History of Logic

Raul Corazzon || e-mail: rc@ontology.co

The History of Logic from Aristotle to Gödel

Introduction

"Preliminary definition of the subject matter of the history of logic is hard to come by. For apart from 'philosophy' there is perhaps no name of a branch of knowledge that has been given so many meanings as 'logic'. Sometimes the whole of philosophy, and even knowledge in general, has been thus named, from metaphysics on the one hand, cf. Hegel, to aesthetics ('logic of beauty') on the other, with psychology, epistemology, mathematics etc. in between. With such a wide choice it is quite impossible to include in a history of logical problems all that has been termed 'logic' in the course of western thought. To do so would practically involve writing a general history of philosophy. But it does not follow that the use of the name 'logic' must be quite arbitrary, for history provides several clues to guide a choice between its many meanings.

This choice can be arrived at by the following stages.

1. First let us discard whatever most authors either expressly ascribe to some other discipline, or call 'logic' with the addition of an adjective, as for example epistemology, transcendental logic, ontology etc.

2. When we examine what remains, we find that there is one thinker who so distinctly marked out the basic problems of this residual domain that all later western inquirers trace their descent from him: Aristotle. Admittedly, in the course of centuries very many of these inquirers -- among them even his principal pupil and successor Theophrastus -- have altered Aristotelian positions and replaced

them with others. But the essential problematic of their work was, so far as we know, in constant dependence in one way or another on that of Aristotle *Organon*. Consequently we shall denote as 'logic' primarily those problems which have developed from that problematic.

3. When we come to the post-Aristotelian history of logic, we can easily see that one part of the *Organon* has exercised the most decisive influence, namely the Prior Analytics. At some periods other parts too, such as the Topics or the Posterior Analytics, have indeed been keenly investigated and developed. But it is generally true of all periods marked by an active interest in the *Organon* that the problems mainly discussed are of the kind already to hand in the Prior Analytics. So the third step brings us to the point of describing as 'logic' in the stricter sense that kind of problematic presented in the Prior Analytics.

4. The Prior Analytics treats of the so-called syllogism, this being defined as logos in which if something is posited, something else necessarily follows. Moreover such *logoi* are there treated as formulas which exhibit variables in place of words with constant meaning; an example is 'B belongs to all A'. The problem evidently, though not explicitly, presented by Aristotle in this epoch-making work, could be formulated as follows. What formulas of the prescribed type, when their variables are replaced by constants, yield conditional statements such that when the antecedent is accepted, the consequent must be admitted? Such formulas are called 'logical sentences'. We shall accordingly treat sentences of this kind as a principal subject of logic." (pp. 2-3)

From: Joseph Bochenski, *A History of Formal Logic*, New York: Chelsea Publishing Co. 1961.

Logic and Ontology

The question "how are logic and ontology interrelated?" is an ambiguous question, that is, it can refer either to logic and ontology themselves or to the metatheories of logic and ontology (that is, to the views about them). Furthermore, in the first case, both logic and ontology may be considered either objectively or subjectively.

(1) If the question refers to logic and ontology themselves considered objectively (that is, in their content), the disciplines are seen as sets of laws and/or rules, and so the problem is purely logical. It will be clear that its solution depends largely on the content of logic and of ontology as they were constructed at a given time.

(2) If the question refers to the same, but as seen subjectively (that is, in as far as they were conceived by some thinkers or groups of thinkers), then it is about empirical facts and is then a historical question: how did the fact that x held the ontology *O* influence the fact that he also held the logic *L* or inversely?

(3) Finally, if the question is concerned not with the two systems as they are but rather with the metatheoretical views about them (that is, with the corresponding philosophies of logic), the question is a quite different one. That this is so is indicated by the fact that often the same type of logic was philosophically interpreted in a different manner by two different schools. This question, in turn, can be considered either logically or historically. It should be clear that the first question is fundamental. Therefore, the principal focus of this presentation will be upon it. The philosophy of logic and ontology will be treated only secondarily, while the historical question of the mutual factual influences of doctrines about them will be only marginally noted.

Now to state at once one of the principal conclusions of the present investigation, it must be confessed that there is considerable confusion about that basic question. Almost any imaginable answer has been proposed by one or another philosopher. To mention only two of the extreme views, respectable logicians have maintained that there is a complete identity of both disciplines (thus, Scholz) and that there is no relation whatsoever between them (thus, Nagel). The very fact that this is so requires an explanation. As is always so in such cases, this explanation must be historical.

One reason for the unfortunate state prevailing in investigations of this problem can readily be identified: ignorance. Most ontologists do not know even the ABC's of logic. But the inverse is also true: most logicians do not have the least idea what ontology might be. These deficiencies are often combined, on both sides, with value judgments of an unkind sort. Thus, to most ontologists, logic does

not seem to be a serious discipline, although they concede that it provides (hélas!) some practical results for computer science. On the other hand, ontology is merely nonsense in the estimation of many logicians. It is little wonder that such scholars produce few worthwhile contributions regarding the relations of the two disciplines.

But this is not the whole answer. The present bifurcation did not always prevail. There have been ontologists who were well instructed in logic and who were even creative logicians in their own right ; Thomas Aquinas and Uddyotakâra (seventh century) are examples. There were also logicians who knew a good deal about ontology; one need think only of Leibniz and of Whitehead. Nevertheless, confusion about our problem is widespread across the ages. Some explanation must be offered for this fact, and once again it has to explained historically. (pp. 274-275)

(...)

The history begins with Aristotle, as so many philosophical questions do. Nor is it a question of that history merely beginning with him. For in many cases one gets the impression that where "the Master of those who know" (Dante) failed to perceive or to formulate a problem, his successors had a difficult time at formulating or solving it. Among these problems is that of the relations between logic and ontology.

The following is a brief description of both disciplines as they appear to the unbiased reader in the Aristotelian corpus. There is a book, or rather a collection of writings, called "*Metaphysics*" by Andronikos Rhodes. There is also a collection of works which received the name "*Organon*" from the commentators. None of these names derive from Aristotle himself. There can be no doubt, however, that we find in his writings a considerable number of doctrines belonging to what will subsequently be called 'logic" and "ontology" respectively.

As regards ontology, Aristotle talks about a "first philosophy" and a "divine science." He says that they are about being as being; what we see here is an attempt to define this discipline. But as far as logic is concerned, we find no name for it in his writings. (...) Still less is there any attempt to define the subject matter of logic.

If, however, we turn from his philosophy of logic and of ontology to the theories themselves (that is, to the systems Aristotle developed), it is relatively easy to describe what he would have meant by "ontology" and "logic" respectively, if he had such terms.

Regarding ontology, we should first note that Aristotle, unlike many later thinkers, did not believe that there is an entity or even a meaning unambiguously associated with the term "being." In one of those passages which can certainly be esteemed as a stroke of genius, Aristotle explicitly states that "being" is an ambiguous term; he justifies this assertion by a sort of embryonic theory of types. And yet, we find extensive discussions of the characteristics of entities in general in the *Metaphysics* and elsewhere. On closer inspection, we discover that his ontological doctrines can be divided into two classes.

First of all, in the fourth book of his Metaphysics, Aristotle undertakes to state and discuss the "principles" -- namely, non-contradiction and the excluded middle. (Aristotle made explicit use of the principle of identity in his logic, but never made it the object of a similar study.) Next we have a number of analyses of concrete entities. Of these the most conspicuous are the doctrine of act and potency and the table of the categories (also studied in the *Organon*, but obviously belonging to the "first philosophy"). The last named could be and has often been viewed as a classification of entities. But it seems more consistent with Aristotle's thought to consider it as a sort of analysis of a concrete entity into its various aspects. (...)

