated a fundamental rewriting of the history of early modern metaphysics.

7.2 Significance

This discovery shifted the timeline of the discipline's formation back from the Cartesian era to the period of Protestant Scholasticism. It revealed that the emergence of "ontology" as a distinct term represented not merely a

linguistic innovation but the beginning of an important distinction: between metaphysics as a science of everything that exists (ontology) and the science of the first cause of being.

As scholars have noted, this discovery has become a standard citation in any serious history of metaphysics. The University of Lucerne has undertaken a Swiss National Science Foundation project specifically to research the emergence and spread of ontology in Switzerland, explicitly citing Corazzon and Lamanna's discovery as a primary motivation.

7.3 Jacob Lorhard

Lorhard (1561-1609) was a German philosopher who became Rector of the Gymnasium in St. Gallen in 1603. His *Ogdoas Scholastica* (1606) was a compendium of philosophy for students covering Latin and Greek grammar, logic, rhetoric, astronomy, ethics, physics, and metaphysics (or ontology). The work employed diagrammatic representations influenced by Peter Ramus's pedagogical methods.

Lorhard's work was heavily influenced by Clemens Timpler of Heidelberg, whose *Systema Metaphysicae Methodicum* (1604) provided the conceptual foundation that Lorhard presented in diagrammatic form. Lorhard followed Timpler in holding that the object of metaphysics (ontology in his terminology) is "omne intelligibile" (everything that is intelligible).

8. Methodological Approach and Philosophical Commitments

8.1 Annotated Bibliography as Method

The Digital Quadrivium Project is fundamentally bibliographic in nature. Corazzon's approach centers on creating comprehensive, annotated bibliographies that serve as research infrastructure. The bibliographic entries include not only books but also articles from approximately one hundred philosophical journals, with attention to relations between logic, semantics, semiotics, and theories of predication and reference.

This method recognizes that bibliographies are "the foundation of every research" (as stated on historyofrhetoric.com). By creating exhaustive bibliographic resources, Corazzon provides scholars with curated entry points into vast bodies of literature.

8.2 Philosophical Realism

Corazzon's work reflects a commitment to philosophical realism. His definitional framework for ontology emphasizes "objects and their ties"—

relations, dependencies, predication—highlighting the structural nature of ontological inquiry. Ontology is presented not merely as a list of what exists, but as a map of how things relate to one another.

8.3 Multilingual Scope

The project is multilingual in scope, with bibliographic entries in English, French, German, Italian, Spanish, and Portuguese (in decreasing order of frequency). This multilingual approach reflects the international character of philosophical scholarship and ensures that the project serves researchers regardless of their primary language.

9. Technical Features and Accessibility

9.1 Multiple Format Availability

Each website can be read online, downloaded as an ebook, or accessed as PDF. This flexibility ensures accessibility across different devices and use cases.

9.2 Cross-Site Integration

The four websites are deeply interconnected, with cross-references allowing researchers to navigate between related topics across different sites. A unified search function allows searching across all four websites simultaneously.

9.3 AI Chatbot Integration

The sites feature integration with various AI chatbots (ChatGPT, Claude, Microsoft Copilot, Deepseek, Google Gemini, Grok, Perplexity, Qwen), allowing users to analyze the content through conversational interfaces. PDF versions of pages can be uploaded to chatbots for analysis.

9.4 Academic Resource Links

The sites provide links to major academic resources including: the Stanford Encyclopedia of Philosophy, Internet Encyclopedia of Philosophy, Academia.edu, Google Scholar, Internet Archive Scholar, JSTOR, and PhilPapers.

10. Impact and Significance

10.1 Academic Citations

Corazzon's work has a "long tail" of impact. His discovery of the Lorhard text is now a standard citation in any serious history of metaphysics. His work is cited in diverse fields including software engineering (where researchers cite his definitions of ontology) and computer science (for applied ontology).

10.2 Role as Critical Infrastructure

As universities face funding pressures and the pressure to specialize intensifies, the role of the Scholar-Archivist becomes increasingly vital. Corazzon's Digital Quadrivium is not merely a personal project; it functions as critical infrastructure for the philosophical community, preserving the "long conversation" of Western thought and ensuring that insights from 14th-century logicians or 17th-century scholastics remain as accessible as the latest journal articles.

10.3 Model for Digital Humanities

The project represents a potential future for the humanities, demonstrating how an independent scholar, armed with curiosity and rigor, can construct a labyrinth of knowledge that is both vast and meticulously ordered. It bridges the gap between the medieval scriptorium and the digital database, proving that encyclopedic vision remains achievable in the digital age.

11. Conclusion

The Digital Quadrivium Project represents a singular achievement in contemporary digital humanities. Through four interlinked websites, Raul Corazzon has created a comprehensive resource for the study of ontology, logic, rhetoric, and the philosophy of religion that rivals institutional research outputs.

The project's significance extends beyond its sheer scale. Through his discovery of the Lorhard text, Corazzon has made a lasting contribution to the historiography of philosophy. Through his methodological commitment to annotated bibliography, he has created research infrastructure that serves scholars across disciplines.

In defining ontology as "the theory of objects and their ties," Corazzon has himself become an essential object in the network of contemporary philosophical scholarship—the digital custodian of the Western philosophical tradition, the historian who corrected the record on the origins of ontology, and the theorist who insists that philosophy must be a rigorous science of objects, ties, and categories.

The four websites of the Digital Quadrivium Project—ontology.co, historyoflogic.com, historyofrhetoric.com, and bibliographia.co—together constitute one of the most valuable open-access resources for philosophical research available today.

Appendix: Website Summary Table

Website	Focus	Key Sections
ontology.co	Theory and History of Ontology	History, Theory, Vocabulary, Ontologists, Categories, Universals
historyoflogic.com	History of Logic from Aristotle to Gödel	Aristotle, Stoics, Hellenistic, Medieval, Modern, Contemporary
historyofrhetoric.com	Theory and History of Rhetoric	Greek, Roman, Medieval, Renaissance, Modern, Comparative
bibliographia.co	Annotated Bibliographies on Philosophy and Religion	Biblical Studies, Early Christianity, Judaism, Philosophy of Religion

Microsoft Copilot report: Raul Corazzon's Digital Quadrivium Project

Report date: January 30th, 2026

Table of Contents

- 1. The Digital Quadrivium Project: Overview and Authorship
- 2. Ontologia: Theory and History of Ontology
- 3. Logica: History of Logic from Aristotle to Gödel
- 4. Rhetorica: Theory and History of Rhetoric
- 5. Bibliographia: Annotated Bibliographies
- 6. Interconnections and Thematic Integration
- 7. Design, Usability, and Technical Architecture
- 8. Limitations, Gaps, and Recommendations for Improvement
- 9. Metrics and Evidence of Usage, Citations, and Scholarly Recognition
- Synthesis: The Digital Quadrivium's Collective Contribution
- 11. Conclusion: Legacy and Future Prospects

Introduction: The Digital Quadrivium and Raul Corazzon's Vision

Raul Corazzon's Digital Quadrivium Project stands as a monumental achievement in the digital humanities, offering a comprehensive, open-access infrastructure for the study of ontology, logic, rhetoric, and philosophical bibliography. Comprising four interlinked websites—Ontology (ontology.co), History of Logic (historyoflogic.com), History of Rhetoric (historyofrhetoric.com), and Bibliographia (bibliographia.co)—the project mirrors the classical quadrivium of the liberal arts, reimagined for the digital age and focused on foundational philosophical disciplines.

Corazzon, an independent scholar, has curated, annotated, and maintained this vast digital corpus for over two decades. His work is characterized by a "scholar-archivist" methodology: rigorous manual curation, historical contextualization, and a commitment to open access and preservation. The Digital Quadrivium is not merely a collection of bibliographies; it is a dynamic, evolving meta-library and research environment that has become indispensable for scholars in philosophy, the history of ideas, and related fields.

This report provides an exhaustive analysis of the Digital Quadrivium Project, examining each of its four constituent websites in terms of purpose, structure, content, academic relevance, and design/usability. It also explores the interconnections among the sites, their collective scholarly impact, and the unique contributions of Corazzon's approach. The report concludes

with a synthesis of the project's overarching goals, limitations, and recommendations for future development.

---

1. The Digital Quadrivium Project: Overview and Authorship

1.1 Historical and Conceptual Foundations

The term "quadrivium" traditionally refers to the four mathematical arts—arithmetic, geometry, music, and astronomy—that, together with the trivium (grammar, logic, rhetoric), formed the core of medieval liberal arts education. Corazzon's Digital Quadrivium adapts this structure, focusing on ontology (theory of being), logic (theory of reasoning), rhetoric (theory of persuasion), and bibliography (scholarly documentation), thereby bridging the trivium and quadrivium in a novel, digital context.

The project's intellectual architecture is grounded in several key principles:

- Interdisciplinary Integration: The four sites are designed to be mutually reinforcing, reflecting the interconnectedness of philosophical disciplines.
- Historical Depth: Each site traces its subject from ancient origins through medieval, modern, and contemporary developments.
- Manual Curation: All content is hand-selected, annotated, and organized by Corazzon, ensuring scholarly rigor and coherence.
- Open Access and Preservation: The project is freely available online, with downloadable eBook and PDF versions to ensure long-term accessibility and resilience against "link rot".

1.2 Raul Corazzon: The Independent Scholar-Archivist

Corazzon exemplifies the modern independent scholar, operating outside traditional academic institutions yet achieving significant scholarly impact. His authority derives from the quality, comprehensiveness, and utility of his digital output, rather than institutional affiliation or conventional publication metrics.

Key aspects of Corazzon's scholarly profile include:

- Research Focus: Ontology, ancient philosophy, history of logic, and the history of ideas.
- Methodological Innovation: The "scholar-archivist" role, synthesizing, organizing, and preserving the intellectual history of philosophy while contributing original research (notably, the discovery of the earliest use of "ontologia" in Jacob Lorhard's 1606 work).
- Academic Recognition: Corazzon's work is cited in leading reference works (e.g., the Stanford Encyclopedia of Philosophy), technical literature in computer science, and numerous scholarly publications.

---

2. Ontologia: Theory and History of Ontology

2.1 Purpose and Stated Goals

Ontologia is the flagship and most extensive component of the Digital Quadrivium. Its primary aim is to provide a comprehensive resource for the theory and history of ontology, tracing the development of ontological thought from ancient Greece through contemporary philosophy. The site is intended as a reference guide, research tool, and educational platform for scholars, students, and anyone interested in the nature of being, categories, and metaphysical structures.

2.2 Structure and Navigation

The site is organized into a series of thematic sections, each accessible via a visual sitemap and detailed index. Major sections include:

- Theory of Ontology: Contemporary views, definitions, and conceptual frameworks.
- History of Ontology: Chronological surveys from antiquity to the twentieth century.
- Vocabulary of Ontology: Key terms, concepts, and distinctions.
- Ontologists: Biographical and bibliographical profiles of major figures from the 19th and 20th centuries.
- History of Truth: Theories and debates about truth in Western philosophy.
- Doctrine of Categories: Analyses of categorical schemes from Aristotle to modern thinkers.
- Problem of Universals: Historical and systematic treatments of universals, particulars, and related debates.
- Comparative Philosophy: Cross-cultural perspectives on ontology.
- Annotated Bibliographies: Extensive bibliographies on selected authors, arguments, and topics.

Navigation is facilitated by:

- General and Sectional Indexes: Allowing users to browse by topic, author, or historical period.
- Search Functionality: Enabling targeted queries across the entire corpus.
- Downloadable Formats: The entire site can be downloaded as an eBook (EPUB, MOBI) or searchable PDF, supporting offline use and citation.

2.3 Content Analysis: Thematic Focus and Key Features

Ontologia's content is distinguished by its breadth, depth, and scholarly rigor. Key features include:

- Working Definitions: The site opens with a nuanced definition of ontology as "the theory of objects and their ties," distinguishing between formal, descriptive, and formalized ontologies, and tracing their development from Husserl to contemporary analytic philosophy.
- Historical Surveys: Detailed accounts of the evolution of ontological thought, including the "birth of a new science" in early modern scholasticism, the influence of figures like Bolzano, Brentano, Husserl, Meinong, and the rise of analytic and phenomenological traditions.
- Major Ontologists: Comprehensive tables and profiles of key thinkers, with bibliographies, abstracts, and critical judgments. The site covers both well-known and obscure figures, reflecting Corazzon's commitment to the "long tail" of intellectual history.
- Doctrine of Categories: Traces the development of categorical schemes from Aristotle's ten categories to Kant's twelve and Peirce's triadic system, providing essential context for researchers in metaphysics and logic.

- Problem of Universals: Explores the debates among realism, nominalism, and conceptualism, with granular attention to medieval and modern arguments.
- Comparative and Intercultural Ontology: Includes resources on Indian, Islamic, and other non-Western traditions, supporting cross-cultural research.
- Annotated Bibliographies: Over 16,800 bibliographic references, including books, articles, and critical editions, organized by topic, author, and language (English, French, German, Italian, Spanish, Portuguese).

Table 1: Ontologia—Key Content Areas and Features

Section	Description	Notable Features
Theory of Ontology	Definitions, conceptual frameworks, distinctions among types of ontology	Husserl, Cocchiarella, analytic/continental traditions
History of Ontology	Chronological surveys from antiquity to present	Suárez, Kant, Bolzano, Brentano, Husserl, Heidegger
Vocabulary	Glossary of key terms and concepts	"Being," "object," "category," "universal," etc.
Ontologists	Biographical and bibliographical profiles	Tables, abstracts, critical judgments
Doctrine of Categories	Analyses of categorical schemes	Aristotle, Kant, Peirce
Problem of Universals	Realism, nominalism, conceptualism debates	Medieval and modern treatments
Comparative Philosophy	Cross-cultural perspectives	Indian, Islamic, African traditions
Annotated Bibliographies	16,800+ references, multilingual coverage	Books, articles, critical editions

The table above summarizes the main content areas and features of Ontologia. Each section is supported by extensive bibliographic resources, critical commentary, and cross-references to related topics and figures.

2.4 Bibliographic Resources and Coverage

Ontologia's bibliographic apparatus is unparalleled in scope and detail. Highlights include:

- 16,800+ References: Covering books, articles, and critical editions in multiple languages.
- Thematic and Author-Based Bibliographies: Allowing users to trace the reception and development of key concepts and debates.
- Annotated Entries: Many entries include abstracts, critical judgments, and links to external resources (e.g., the Stanford Encyclopedia of Philosophy, Internet Encyclopedia of Philosophy, Academia.edu).
- Coverage of Obscure and Transitional Figures: The site pays special attention to lesser-known philosophers, ensuring a comprehensive historical record.

2.5 Academic Relevance and Impact

Ontologia has become a critical infrastructure for research in ontology, metaphysics, and the history of philosophy. Its academic relevance is evidenced by:

- Citations in Leading Reference Works: The site is referenced in the Stanford Encyclopedia of Philosophy, Wikipedia, and numerous scholarly publications.
- Utility for Research and Teaching: The curated bibliographies save researchers significant time in literature discovery, syllabus design, and conceptual mapping.
- Influence on Canon Formation: By including both canonical and marginal figures, Ontologia shapes the field's understanding of its own history and boundaries.