In summary, the Aristotelian ontology appears to be a study (1) of (isomorphically, we would say) common properties of all entities and (2) of the aspects into which they can be analyzed. Both sorts of studies are about *real objects*. One distinctive characteristic of this ontology is its conspicuous lack of existential statements, which is contrary to what we find in what is now commonly called "metaphysics". (pp. 279-281)

(...)

In summary, then, Aristotle left: (1) an ontology conceived as a theory of real entities in general and of their most general aspects; this discipline is defined; (2) two quite different systems of logic: a

technology of discussion and an object-linguistic formal logic; (3) a considerable overlapping of both disciplines (for example, the "principles," the categories, etc.) ; (4) not even a hint, direct or indirect, as to what formal logic might be about ; in other words, no philosophy of logic at all.

It should be clear that in that frame of reference, the question of the relations between logic and ontology cannot even be clearly stated. For we do not know what logic is nor which of the two logics has to be considered nor where are the boundaries between it and ontology.

And yet that is the frame of reference within which most of the Western discussions of our problem will develop. That is, so it seems, the explanation of the confusion reigning in our field.

With the Stoics, we find a clear choice between the alternative conceptions of logic: they opt for "dialectics," the art of arguing. This does not mean that they remained at the level of the Topics. On the contrary, their logic of propositions, magnificently developed, is formal logic. But it is conceived as being a set of rules of arguing.

Moreover, the Stoics were the first to formulate a consistent theory of the object of logic. Logic is, according to them, radically different from ontology of the Aristotelian type. There is, it is true, no ontology in their philosophy; and what corresponds to the Aristotelian table of categories is considered to be a part of logic. But the subject matter of logic, the meanings, is sharply distinguished from what is real. For, whereas everything which is real, including mental entities, is a body in the Stoics' view, the meanings are not bodies. They are ideal entities.

Thus the first known philosophy of logic emphasizes the radical difference and independence of logic as regards ontology.

The Scholastics make no use of the term "ontology" and discuss subjects which will subsequently be called "ontological" in the context of their commentaries on Aristotle's Metaphysics. As compared with the latter, there are some important developments. For example, much consideration is given to the semantic status of "being." We are aware of several positions adopted regarding this problem: while the Thomists considered "being" as analogous (that is, basically a systematically ambiguous term), others, such as the

Ockhamists, held that it was purely ambiguous; Scotists, on the other hand, claimed that it is a "genus" (that is, not an ambiguous expression). Depending on the position assumed, some philosophers will develop a general theory of being, while others will not. In addition, we find a few new chapters in ontology: above all, the doctrine of the distinction between essence and existence, the theory of the "transcendental" properties of all entities, and, of course, a rich technical elaboration of every doctrine. With these exceptions, the subject matter of ontology is the same as that found in Aristotle.

When we turn to logic, the situation is quite different. While incorporating and developing a number of Aristotelian doctrines, Scholastic logic is very much un-Aristotelian insofar as its method and approach are concerned, but also, to a large extent, as regards the content. It is completely metalinguistic and consists of rules. But it is unlike Stoic logic as well, for its explicit concern is not with mere meanings but rather with what were called propositions (meaningful sentences). Semantics undergoes tremendous development during this period.

This being so, several important facts which are relevant to our problem emerge. First of all, a sharp distinction between logic and ontology is explicitly established: the former is metalinguistic, the latter, object-linguistic; logic formulates rules, ontology, laws. Secondly, given this distinction and the nature of the Aristotelian corpus, a curious duplication of doctrines appears: problems are treated twice, once in logic and then again in ontology. As Ockham noted, there are two principles of noncontradiction: one ontological, stated in object-language, and another logical, formulated in meta-linguistic terms.

The Scholastics also formulated various philosophies of logic. They had several common views. For one, logic, while being primarily a methodology of reasoning and arguing, is said to be also a theory of certain entities. Second, they all shared the assumption that logic is not about "first intentions," which are dealt with in ontology, but rather about "second intentions." However, these terms assumed very different meanings in the context of different schools. (pp. 282-283)

(...)

The modern era, prior to the rise of mathematical logic, is an alogical and a largely unontological period. It opens with the Humanists; in their view, if logic has any usefulness at all, it is only as a set of rules for everyday arguments: it is an inferior sort of rhetoric, as Valla put it. Later on, when the scientific spirit began to rise, even the most rationalistic thinkers, such as Descartes, would not dare to reconsider the Humanists' total condemnation of "scholastic subtleties," including formal logic. Gradually, the so-called conventional logic was formulated.

The latter consists of extracts from Scholastic logic which omit almost every logical matter not connected with the theory of the assertoric syllogism (thus, the logic of propositions among others) and with the addition of a number of methodological doctrines. Logic is quite clearly conceived of as "dialectics," "the art of thinking," as the authors of the influential *Logique de Port-Royal* titled it. Philosophically, there is a novelty: widespread psychologism, according to which logic has as its object mental entities and activities (concepts, judgments, reasonings).

There is, of course, one great exception -- Leibniz, a logician of genius and an important thinker in the field of ontology. His ontology has been popularized by Wolff; in the latter's work the term "ontology" is clearly defined as designating the most general part of metaphysics, dealing with "being in general" (quite in the Aristotelian spirit). Leibnizian logic is mathematical and should rather be considered together with more recent logics, for its influence on the seventeenth, eighteenth, and nineteenth centuries was almost negligible. Leibniz also established his own philosophy of logic, which can only be understood in light of his logic. Our discussion of this will be deferred as well.

But, apart from Leibniz, the situation of our problem is not much different from that found in the Stoics and Scholastics: as logic is concerned with the mental behavior of men and ontology with being in general, the separation of the two is just as sharp as in the older schools. Indeed, this separation is reinforced by the fact that logic is now thought of as being a purely practical discipline and not as a theoretical one.

The whole course of the evolution between Aristotle and Boole may be summarized as follows. Ontology, whenever present, is on the whole of the Aristotelian type: a general theory of real entities. Regarding logic, the great majority of thinkers opt for the first Aristotelian logic, that of the Topics; they cultivate this discipline as a methodology of thought. While it is true that some Scholastics admitted a theory founding such a methodology, their logic nevertheless belongs to the type outlined in the Topics, not to that of the Prior Analytics. With such an assumption as a basis, whatever philosophy of logic they developed--whether conceived as a theory of meanings, of second intentions, of syntax or of mental entities, it was always radically different from ontology." (pp. 284-285)

From: Joseph Bochenski, "Logic and Ontology", *Philosophy East and West*, 24, 1974, pp. 275-292.

"Aristotle was the founder not only of logic in western philosophy, but of ontology as well, which he described in his *Metaphysics* and the *Categories* as a study of the common properties of all entities, and of the categorial aspects into which they can be analyzed. The principal method of ontology has been one or another form of categorial analysis, depending on whether the analysis was directed upon the structure of reality, as in Aristotle's case, or upon the structure of thought and reason, as, e.g., in Kant's *Critique of Pure Reason*. Viewed in this way, the two subjects of logic and ontology could hardly be more different, and many schools in the history of philosophy, such as the Stoics, saw no common ground between them. Logic was only a system of rules for how to argue successfully, and ontology, as a categorial analysis and general theory of what there is (in the physical universe), was a system of categories and laws about being.

Scholastic logicians also drew a sharp distinction between logic and ontology, taking the latter to be about ‘first intentions’ (concepts abstracted directly from physical reality), and the former about ‘second intentions’ (concepts abstracted wholly from the ‘material’ content of first intentions, as well as about such categorial concepts as individual, proposition, universal, genus, species, property, etc., and so-called syncategorematic concepts such as negation). According to Aquinas, second intentions have a foundation in real

entities, but 'exist' only in knowledge; i.e., they do not exist in the real world but depend on the mind for their existence – which is not say that they are subjective mental entities." (p. 117)

A survey of research on the history of logic until 1950

"Ancient and medieval history of ancient logic.

One meets sometimes with the assertion that history of philosophy is an invention of the XVIIIth century. This is in so far correct, that in older times -- in spite of Aristotle's and Thomas Aquinas' explicit teaching -- scholars neglected completely the genetic point of view in history of logic; on the other hand, thorn is no doubt that another aspect of historiography, namely the understanding of doctrines, was much cultivated by ancient and medieval thinkers. A complete account of ancient logic would have to take their results into consideration. Unfortunately, we know practically nothing of all the huge work which was accomplished, especially on Aristotle, by Greek, Syrian, Arabian, Jewish, or, above all, by Latin medieval logicians: as was already stated, the Greek commentators have not yet been studied, while the others are little more than a field for future research. And yet, we know that there were important discoveries during that time. This has been proved at least in one particularly striking instance: Albertus Magnus had a perfect understanding (superior to that of Alexander [of Aphrodisias], not to mention Prantl) of the highly difficult Aristotelian modal logic. This understanding has been nearly completely lost, however, during the modern ages.

State of the history of formal logic during the XIXth century.

Modern history of Logic had been started during the XIXth century, but its state was very bad at that time -- indeed until 1930 approximately -- because of two phenomena. On one hand, most of the historians of logic took for granted what Kant said on it; namely that "formal logic was not able to advance a single step (since Aristotle) and is thus to all appearance a closed and complete body of

doctrine" (*); consequently, there was, according to them, no history of logic at all, or at the most, a history of the decay of Aristotelian doctrines. On the other hand, authors writing during that period were not formal logicians and by "logic" they mostly understood methodology, epistemology and ontology. That is why e.g. Robert Adamson could devote 10 pages to such a "logician" as Kant -- but only five to the whole period from the death of Aristotle to Bacon, i.e. to Theophrastus, the Stoic-Megaric School and the Scholastics. In order to realize what this means, it will be enough to remember that from the point of view we assume here, Kant is not a logician at all, while the leading Megaricians and Stoics are among the greatest thinkers in Logic.

The worst mischief was done during that period by the work of Carl Prantl (1855). This is based on an extensive knowledge of sources and constitutes the only all-embracing History of Ancient Logic we have until now. Unfortunately, Prantl suffered most acutely from the two above-mentioned phenomena: he believed firmly in the verdict of Kant and had little understanding of formal logic. Moreover, he had the curious moralizing attitude in history of logic, and, as he disliked both the Stoics and the Scholastics, he joined to incredible misinterpretations of their doctrines, injurious words, treating them as complete fools and morally bad men precisely because of logical doctrines which we believe to be very interesting and original. It is now known that his work -- excepting as a collection of texts (and even this far from being complete) -- is valueless. But it exercised a great influence on practically all writers on our subject until J. Łukasiewicz and H. Scholz drew attention to the enormous number of errors it contains.

Recent research.

We may place the beginning of recent research in our domain in 1896 when Peirce made the discovery that the Megaricians had the truth-value definition of implication. The first important studies belonging to the new period are those of G. Vailati on a theorem of Plato and Euclid (1904), A. Rüstow on the Liar (1908) and J. Łukasiewicz (1927); the Polish logician proposed in it his re-discovery of the logical structure of the Aristotelian syllogism and of Stoic arguments. Four years later appeared the highly suggestive,

indeed revolutionary, *History of Logic* by H. Scholz, followed in 1935 by the paper of Łukasiewicz on history of logic of propositions; this is considered until now as the most important recent contribution to our subject. Both scholars -- Łukasiewicz and Scholz -- formed small schools. J. Salamucha, the pupil of the former, wrote on Aristotle's theory of deduction (1930) and the present author on the logic of Theophrastus (1939). Fr. J. W. Stakelum, who studied with the latter, wrote a book on Galen and the logic of propositions. On the other hand, A. Becker, a student of H. Scholz, published an important book on Aristotle's contingent syllogisms (1933). Professor K. Dürr was also influenced by Łukasiewicz in his study on Boethius (1938); his results were somewhat improved by R. van den Driessche (1949). In the English speaking world we may mention the paper of Miss Martha Hurst on implication during the IVth century (1935) -- but above all the already quoted work of Dr. B. Mates on Stoic Logic (in the press [*published 1953*]), which, being inspired by Łukasiewicz and his school may be considered as one of the best achievements of recent research.

Such is, in outline, the work done by logicians. On the other hand philologists had considerable merits in the study of ancient logic. We cannot quote here all their contributions, but at least the important book of Fr. Solmsen (1929) on the evolution of Aristotle's logic and rhetoric must be mentioned, and, above all, the masterly commentary on the Analytics by Sir W. D. Ross (1949). It does not always give full satisfaction to a logician trained on modern methods, but it is, nevertheless, a scholarly work of a philologist who made a considerable effort to grasp the results of logicians." (pp. 4-7, some notes omitted)

Aristotle's Logic: General Survey and Introductory Readings

A summary of Aristotle's syllogistic

"We have identified five aspects of Aristotle's syllogistic to highlight the remarkable modernity of his logical investigations: 1) Aristotle took logic to be a formal part of epistemology. A logic is an instrument for establishing knowledge of logical consequence; this is a principal concern of the science of logic. 2) *Prior Analytics* is a metalogical treatise on the syllogistic deduction system. Aristotle exhaustively treated all possible combinations of elemental "syllogistic" argument patterns to determine which have only valid argument instances. 3) Aristotle recognised the epistemic efficacy of certain elemental argument patterns having only valid instances, and he explicitly formulated them as rules of natural deduction in corresponding sentences. 4) *Prior Analytics* is a proof-theoretic treatise in which Aristotle described a natural deduction system and demonstrated certain of the logical relationships among syllogistic rules. In fact, Aristotle modelled his syllogistic in a rudimentary way for this purpose. One important metasystematic result is to have established the independence of a set of deduction rules. Finally, 5) Aristotle worked with a notion of substitution sufficient for distinguishing logical syntax and semantics. In this connection he also distinguished validity from deducibility sufficiently well to note the completeness of his logic. Our reading of *Prior Analytics* takes Aristotle to have treated the process of deduction much as modern mathematical logicians do and not to have been confused about some fundamental matters of logic. Least of all was he confused, as some commentators believe, about a distinction between "following

necessarily" and "being necessary," both in respect of the distinction between a *συλλογισμός* or a deduction and a demonstration and of the distinction between assertoric logic and modal logic. Aristotle clearly distinguished between 1) a given sentence's following necessarily from other given sentences and 2) a given sentence denoting a state of affairs to be necessary (or possible). Seeing that he was concerned with the deduction process helps us to avoid such an error. In any case, Aristotle recognised that, while the conclusion of a given argument follows necessarily from its premises, this necessity might not be evident to a participant. He knew that the epistemic process of deduction produces knowledge, or makes evident, that a given sentence follows necessarily from other given sentences. He considered the product of this epistemic process to be an argumentation that includes a deductive chain of reasoning in addition to the premises and conclusion. He recognised using deduction rules in the epistemic process for establishing validity, and that this process can be applied in a purely mechanical and computational way. Furthermore, Aristotle distinguished (1) the subject matter of a given argument from (2) the use to which a given argument might be put from 3) the varying expertise of a participant. All these matters are distinct from (4) the formal matters underlying any of them. And precisely to examine these formal matters was his project in *Prior Analytics*. In this connection, then, we understand Aristotle to have distinguished two kinds of knowledge that cannot be otherwise: knowledge of what L is true or false, which pertains to sentences, and (2) knowledge of what is valid or invalid, which pertains to arguments." (pp. 110-111)