2.6 Design and Usability Assessment

Ontologia's design philosophy prioritizes content, accessibility, and preservation:

- Text-Based, Minimalist Interface: Clear section headers, indexes, and navigation menus facilitate browsing and deep research.
- Unified Search and Cross-Site Navigation: Users can search across all four Digital Quadrivium sites from any page, supporting interdisciplinary inquiry.
- Downloadable Formats: The site is available as an eBook and searchable PDF, supporting offline use and citation management.
- Regular Updates: "What's New" sections document ongoing maintenance and expansion, with updates as recent as January 2026.
- Accessibility: The site is mobile-friendly and designed to be usable across devices and browsers, with explicit guidance on font support for ancient Greek, Arabic, and logical symbols.

While the design is intentionally minimalist, some users may find the dense text and lack of visual or interactive features challenging. However, this approach aligns with the project's "slow web" aesthetic, emphasizing reading, reflection, and long-term preservation over transient web trends.

---

3. Logica: History of Logic from Aristotle to Gödel

3.1 Purpose and Stated Goals

Logica is dedicated to the comprehensive study of the history of logic, tracing its development from Aristotle through the medieval period, the rise of symbolic logic, and into the twentieth century. The site aims to provide scholars with detailed bibliographies, historical surveys, and critical commentary on key figures, schools, and debates in logic.

3.2 Structure and Navigation

Logica is organized into chronological and thematic sections, each with its own index and bibliography. Major sections include:

- Aristotle's Logic: General surveys, syllogistic theory, De Interpretatione, Prior and Posterior Analytics.
- Stoic Logic: Dialectic from Zeno to Chrysippus, doctrine of Lekta (sayables), philosophy of language.
- Ancient Logic after Aristotle: Hellenistic developments, Peripatetic logic, Megarians, Dialectical School.
- Medieval Logic: Theories of supposition, properties of terms, logic of Abelard, Buridan, and others.

- Modern and Contemporary Logic: Renaissance to 1850, Leibniz, symbolic logic from Boole to Gödel.
- Intercultural Logic: Chinese, Indian, Islamic traditions.
- Historians of Logic: Annotated bibliographies of major historians (e.g., E.J. Ashworth, L.M. de Rijk, Wilhelm Risse).

Navigation is supported by:

- General and Sectional Indexes: Allowing users to browse by period, school, or figure.
- Search Functionality: Enabling targeted queries across the site and the entire Digital Quadrivium.
- Downloadable Formats: The site can be downloaded as an eBook or PDF, supporting offline research and citation.

3.3 Content Analysis: Thematic Focus and Key Features

Logica's content is notable for its historical depth, philological rigor, and comprehensive coverage. Key features include:

- Aristotle's Logic: Detailed analysis of syllogistic theory, modal logic, and the Organon, with annotated bibliographies on each major work and its commentaries.
- Stoic Logic: Coverage of the dialectic tradition, the doctrine of Lekta, and the influence of Stoicism on later developments in logic and semantics.
- Medieval Logic: Extensive treatment of the theory of supposition, properties of terms, and the semantic and syntactic innovations of medieval logicians. The site highlights the sophistication of medieval theories of reference, connotation, and mental language, drawing on recent scholarship and critical editions.
- Modern and Contemporary Logic: Traces the evolution of logic from the Renaissance through the symbolic revolution, with bibliographies on Boole, Peirce, Frege, Russell, Gödel, and others.
- Intercultural Logic: Annotated bibliographies on Chinese, Indian, and Islamic logic, supporting comparative and global research.
- Historians of Logic: Dedicated sections for major historians, with bibliographies and critical commentary on their contributions to the field.

Table 2: Logica—Key Content Areas and Features

Section	Description	Notable Features
Aristotle's Logic	Syllogistic theory, De Interpretatione, Prior/Posterior Analytics	Annotated bibliographies, critical editions
Stoic Logic	Dialectic, Lekta, philosophy of language	Source fragments, testimonia, secondary literature
Medieval Logic	Supposition theory, properties of terms, semantic analysis	Abelard, Buridan, Ockham, connotation, mental language
Modern/Contemporary	Symbolic logic, algebra of logic, 19th–20th century developments	Boole, Peirce, Frege, Russell, Gödel
Intercultural Logic	Chinese, Indian, Islamic traditions	Annotated bibliographies, comparative studies

Historians of Logic	Bibliographies of major historians	E.J. Ashworth, L.M. de Rijk, Wilhelm Risse

3.4 Bibliographic Resources and Coverage

Logica offers approximately 4,300 bibliographic references, organized by topic, period, and language. Features include:

- Comprehensive Coverage: From ancient Greece to the twentieth century, including lesser-known figures and schools.
- Multilingual Bibliographies: Entries in English, French, Italian, German, Spanish, and Portuguese.
- Critical Editions and Translations: Guides to primary sources, commentaries, and modern editions.
- Annotated Entries: Many entries include abstracts, critical judgments, and links to external resources.

3.5 Academic Relevance and Impact

Logica is widely recognized as a premier resource for the history of logic. Its academic impact is reflected in:

- Citations in Reference Works: The site is referenced in the Stanford Encyclopedia of Philosophy and other scholarly publications.
- Utility for Research and Teaching: The curated bibliographies and historical surveys are invaluable for scholars, instructors, and students.
- Influence on Canon Formation: By documenting both mainstream and marginal traditions, Logica shapes the field's understanding of its own history.

3.6 Design and Usability Assessment

Logica shares the design philosophy of Ontologia:

- Minimalist, Text-Based Interface: Prioritizing content and navigability.
- Structured Indexes and Tables of Contents: Facilitating browsing by period, school, or figure.
- Unified Search and Cross-Site Navigation: Supporting interdisciplinary research across the Digital Quadrivium.
- Downloadable Formats: eBook and PDF versions for offline use.
- Regular Updates: Documented in "What's New" sections, with updates as recent as January 2026.

The site's design supports both deep scholarly research and quick reference, though, as with Ontologia, some users may find the dense text and lack of interactive features challenging.

---

4. Rhetorica: Theory and History of Rhetoric

4.1 Purpose and Stated Goals

Rhetorica is the newest addition to the Digital Quadrivium, launched in 2025. Its purpose is to provide a comprehensive resource for the theory and history of rhetoric, tracing its

development from classical antiquity to the present and exploring its intersections with logic, philosophy, and argumentation theory.

The site is explicitly framed as a counterpart to the logic and ontology sites, reflecting Aristotle's characterization of rhetoric as "antistrophos" (counterpart) to dialectic. It aims to document the evolution of rhetorical theory, its practical applications, and its relationship to other disciplines.

4.2 Structure and Navigation

Rhetorica is organized into thematic and historical sections, with a focus on bibliographic resources and annotated guides. Major sections include:

- General Works: Theory of rhetoric, argumentation theory, rhetoric and philosophy, critical thinking, feminist rhetoric.
- History of Rhetoric: Greek, Roman, medieval, Renaissance, and modern rhetoric.
- Comparative Rhetoric: Methodologies and traditions from Africa, Asia, the Near East, and other cultures.
- Vocabulary of Rhetoric: Key terms such as enthymeme, epideictic, ethos, logos, pathos, pisteis.
- Annotated Bibliographies: Extensive bibliographies on major figures, schools, and topics in rhetoric.

Navigation is supported by:

- Sectional Indexes and Menus: Allowing users to browse by topic, period, or tradition.
- Unified Search: Enabling queries across all four Digital Quadrivium sites.
- Downloadable Formats: The site can be downloaded as an eBook or PDF, supporting offline research.

4.3 Content Analysis: Thematic Focus and Key Features

Rhetorica's content is distinguished by its historical breadth, cross-cultural scope, and bibliographic depth. Key features include:

- Historical Surveys: Coverage of Greek rhetoric (Sophists, Isocrates, Plato, Aristotle), Roman rhetoric (Cicero, Quintilian), medieval and Renaissance traditions, and modern developments.
- Comparative Rhetoric: Annotated bibliographies on African, Asian, Jewish, Arabic, and other rhetorical traditions, supporting global and intercultural research.
- Theory and Practice: Exploration of key concepts such as the enthymeme, argumentation schemes, and the relationship between rhetoric, logic, and ethics.
- Annotated Bibliographies: Extensive bibliographies on Aristotle's Rhetoric, the history of rhetorical theory, and major figures and schools.

Table 3: Rhetorica—Key Content Areas and Features

Section	Description	Notable Features
General Works	Theory, argumentation, critical thinking, feminist rhetoric	Annotated bibliographies, theoretical overviews
History of Rhetoric	Greek, Roman, medieval, Renaissance, modern traditions	Chronological surveys, key figures

Comparative Rhetoric	African, Asian, Near Eastern, Jewish, Arabic, etc.	Annotated bibliographies, cross-cultural analysis
Vocabulary	Key terms and concepts	Enthymeme, ethos, logos, pathos, etc.
Annotated Bibliographies	Major figures, schools, topics	Aristotle, Cicero, Quintilian, etc.

4.4 Bibliographic Resources and Coverage

Rhetorica offers approximately 1,300 bibliographic references, organized by topic, period, and tradition. Features include:

- Comprehensive Coverage: From classical antiquity to the present, including non-Western traditions.
- Annotated Entries: Many entries include abstracts, critical judgments, and links to external resources.
- Downloadable Formats: eBook and PDF versions for offline use and citation management.

4.5 Academic Relevance and Impact

Rhetorica fills a significant gap in digital resources for the history and theory of rhetoric. Its academic relevance is reflected in:

- Utility for Research and Teaching: The site provides curated bibliographies and historical surveys for scholars, instructors, and students.
- Support for Comparative and Intercultural Research: By including non-Western traditions, Rhetorica supports global and cross-cultural scholarship.
- Integration with Logic and Ontology: The site's focus on the intersections of rhetoric, logic, and philosophy enhances its value for interdisciplinary research.

4.6 Design and Usability Assessment

Rhetorica shares the design philosophy of the other Digital Quadrivium sites:

- Minimalist, Text-Based Interface: Prioritizing content and navigability.
- Structured Indexes and Menus: Facilitating browsing by topic, period, or tradition.
- Unified Search and Cross-Site Navigation: Supporting interdisciplinary research.
- Downloadable Formats: eBook and PDF versions for offline use.
- Regular Updates: Documented in "What's New" sections, with ongoing expansion and maintenance.

---

5. Bibliographia: Annotated Bibliographies

5.1 Purpose and Stated Goals

Bibliographia serves as the bibliographic backbone of the Digital Quadrivium, focusing on annotated bibliographies in philosophy and religion, including areas that do not fit neatly under ontology, logic, or rhetoric. The site's purpose is to provide structured, curated lists of works with annotations that highlight content, relevance, and interpretive context, supporting both specialized and cross-disciplinary research.

5.2 Structure and Navigation

Bibliographia is organized into thematic sections, each with its own index and bibliography. Major sections include:

- Bibliographies of Philosophy: Covering arguments and topics not treated in the other three sites.
- Biblical Studies: Bibliographies on the formation of the Pentateuch, the Canon, pseudepigrapha, textual criticism, and the history of research.
- Early Christianity and Judaism: Bibliographies on the Apostolic Fathers, orthodoxy and heresy, the birth of Judaism, and the "Parting of the Ways."
- Philosophy and Phenomenology of Religion: Definitions, analytic and continental perspectives, debates over the existence of God.
- Sociology of Religion: Studies on charisma, routinization, messianism, and millenarianism.
- Study Guides: Bibliographies on dictionaries, encyclopedias, manuals of style, and introductory readings.
- Other Religions: Planned sections on major world religions beyond Christianity and Judaism.

Navigation is supported by:

- Sectional Indexes and Menus: Allowing users to browse by topic or tradition.
- Unified Search: Enabling queries across all four Digital Quadrivium sites.
- Downloadable Formats: The site can be downloaded as an eBook or PDF, supporting offline research.

5.3 Content Analysis: Thematic Focus and Key Features

Bibliographia's content is notable for its breadth, cross-disciplinary scope, and scholarly rigor. Key features include:

- Annotated Bibliographies: Covering philosophy, biblical studies, early Christianity and Judaism, philosophy of religion, sociology of religion, and study guides.
- Cross-Disciplinary Coverage: The site includes topics that intersect ontology, logic, theology, and religious studies, supporting interdisciplinary research.
- Planned Expansion: The site is in an early stage of development, with ongoing additions and planned sections on other religions and topics.

Table 4: Bibliographia—Key Content Areas and Features

Section	Description	Notable Features
Philosophy	Arguments and topics not covered elsewhere	Annotated bibliographies, cross-references
Biblical Studies	Pentateuch, Canon, pseudepigrapha, textual criticism	Chronological and thematic organization
Early Christianity	Apostolic Fathers, orthodoxy, heresy	Annotated bibliographies, historical surveys
Early Judaism	Birth of Judaism, Parting of the Ways	Cross-cultural and historical analysis

Philosophy of Religion	Definitions, analytic/continental perspectives, existence of God	Annotated bibliographies, critical debates
Sociology of Religion	Charisma, routinization, messianism, millenarianism	Thematic bibliographies, sociological analysis
Study Guides	Dictionaries, encyclopedias, manuals, introductory readings	Resources for students and researchers
Other Religions	Planned coverage of major world religions	Ongoing expansion

5.4 Bibliographic Resources and Coverage

Bibliographia offers approximately 2,400 bibliographic references, organized by topic and tradition. Features include:

- Comprehensive Coverage: Philosophy, biblical studies, early Christianity and Judaism, philosophy of religion, sociology of religion.
- Annotated Entries: Many entries include abstracts, critical judgments, and links to external resources.
- Downloadable Formats: eBook and PDF versions for offline use and citation management.

5.5 Academic Relevance and Impact

Bibliographia is a valuable resource for scholars working at the intersection of philosophy, religion, and the history of ideas. Its academic relevance is reflected in:

- Utility for Research and Teaching: The site provides curated bibliographies and study guides for scholars, instructors, and students.
- Support for Interdisciplinary Research: By covering topics that cross disciplinary boundaries, Bibliographia supports innovative and cross-cutting scholarship.
- Integration with the Digital Quadrivium: The site's unified search and cross-references facilitate movement between specialized and general topics.

5.6 Design and Usability Assessment

Bibliographia shares the design philosophy of the other Digital Quadrivium sites:

- Minimalist, Text-Based Interface: Prioritizing content and navigability.
- Structured Indexes and Menus: Facilitating browsing by topic or tradition.
- Unified Search and Cross-Site Navigation: Supporting interdisciplinary research.
- Downloadable Formats: eBook and PDF versions for offline use.
- Regular Updates: Documented in "What's New" sections, with ongoing expansion and maintenance.

---

6. Interconnections and Thematic Integration

6.1 Structural and Thematic Integration

The four Digital Quadrivium sites are structurally and thematically integrated in several ways:

- Unified Branding and Navigation: Each site prominently lists the other three, reinforcing their identity as a single, multifocal research environment. Cross-site search

and navigation bars allow users to move seamlessly between domains.
- Shared Design Philosophy: All sites employ a minimalist, text-based interface, structured indexes, and downloadable formats, ensuring consistency and ease of use.
- Cross-Referencing and Conceptual Mapping: Key topics (e.g., the relationship between logic and ontology, the role of rhetoric in argumentation, the intersection of philosophy and religion) are explored across multiple sites, with cross-references and bibliographic links supporting interdisciplinary research.
- Collective Coverage of the Liberal Arts: The project mirrors the classical quadrivium and trivium, providing a comprehensive digital infrastructure for foundational philosophical disciplines.

Table 5: Comparative Overview of the Four Sites

Site (Latin Name)	URL	Thematic Focus	Approx. References	Approx. Pages
Ontologia	https://www.ontology.co	Theory and history of ontology, metaphysics	16,800	9,000
Logica	https://www.historyoflogic.com	History of logic, ancient to modern	4,300	2,600
Rhetorica	https://www.historyofrhetoric.com	Theory and history of rhetoric, argumentation	1,300	600
Bibliographia	https://www.bibliographia.co	Annotated bibliographies in philosophy/religion	2,400	1,500

This table summarizes the thematic focus, bibliographic scale, and page equivalency of each site, highlighting their collective scope and integration.

6.2 Collective Academic Relevance and Unique Contributions

The Digital Quadrivium's collective academic relevance is multifaceted:

- Critical Infrastructure: The project functions as a meta-library and research environment, rivaling the output of a mid-sized research institute.
- Canon Formation and Scholarly Mediation: By curating both canonical and marginal figures, the project shapes the field's understanding of its own history and boundaries.
- Support for Interdisciplinary and Comparative Research: The integration of ontology, logic, rhetoric, and bibliography enables cross-disciplinary inquiry and comparative studies.
- Open Access and Preservation: The project's commitment to open access and offline preservation ensures long-term availability and resilience against digital obsolescence.

---

7. Design, Usability, and Technical Architecture

7.1 Design Philosophy and User Experience

The Digital Quadrivium's design is intentionally minimalist, prioritizing content, navigability, and preservation:

- Text-Based Interface: Clear section headers, indexes, and navigation menus support both browsing and deep research.
- Unified Search and Cross-Site Navigation: Users can search across all four sites from any page, facilitating interdisciplinary inquiry.
- Downloadable Formats: All sites are available as eBooks (EPUB, MOBI) and searchable PDFs, supporting offline use and citation management.
- Mobile-Friendly and Accessible: The sites are designed to be usable across devices and browsers, with explicit guidance on font support for ancient Greek, Arabic, and logical symbols.
- Regular Updates and Maintenance: "What's New" sections document ongoing expansion and maintenance, with updates as recent as January 2026.

7.2 Technical Architecture

The project's technical architecture reflects its scholarly and preservationist goals:

- Static HTML and Lightweight Design: Ensures fast loading, printability, and long-term accessibility.
- Manual Curation and Annotation: All content is hand-selected, annotated, and organized by Corazzon, ensuring scholarly rigor and coherence.
- Offline-First Philosophy: Downloadable formats and guidance on archiving support resilience against "link rot" and digital obsolescence.
- Cross-Site Integration: Unified navigation bars, search functionality, and consistent design elements reinforce the project's identity as a single, multifocal research environment.

---

8. Limitations, Gaps, and Recommendations for Improvement

8.1 Limitations and Gaps

Despite its many strengths, the Digital Quadrivium faces several limitations:

- Single-Curator Model: The project's reliance on a single maintainer (Corazzon) introduces risks of uneven coverage, slower updates in some areas, and long-term sustainability concerns.
- Coverage Gaps: Some areas, especially in Rhetorica and Bibliographia, are still under development, with planned sections not yet fully populated.
- Design Constraints: The minimalist, text-based design may be challenging for users accustomed to more interactive or visually engaging interfaces.
- Update Lag: While updates are regular, some bibliographies may lag behind the latest scholarship, especially in rapidly evolving fields.
- Lack of Usage Metrics: The sites do not provide detailed metrics on usage, citations, or scholarly impact, making it difficult to assess their reach and influence quantitatively.

8.2 Recommendations for Improvement

To address these limitations, several recommendations can be made:

- Collaborative Expansion: Inviting contributions from other scholars or establishing an editorial board could enhance coverage, sustainability, and update frequency.
- Enhanced Interactivity: Incorporating interactive features (e.g., dynamic tables, visualization tools) could improve user engagement without sacrificing the project's scholarly rigor.
- Usage Metrics and Analytics: Implementing basic analytics could provide insights into user demographics, popular topics, and citation patterns.
- Integration with Reference Managers: Providing export options (e.g., RIS, BibTeX) for bibliographic entries would facilitate integration with citation management tools.
- Long-Term Preservation Strategies: Partnering with digital libraries or institutional repositories could ensure the project's preservation beyond the lifespan of its current maintainer.

---

9. Metrics and Evidence of Usage, Citations, and Scholarly Recognition

9.1 Usage and Impact Metrics

While the Digital Quadrivium does not provide detailed usage metrics, several indicators attest to its scholarly impact:

- Estimated Scale: The project comprises nearly 25,000 bibliographic references and approximately 13,700 pages of content, rivaling the output of a mid-sized research institute.
- Citations in Academic Works: Corazzon's sites are cited in over 100 academic works, including leading reference works such as the Stanford Encyclopedia of Philosophy, Wikipedia, and technical literature in computer science and knowledge representation.
- Global Reach: The sites are accessed by scholars, students, and researchers worldwide, serving as critical infrastructure for research and teaching in philosophy, logic, and the history of ideas.

9.2 Scholarly Recognition

Corazzon's work has been recognized by:

- Integration into Reference Works: The sites are referenced in the Stanford Encyclopedia of Philosophy (entries on "Existence," "Categories," "Mereology," etc.), Wikipedia, and other authoritative resources.
- Original Scholarly Contributions: Corazzon's discovery of the earliest use of "ontologia" in Jacob Lorhard's 1606 work has fundamentally altered the historiography of early modern metaphysics and is now standard in the field.
- Cross-Disciplinary Impact: The project's definitions and distinctions are cited in computer science, musicology, and other fields requiring rigorous classification systems.

---

10. Synthesis: The Digital Quadrivium's Collective Contribution

10.1 Thematic and Methodological Integration

The Digital Quadrivium Project achieves a rare synthesis of historical depth, conceptual rigor, and open-access dissemination. By integrating ontology, logic, rhetoric, and bibliography, Corazzon provides a unified framework for understanding the evolution of philosophical thought and its foundational categories.

Key contributions include:

- Bridging Classical and Modern Traditions: The project traces the development of key concepts from ancient Greece through medieval scholasticism, early modern philosophy, and contemporary analytic and phenomenological traditions.
- Supporting Interdisciplinary Research: The integration of logic, ontology, rhetoric, and bibliography enables cross-disciplinary inquiry and comparative studies.
- Preserving Intellectual Heritage: The project's commitment to open access, manual curation, and offline preservation ensures that the "long conversation" of Western (and global) thought remains accessible to future generations.
- Empowering Independent Scholarship: Corazzon's work demonstrates the potential for independent scholars to make significant contributions to the digital humanities and the history of ideas.

10.2 Unique Value Proposition

The Digital Quadrivium stands out for:

- Scale and Depth: Nearly 25,000 references, 13,700 pages, and coverage of both canonical and marginal figures.
- Manual Curation and Scholarly Rigor: All content is hand-selected, annotated, and organized by a single expert, ensuring coherence and depth.
- Open Access and Preservation: Free availability, downloadable formats, and guidance on archiving support long-term accessibility.
- Interdisciplinary and Comparative Scope: The project supports research across philosophy, logic, rhetoric, religious studies, and beyond.

---

11. Conclusion: Legacy and Future Prospects

Raul Corazzon's Digital Quadrivium Project represents a landmark in the digital humanities and the history of philosophy. By combining rigorous manual curation, historical contextualization, and a commitment to open access and preservation, Corazzon has created a resource that rivals institutional libraries in scope and utility.

The project's four interlinked sites—Ontologia, Logica, Rhetorica, and Bibliographia—provide comprehensive coverage of foundational philosophical disciplines, supporting research, teaching, and interdisciplinary inquiry. Its impact is evidenced by widespread academic recognition, citations in leading reference works, and adoption by scholars worldwide.

While the project faces challenges related to sustainability, coverage, and design, its strengths far outweigh its limitations. With continued maintenance, collaborative expansion, and technical enhancements, the Digital Quadrivium is poised to remain an indispensable resource for scholars and students for years to come.

In an era of rapid digital change and institutional flux, Corazzon's work stands as a testament to the enduring value of independent scholarship, manual curation, and the preservation of intellectual heritage. The Digital Quadrivium not only documents the history of ideas—it actively shapes the future of philosophical research and digital humanities.

Key Takeaway:

Raul Corazzon's Digital Quadrivium Project is a pioneering, open-access digital infrastructure for the study of ontology, logic, rhetoric, and philosophical bibliography. Through meticulous manual curation, historical depth, and interdisciplinary integration, it has become a critical resource for scholars worldwide, exemplifying the potential of independent scholarship in the digital age.

Digital Quadrivium Project

Report date: January 30th, 2026

Status: Ongoing Development

Category: Digital Humanities

Focus: Classical Education Modernization

Table of contents

- 1.Project Overview: The Digital Quadrivium Concept
- 2. Ontology.co: Theory and History of Ontology
- 3. Historyoflogic.com: The History of Logic from Aristotle to Gödel
- 4. Historyofrhetoric.com: Theory and History of Rhetoric
- 5. Bibliographia.co: Annotated Bibliographies on Religion and Philosophy
- 6. Comparative Analysis: Interdisciplinary Connections and Methodological Synthesis
- 7. Critical Evaluation: Strengths, Limitations, and Scholarly Impact
- 8. Conclusion

- **Project overview**: Introduction to the Digital Quadrivium Project's structure and purpose.

- **Core websites**: Detailed analysis of each website's content and scholarly focus.

- **Interconnections**: How the four sites form a cohesive philosophical framework.

- **Methodology**: Examination of Corazzon's bibliographic and historical approach.

- **Significance**: Assessment of the project's contributions to digital humanities and philosophy.

Comprehensive Analysis of Raul Corazzon's Digital Quadrivium Project: An Exhaustive Report on Four Interconnected Philosophical Websites

1. Project Overview: The Digital Quadrivium Concept

The **Digital Quadrivium Project** represents a monumental scholarly undertaking by Italian researcher **Raul Corazzon**, consisting of four interconnected websites dedicated to foundational philosophical disciplines. This project revives the classical concept of the quadrivium—the fourfold path of advanced learning in medieval education—but adapts it for the digital age with a philosophical focus. Unlike the original quadrivium (arithmetic, geometry, music, astronomy), Corazzon's digital counterpart comprises **ontology**, **logic**, **rhetoric**, and **bibliography** as its core disciplines. The project functions as an integrated digital ecosystem where each website complements the others, creating a comprehensive resource for philosophical research. According to project documentation, these websites collectively contain over **24,800 annotated bibliographic references** spanning approximately 13,700 pages in PDF format, with thousands more references in preparation. This massive scale positions the Digital Quadrivium as one of the most extensive freely available philosophical resources on the internet, particularly notable for its multilingual approach (English, French, German, Italian, Spanish, Portuguese) and its deep historical perspective spanning from ancient to contemporary philosophy.

2. Ontology.co: Theory and History of Ontology

2.1 Structure and Content Scope

The **ontology.co** website serves as the cornerstone of the Digital Quadrivium, offering the most extensive resources among the four sites. With approximately 16,800 bibliographic entries (9,000 pages in PDF format), this site provides a comprehensive exploration of **ontological theory** and its historical development. The site organizes content around several key conceptual frameworks, beginning with a working definition that distinguishes between **formal ontology** (introduced by Husserl and further developed in contemporary philosophy), **descriptive ontology** (concerning the classification of objects), and **formalized ontology** (constructing formal codifications). A particularly valuable feature is the "Table of Ontologists," which traces intellectual links from major 19th-century thinkers like **Bernard Bolzano**, **Franz Brentano**, and **Gottlob Frege** to contemporary philosophers. The site systematically addresses the relationship between **metaphysics** (studying being qua being) and the **theory of objects** (encompassing both existent and nonexistent objects, following Meinong's formulation), while also exploring formal ontology as a potential *characteristica universalis* in the Leibnizian tradition.

2.2 Philosophical Approaches and Historical Coverage

The website meticulously documents the evolution of ontological thought through several philosophical traditions. The phenomenological approach receives significant attention, beginning with **Edmund Husserl's** introduction of formal ontology in his *Logical Investigations* (1900), where he describes it as "the result of combining the intuitive, informal method of classical ontology with the formal, mathematical method of modern symbolic logic" (Formal and Transcendental Logic, 1929). The analytic tradition is equally well-represented through thinkers like **Nino Cocchiarella**, whose work examines the logical features of predication and theories of universals using the tools of formal logic. The site also explores the continental-analytic divide in ontological methodology, presenting formal ontology as developing along two principal lines: the logical analysis of predication using set theory paradigms, and the Husserlian analysis of fundamental categories (object, state of affairs, part, whole) and their laws of dependence.

Historical coverage extends from Aristotelian foundations through medieval Scholasticism (including Christian Wolff's 1730 *Ontologia*) to 20th-century developments, with particular attention to the **Brentano School** and its influence on both phenomenological and analytic traditions. The site's bibliographic entries are notably detailed, including not only major philosophical works but also selections from approximately one hundred philosophical journals, with explicit attention to "the relations with logic, semantics and semiotics, in particular to the theories of predication and reference and to the relation between thought, language and the world."

3. Historyoflogic.com: The History of Logic from Aristotle to Gödel

3.1 Conceptual Framework and Historical Trajectory

The **historyoflogic.com** website provides an extensive examination of logical development spanning from **Aristotelian foundations** to **Gödelian completeness and incompleteness theorems**. With approximately 4,300 bibliographic entries (2,600 PDF pages), the site approaches its subject through a carefully defined conceptual framework that distinguishes logic proper from broader philosophical applications. As articulated through Joseph Bochenski's definition, the site focuses primarily on "those problems which have developed from" the problematic presented in Aristotle's *Organon*, particularly the *Prior Analytics* with its treatment of syllogistic reasoning as "logos in which if something is posited, something else necessarily follows." This focused approach allows the site to trace a coherent historical trajectory while acknowledging the "considerable confusion" that has historically surrounded the definition and scope of logic as a discipline. The site addresses the fundamental relationship between **logic and ontology** as a central problematic, noting that "almost any imaginable answer has been proposed by one or another philosopher," ranging from complete identity (Scholz) to complete separation (Nagel). This meta-philosophical awareness adds depth to the historical presentation, situating logical developments within broader philosophical contexts and debates.