Gorge Boger, "The Modernity of Aristotle's Logic" in: Demetra Sfendoni-Mentzou et al. (eds.), *Aristotle and Contemporary Science. Vol. II*, Bern: Peter Lang 2001, pp. 97-112.

The modernity of Aristotle's logic

"Only recently have we been able to recover something of Aristotle's promethean accomplishments relating to logic. Indeed, we are recognising more and more that part of the history of modern mathematical logic is to have re-invented the wheel that Aristotle turned many years ago. It is astonishing that for .hundreds of years, perhaps dating to before the Port Royal Logic, Aristotelian logic, or

traditional logic, has been taught without a single reference to the process of deduction. This was the practice of R. Whately, W. S. Jevons, H. W. B. Joseph, J. N. Keynes, R. M. Eaton, and many others. It is still the practice in untold numbers of introductory textbooks on categorical logic to test a syllogism according to rules of quality, quantity, and distribution, and entirely to overlook the deduction process of chaining syllogisms, not to mention the glaring traditionalist error of taking a syllogism to be either a valid or invalid argument. Jan Łukasiewicz can be credited with being the first to shed light on the syllogistic by examining it with the theoretical apparatus of mathematical logic. But Łukasiewicz and his followers really only "improved" the traditionalist interpretation with a sophistication afforded by mathematical logic. Both lines of interpretation took Aristotle's presentation in *Prior Analytics* to be his own axiomatization of the syllogistic. While traditionalists awkwardly drew lines between sentences (or sentence patterns) in different syllogisms to indicate their logical relationships (their so-called reductions or analyses), axiomaticists such as Łukasiewicz cleverly turned a *συλλογισμός* into a logically true conditional proposition that could be processed by a propositional logic. In this way the axiomaticists aimed to elucidate the logical relationships among the syllogisms. Again, the epistemic process of deduction explicitly treated in *Prior Analytics* was overlooked. It was not until the early 1970s with the independent works of John Corcoran and Timothy Smiley that the case for Aristotle's reputation as a logician of consummate intelligence and originality was well argued. They established Aristotle to have been concerned with the deduction process just as many modern logicians are. Corcoran and Smiley also used mathematical logic to model Aristotle's syllogistic. However, instead of finding an axiomatization of a logic, they discovered a natural deduction system. But they remained puzzled by reduction, in part, we believe, because they did not think that Aristotle modelled his own system of deduction rules nor that he could envisage distinguishing syntax and semantics. Our interpretation builds on the work of Corcoran and Smiley, and now on that of Robin Smith whose 1989 translation of *Prior Analytics* has incorporated their findings. We believe, however, that Aristotle did model his own system. In particular, we see him as treating a *συλλογισμός* as a rule of deduction in *Prior Analytics* A.4-7, and that he himself was able

proof-theoretically to determine certain mathematical properties of his deduction system. He was able to refine the system by eliminating redundant rules, and he affirmed his system's completeness. These are Aristotle's own accomplishments, not merely those of modem logicians who, using mathematical logic, believe themselves to have discovered features of the syllogistic unknown to Aristotle. Indeed, modern logicians might wonder at their "having spoken" Aristotelian logic their whole lives, without any idea of it." (pp. 111-112)

Gorge Boger, "The Modernity of Aristotle's Logic" in: Demetra Sfendoni-Mentzou et al. (eds.), *Aristotle and Contemporary Science. Vol. II*, Bern: Peter Lang 2001, pp. 97-112.

Logic as Formal ontology

"There are several different conceptions of the nature of logic. Here I want to contrast an ontic conception with an epistemic conception. On one ontic conception logic investigates certain general aspects of 'reality', of 'being as such', in itself and without regard to how (or even whether) it may be known by thinking agents: in this connection logic has been called formal ontology. On one epistemic conception, logic amounts to an investigation of deductive reasoning per se without regard to what it is reasoning about; it investigates what has been called formal reasoning. On this view, logic is part of epistemology, viz. the part that studies the operational knowledge known as deduction. It has been said that one of the main goals of epistemically-oriented logic is to explicate the expression 'by logical reasoning' as it occurs in sentences such as: a deduction shows how its conclusion can be obtained by logical reasoning from its premise-set.

Relevant to the axiomatic method there would be two branches of epistemology: one to account for knowledge of the axioms and one to account for how knowledge of the theorems is obtained from knowledge of the axioms, in other words, one investigating induction and one investigating deduction. The latter is logic according to the epistemic conception.

On the ontic view of logic, on the other hand, logic is an attempt to gain knowledge of the truth of propositions expressible using only

generic nouns (individual, property, relation, etc.) and other 'logical' expressions. In the framework of *Principia Mathematica* those are propositions expressible using only variables and logical constants. *Principia Mathematica* is an excellent example of an axiomatic presentation of logic as formal ontology. Below are some typical laws of formal ontology.

Excluded middle: Given any individual and any property either the property belongs to the individual or the property does not belong tothe individual.

Noncontradiction: Given any individual and any property it is not the case that the property both belongs to the individual and does not belong to the individual.

Identity: Given any individual and any property, if the property belongs to the individual then the individual has the property.

Dictum de omni: Every property A belonging to everything having a given property B which in turn belongs to everything having another property C likewise belongs to everything having that other property C.

Dictum de nullo: Every property A belonging to nothing having a given property B which in turn belongs to everything having another property C likewise belongs to nothing having that other property C.

Commutation of Complementation with Conversion: Given any relation R the complement of the converse of R is the converse of the complement of R.

From this sample of logic as ontic science we can see how the focus is on ontology, or, as has been said by others, on the most general features of reality itself and not on methods of gaining knowledge. According to Russell *Introduction to mathematical philosophy,* 1919, 169, 'logic is concerned with the real world just as truly as zoology, though with its more abstract and general features.' These six laws are purely ontic in that they involve no concepts concerning a knowing agent or concerning an epistemic faculty such as perception, judgement, or deduction. This is not to deny that there is an epistemic dimension to logic as ontic science but only to affirm that the focus if ontic. Every science in so far as it is science has an

epistemic dimension. The epistemic differs from the ontic more as size differs from shape than as, say, animal differs from plant.

Logic as ontic science was referred to above as formal ontology. Logic as epistemic metascience may in like manner be called formal epistemology. It is important and interesting to note that both are called formal logic but for very different reasons. Some formal onticists justify the adjective formal by reference to the fact that its propositions are expressed exclusively in general logical terms without the use of names denoting particular objects, particular properties, etc. cf. Russell 1919, 197. Some formal epistemicists justify the adjective formal by reference to the fact that the cogency of an argumentation is subject to a principle of form and in particular to the following principles: (l) every two argumentations in the same form are either both cogent or both non-cogent, (2) every argumentation in the same form as a deduction is itself a deduction. In fact, some formal epistemicists such as Boole claimed, with some justification, that they were dealing with the forms of thought, i.e. with the forms of cogent argumentations. For more on cogency of argumentations and the principles of form see Corcoran 1989.

Formal onticists are often easy to recognize because of their tendency to emphasize the fact that formal ontology does not study reasoning per se. In fact, the formal onticists often think that the study of reasoning belongs to psychology and not to logic. For example, Łukasiewicz in his famous book on Aristotle's syllogistic makes the following two revealing remarks. Łukasiewicz 1957 pages 12 and 73, respectively. 'Logic has no more to do with thinking than mathematics. "[Aristotle's] system is not a theory of the forms of thought nor is it dependent on psychology; it is similar to a mathematical theory...'

There are significant differences among formal onticists. For example, even among those that emphasize the truth-preserving character of deduction some accept the view that it is consequences-conservative as well and some reject this view. For example, Łukasiewicz 1929, 16 explicitly rejects the view that deduction is a process of information extraction. He says that in deductive inference '...we may obtain quite new results, not contained in the premises'." (pp. 17-19)

Selected Bibliography on the Logic of Aristotle: General and Introductory Readings

Introductory readings

1. Allen, James. 1995. "The Development of Aristotle's Logic: Part of an Account in Outline." *Boston Area Colloquium in Ancient Philosophy* no. 11:177-205.

   "At the beginning of the history of logic stands the theory set out in the *Prior Analytics*. Studies of this theory 'from the point of view of modern formal logic' have made it possible to appreciate as never before Aristotle's achievement as a logician. But the theory of the *Prior Analytic*s is itself the outcome of a development in Aristotle's thinking whose starting points do not lend themselves to study from the same perspective. My object in this paper is to sketch an account of these starting points. In this way I hope also to throw some light on Aristotle's eventual invention or discovery of logic." (p. 177)

2. ———. 2007. "Aristotle on the Disciplines of Argument: Rhetoric, Dialectic, Analytic." *Rhetorica* no. 25:87-108.

   Abstract "According to an argument made by other authors, analytic—the formal logical theory of the categorical syllogism expounded in the Prior Analytics—is a relatively late development in Aristotle's thinking about argument. As a general theory of validity, it served as the master discipline of argument in Aristotle's mature thought about the subject. The object of this paper is to explore his early conception of the

relations between the argumentative disciplines. Its principal thesis, based chiefly on evidence about the relation between dialectic and rhetoric, is that before the advent of analytic dialectic played a double role. It was both the art or discipline of one practice of argumentation and the master discipline of argument to which other disciplines turned for their understanding of the fundamentals of argument."

3. Aubenque, Pierre. 1968. "La dialectique chez Aristote." In *Aristotle on Dialectic: the Topics. Proceedings of the third Symposium Aristotelicum*, edited by Owen, Guilym E. L., 9-31. Oxford: Clarendon Press.

4. Bäck, Allan. 2000. *Aristotle's Theory of Predication*. Leiden: Brill.

5. Barnes, Jonathan. 1959. "Aristotle's theory of demonstration." *Phronesis* no. 14:123-152.

   Reprinted in: J. Barnes, M. Schofield, R. Sorabji (eds.), A*rticles on Aristotle. Vol. 1: Science*, London: Duckworth 1975, pp. 65-87.

6. ———. 1996. "Grammar On Aristotle's terms." In *Rationality in Greek Thought*, edited by Frede, Michael and Striker, Gisela, 175-202. New York: Oxford University Press.

   "However that may be, Aristotelian syllogistic concerned itself exclusively with monadic predicates. Hence it could not begin to investigate multiple quantification. And that is why it never got very far. None the less, the underlying grammar of Aristotle's logic did not in itself block the path to polyadicity. The later Peripatetics were conservative creatures and they lacked logical imagination. Moreover, Aristotle himself had assured them that his syllogistic was adequate for all serious scientific needs. As for Aristotle, his service to logic is nonpareil, and it would be grotesque to chide him for lack of inventiveness. It is true that, in logical grammar, he did not climb above the level which he attained in the de Interpretatione. But the Analytics does not represent a fatal, or even a new, grammatical excursion. And the story of Aristotle's fall, like the story of the fall of Adam, is a myth." (pp. 201-202)

7. Bastit, Michel, and Follon, Jacques, eds. 2001. *Logique et métaphysique dans l'Organon d'Aristote*. Louvain: Peeters.

8. Bennekom, Riek van. 1986. "Aristotle and the Copula." *Journal of the History of Philosophy* no. 24:1-18.

   "How is it to be explained that Aristotle recognizes more than once the distinction between the copulative and the existential senses of "einai", but ignores this distinction in the crucial passage *Metaphysics* "D" 7 dealing with the ten different categories and the corresponding ten senses of "einai"? The author argues that Aristotle's fundamental conception of being was a fused one: "x is f" implies, and even states, "x exists"; he terms this principle: existence extraction license (eel). That eel leads to absurdities with negative "kafautou" predications and that it fits ill with the new ontological theory being developed in *Metaphysics* "H" 2 seems to have escaped Aristotle. The distinction between copulative and existential "einai" is applied by Aristotle only to "kata sumbebekos" predications, and an examination of *De interpretatione* 21a25ff shows that even here the tendency towards a fused concept of being prevails."

Sfendoni-Mentzou, Demetra, Hattiangadi, Jagdish and Johnson, David M., 97-112. Bern: Peter Lang.

"Below we gather five salient features of Aristotle's logical investigations in *Prior Analytics* A that reveal the mathematical nature of his studies: (1) He took logic to be a formal part of epistemology. (2) He treated syllogistic deduction metalogically, or metasystematically. (3) He explicitly formulated rules of natural deduction. (4) He modelled his syllogistic deduction system to demonstrate certain logical relationships among its rules. And (5) he distinguished logical syntax from semantics sufficiently to note the completeness of his logic. While each of these features is remarkable in itself, when they are viewed together they reveal the striking philosophical modernity of an ancient logician." (p. 100)

    "In this monograph Dr. Wilke attempts to distinguish within the text of the *Organon* the different strata which mark the stages of development in Aristotle's logic. This development, he believes, is essentially the history of Aristotle's discovery of the quantity of judgments and the ever increasing role of the particular proposition, which means the gradual emancipation of logic from its metaphysical (i. e. Platonic) background. In the development of the doctrine of modality Dr. Gohlke finds a second means of distinguishing different chronological strata and a third in the changing theory of method, particularly in the supposed alteration of Aristotle's attitude toward the object of demonstration."

    "It is a widely accepted view amongst scholars that Aristotle believed that the subject of an assertion might fail to refer. Two texts, *De interpretatione* XI 21 a 25-28 and *Categories* X 13 b 12-35, are generally cited as evidence for this belief. In this paper I argue that both passages have previously been misunderstood and that Aristotle did not accept the possible referential failure of the subject of an assertion. In section I, after first discussing the standard interpretations of both texts, I note the difficulties which result from these accounts. In section II I offer a brief general argument showing that Aristotle's own account of what an assertion is implies that it is impossible for the subject of an assertion to fail to refer. In section III I present my own analysis of each passage and show that when properly understood neither is in any way concerned with the problem of referential failure."