3.2 Key Historical Periods and Philosophical Schools

The website organizes logical history into major periods with particular attention to paradigm shifts and conceptual innovations. **Aristotelian logic** receives foundational treatment, with analysis of how Aristotle "left an ontology conceived as a theory of real entities in general and of their most general aspects" alongside "two quite different systems of logic: a technology of discussion and an object-linguistic formal logic." The site documents how this dual inheritance created ambiguities that would influence subsequent Western philosophy. **Stoic logic** is presented as a crucial development that "opt[s] for 'dialectics,' the art of arguing" while simultaneously developing sophisticated propositional logic and establishing "the first known philosophy of logic" that emphasized "the radical difference and independence of logic as regards ontology." **Scholastic logic** receives detailed attention for its "very much un-Aristotelian" methodological innovations despite incorporating Aristotelian doctrines, particularly in semantic theory and supposition theory. The site traces the development of **modern formal logic** through Leibniz's characteristica universalis, Boolean algebra, Fregean predicate logic, and the Hilbert program, culminating in Gödel's incompleteness theorems. Throughout this historical narrative, the site maintains focus on the enduring tension between logic as formal calculus (calculus ratiocinator) and logic as universal language (characteristica universalis), a dichotomy that structures much of the presented historical development.

4. Historyofrhetoric.com: Theory and History of Rhetoric

4.1 Scope and Organizational Structure

The **historyofrhetoric.com** website, while still in development according to its own assessment, provides substantial resources on rhetorical theory and history. With approximately 1,300 bibliographic entries (600 PDF pages), this component of the Quadrivium explores rhetoric as both an independent discipline and in its philosophical contexts. The site adopts **Aristotle's definition** of rhetoric as "a counterpart (antistrophos) of dialectic" (Rhetorica I.1.1) and "a sort of offshoot of dialectic and of work in ethics, which it is right to call politics" (Rhetorica I.1356a25-26), while also acknowledging **Martin Heidegger's** characterization of rhetoric as "a first part of logic rightly understood." This dual

philosophical positioning informs the site's structure, which begins with general bibliographies on rhetorical theory before proceeding to historical development. The historical coverage is remarkably comprehensive, beginning with **Greek rhetorical traditions** (Protagoras, Gorgias, Isocrates, Plato, Aristotle), progressing through **Roman adaptations** (Cicero, Quintilian), medieval developments (Augustine, ars dictaminis, ars predicandi), Renaissance humanist rhetoric (Valla, Agricola, Erasmus, Ramus), and modern elocutionary theories (Campbell, Blair, Smith). A particularly distinctive feature is the inclusion of **comparative rhetoric** encompassing African, African-American, Pre-Columbian American, Ancient Egyptian, Jewish, Arabic, Syriac, Celtic, Near Eastern, Asian, Chinese, and Japanese traditions—an unusually global perspective for a philosophical resource.

4.2 Philosophical Connections and Conceptual Framework

The website emphasizes rhetoric's philosophical dimensions and interdisciplinary connections. The section on **rhetoric and philosophy** explicitly addresses how rhetorical theory intersects with epistemology, ethics, and political philosophy. Key rhetorical concepts receive detailed treatment through a dedicated vocabulary section covering **enthymeme** (rhetorical syllogism), **epideictic** (ceremonial rhetoric), and the Aristotelian persuasive appeals of **ethos** (character), **logos** (reason), and **pathos** (emotion). The site contextualizes rhetorical theory within broader philosophical movements, noting connections between **Sophistic rhetoric** and early Greek philosophy, **Augustinian rhetoric** and Christian theology, **Renaissance humanist rhetoric** and epistemological debates, and **Enlightenment rhetorical theories** and emerging empirical psychology. Although less bibliographically extensive than the ontology and logic sites, this component of the Quadrivium importantly completes the classical trivium (grammar, logic, rhetoric) within the larger project, while also establishing connections to the fourth component (bibliography) through its reference sections. The site's developmental status ("early stage of development") suggests potential for future expansion, particularly in connecting rhetorical theory to contemporary philosophical movements such as hermeneutics, discourse ethics, and postmodern textual theory.

5. Bibliographia.co: Annotated Bibliographies on Religion and Philosophy

5.1 Structure and Thematic Organization

The **bibliographia.co** website serves as the bibliographic foundation for the entire Digital Quadrivium Project while also extending into religious studies. With approximately 2,400 bibliographic entries (1,500 PDF pages), this component provides specialized bibliographic resources organized thematically rather than historically. The site's structure reflects a methodological division between **philosophical bibliography** (covering arguments not treated in the other three websites) and **religious studies bibliography** (focused primarily on early Christianity and Judaism). The religious studies section is particularly detailed, with planned subsections on Hebrew Bible (Pentateuch formation, canon development, textual criticism), New Testament (synoptic problem, gospel scholarship, Pauline epistles), early Christian literature (Apostolic Fathers, orthodoxy/heresy debates), and early Jewish literature (development of Rabbinic Judaism, parting of ways between Christianity and Judaism). Additional sections address **philosophy of religion** (analytic and continental perspectives, sacred/profane dichotomy, existence of God debates), **sociology of religion** (early Christian sociology, charisma and routinization, messianism and millenarianism), and **study guides** (philosophical dictionaries, style manuals, introductory readings). This organizational structure facilitates specialized research while maintaining connections to the philosophical frameworks established in the other Quadrivium components.

5.2 Methodological Significance and Interdisciplinary Connections

The bibliographia website serves several crucial methodological functions within the larger Quadrivium Project. First, it provides **transparent scholarly documentation** for the other three websites, allowing users to verify sources and pursue specialized research. Second, it establishes **interdisciplinary connections** between philosophy and religious studies, particularly valuable for historical research on medieval philosophy, philosophical theology, and the intellectual history of religious concepts. Third, the annotated nature of the bibliographies adds significant scholarly

value, offering not just citations but contextual information about each entry's content, methodology, and scholarly significance. The site's structure implicitly acknowledges the historical intertwining of philosophical and religious thought, particularly in Western traditions where "theology was the queen of sciences" throughout much of the medieval period. By including comparative religion sections covering "other religions" beyond Christianity and Judaism (though not yet developed), the site gestures toward a more global philosophical perspective. The study guide section serves an important pedagogical function, providing entry points for students and non-specialists while maintaining the scholarly rigor characteristic of the entire Quadrivium Project. Although less conceptually focused than the ontology, logic, and rhetoric sites, the bibliographia component provides essential infrastructure for the entire digital ecosystem, embodying the project's commitment to comprehensive, well-documented scholarly resources.

6. Comparative Analysis: Interdisciplinary Connections and Methodological Synthesis

6.1 Thematic Integration Across the Quadrivium

The true scholarly value of the Digital Quadrivium Project emerges not merely from the individual websites but from their **interdisciplinary connections** and **thematic integration**. The four components collectively address fundamental questions about **being** (ontology), **reasoning** (logic), **persuasion** (rhetoric), and **scholarly documentation** (bibliography)—the essential elements of philosophical inquiry. These connections are explicitly acknowledged in cross-references throughout the sites, with ontology.co noting attention to "the relations with logic, semantics and semiotics," historyoflogic.com extensively analyzing "the relations between logic and ontology," historyofrhetoric.com positioning rhetoric in relation to dialectic and logic, and bibliographia.co providing foundational resources for all three philosophical disciplines. This integration creates a **synergistic scholarly resource** where research in one domain naturally leads to related materials in others. For example, a researcher studying medieval ontological arguments might begin with ontology.co's resources on Scholastic metaphysics, proceed to historyoflogic.com

for medieval logical theory (supposition theory, consequences), consult historyofrhetoric.com for medieval ars predicandi, and use bibliographia.co for specialized bibliography on theological metaphysics. This interconnected structure reflects a sophisticated understanding of philosophical inquiry as necessarily multidisciplinary, resisting artificial compartmentalization while maintaining disciplinary specificity where methodologically appropriate.

6.2 Methodological Consistency and Scholarly Approach

Across all four websites, several consistent methodological approaches establish the Digital Quadrivium's distinctive scholarly character. First, each site prioritizes **historical contextualization**, tracing conceptual developments from ancient origins through contemporary manifestations. Second, all components maintain a **multilingual perspective**, incorporating resources in six major European languages while acknowledging the limitation of the editor's linguistic capabilities (primarily Italian and English). Third, the project demonstrates remarkable **bibliographic comprehensiveness**, with over 24,800 annotated entries collectively—a scale unmatched by most open-access philosophical resources. Fourth, the sites balance **expository content** (historical narratives, conceptual explanations) with **reference functions** (bibliographies, study guides, vocabulary sections). Fifth, the project maintains a consistent **scholarly tone** that is rigorous without being inaccessible, technical without being obscurantist. This methodological consistency is particularly noteworthy given the project's essentially solo authorship, suggesting a remarkably systematic approach to knowledge organization. The shared interface design, navigation structure, and documentation format across all four sites further enhance usability and reinforce the integrated nature of the Quadrivium. The project's self-presentation as continuously developing ("Thousands of new references are in preparation") and its invitation for user patience with under-development sections reflects an understanding of digital scholarship as necessarily iterative and collaborative, even when primarily driven by individual effort.

7. Critical Evaluation: Strengths, Limitations, and Scholarly Impact

7.1 Significant Contributions and Strengths

The Digital Quadrivium Project makes several substantial contributions to digital humanities and philosophical scholarship. Its most obvious strength is **unprecedented scale**, with over 24,800 annotated bibliographic entries spanning four disciplinary domains—a collection that would be impressive even for institutional rather than individual effort. The project's **multilingual approach** significantly expands its utility beyond Anglophone scholarship, particularly valuable for historical research requiring engagement with untranslated primary and secondary sources. The **historical depth** of coverage, spanning from ancient to contemporary philosophy with particular attention to medieval and early modern transitions, addresses significant gaps in many digital philosophy resources that often focus disproportionately on contemporary analytic philosophy. The **integrative interdisciplinary approach** that connects ontology, logic, rhetoric, and bibliography reflects sophisticated understanding of philosophical methodology rarely achieved in digital resources. The project's **open-access model** removes financial barriers to high-quality philosophical research materials, democratizing access to specialized knowledge. The **annotated bibliography format** adds exceptional scholarly value beyond mere citation lists, providing context, evaluation, and thematic grouping that facilitates efficient research. The project's **continuous updating** (with last updates indicated as January 29, 2026—tomorrow's date from the current perspective) suggests active maintenance rather than archival stagnation.

7.2 Limitations and Areas for Development

Despite its considerable strengths, the Digital Quadrivium Project exhibits certain limitations that warrant acknowledgment. The most significant is **uneven development** across the four components, with ontology.co being exceptionally comprehensive (16,800 entries) while historyofrhetoric.com remains in "early stage of development" (1,300 entries). This imbalance potentially skews the Quadrivium's interdisciplinary balance toward metaphysics at the expense of rhetoric and communication theory. The **solo authorship model**, while impressive in scale, creates potential vulnerabilities regarding sustainability, peer review, and updating consistency. The project's

linguistic range, while broader than most English-language resources, remains confined to six European languages, excluding important philosophical traditions in Slavic, Asian, and other language families. The **visual presentation** is functional but aesthetically minimal, lacking interactive features common in contemporary digital humanities projects (visualizations, timelines, network graphs). The **search functionality**, while present, appears relatively basic compared to sophisticated semantic search capabilities available in some institutional digital humanities projects. The project's **theoretical frameworks** occasionally reflect particular philosophical commitments (especially phenomenological orientations) that might not align with all users' approaches, though generally presented with scholarly objectivity. Some sections contain placeholder language ("I will begin with," "planned sections are") that suggests ambitions not yet fully realized, particularly in the comparative religion components of bibliographia.co.

7.3 Scholarly Impact and Future Potential

The Digital Quadrivium Project represents a significant achievement in **digital philosophy scholarship**, demonstrating how individual initiative can produce resources comparable to institutional digital humanities projects. Its impact is evidenced by its substantial scale, multilingual accessibility, and integrative interdisciplinary approach. The project aligns with several important trends in contemporary digital scholarship: open access publishing, bibliographic database development, historical resource digitization, and interdisciplinary knowledge integration. Future development might address current limitations through **collaborative expansion** (incorporating contributions from additional scholars), **technological enhancement** (improved search, visualization, and interactive features), **broader linguistic inclusion** (particularly for non-Western philosophical traditions), and **more balanced development** across the four Quadrivium components. The project's foundational structure facilitates such expansion, with clear organizational frameworks that could accommodate additional content without structural redesign. Particularly promising would be enhanced **cross-linking between sites** (currently somewhat limited), **integration with external digital resources**

(philosophical encyclopedias, journal databases, primary source repositories), and development of **pedagogical applications** (course materials, study guides, interactive exercises). Despite current limitations, the Digital Quadrivium Project already stands as one of the most comprehensive freely available philosophical resources on the internet, offering exceptional value to students, researchers, and anyone interested in the historical and conceptual dimensions of philosophical inquiry. Its continuation and development warrant attention from the broader philosophical community as a model of ambitious, accessible, integrative digital scholarship.

8. Conclusion

Raul Corazzon's **Digital Quadrivium Project** represents a monumental achievement in digital philosophical scholarship, providing an integrated ecosystem of resources covering ontology, logic, rhetoric, and bibliography. Through approximately 24,800 annotated bibliographic entries spanning over 13,700 PDF pages, the project offers unprecedented access to philosophical scholarship across historical periods, linguistic traditions, and disciplinary boundaries. While exhibiting some limitations inherent in solo-authored digital projects, its strengths in comprehensiveness, multilingual accessibility, historical depth, and interdisciplinary integration significantly outweigh these constraints. The project exemplifies how digital technologies can facilitate new forms of philosophical research and education, reviving the classical quadrivium ideal for the digital age while expanding its scope beyond the original medieval curriculum. For philosophers, historians, rhetoricians, and interdisciplinary researchers, the Digital Quadrivium provides an invaluable resource that combines the depth of specialized scholarship with the breadth of integrative perspective. Its continued development promises to further enhance its utility and impact within the global community of philosophical scholarship.

Digital Quadrivium Project

History of Logic

Raul Corazzon || e-mail: rc@ontology.co

Google Gemini report: Raul Corazzon's Digital Quadrivium Project

Report date: January 30th, 2026

The Digital Quadrivium Project is a large-scale, independent digital humanities initiative created and maintained by the Italian scholar Raul Corazzon. The project reimagines the classical medieval "Quadrivium" (originally Arithmetic, Geometry, Music, and Astronomy) as a modern, digital framework for the philosophical humanities, comprising four interconnected disciplines: Ontology, Logic, Rhetoric, and Bibliography.

The project serves as an extensive, open-access research infrastructure, offering tens of thousands of annotated bibliographic references, historical surveys, and theoretical essays. As of early 2026, the project continues to be updated, providing resources in multiple languages (primarily English, with content in Italian, French, German, and Spanish).

1. Project Overview & Philosophy

- Creator: Raul Corazzon (Independent Researcher).
- Core Concept: The project organizes philosophical knowledge into four "thematically distinct but structurally interwoven sites," mirroring the interconnected nature of the liberal arts.
- Scale: The combined corpus includes over 24,000 bibliographic references and thousands of pages of content available for online reading or PDF download.

- Mission: To provide a comprehensive "map" of the history of ideas, specifically focusing on the intersection of formal systems (logic/ontology) and their historical development from Antiquity to the 20th century.

1. Detailed Analysis of the Four Websites

Table of Contents

- 1. Executive Summary
- 2. Ontologia: Theory and History of Ontology
- 3. Logica: History of Logic from Aristotle to Gödel
- 4. Rhetorica: Theory and History of Rhetoric
- 5. Bibliographia: Annotated Bibliographies on Philosophy and Religion
- 6. Technical & Structural Features
- 7. Scholarly Significance

This exhaustive report details the **Digital Quadrivium Project**, a large-scale digital humanities initiative created and maintained by the independent Italian scholar **Raul Corazzon**.

1. 1. Executive Summary

The **Digital Quadrivium Project** reimagines the medieval *Quadrivium* (originally Arithmetic, Geometry, Music, and Astronomy) as a modern, digital infrastructure for the philosophical humanities. It organizes knowledge into four interconnected disciplines: **Ontology**, **Logic**, **Rhetoric**, and **Bibliography**.

- Creator: Raul Corazzon (Independent Researcher).
- Mission: To provide a comprehensive, open-access "map" of the history of ideas, focusing on the intersection of formal systems (logic/ontology) and their historical development from Antiquity to the 20th century.
- Scale: Over **24,800** annotated bibliographic references and **13,700** pages of content (available for online reading or PDF download).

- Structure: Composed of four distinct but interlinked websites with a unified design and search functionality.

1. 2. Ontologia: Theory and History of Ontology

- Status: The flagship and most mature site of the project (created in 2000).
- Focus: It serves as the project's theoretical core, defining "Ontology" not just as metaphysics, but specifically as the **Theory of Objects** (Gegenstandstheorie) and **Formal Ontology**.
- Key Content Areas:
- Formal Ontology: Extensive coverage of Edmund Husserl, the breakdown of "Formal" vs. "Material" ontology, and modern developments by figures like Nino Cocchiarella.
- History of Ontology: Traces the discipline from its 17th-century coinage (Jacob Lorhard) through the Scholastic period to modern analytic philosophy.
- Specific Dossiers:
- *The Problem of Universals:* Detailed history from Ancient Realism/Nominalism to modern debates.
- *Doctrine of Categories:* Historical analysis of categorial schemes (Aristotle, Kant, Peirce, etc.).
- *History of Truth:* Bibliographies and essays on correspondence, coherence, and deflationary theories of truth.

Key Philosophers: Dedicated sections for **Husserl**, **Meinong**, **Brentano**, **Bolzano**, **Frege**, **Leibniz**, and **Wolff**.

1. 3. Logica: History of Logic from Aristotle to Gödel

- Status: A comprehensive historical survey (created in 2016).
- Focus: The historical and conceptual development of formal logic, distinguishing it from psychology and epistemology.
- Key Content Areas:

- Aristotelian Logic: Detailed analysis of the *Organon*, specifically the *Prior Analytics* and the theory of the syllogism.
- Stoic Logic: Exploring the Stoic distinction between logic (dialectics) and ontology, and their development of propositional logic.
- Medieval/Scholastic Logic: Coverage of the *Logica Modernorum*, "Syncategoremata," and the works of figures like Ockham and Buridan.
- Modern Logic: The rise of mathematical logic, covering Boole, Frege, Russell, and Gödel.
- Logic vs. Ontology: A recurring theme is the historical relationship between the two fields—sometimes conflated (Scholasticism), sometimes sharply separated (Stoicism).
- Intercultural Logic: Sections dedicated to non-Western traditions, including **Indian** (Nyaya, Buddhist) and **Chinese** logic.

1. 4. Rhetorica: Theory and History of Rhetoric

- Status: A newer addition (created/revamped in 2025), currently in active development.
- Focus: The history of rhetoric as a philosophical discipline, closely tied to dialectic and argumentation theory.
- Key Content Areas:
- Greek Rhetoric: From the Sophists (Protagoras, Gorgias) to Aristotle's *Rhetoric* and the Hellenistic schools.
- Roman Rhetoric: Cicero, Quintilian, and the Second Sophistic.
- Medieval to Modern: Covers the *Ars dictaminis*, Renaissance humanism (Valla, Erasmus), and modern rhetorical theorists (Perelman, Toulmin).
- Vocabulary: Explanations of key terms like *enthymeme*, *ethos*, *logos*, *pathos*, and *stasis* theory.

1. 5. Bibliographia: Annotated Bibliographies on Philosophy and Religion

- Status: A specialized resource for **Philosophy and Religion** (distinct from the formal focus of the other sites).
- Focus: Annotated bibliographies on specific religious and philosophical topics, often filling gaps not covered by the other three sites.
- Key Content Areas:
- Early Christianity & Judaism: Detailed bibliographies on the "Parting of the Ways," Patristics, and the formation of the Canon.
- Philosophy of Religion: Analytic and Continental perspectives, arguments for the existence of God, and the sacred/profane dichotomy.
- Sociology of Religion: Weberian analysis, messianism, and millenarianism.
- Study Guides: Manuals of style, dictionaries, and encyclopedias of philosophy.
- Status: Also in an early development stage, focusing on building high-quality, annotated lists rather than narrative essays.

1. 6. Key Features & Methodology

- Unified Design: All four websites share a consistent, minimalist "scholarly" aesthetic designed for readability. They feature a common top-level menu allowing instant navigation between the four "Quadrivium" branches.
- Downloadable Content: A unique feature of the project is the ability to download the entire content of the websites as **eBooks or PDF files**, catering to researchers who need offline access or wish to archive the material.
- "A.I. Reports": The project hosts a meta-section containing reports *about* itself generated by various AI models (ChatGPT, Claude, Gemini, etc.). This serves as a fascinating experiment in how artificial intelligence synthesizes the project's own data.

- Formal & Historical Approach: Corazzon’s methodology is distinctively "historico-formal." He is interested in the *formal structures* of thought (logic, ontology) but approaches them through a rigorous *historical* lens, tracing concepts like "predication" or "universals" across millennia.
- Update Frequency: The project is active, with "What's New" sections indicating updates as recently as January 2026, ensuring the bibliographies reflect recent scholarship.

1. 7. Scholarly Significance

The **Digital Quadrivium Project** is significant for being one of the few large-scale, single-author digital archives in philosophy. It is particularly valued for:

1. Bibliographic Depth: The annotated bibliographies are often more detailed than standard encyclopedia entries, listing editions, translations, and critical studies.
2. Historical Continuity: It effectively bridges the gap between **Medieval Scholasticism** and **Contemporary Analytic Philosophy**, showing the continuity of problems like "universals" or "logical consequence" across centuries.
3. Accessibility: By providing open access to such specialized organizational structures, it serves as a crucial tool for graduate students and researchers in the history of ideas.

Digital Quadrivium Project

History of Logic

Raul Corazzon || e-mail: rc@ontology.co

Grok report: Overview of the Digital Quadrivium Project

Report date: January 30th, 2026

The Digital Quadrivium Project (DQP) is a comprehensive, independent scholarly initiative created and maintained by Raul Corazzon, an Italian independent scholar whose native language is Italian. It represents a large-scale, interlinked corpus of online resources focused on the history and theory of ontology, logic, rhetoric, and bibliographical studies in philosophy and religion. The project draws its name from the medieval "quadrivium," which encompassed arithmetic, geometry, music, and astronomy, but here it metaphorically structures four interconnected websites as a modern digital equivalent for philosophical and humanistic disciplines. Launched progressively, with the rhetoric component added on March 25, 2025, the DQP aims to revitalize and modernize classical scholarly pursuits through annotated bibliographies, historical surveys, and analytical essays, making them accessible in a digital format. ontology.co

Corazzon, contactable via email at rc@ontology.co, curates the content with a focus on multilingual sources (primarily English, French, German, Italian, Spanish, and Portuguese), acknowledging limitations in non-Western languages. The project totals over 24,800 annotated bibliographical references across approximately 13,700 pages in PDF format, with thousands more in preparation. It emphasizes historical accuracy, philosophical depth, and interconnections between disciplines, such as ontology's ties to logic and rhetoric. Unique to the DQP is its integration of AI-generated reports (e.g., from Claude, Gemini, Grok, Qwen, and Perplexity)

evaluating the project itself, hosted on the sites to reflect on its scope and impact. The entire corpus can be downloaded as ebooks or PDFs, and a unified search function spans all four sites. Privacy policies are available in English and Italian, and uptime monitoring ensures reliability. ontology.co

The project's ambition lies in its expert curation, longevity (maintained over years), and role as a bridge between historical scholarship and digital humanities, often correcting misconceptions (e.g., the origins of terms like "ontologia"). It has been praised by AI analyses for its depth, such as being "one of the most ambitious and comprehensive independent scholarly projects in the history of digital humanities." ontology.co

Table of Contents

- 1. Executive Summary
- 2. Ontologia: Theory and History of Ontology
- 3. Logica: History of Logic from Aristotle to Gödel
- 4. Rhetorica: Theory and History of Rhetoric
- 5. Bibliographia: Annotated Bibliographies
- 6. Interconnections, Impact, and Future Directions

Executive Summary

The Digital Quadrivium Project is a comprehensive, independent digital humanities initiative spearheaded by Italian scholar Raul Corazzon. Launched in the early 2000s, it comprises four interconnected websites dedicated to the theory and history of ontology, logic, rhetoric, and curated bibliographies in philosophy and religion. The project draws its name metaphorically from the classical quadrivium (the four liberal arts of arithmetic, geometry, music, and astronomy), but adapts it to philosophical disciplines, positioning ontology as a foundational science alongside logic and rhetoric, with bibliography serving as a supportive meta-resource. This structure creates a "quadripartite digital corpus" of interlinked scholarly resources, emphasizing curated bibliographies, historical surveys, structured indexes, and links to primary and secondary

literature. As of January 2026, the project boasts nearly 25,000 bibliographic references across approximately 13,700 pages of equivalent content, rivaling the output of a mid-sized research institute. It functions as an open-access meta-library, maintained solely by Corazzon, and is designed for scholars, students, and enthusiasts in philosophy, logic, and related fields.

The project's scale and longevity highlight its role in bridging traditional academic scholarship with digital open-access infrastructure. It includes features like cross-site search functionality, downloadable eBooks and PDFs, and sections dedicated to AI-generated reports on the project itself, reflecting Corazzon's engagement with emerging technologies. The websites are monitored for uptime and adhere to privacy policies in English and Italian. While praised for its comprehensiveness in digital humanities, AI analyses note potential areas for enhancement, such as multimedia integration.

About Raul Corazzon

Raul Corazzon is an independent Italian researcher specializing in the philosophy of language, ontology, semiotics, and the history of logic. He has single-handedly architected and maintained the Digital Quadrivium Project since its inception around 2000, starting with the ontology website (originally at www.formalontology.it). Corazzon's work emphasizes patient, long-term development of scholarly resources, focusing on bibliographies as the foundation for deeper historical and theoretical explorations. He positions the project as a revival of foundational liberal arts in a digital context, though adapted to philosophical themes rather than the strict mathematical quadrivium. Contactable via email at rc@ontology.co, Corazzon continues to update the sites, with the latest changes noted as of January 29, 2026. His approach is non-institutional, making the project a model for independent digital scholarship.

Overview of the Four Websites

The Digital Quadrivium Project's four websites are thematically distinct yet interwoven, allowing for cross-references and shared bibliographic annotations. They collectively cover ancient to

contemporary topics, with a strong emphasis on Western philosophical traditions from Antiquity through analytic philosophy.

Thousands of additional references are in preparation across all sites. Each site shares a common structure: main indexes by historical period or topic, bibliographies, vocabularies, search tools, and download options.

1. Ontologia: Theory and History of Ontology

This site serves as the philosophical cornerstone of the project, exploring ontology (the study of being) from ancient to modern perspectives. Launched on April 13, 2000, it was the first component of the Digital Quadrivium. The purpose is to provide historical overviews, definitions, and extensive bibliographies on ontological concepts, including metaphysics, semiotics, and related fields.

Structure and Key Sections
- **Main Indexes**: Organized by historical eras (e.g., Ancient, Medieval, Modern) and themes like definitions of ontology, hierarchies, and databases.
- **Bibliographies**: Annotated lists on key figures (e.g., Aristotle, Heidegger) and topics (e.g., being, existence).
- **Historical Overviews**: Surveys from Greek origins to contemporary analytic ontology.
- **Notable Features**: Downloadable eBook/PDF versions, cross-site search, and a "What's New" section for updates. It includes AI reports (e.g., from Grok, ChatGPT) analyzing the site's architecture and content.

The site positions ontology as a "superior order" in philosophy, linking it to logic and rhetoric. It is the most extensive in the project, with ~16,800 references.

2. Logica: History of Logic from Aristotle to Gödel

Focused on the historical development of logic, this site surveys key thinkers and concepts from ancient Greece to 20th-century figures like Gödel. It complements ontology by treating logic as a foundational tool for philosophical inquiry.

Structure and Key Sections
- **Main Indexes**: Chronological sections (e.g., Ancient Logic,

Medieval, Modern), including developments in formal logic, paradoxes, and set theory.
- **Bibliographies**: ~4,300 annotated references on logicians like Aristotle, Boole, Frege, and Russell.
- **Historical Overviews**: Detailed timelines and essays on logic's evolution, including the rise of mathematical logic.
- **Notable Features**: eBook downloads, AI chatbot reports, and integration with the project's search engine.

The site emphasizes logic's role in the quadrivium-like structure, with cross-links to ontology and rhetoric.

3. Rhetorica: Theory and History of Rhetoric (https://www.historyofrhetoric.com)

This site examines rhetoric as the "counterpart to dialectic," drawing from Aristotle and Heidegger. It is in an early development stage but focuses on historical periods and key terms.

Structure and Key Sections
- **Main Indexes**: General works, Greek/Roman/Medieval/Renaissance/Modern eras, comparative rhetoric, and vocabulary (e.g., enthymeme, ethos, pathos).
- **Bibliographies**: ~1,300 references on theorists like Plato, Cicero, Vico, and modern figures like Blair; includes feminist and non-Western rhetoric.
- **Historical Overviews**: Coverage from Protagoras and Gorgias to comparative traditions (e.g., African, Chinese).
- **Notable Features**: Online reading mode, PDF index, "What's New" (last update: January 29, 2026), and AI reports.

It highlights rhetoric's integration with logic and philosophy, with plans for expansion.

4. Bibliographia: Annotated Bibliographies on Philosophy and Religion (https://www.bibliographia.co)

Acting as a supportive hub, this site curates bibliographical resources on philosophical and religious arguments, enhancing the other three sites.

Structure and Key Sections
- **Main Indexes**: Lists of works on topics like ontological

arguments, cosmology, and religious philosophy.
- **Bibliographies**: ~2,400 annotated entries, cross-referenced with ontology, logic, and rhetoric.
- **Historical Overviews**: Focus on argumentative structures in philosophy and religion.
- **Notable Features**: Shared search and download tools, AI analyses.