    "I provide a survey of the contents of the works belonging to Aristotle's *Organon* in order to define their nature, in the light of his declared intentions and of other indications (mainly internal ones) about his purposes. No unifying conception of logic can be found in them, such as the traditional one, suggested by the very title *Organon*, of logic as a methodology of demonstration. Logic for him can also be formal logic (represented in the main by the *De Interpretatione*), axiomatized syllogistic (represented in the main by the *Prior Analytics)* and a methodology of dialectical and rhetorical discussion. The consequent lack of unity presented by those works does not exclude that both the set of works called *Analytics* and the set of works concerning dialectic (*Topics* and *Sophistici Elenchi*) form a unity, and that a certain priority is attributed to the analytics with respect to dialectic."

"In chaps. 2, 5-7 of his *Prior analytics*, Aristotle is concerned with circular proof. He gives an account of circular proofs within the framework of his syllogistic theory and discusses how they come about in the three figures of categorical syllogisms. The results of this discussion are summarized at the end of this section, at *APr*. 59 A 32-41. The summary contains several statements to the effect that certain circular proofs come about in the third figure. Some of these statements are problematic because the circular proofs in question are actually not in the third figure of categorical syllogisms ; in fact, these proofs are not categorical syllogisms at all, but what Theophrastus called prosleptic syllogisms (Aristotle, *Sch*. *Σ* 190 A 1-4 Brandis). Hence, the statements are incorrect if they are understood to refer to the third figure of Aristotle's categorical syllogisms. The passage can, however, be shown not to be spurious: the problematic statements in it refer not to the third figure of categorical syllogisms, but to the third figure of prosleptic syllogisms. On this interpretation, the statements can be regarded as genuine. They show that Aristotle was aware of a classification of prosleptic syllogisms into three figures, even though such a classification does not occur elsewhere in his writings. Thus, the passage appears to be the earliest evidence we have of figures of prosleptic syllogisms."

"Aristotle's conception of identity is too large a subject to be analyzed in a single article. I will try to discuss here just one of the many problems raised by his views on sameness. It is not, perhaps, the most stimulating question one could wish to see treated, but it is a question about logic, where I feel a little more at ease than among the complicated and obscure riddles of metaphysics. My subject will be Aristotle's references to what is nowadays called 'Leibniz' Law' (*LL*): if two objects x and y are the same, they both share all the same properties.

(...)

First, I will consider Aristotle's statements about *(LL)* and the analyses he gives of some supposed counterexamples to this principle. Secondly, the interpretations of his view among his Greek commentators will be taken into account and their distance from the position of the master evaluated. As Professor Moraux has taught us, the study of the Aristotelian tradition often gives us the opportunity of understanding Aristotle's own meaning better." (pp. 57-58)

    See also: *Erratum: Aristotle on Predication*, The Philosophical Review, Vol. 76, No. 4 (Oct., 1967), p. 543.

    "In the *Topics, Categories,* and *De Interpretatione,* Aristotle is struggling with a variety of problems that span the fields of metaphysics and philosophy of language. Both the problems and the attempted solutions have much relevance to some of the main issues in contemporary British and American philosophy. Thus it is unfortunate that though there is a large number of ancient commentaries on these texts, little has been written on these matters in modern times that is of genuine philosophical significance. Professor Ackrill's new translation and notes' make a fine contribution toward remedying this deficiency. (...)

    It is impossible to write a complete review of Ackrill's book, for, not being able to assume familiarity with Aristotle's theories, the reviewer would have to cover simultaneously Aristotle's views, the quality of the new translation, and the quality of Ackrill's notes. As an alternative, the reviewer hopes to introduce the reader to this volume by selecting one of the key nest of problems that Aristotle discusses in these works and discussing Aristotle's views, the translation, and Ackrill's views in this limited context. Unfortunately, even this limited task is too large for the size of a paper to be expected under these circumstances. Nevertheless, this sketchy introduction might be of some value to those interested in the problems at hand."

    Zur Modernen Deutung der aristotelischen Logik. Band 9.

    "In keeping with the fundamental aims of the series *Zur modernen Deutung der Aristotelischen Logik* -- i.e. to make available articles otherwise difficult to trace -- the editors of this IXth volume present essays from Romania, together with a brief overview of the history of logic in Romania. Although the essays were published in two major international languages -- mainly in French, with some in German -- they appeared in Romanian journals which have a limited circulation in the West. Studies have been selected for their focus on major areas of Aristotelian logic: the theory of categories, syllogistics, logical principles and the theory of knowledge; an additional theme is the historical significance of Theophil Corydaleu's work. All these combine to give a comprehensive view of contemporary Aristotle scholarship in Romania."

    Traduzione italiana: *Il principio di non-contraddizione in Aristotele,* Torino: Bollati-Boringhieri, 2008.

Index: Introduction 9; I. The PNC as a law of reality and thought 17; II. The PNC as indemonstrable principle 69; Conclusion 111; Bibliography 119; Index of names 127-128.

"The aim of this study is to discuss the formulation of the principle of non-contradiction (PNC) based on the text of Aristotle. It does not deal with the whole Aristotle's *Metaphysics*. We take certain passages selectively from chapter 3 and chapter 4 of the *Metaphysics,* with a view to interpreting the PNC as a law of being.

Our discussion focuses mainly on how Aristotle regards the PNC as a law of reality and a law of thought. Then we shall see the possibility of knowing the PNC by way of intuitive understanding. This leads us to affirm that the PNC is a supreme principle that we cannot demonstrate. The only way Aristotle thinks it possible to speak about the principle in question is by way of confutation, using a dialectical argument: in order to proceed with the confutational proof, the opponent must say something which is meaningful for himself and for others. Aristotle distinguishes proper demonstration from a dialectical argument. We shall also try to specify the dialectical method that Aristotle uses to prove the PNC.

This study has two chapters. The first chapter deals with the PNC as a law of reality and thought. This has two parts: the first part deals with *Metaph*. IV, 3, 1005b 19-20; IV, 3, 1005b 26-27; IV, 6, 1011b 15-20 and the secand part analyses *Metaph*. IV, 3, 1005b 24-26; IV, 3, 1005b 28-31. These passages treat the PNC as a law of reality and thought respectively.

We shall interpret the PNC as a law of being from two points of view: first, based on the different types of opposition that Aristotle explains in the *Categories,* we shall see the meaning of «contradiction» that Aristotle understands in the formulation of PNC. Our conclusion will be that the greatest opposition that Aristotle has conceived in his whole work is the contradiction between being and non-being. The other oppositions such as contraries, privation and relatives, are oppositions that do not produce contradiction. As we shall see, the opposition between the relatives father and son, between privations vision and

blindness, and between the contraries white and black, could not be predicated at the same time of the same subject in the same respect. But they are different from the sense of contradiction that Aristotle conceived in the formulation of the PNC -- because they do not distinguish absolutely the two extreme existences being and non-being." (pp. 9-10)

73. Perreiah, Alan R. 1993. "Aristotle's axiomatic science: Peripatetic notation or pedagogical plan?" *History and Philosophy of Logic* no. 14:87-99.

    "To meet a dilemma between the axiomatic theory of demonstrative science in "Posterior analytics" and the non-axiomatic practice of demonstrative science in the physical treatises, Jonathan Barnes has proposed that the theory of demonstration was not meant to guide scientific research but rather scientific pedagogy. The present paper argues that far from contributing directly to oral instruction, the axiomatic account of demonstrative science is a model for the written expression of science. The paper shows how this interpretation accords with related theories in the "Organon", including the theories of dialectic in "Topics" and of deduction in "Prior analytics"."

76. Rijk, Lambertud Marie de. 2002. *Aristotle: Semantics and Ontology. Volume I: General Introduction. The Works on Logic*. Leiden: Brill.

    From the Preface: "In this book I intend to show that the ascription of many shortcomings or obscurities to Aristotle resulted from persistent misinterpretation of key notions in his work. The idea underlying this study is that commentators have wrongfully attributed anachronistic perceptions of

`predication', and statement-making in general to Aristotle. In Volume I, what I consider to be the genuine semantics underlying Aristotle's expositions of his philosophy are culled from the *Organon*. Determining what the basic components of Aristotle's semantics are is extremely important for our understanding of his view of the task of logic -- his strategy of argument in particular.

In chapter 1, after some preliminary considerations I argue that when analyzed at deep structure level, Aristotelian statement-making does not allow for the dyadic 'S is P' formula. An examination of the basic function of `be' and its cognates in Aristotle's philosophical investigations shows that in his analysis statement-making is copula-less. Following traditional linguistics I take the `existential' or hyparctic use of `be' to be the central one in Greek *(pace* Kahn), on the understanding that in Aristotle hyparxis is found not only in the stronger form of `actual occurrence' but also in a weaker form of what I term `connotative (or intensional) be' (1.3-1.6). Since Aristotle's `semantic behaviour', in spite of his skilful manipulation of the diverse semantic levels of expressions, is in fact not explicitly organized in a well-thought-out system of formal semantics, I have, in order to fill this void, formulated some semantic rules of thumb (1.7).

In chapter 2 I provide ample evidence for my exegesis of Aristotle's statement-making, in which the opposition between `assertible' and `assertion' is predominant and in which `is' functions as an assertoric operator rather than as a copula (2.1-2.2). Next, I demonstrate that Aristotle's doctrine of the categories fits in well with his view of copula-less statement-making, arguing that the ten categories are `appellations' ('nominations') rather than sentence predicates featuring in an `S is P' formation (2.3-2.4). Finally, categorization is assessed in the wider context of Aristotle's general strategy of argument (2.5-2.7).

In the remaining chapters of the first volume (3-6) I present more evidence for my previous findings concerning Aristotle's `semantic behaviour' by enquiring into the role of his semantic

views as we find them in the several tracts of the *Organon,* in particular the *Categories De interpretatione* and *Posterior Analytics*. These tracts are dealt with *in extenso,* in order to avoid the temptation to quote selectively to suit my purposes."

77. ———. 2002. *Aristotle: Semantics and Ontology*. *Volume II: The Metaphysics, Semantics in Aristotle's Strategy of Argument*. Leiden: Brill.

From the Preface to the first volume: "The lion's part of volume two (chapters 7-11) is taken up by a discussion of the introductory books of the *Metaphysics* (A-E) and a thorough analysis of its central books (Z-H-O). I emphasize the significance of Aristotle's semantic views for his metaphysical investigations, particularly for his search for the true *ousia*. By focusing on Aristotle's semantic strategy I hope to offer a clearer and more coherent view of his philosophical position, in particular in those passages which are often deemed obscure or downright ambiguous.

In chapter 12 1 show that a keen awareness of Aristotle's semantic modus operandi is not merely useful for the interpretation of his metaphysics, but is equally helpful in gaining a clearer insight into many other areas of the Stagirite's sublunar ontology (such as his teaching about Time and Prime matter in *Physics).*

In the Epilogue (chapter 13), the balance is drawn up. The unity of Aristotelian thought is argued for and the basic semantic tools of localization and categorization are pinpointed as the backbone of Aristotle's strategy of philosophic argument.

My working method is to expound Aristotle's semantic views by presenting a running commentary on the main lines found in the *Organon* with the aid of quotation and paraphrase. My findings are first tested (mainly in Volume II) by looking at the way these views are applied in Aristotle's presentation of his ontology of the sublunar world as set out in the *Metaphysics,* particularly in the central books (ZHO). As for the remaining works, I have dealt with them in a rather selective manner, only to illustrate that they display a similar way of philosophizing and a similar strategy of argument. In the second volume, too,

the exposition is in the form of quotation and paraphrase modelled of Aristotle's own comprehensive manner of treating doctrinally related subjects: he seldom discussed isolated problems in the way modern philosophers in their academic papers, like to deal with special issues tailored to their own contemporary philosophic interest."

86. Striker, Gisela. 1998. "Aristotle and the uses of logic." In *Method in Ancient Philosophy*, edited by Gentzler, Jyl, 209-226. New York: Oxford University Press.

    "Aristotle, as we all know, invented formal logic. Over the last fifty years or so, scholars have learned to recognize that what he presented in the first few chapters of the Prior Analytics (An. pr.) is the real thing -- a system of formal logic, whether or not the inspiration for the discovery of the syllogism had anything to do with Platonic division. We no longer hear about the magical force of the middle term or the alleged demonstrative power of first figure syllogisms as opposed to, say, the superficial subtleties of Stoic logic. Although Aristotle's syllogistic covers only a small part of' the field of modern mathematical logic, what he offered contained all the elements of a formal deductive system. He introduces the system of syllogistic moods by defining its technical terms, stating and justifying the primitive rules, and then providing formally correct proofs of the derivative rules. In other words, he developed a complete system of natural deduction, limited indeed by the assumption that all propositions must be simple subject-predicate sentences, but otherwise flawless. (1)

    (...)

    Aristotle was interested both in logic as a theory and in its more humdrum uses in philosophical, or indeed everyday, argument, and more than half of the text of the Prior Analytics is concerned with the uses of logic in argument, rather than with either the exposition of a formal system or what we would calf logical theory. This is what one should expect, since Aristotle invented formal logic for the purposes of his general theory of argument, not just as a formal theory of deductive proof or an 'underlying logic' for demonstrative science. (5) In order to show how the perspective of a general theory of argument differs from that of logical theory, I will argue that although syllogistic can be shown to be complete in the modern logician's sense, it was not considered by its author to be complete in the sense relevant to his project. A deduction system is complete in

the modern sense if it allows one to deduce all (and only) the valid formulae.

What Aristotle has in mind when he set out to show that 'every deductive argument (sullogismos) is one of the (syllogistic) figures' (A23 40b20-22) was the claim that every valid deductive argument can be formulated as one or more syllogisms in the narrow sense. This, as Aristotle recognized, is not the case (A 44. 50b2-3). However, I will also argue that he thought syllogistic captured at least a necessary component of every valid deductive argument, and perhaps that it was indeed sufficient as an account of the logical form of scientific demonstration. Finally, I will illustrate the role of formal syllogistic in the theory of argument by a few examples from the second half of book A and from book B." (pp. 210-211)

(1) This summarizes the conclusion of J. Corcoran, 'Aristotle's Natural Deduction System', in idem (ed.), Ancient Logic and its Modern Interpretations (Dordrecht: Reidel. 1974), p. 122-3.

87. Theron, Stephen. 2002. "The interdependence of semantics, logic, and metaphysics as exemplified in the Aristotelian tradition." *International Philosophical Quarterly* no. 42:63-91.