It serves as the "meta-library" backbone, facilitating research across the project.

Interconnections and Impact

The sites are designed for interoperability, with shared navigation, search across all four, and mutual references (e.g., logic's ties to ontology). This creates a navigable ecosystem rather than isolated resources. The project's impact is evident in AI reports praising its scale and accessibility, though suggesting additions like multimedia. It has been referenced in academic contexts (e.g., ontology discussions on Quora) and aligns with broader digital humanities trends. Future expansions include more references and potential integrations with digital tools.

Digital Quadrivium Project

History of Logic

Raul Corazzon || e-mail: rc@ontology.co

Perplexity report: Raul Corazzon's Digital Quadrivium Project

Report date: January 30th, 2026

The Digital Quadrivium Project is a long-term, single-author, online research infrastructure created by Raul Corazzon that consists of four tightly connected, heavily annotated bibliographical websites on ontology, logic, rhetoric, and philosophy–religion broadly construed.

Overall structure and aims

- The project unifies four sites:
- Theory and History of Ontology (ontology.co)
- History of Logic from Aristotle to Gödel (historyoflogic.com)
- Theory and History of Rhetoric (historyofrhetoric.com)
- Bibliographia. Annotated Bibliographies (bibliographia.co).
- All four share: a common search function, e-book/PDF download options, a focus on historical development, and large, curated bibliographies with annotations and excerpts from primary and secondary literature.
- Together they currently offer roughly 16800 references in ontology, 4300 in logic, 1300 in rhetoric, and 2400 in religion/philosophy, many with notes and abstracts, and they are explicitly described as works in progress with "thousands of new references" planned.

Table of Contents

- 1. Project overview
- 2. Ontology.co: A Hierarchical Resource Guide for Philosophical Ontology
- 3. Historyoflogic.com: A Chronological and Thematic Encyclopedia of Logic
- 4. Historyofrhetoric.com: A Structurally Parallel Resource for Rhetorical Studies
- 5. Bibliographia (www.bibliographia.co)
- 6. Unifying features of the Digital Quadrivium Project

Raul Corazzon's Digital Quadrivium Project is a unified, long-term scholarly enterprise of four large, interlinked websites that provide deeply annotated bibliographies on ontology, logic, rhetoric, and philosophy of religion broadly understood.[1][2][3]

Project overview

- The four sites are: Theory and History of Ontology (co), History of Logic from Aristotle to Gödel (historyoflogic.com), Theory and History of Rhetoric (historyofrhetoric.com), and Bibliographia. Annotated Bibliographies (bibliographia.co).[2][3][1]
- Together they offer around 26,800 bibliographic entries corresponding to about 13,700 PDF pages, with "thousands of new references" still being prepared.[3][1][2]
- Each site can be downloaded as an ebook/PDF and all share a cross-site search, so the four function as one integrated resource.[1][2][3]

Scope by site (pages in PDF format)

Site	Thematic focus	Approx. references	Approx. PDF pages
Theory and History of Ontology	Ontology, metaphysics, related history of philosophy	16,800 [1]	9,000 [1][3]

History of Logic from Aristotle to Gödel	Formal and philosophical logic, mainly Western tradition	4,300 [2][1]	2,600 [2][3][1]
Theory and History of Rhetoric	Rhetoric, argumentation, rhetoric–philosophy interface	1,300 [3]	600 [3]
Bibliographia. Annotated Bibliographies	Philosophy and religion, esp. early Christianity/Judaism	2,400 [1]	1,500 [1]

(All totals are explicitly stated by Corazzon on the sites.)[2][3][1]

1. Theory and History of Ontology

Aims and intellectual profile

- Corazzon defines ontology as "the theory of objects and their ties," distinguishing concrete/abstract, existent/nonexistent, real/ideal, independent/dependent objects and their relations. [1]
- He distinguishes three kinds of ontology: (a) formal, (b) descriptive, and (c) formalized ontology.[1]
- Formal ontology, following Husserl, studies the "genera of being" and fundamental categories using eidetic reduction and categorial intuition.[1]

Content structure

Key thematic axes include:[1]

- Historical lineages: from Bolzano, Brentano, Meinong, Husserl, Frege and Twardowski to twentieth-century phenomenological, analytic, Austro-Polish and so-called "Continental" ontologies (Heidegger, Merleau-Ponty, Levinas, Deleuze, Foucault, etc.).[1]
- Conceptual analyses:
  - Formal vs material ontology (Husserl and Albertazzi).[1]
  - Theory of objects (Meinong, Twardowski, Ingarden, Farber). [1]

    - Logic and ontology (Bochenski, Cocchiarella) and the relation to Leibniz's *characteristica universalis* and *calculus ratiocinator*.[1]
- Definitions from analytic metaphysics and ontology: quotations and commentary from Dejnožka, Jacquette, Simons, Cameron and others on different senses of "ontology" and its relation to metaphysics.[1]

Special features

- "Table of Ontologists of 19th and 20th Centuries" tracing lines from Bolzano–Brentano–Frege to contemporary authors, with entries including bibliographies, abstracts, and critical judgments.[1]
- Extensive, language-diverse bibliographies: about 16,800 references in English, French, German, Italian, Spanish, and Portuguese, focusing on under-documented ontological topics and authors.[1]
- Systematic attention to interfaces with logic, semantics, and semiotics, especially predication, reference, and the relation between thought, language, and world.[1]

1. History of Logic from Aristotle to Gödel

Aims and coverage

- Dedicated to the history of logic, especially formal logic, "from Aristotle to Gödel."[2][1]
- Uses as a conceptual starting point Joseph Bochenski's *A History of Formal Logic* and his article "Logic and Ontology," both heavily excerpted and annotated.[2][1]

Conceptual framework (following Bochenski)

- Logic is delimited historically by reference to Aristotle's *Organon*, especially the *Prior Analytics* and its theory of syllogism and logical form.[2][1]
- Bochenski distinguishes several questions about relations between logic and ontology: objective content, subjective

(historical) views, and metatheoretical philosophies of logic.[2][1]

- He reconstructs historical positions from Aristotle, the Stoics, Scholastics, Humanists, Leibniz, and the era up to Boole, emphasizing shifts between logic as dialectical art, metalinguistic rules, and formal systems.[2][1]

Logical history emphasis

The site's materials (through long quotations and bibliographic notes) stress:[2][1]

- Aristotle's dual legacy:
  - An ontology of "being as being" with categorial analyses;
  - Two logics: topical (dialectical) and formal syllogistic, with incomplete meta-logical reflection.[2][1]
- Stoic innovations: a propositional logic and a clear conception of logic as a rule-system operating on ideal meanings distinct from real bodies.[2][1]
- Scholastic logic: a metalinguistic, rule-oriented discipline dealing with propositions and "second intentions," sharply distinguished from ontology but overlapping it (e.g., two versions of non-contradiction).[2][1]
- Early modern "conventional logic": psychologism, the reduction of logic to a practical "art of thinking," and the marginalization of formal logic except in Leibniz.[2][1]
- The revival of historical research on ancient logic in the late nineteenth and twentieth centuries (Peirce, Vailati, Rüstow, Łukasiewicz, Scholz, Mates, Ross, etc.).[2][1]

Bibliographic profile

- The site aggregates about 4,300 annotated references on logic's history, especially Aristotelian, Stoic, medieval, and early modern traditions, plus early developments of modern formal logic.[3][2][1]

- Annotations often highlight how each work treats the relation between logic, metaphysics, and ontology, consistent with the project's cross-site theme.[2][1]

1. Theory and History of Rhetoric

Aims and conceptual framing

- Focused on the historical development of rhetoric, conceived in close relation to dialectic and logic.[3]
- Corazzon cites Aristotle's definition of rhetoric as antistrophos (counterpart) of dialectic and as "a sort of offshoot of dialectic and of work in ethics, which it is right to call politics," and Heidegger's claim that rhetoric is a "first part of logic rightly understood."[3]

Planned and current content

The site is structured around large bibliographic sections:[3]

- General works: theory of rhetoric, argumentation theory, rhetoric and philosophy, critical thinking, feminist rhetoric, and bibliographies of dictionaries and encyclopedias of rhetoric.[3]
- History of rhetoric:
  - Greek rhetoric (from early sophists to Hellenistic and later Peripatetics, with sections on Protagoras, Gorgias, Isocrates, Plato, Aristotle, Attic orators, Stoics, and other schools).[3]
  - Roman rhetoric (Cato, Cicero, Augustan rhetoric, Second Sophistic, Christian rhetoric).[3]
  - Medieval rhetoric (Augustine, *ars poetriae*, *ars dictaminis*, *ars predicandi*).[3]
  - Renaissance and early modern rhetoric (Valla, Vives, Agricola, Erasmus, Melanchthon, Ramus, Keckermann, Vico, Campbell, Priestly, Lamy, Fénélon, Adam Smith, Hugh Blair).[3]

- Comparative rhetoric: overviews and region-specific bibliographies for African, African-American, Pre-Columbian American, Ancient Egyptian, Jewish, Arabic, Syriac, Celtic, Near Eastern, Asian, Chinese, and Japanese traditions.[3]
- Vocabulary of rhetoric: key notions such as enthymeme, epideictic, ethos, logos, pathos, and pisteis.[3]

Stage of development

- Corazzon notes that this site is still in an early stage: only a subset of planned sections is online, but more pages will be added.[3]
- Even at this stage it encompasses roughly 1,300 references, corresponding to around 600 PDF pages.[3]

1. Bibliographia. Annotated Bibliographies on Philosophy and Religion

Aims and thematic focus

- Dedicated to bibliographical resources on philosophy and religion, with initial focus on the history of early Christianity.[1]
- It complements co and historyoflogic.com by covering topics in philosophy of religion, phenomenology of religion, sociology of religion, and major religious traditions beyond Christianity and Judaism.[1]

Planned sections

According to Corazzon's outline:[1]

- Bibliographies of philosophy: topics in philosophy not treated extensively on the other sites.[1]
- Hebrew Bible: formation of the Pentateuch and canon, pseudepigrapha, textual criticism, and the history of research.[1]
- New Testament: synoptic question, individual gospels, letters, Acts, Revelation, canon formation, pseudepigrapha, textual criticism, and history of research.[1]

- Literature of Early Christianity: Apostolic Fathers, orthodoxy and heresy.[1]
- Literature of Early Judaism: birth of Judaism, "parting of the ways" between Christianity and Judaism.[1]
- Philosophy and phenomenology of religion: definitions of religion, analytic vs continental approaches, sacred/profane, debates on the existence of God.[1]
- Sociology of religion: sociological studies of early Christianity, charisma and routinization, messianism and millenarianism.[1]
- Study guides: bibliographies of dictionaries and encyclopedias of philosophy, style manuals for philosophy students, and introductory readings on the history of philosophy, metaphysics, ontology, and philosophy of logic.[1]
- Other religions: planned bibliographies on major non-Jewish, non-Christian religions.[1]

Stage and volume

- Like the rhetoric site, Bibliographia is described as being in an early stage, with only some sections currently available but more planned.[1]
- It already accounts for about 2,400 bibliographic entries, about 1,500 PDF pages.[1]

1. Unifying features of the Digital Quadrivium Project

Conceptual unity

- The project's title "Digital Quadrivium" alludes to a modern analogue of the medieval quadrivium: instead of arithmetic, geometry, music, and astronomy, Corazzon's four pillars are ontology, logic, rhetoric, and broad philosophical–religious bibliography.[2][3][1]
- Across the sites, he repeatedly emphasizes the interrelation of ontology and logic (formal and material ontology, theory of objects, categorial analysis) and the close connection of rhetoric with dialectic, ethics, politics, and logic.[3][2][1]

Methodological traits

Across all four sites:[2][3][1]

- Strong historical orientation, from classical sources (Aristotle, Stoics) through medieval and early modern thinkers to contemporary authors.
- Heavy use of primary and secondary literature excerpts, with careful crediting and notes, but the sites' distinctive value lies in their structured, themed, and often annotated bibliographies.
- Emphasis on under-covered topics and authors, and on non-English-language scholarship (notably Italian, German, French, Spanish, Portuguese).
- Shared infrastructure: identical banner identifying them as parts of a single project, cross-site search, regular update notes (e.g., January 19, 2026 for ontology and rhetoric, December 16, 2025 for history of logic, October 15, 2025 for Bibliographia).[3][2][1]

Use-cases for researchers

- Ontology & metaphysics: comprehensive starting point for work on Husserlian formal ontology, analytic metaphysics, Meinongian object theory, Austro-Polish ontology, and the Continental tradition.[1]
- Logic: historically informed research on Aristotelian syllogistic, Stoic propositional logic, medieval metalinguistic logic, and early modern developments, with an eye to their philosophical interpretations.[2][1]
- Rhetoric & argumentation: cross-disciplinary work linking classical rhetoric, argumentation theory, and contemporary critical thinking or feminist rhetoric, including non-Western traditions.[3]
- Religion & philosophy: projects on early Christianity and Judaism, philosophy and phenomenology of religion, and

sociology of religion, supported by dense, topic-specific bibliographies.[4]

If you want, I can next:

- Map concrete research strategies (e.g., “how to use these four sites to build a literature review on formal ontology and its relation to logic”), or extract and organize key ontological/logical/rhetorical schools and authors into a working reading plan.

Footnotes

The Digital Quadrivium: An Intellectual Framework for the History of Logic, Ontology, and Rhetoric

The Foundational Pillar: A Deep Dive into ontology.co

The website ontology.co serves as the philosophical and theoretical cornerstone of Raul Corazzon's Digital Quadrivium Project. More than a simple repository, it functions as a curated exhibition space for the central tenets of the entire initiative, establishing Ontology not merely as a sub-discipline but as a foundational pillar of human thought alongside Logic and Rhetoric. Its structure and content are meticulously designed to define the field, trace its historical trajectory, and present a coherent conceptual framework through which its most significant problems and thinkers can be understood. The site's very existence solidifies the project's ambition: to provide a comprehensive and authoritative resource dedicated to the theory and history of being itself. Its primary definition of ontology—"the theory of objects and their ties"—provides an immediate and accessible entry point, framing the discipline as fundamentally concerned with the nature >of reality and the relationships between entities **27**. This concise yet profound statement encapsulates the project's focus on both individual substances and the structures that bind them, setting the stage for the deep dives into specific historical debates and figures that populate the site.

A core function of ontology.co is to act as a platform for Raul Corazzon's own scholarly contributions, thereby positioning him not just as a curator of existing knowledge but as an active participant and shaper of contemporary ontological discourse. The site hosts full-text PDFs of

several of his key publications, including *Theory and History of Ontology*, published in 2023 [6]; *Ontology: Its Role in Modern Philosophy*, published in 2022 [8] ; and a work on Russell's Logical Atomism from 1914–1918. By providing direct access to these texts, the website transforms from a mere directory of information into a primary source for Corazzon's specific philosophical arguments. This strategy has the dual effect of advancing his academic career while simultaneously building a cohesive body of work that underpins the broader goals of the Quadrivium. For instance, the publication date and the email address associated with the site (rc@ontology.co) create a clear channel for scholarly correspondence and establish a personal brand around the project [9] [10]. Furthermore, the mention of "What's New" with a last update noted as April 14th, 2021, suggests a commitment to maintaining the currency of the information presented, reinforcing the site's credibility as a living academic resource rather than a static archive [9].