Abstract: "A general metaphysical account of logic, meaning, and reference that developed from the Greeks through the medievals and up into modern times can be called Aristotelian. 'Copernican' claims (Kant, Frege), radically to replace this paradigm as quasi-'Ptolemaic', actually participated in the prolonged decline of scholasticism, after Aquinas in particular. We need to recognize, or to remember, the priority of being to truth and not to conflate them. We need to explicate the origin of thinking (abstraction) as at one remove from immediate sense-experience. Syllogistic logic then emerges as a true causal account of reasoning in general; it is not some primitive attempt to outline a formal logical system. An account of suppositio as controlling the analogous uses of our finite store of words in reference to an infinite reality itself shaped by criss-cross patterns of likenesses, governs the general picture supplied here."

    "Two main claims are defended. The first is that negative categorical statements are not to be accorded existential import insofar as they figure in the square of opposition. Against Kneale and others, it is argued that Aristotle formulates his O statements, for example, precisely to avoid existential commitment. This frees Aristotle's square from a recent charge of inconsistency. The second claim is that the logic proper provides much thinner evidence than has been supposed for what appears to be the received view, that is, for the view that insofar as they occur in syllogistic negative categoricals have existential import. At most there is a single piece of evidence in favor of the view -- a special case of *echthesis* or the setting out of a case in proof."

    "Aristotle has a doctrine, or series of doctrines, of accidental predication, accidental being, accidental unity and accidental sameness, which scholars have recently illuminated by reference to problems in the philosophy of logic. (See references below to papers by Gareth Matthews, Nicholas White and Alan Code.) But they have not so far found a single key to the understanding of these doctrines. The key can, I believe, be found by comparing Aristotle's doctrines with Russell's Theory of Descriptions. Russell's theory is couched in the formal mode of speech: it is concerned with distinguishing amongst expressions which rank grammatically as subjects of sentences those which alone are true logical subjects.

    Aristotle's theory is couched for the most part in the material mode: he speaks of accidental unities or beings as though they were a subclass of entities, in a way which has allowed Gareth Matthews recently to talk of this doctrine as a doctrine of "kooky objects."(1)" (p. 63)

    (1) Gareth B. Matthews, "Accidental Unities," in *Language and Logos*, edited by M. Schofield and M. Nussbaum (Cambridge University Press, 1982) pp. 223-240. One may compare the way in which the phenomena of

referential opacity are spoken of in terms of "intentional objects."

Semantics and Philosophy of Language in Aristotle's *De Interpretatione*

Introduction

"The central theme of the *De interpretatione* is the nature of contradiction between assertions. This is a crucially important theme for dialectic, whose regular tasks include that of establishing the contradictory of a proposed thesis, and that of replying to a dilemmatic question by choosing between the affirmation and the negation of a given thesis.(4) The inquiry into language as such, which occupies the first four chapters, is subordinated to this goal.

One apparent obstacle to such a view of the treatise is the (highly suspect) transmitted title, Περὶ ερμηνείας, which should probably be understood in the sense "On language" (cf. *De anima* II 8, 420b19-21, where ερμηνεία functions as a synonym of διάληκτος). A second obstacle is the opening announcement: "First we must determine what a name is, and what a verb is, then what are a negation, an affirmation, an assertion, and a sentence (λόγος)". This programme attaches no special importance to contradiction: affirmation and negation merely appear in the middle of the agenda.(5) In fact though, these two obstacles may helpfully cancel each other out. All we need is the simple hypothesis that the original, lost title of the work (or lecture course) already specified contradiction as the principal theme. There is in fact good reason to think that the authentic title was *On affirmation and negation*.(6) In that case the opening sentence was unambiguously understood as specifying the series of definitions required as a *preliminary* to that central theme.

Later, when the authentic title was lost, we need only suppose that an early editor was misled by the programmatic opening sentence into identifying language itself as the work's main theme, and inventing its current title, "On language".

As regards the progression in the opening chapters from "name" (δνομα) and "verb" (ρήμα) to "sentence" (λόγος), even this should not really be seen as an investigation of language as such. In ignoring all components of statements other than "names", "verbs", and the negation sign, Aristotle continues and reflects the project in Plato's *Sophist* 260-264 of investigating statements *qua* bearers of truth and falsity. (Even the treatment of negation represents the legacy of the *Sophist:* Aristotle follows Plato (257b-c) in regarding "not" as negating only the word which follows, (7) in contrast with Stoic logic, which uses it to negate an entire proposition). This is a further sign that the dominant theme is a specific one, the relation between certain kinds of assertion, rather than language in general." (pp. 88-89)

Notes

(4) My understanding of this and many other aspects of the *De int.* has been transformed by a recently completed Cambridge doctoral thesis, soon to be published: C.W.A. Whitaker, An *analysis of Aristotle's* De interpretatione [published in 1996 as: *Aristotle's De interpretatione. Contradiction and dialectic.* Oxford: Clarendon Press]. He shows that the treatise is to be read in conjunction with the *Topics* much more than with the *Analytics.*

(5) The agenda itself does not observe a strictly linear sequence. The first pair, δνομα/ρήμα, does correspond to chapters 2 and 3 respectively. But ἀπόφασις καὶ κατάφασις καὶ ἀπόφανσις καὶ λόγος precisely reverses the order followed in chapters 4-6, starting with the two species, then moving to their genus and finally to the genus of their genus. On this, see Montanari (1984, I: 25-31).

(6) I suggest this because (a) the ancient commentators knew a work by Theophrastus entitled Περὶ καταφάσεως καὶ ἀποφάσεως, which they said covered the same themes as *Int.* (Theophrastus frr. 71G, 72A, 79, 8 lB FHSG; cf. schol. in Ar. *De int.* 94b14-17 Brandis, in Bekker (1961, vol.4), and (b) Theophrastus' other works

corresponding to the *Organon* all had identical titles to the matching Aristotelian texts: he wrote a *Categories,* a *Topics,* a *Prior Analytics* and a *Posterior Analytics* (frr. 1, 2, 71F, 100B, 104, 112B, 113B, 117, 124A, 127A, 127B FHSG). (Despite frr.frr. 71A and 71E (FHSG), it seems most unlikely that Theophrastus wrote a work actually entitled Περὶ ἑρμηνε'ας). An alternative but less plausible hypothesis is that of Maier (1900: 70-1) that it was Theophrastus himself who, finding the Aristotelian treatise already untitled, invented the title Περὶκαταφάσεως καὶ ἀποφάσεως. But it is hard to believe that Aristotle's long-term close collaborator on logic and dialectic was ignorant of its authentic title. The likelier story is that it was only after Theophrastus' death that the inauthentic title was invented to fill a gap in the MSS.

(7) This is well demonstrated by Whitaker [1996] *cit*.

From: David Sedley, Aristotle's *De interpretatione* and Ancient Semantics, in: Giovanni Manetti (ed.), Knowledge Through Signs. Ancient SemioticTtheories and Practices, Turnhout: Brepols, 1996, pp. 87-108.

"The results so far are as follows. The semantic theory of the *De interpretatione* places itself at the service of Aristotle's study of contradiction between assertions, and reflects a Platonic debate on the question how beliefs and assertions come to be true or false. It is from this perspective, and not for their own sake, that the theory also addresses itself to the minimum semantic components of assertions, names and verbs. Therefore the semantic passage in chapter 1 is to be thought of as prefixed to the entire work, especially the final chapter, and not specially to chapters 1-4" p. 100

An overview of the De interpretatione (Peri hermeneias)

ORDER OF THE *PERI HERMENEIAS.*

"Since the enunciation is the principal subject of the *Peri