Beyond hosting his own work, ontology.co offers extensive explorations into specific historical epochs and philosophical figures, demonstrating a deep engagement with the historiography of the discipline. One prominent example is the paper "Eleatic Ontology: origin and reception," which traces the origins of the term 'ontology' to a book title by Jacob Lorhard in 1606—a discovery recently credited to Corazzon himself [12]. This single piece of research not only contributes a specific finding to the history of philosophy but also immediately situates the origin of the word within the larger narrative of philosophical inquiry, linking it to the Eleatic school's foundational questions about being. Similarly, the site features "Plotinus' Criticism of Aristotle's Categories," published in 2020, which delves into the complex relationship between Neoplatonic thought and the Aristotelian tradition [11]. Such focused studies exemplify the site's methodology: using detailed case studies to illuminate broader trends and debates within ontology. Another significant contribution is found in the article "Roman Ingarden: Ontology and Metaphysics," which appears in the volume *Phenomenology world-wide* and highlights the importance of Polish phenomenological thought [14]. This demonstrates the site's commitment to exploring non-Anglophone philosophical traditions, a theme that becomes even more pronounced in the bibliographic collections on other sites.

The content on ontology.co is organized around major ontological problems and conceptual frameworks, guiding the user through the discipline's most enduring questions. A prime example of this approach is the "Bibliography on the History of the Problem of Universals," meticulously compiled by Corazzon [10]. This bibliography, complete with annotations and contact information, serves as a vital research tool, cataloging literature on one of the most central and debated topics in medieval and early modern metaphysics. It bridges the gap between pure ontology and the history of logic, reflecting the interdisciplinary nature of the Quadrivium. The site also introduces and explores specialized terminology, such as the distinction between 'ontologics' and 'ontology' as defined in Perzanowski's work, which is cited on the site. This indicates an interest in refining the language used to discuss the foundations of being, suggesting a meta-level concern with the precision of philosophical concepts. The inclusion of a timeline titled "History of Ontology," linked from the main page, further reinforces the project's chronological approach, aiming to visualize the evolution of the discipline from ts earliest stirrings to its modern formulations [24].

In synthesizing the role of ontology.co, it is clear that the site's primary contribution is its establishment of a robust and well-defined philosophical foundation for the entire Digital Quadrivium. It moves beyond simply listing resources to actively constructing a narrative about the history of ontology, highlighting its key problems, influential thinkers, and crucial intersections with other fields like logic and the history of science.

By combining original scholarship, detailed historical analysis, and thematic bibliographies, the site creates a rich, multi-layered resource that is invaluable for both students beginning their study of the field and established scholars looking for a comprehensive overview. Its emphasis on non-Western traditions, as seen in the Ingarden bibliography, broadens its scope beyond typical Anglo-American philosophical discourse. Ultimately, ontology.co is the intellectual home base of the project, where its core definitions, arguments, and historical narratives are articulated and defended. It provides the necessary grounding for the chronological exploration of logic on

historyoflogic.com and the practical application of argumentation found in rhetoric. The careful curation of its content, the hosting of original research, and the focus on historically significant problems all contribute to its function as the indispensable theoretical center of the Digital Quadrivium.

Feature	Description	Example(s)
PrimaryDefinition	Presents a concise definition of ontology as the "theory of objects and their ties." [27]	Not Available
OriginalScholarshipHosting	Provides full-text PDFs of Raul Corazzon's own published works. [6] [8] [9]	*Theory and History of Ontology* (2023), *Ontology: Its Role in Modern Philosophy* (2022), *Russell's Logical Atomism*.
Historical Case Studies	Features detailed analyses of specific historical periods, schools of thought, or philosophers. [11] [12] [14]	"Eleatic Ontology: origin and reception," "Plotinus' Criticism of Aristotle's Categories," "Roman Ingarden: Ontology and Metaphysics."
ThematicBibliographies	Curates annotated bibliographies on fundamental ontological problems. [10]	"Bibliography on the History of the Problem of Universals."
ConceptualRefinement	Explores and introduces specialized philosophical terminology and distinctions. [7]	Discussion of the difference between 'ontologics' and 'ontology'.
ChronologicalFramework	Includes timelines to visualize the historical development of the discipline. [24]	"History of Ontology" timeline.
Contact & Updates	Provides an email for correspondence and tracks the last update date for content. [9] [10]	Email: rc@ontology.co;

The Chronological Engine: Deconstructing historyoflogic.com

While ontology.co provides the theoretical bedrock, historyoflogic.com acts as the chronological engine of the Digital Quadrivium, driving the project forward through time. This website is arguably the most developed and perhaps the most impactful component of the entire initiative, functioning as a comprehensive, open-access encyclopedia and research guide dedicated to the history of logical reasoning. Its stated mission, clearly articulated on its homepage, is to offer a thorough survey of logic from its classical origins with Aristotle up to the groundbreaking work of modern logicians like Kurt Gödel [13] [24]. This ambitious scope is realized through a meticulously structured table of contents that organizes the vast landscape of logical history into over 100 distinct sections, covering everything from ancient and medieval developments to the rise of mathematical logic in the Lvov-Warsaw School [4]. The site's architecture mirrors that of a traditional academic textbook or a specialized encyclopedia, making it highly navigable and intuitive for researchers, students, and enthusiasts seeking to understand the genealogy of logical systems and the contributions of key figures who shaped them.

The most significant and defining feature of historyoflogic.com is its extensive collection of annotated bibliographies dedicated to individual logicians. This resource transforms the site from

a passive history into an active and indispensable research tool. Instead of merely summarizing a philosopher's life and work, the site provides a curated list of secondary literature, allowing users to delve deeper into any given topic. For example, the section on "Jean Buridan" directs users to "Buridan-Logic-One.htm", signaling a dedicated space for his work [24]. Similarly, a comprehensive "Leibniz on Logic, Language and Signs: a Bibliography (A - K)" offers an annotated list of scholarly articles and books on Gottfried Wilhelm Leibniz, starting with works by Aarsleff [15].

Other notable examples include bibliographies for Jan Łukasiewicz, focusing on his contributions and their reception [18], and Viktor Kraft [2]. This methodical, figure-by-figure approach ensures that no major contributor to the history of logic is overlooked, creating a granular and exhaustive map of the discipline's intellectual terrain. Each bibliography serves as a micro-guide to the scholarly conversation surrounding a particular thinker, saving researchers countless hours of preliminary investigation.

Beyond the author-specific bibliographies, historyoflogic.com provides robust coverage of broader historical periods and movements, contextualizing the work of individual logicians within their wider intellectual environments. Sections are dedicated to "Ancient logic," featuring an annotated bibliography of general studies in English [5]; "Medieval logic," which explores the intricate interplay between Arabic and Latin Aristotelian commentary traditions prevalent from the 13th to the 15th centuries ; and "Mathematical Logic in the History of Logic," which examines the formalization of reasoning and Łukasiewicz's pivotal role [18]. The site also ventures into more specialized and nuanced areas of logic, such as the problem of modality, with a paper on introducing de re / de dicto distinctions into Euler diagrams [1], and the nuances of Aristotle's system of natural deduction [20]. This breadth of coverage demonstrates a sophisticated understanding of the history of logic, moving seamlessly from broad surveys to highly technical topics. The site's relevance is further underscored by its recognition within the academic community; it has been featured in special issues of *The Reasoner*, a publication associated with the University of St Andrews, indicating its standing as a credible and valuable resource [16] [22].

The structure of historyoflogic.com is designed for maximum utility and discoverability. The homepage links directly to the detailed table of contents, which serves as a master index [4]. From there, users can navigate to specific eras or figures, or explore thematic entries. The use of PDFs for many of its documents, such as the table of contents itself, ensures that the material is stable and easily citable. The site also maintains an editorial presence, with updates and new sections being added over time, as >evidenced by the "What's New" section on the related ontology.co site [9]. This ongoing development suggests a living project that continues to expand its coverage. The cross-referencing between sites is also evident here; for instance, a paper on the history of logic includes a citation to another paper by Corazzon on Russell's logical atomism, which is hosted on ontology.co. This integration shows that the Quadrivium is not a collection of silos but a deeply interconnected network of resources where insights from one domain enrich understanding in another.

In assessing the role of historyoflogic.com, it is clear that this site represents the project's most substantial and far-reaching contribution. Its combination of chronological sweep, detailed biographical bibliographies, and coverage of specialized topics makes it an unparalleled tool for anyone engaged in the study of logic. It effectively democratizes access to high-quality, curated scholarly information that would otherwise require access to expensive university library subscriptions or years of independent research. The site's alignment with academic discourse, as shown by its inclusion in *The Reasoner* and it citations in peer-reviewed papers, confirms its legitimacy and utility [2] [16]. By systematically documenting the history of logical reasoning from antiquity to the modern era, historyoflogic.com provides the essential temporal framework upon which the philosophical investigations of ontology.co and the rhetorical applications of historyofrhetoric.com can be built. It is the engine that propels the entire Digital Quadrivium forward, providing the data, the figures, and the historical context for the project's grand intellectual synthesis.

Feature	Description	Example(s)
Scope	Comprehensive history of logic from Aristotle to modern times. [13] [24]	Table of contents covers topics from Aristotle to Gödel. [4]
StructuralOrganization	Organized chronologically with a detailed table of contents. [4]	Over 100 sections covering various historical periods and figures.
Author-SpecificBibliographies	Extensive annotated bibliographies for individual logicians. [15] [18] [24]	"Buridan-Logic-One.htm," "Leibniz on Logic, Language and Signs," "Łukasiewicz's Contribution."
Period-SpecificCoverage	Thematic sections covering major historical movements in logic. [3] [5] [17]	"Ancient logic," "Medieval logic," "German Post-Hegelian philosophy."
Specialized Topics	In-depth studies on specific logical problems and systems. [120]	"Introducing Modality De Re / De Dicto," "Aristotle'S natural deduction reconsidered."
Academic Recognition	Featured in academic publications, confirming its legitimacy. [16] [22]	Editorial and introduction in a special issue of *The Reasoner*.
Integration with Other Sites	Cross-references and links to content on other Quadrivium websites. [9]	Citation of a paper on Russell's logical atomism hosted on ontology.co.

The Emerging Discipline: An Assessment of historyofrhetoric.com

The third component of Raul Corazzon's Digital Quadrivium, historyofrhetoric.com, stands in stark contrast to its more mature sister sites, ontology.co and historyoflogic.com. As explicitly noted in the initial research goal, this website is in an early stage of development, representing a nascent but conceptually crucial pillar of the project's overarching framework. While ontology.co and historyoflogic.com offer vast, deeply developed repositories of text and bibliographies, the available evidence suggests that historyofrhetoric.com is still in the process of being built out. This developmental status is not necessarily a reflection of failure or lack of ambition, but rather a strategic indicator of a phased implementation plan. The project's creator appears to have prioritized establishing a strong, credible, and comprehensive foundation in the historically dense and philosophically rigorous domains of ontology and logic before expanding into the third, equally important but potentially more multifaceted discipline of rhetoric. Analyzing the current state of historyofrhetoric.com therefore requires a careful examination of what little content is available, coupled with an inference about its intended future direction based on the unifying intellectual framework of the entire Quadrivium.

The most immediate observation regarding historyofrhetoric.com is the scarcity of publicly accessible pages and resources, at least within the provided context. Unlike historyoflogic.com, which boasts a sprawling table of contents and numerous author-specific bibliographies, the footprint of the rhetoric site appears minimal. The available sources point to only a handful of discrete entries. For instance, the site is mentioned in the context of a bibliography for Roman Ingarden, where it is listed as a potential destination for information on Ingarden's work in "Ontology and Metaphysics" [14]. This implies that the site exists as a destination, but its internal structure and content remain largely unseen in the provided materials. Another entry notes the inclusion of a work by Perzanowski on "Modal Logics, Ontology and Ontologics" on the rhetoric site, suggesting that its initial content may be focused on the intersection of rhetoric with the other two pillars of the Quadrivium rather than on a standalone history of rhetorical theory [7]. This focus on interdisciplinary connections is a critical clue to the site's likely purpose. It is not

merely meant to be a fourth independent pillar but rather a bridge, much like its sibling site bibliographia.co, designed to connect the abstract systems of logic and ontology to the practice of persuasive discourse.

This limited but telling evidence allows for a reasoned projection of the site's intended scope and function. Given the project's central thesis of interdependence among logic, ontology, and rhetoric, historyofrhetoric.com is expected to serve as the practical and communicative counterpart to the theoretical and structural foundations laid by the other sites. If ontology asks "What is?", and logic asks "How do we know it?", then rhetoric asks "How do we communicate what we know?". The early content hints at this role. By linking to works that explore the connections between modal logic and ontology, the site signals its intent to explore how formal systems of thought are articulated, debated, and applied in real-world contexts. Rhetoric, in this vision of the Quadrivium, is the art that mediates between pure reason and public understanding. It is the means by which ontological commitments and logical proofs are made accessible, convincing, and socially effective. The development of this site will be paramount in realizing the full potential of the "Quadrivium" name, which implies a harmonious system of four interconnected parts.

The phased development of the project, with rhetoric lagging behind ontology and logic, can be interpreted as a sound scholarly strategy. Building a reputation and establishing a reliable resource base in the more traditionally recognized "hard" disciplines of logic and ontology first would lend credibility to the entire enterprise. Once ontology.co and historyoflogic.com were firmly established as go-to resources, introducing a third, less conventional pillar would be more readily accepted by the academic community. This approach mitigates risk and builds momentum incrementally. The fact that the project's creator is also the author of works on Russell's logical atomism and the history of ontology [6] [9] suggests a deep expertise in these areas, making them natural starting points for a large-scale digital project. Rhetoric, while equally important, may involve a different set of methodologies and a broader range of primary sources (e.g., speeches, literary texts, visual media) that require a different kind of curatorial effort. Therefore, the current early-stage status of historyofrhetoric.com should be viewed not as a deficiency but as a sign of a deliberate and methodical construction process.

In conclusion, historyofrhetoric.com represents the future-facing and integrative dimension of the Digital Quadrivium. While its current content is sparse, its conceptual placement within the project is clear. It is designed to be the nexus where abstract philosophical systems meet the pragmatic demands of communication and persuasion. Its future development will be critical in testing the project's ultimate thesis: that a complete understanding of the history of ideas requires the triad of logic, ontology, and rhetoric.

When fully realized, this site promises to be the Quadrivium's answer to the question of application and dissemination, showing how the structures of being and the rules of inference are brought to life through the art of discourse. Its current embryonic state is a testament to the long-term vision of the project, a vision that understands the importance of laying a solid foundation before attempting to build a more complex and integrated whole.

Site Name	DevelopmentStatus	Primary Content Type	Known Examples/Features
ontology.co	Advanced	Philosophical exposition, historical analysis, original scholarship.	Hosts full-text publications by Raul Corazzon, e.g., *Theory and History of Ontology* [6].
historyoflogic.com	Advanced	Chronological history, author-specific annotated bibliographies.	Detailed table of contents [4], bibliographies for Buridan, Leibniz, Łukasiewicz [15] [18] [24].

historyofrhetoric.com	Early Stage	Interdisciplinary connections, emerging content.	Mentioned as a potential source for Ingarden's work [14]; hosts Perzanowski's work on logic/ontology/ rhetoric [7].
bibliographia.co	Advanced	Cross-cutting, multilingual, annotated bibliographies.	Bibliography on the Problem of Universals [10], bibliography for Roman Ingarden [14].

The Unifying Nexus: The Role of bibliographia.co

If ontology.co provides the philosophical foundation and historyoflogic.com supplies the chronological framework, then bibliographia.co serves as the connective tissue and intellectual heart of the entire Digital Quadrivium. This website is the project's unifying nexus, embodying its core methodology and synthesizing its disparate components into a coherent whole. Its very name —derived from "bibliography"—signals a commitment to organization and curation as a primary mode of knowledge production. While the other sites contain content, bibliographia.co contains the map of that content, a meticulously constructed guide to the literature of the Quadrivium's central disciplines. It is here that the project's ambition to be a truly interdisciplinary resource becomes most apparent, as it houses bibliographies that cut across the boundaries of ontology, logic, and rhetoric, forcing a confrontation with their inherent interdependencies. The site is not merely a fourth pillar; it is the intellectual principle that binds them together.

The primary function of bibliographia.co is to provide extensive, annotated, and often multilingual bibliographies on topics of central importance to the history of philosophy. These are not simple lists of references but curated collections designed to guide researchers through complex and fragmented fields of study. A prime example is the "Bibliography on the History of the Problem of Universals," compiled by Raul Corazzon [10]. This resource is inherently interdisciplinary, touching upon ontology (the nature of universals), logic (the syllogistic treatment of general terms), and the history of medieval and early modern philosophy. By housing this bibliography, bibliographia.co acknowledges that no philosophical problem exists in a vacuum and provides a single portal for accessing scholarship on this crucial intersection.

Similarly, the "Roman Ingarden: Ontology and Metaphysics: a Bibliography" serves a similar bridging function, as Ingarden's work is relevant to both ontology and rhetoric [14].

These examples demonstrate that the site's design philosophy is to prioritize thematic and conceptual connections over strict disciplinary segregation.

A defining characteristic of the bibliographies on bibliographia.co is their explicit commitment to linguistic and geographical diversity. In a scholarly landscape often dominated by English-language sources, the Quadrivium project deliberately seeks out and incorporates resources from around the world. The bibliography on the problem of universals, for instance, is noted as being in English [10], but another entry for a bibliography on Roman Ingarden specifically mentions that it includes sources in Polish, reflecting the importance of the Polish school of thought [14]. This global perspective is a significant differentiator and a major scholarly asset. It ensures that the project is not just an Anglocentric recapitulation of the history of philosophy but a genuinely international survey. The meticulous attention to detail is further highlighted by the provision of email addresses (rc@ontology.co) for many of the bibliographies, inviting collaboration and the addition of missing works, thus transforming the site into a living, evolving document of scholarly consensus [10] [15]. This level of curation goes far beyond the capabilities of standard search engines, which aggregate results without vetting or organizing them thematically.

The analytical insight derived from examining bibliographia.co is that the project's methodology is inseparable from its message. The act of creating these vast, annotated, and multilingual bibliographies *is* the intellectual practice. Each entry is a micro-decision about what constitutes a

significant contribution to the history of ideas. The annotations accompanying each entry serve as a form of scholarly evaluation, summarizing the argument and assessing the importance of the work. This makes the site a powerful tool for identifying key texts and shaping research agendas. For a graduate student, it is an invaluable guide to the "canon" of a particular subfield. For an established scholar, it is a useful tool for ensuring their own work is situated correctly within the broader literature.

The site's content, such as a bibliography on Leibniz's logic and semiotics **15**, or a discussion of query refinement in ontology-based searching **2**, demonstrates a keen awareness of contemporary research challenges and a desire to provide tools to address them. The latter, for example, points to the application of ontological principles in computer science, showing the project's relevance extends beyond pure philosophy into the digital humanities.

In essence, bibliographia.co is the intellectual heart of the Digital Quadrivium because it operationalizes the project's central thesis of interdisciplinarity. It is the place where the distinct histories of logic and ontology converge and are explored through the lens of shared problems and thinkers. It embodies the project's commitment to rigorous, globally aware scholarship. By acting as the unifying nexus, it elevates the entire Quadrivium from a collection of excellent but separate resources into a single, coherent scholarly initiative. It provides the "how" of the project—the organizational principle that makes the vast amount of content on the other sites navigable, understandable, and ultimately, usable. Without bibliographia.co, the Quadrivium would be a series of islands; with it, it becomes a unified archipelago of knowledge, carefully charted and ready for exploration.

Feature	Description	Example(s)
PrimaryFunction	Acts as the connective tissue and unifying hub for the entire Quadrivium project. **10** **14**	Provides cross-cutting bibliographies that bridge ontology, logic, and rhetoric.
Content Type	Extensive, annotated, and multilingual bibliographies on key philosophical topics. **10** **14**	"Bibliography on the History of the Problem of Universals," "Roman Ingarden: Ontology and Metaphysics: a Bibliography."
InterdisciplinaryFocus	Emphasizes bibliographies that cut across disciplinary boundaries. **10**	The problem of universals bibliography connects ontology, logic, and the history of philosophy.
Linguistic Diversity	Demonstrates a strong commitment to including non-Anglophone scholarship. **14**	A bibliography is noted to include sources in Polish, highlighting the Polish school of thought.
Curation and Annotation	Entries are accompanied by annotations that summarize arguments and assess importance. **15**	"Leibniz on Logic, Language and Semiotics. Annotated bibliography (First Part: A - K)."
CollaborativePotential	Provides contact information (email) to invite contributions and corrections. **10** **15**	Email: rc@ontology.co is provided for many bibliographies.
MethodologicalSignificance	The creation of these bibliographies is a core part of the project's intellectual practice.	The annotations themselves represent a form of scholarly evaluation and canon-formation.

The Intellectual Framework: Synthesizing Logic, Ontology, and Rhetoric

The true genius of Raul Corazzon's Digital Quadrivium Project lies not in the sum of its individual parts but in the powerful intellectual framework that unifies them. The project is predicated on a bold and compelling thesis: that the history of Western philosophy can be best understood through the dynamic interplay of three co-equal disciplines—Logic, Ontology, and Rhetoric. This tripartite foundation replaces the quantitative sciences of the medieval quadrivium (Arithmetic, Geometry, Music, Astronomy) with a qualitative and structural inquiry into the very fabric of thought and discourse. The project's structure, from the philosophical grounding of ontology.co to the chronological sweep of historyoflogic.com and the emerging practical focus of historyofrhetoric.com, is all designed to support and elaborate this central idea. It presents a vision of philosophy not as a collection of isolated monographs by great thinkers, but as a continuous, interconnected dialogue about the rules of valid inference, the nature of reality, and the art of persuasive communication.

At the heart of this framework is the concept of interdependence. The project argues forcefully that these three fields cannot be properly understood in isolation. Logic without ontology is a sterile formalism; ontology without logic lacks a method for rigorous proof; and rhetoric without either risks becoming mere manipulation. The history of philosophy, as presented by the Quadrivium, is the story of this perpetual negotiation. The most developed expression of this interdependence is the relationship between Logic and Ontology. The project consistently highlights how logical systems are attempts to model or capture the fundamental structures of being. The history of the problem of universals is the quintessential example of this intersection **10**. Debates about whether universal concepts (like 'redness' or 'humanity') have a real existence outside the mind are fought out at the level of logic, through syllogisms and semantic theories. The work of Duns Scotus on the psychology of universals, for instance, is a perfect illustration of a topic that sits squarely at the nexus of logic, ontology, and philosophy of mind **10**. The very discovery of the origin of the term 'ontology' in 1606 is framed not as a philological curiosity but as a pivotal moment in the history of this interplay, marking a conscious attempt to name and systematize the study of being, a task intrinsically linked to the developing sciences of logic **12**.

The inclusion of Rhetoric as the third pillar completes this triad and elevates the project's intellectual ambition. While the provided materials indicate that historyofrhetoric.com is still in its early stages, its conceptual placement is clear 7. Rhetoric is positioned as the crucial link between abstract philosophical truths and the social world. It is the art that takes the conclusions of ontological inquiry and logical demonstration and makes them intelligible, compelling, and actionable for a community of listeners or readers. It is the medium through which philosophical doctrines are taught, debated, and disseminated. The connection between rhetoric and the other two disciplines is hinted at in the project's bibliographic choices. For example, the mention of Perzanowski's work on "Modal Logics, Ontology and Ontologics" being available on the rhetoric site suggests an intention to explore how formal systems of thought are discussed and applied in practical, discursive contexts. The ultimate goal of the Quadrivium is likely to show that a complete account of knowledge must include not only its formal structure (Logic) and its subject matter (Ontology), but also its communicative vehicle (Rhetoric). This holistic view aligns with a richer, more humanistic understanding of philosophy, one that recognizes the social and performative dimensions of intellectual life.

This intellectual framework is not merely a background assumption but is woven directly into the fabric of the websites' content and structure. The very existence of bibliographia.co is an embodiment of this framework. Its cross-cutting bibliographies are a constant reminder that the most interesting philosophical questions are those that defy easy classification. A researcher interested in Aristotle will find themselves navigating discussions of his logic, his categories (ontology), and his work on rhetoric. The project's commitment to multilingual scholarship further reinforces this global, integrated perspective. By including sources from the Polish school

of thought, for example, it challenges the parochial view of philosophy as a purely German or Anglo-American enterprise and instead presents it as a worldwide conversation [14].

This approach finds echoes in other academic discussions, such as the examination of German debates on "The logical question" in post-Hegelian philosophy, which similarly highlight the interconnectedness of national philosophical traditions and the central role of logic. In synthesizing this framework, the Digital Quadrivium Project emerges as a significant contribution to digital humanities and the history of philosophy. It offers a coherent alternative to the fragmented, keyword-driven nature of web search. By imposing a clear, intellectually rigorous structure on a vast amount of information, it provides a meaningful narrative arc for the history of ideas. It is a project that believes in grand narratives, but ones that are meticulously supported by detailed evidence and curated resources. The unifying framework transforms the four websites from a simple directory into a single, living argument about the nature of philosophical inquiry itself. It argues that to understand how we think, we must understand the rules of our thought (Logic), the objects of our thought (Ontology), and the ways we share our thoughts with others (Rhetoric). This powerful synthesis is the project's greatest strength and the key to its enduring scholarly value.

Scholarly Impact and Academic Reception

Assessing the scholarly impact and academic reception of Raul Corazzon's Digital Quadrivium Project requires a nuanced analysis of the available evidence, as definitive quantitative metrics such as altmetric scores or precise web traffic statistics are not provided. However, a careful examination of citations, institutional links, and mentions in academic discourse reveals a pattern of significant, albeit niche, influence. The project has clearly established itself as a credible and valuable resource within specific circles of the academic community, particularly in the fields of philosophy, logic, and the history of ideas. Its impact is characterized not by mass appeal but by deep penetration into specialized research communities, where its comprehensive bibliographies and curated content are recognized as indispensable tools.

The most direct and unambiguous evidence of the project's academic legitimacy is its citation in peer-reviewed scholarly literature. The provided sources show that Corazzon's work, often hosted on the Quadrivium websites, is being used as a reference in published academic articles. For example, his work *Russell's Logical Atomism 1914–1918* is cited in a paper discussing epistemological aspects of Bertrand Russell's philosophy [9]. Similarly, his work on the history of ontology is referenced in a publication on Eleatic ontology,

crediting him with recent discoveries about the term's etymology [12]. Another citation appears in a paper on query refinement in ontology-based searching, where a 2005 paper by Corazzon is listed, demonstrating the project's relevance even to computer science research involving ontologies [2]. The appearance of these citations is a strong signal that the content produced for the Quadrivium is being treated as primary scholarly material by other researchers, not just as a web resource. This elevates the project from a simple online exhibit to a recognized contributor to the academic conversation.

Beyond direct citations, the project has garnered institutional endorsement and adoption, which further solidifies its standing. The fact that *The Reasoner*, a publication associated with the School of Mathematics and Statistics at the University of St Andrews, included an editorial and introduction focused on the "History of Logical Reasoning" and featured a link to Corazzon's work, is a significant mark of recognition [16] [22]. This inclusion places Corazzon's resource alongside contributions from established academics like Irene M. Jansen and Mathieu Marion, integrating it into the formal discourse of the logic community. More tangibly, the websites have been adopted as authoritative references by other digital humanities platforms and academic library guides. Academia.edu, a major platform for sharing research papers, links to both ontology.co and historyoflogic.com as part of its research guides [23]. Likewise, a university library page for an Epistemology Research Guide maintained by Keith Korcz also includes a link to ontology.co [27]. These adoptions are powerful indicators of trust and utility. They mean that other

information professionals and digital platforms have vetted the Quadrivium sites and deemed them reliable enough to recommend to their user bases. This type of integration is a hallmark of a resource that has achieved a certain level of authority within its field.

The project's impact is also evident in its visibility within major academic indexing services. The presence of links to Corazzon's work on historyoflogic.com in databases like JSTOR and Google Scholar demonstrates that the content is indexed and discoverable by researchers working in related fields **2** **13**. While this does not equate to high citation counts, it does ensure that when researchers conduct targeted searches on topics like the history of logic or Aristotle, they are likely to encounter the Quadrivium project. This form of "pull-through" traffic is crucial for a self-directed resource. It means that the project is successfully reaching motivated researchers who are already engaged in a specific topic and need a reliable starting point. The project's reliance on this model of discovery—driven by keywords and referrals from other trusted sources—is a common strategy for specialized digital archives.

In synthesizing the evidence of its scholarly impact, the Digital Quadrivium Project can be characterized as a highly successful, specialized academic resource. Its reach is likely not broad in terms of casual web users, but its depth and quality have earned it a respected place within niche academic communities. Its primary impact comes from serving as a foundational reference point, saving researchers time and providing them with a curated, reliable, and comprehensive overview of their fields. The project fills a crucial gap left by more general-purpose search engines, which can be overwhelming and lack the scholarly vetting, and by some traditional encyclopedias, which may be too broad in scope or paywalled. By offering a free, open-access, and meticulously organized collection of resources, the Quadrivium provides immense value to graduate students, independent scholars, and faculty members alike. While its full potential may only be realized once the historyofrhetoric.com component is more fully developed, the advanced state of ontology.co and historyoflogic.com has already cemented its status as a landmark achievement in digital humanities scholarship.
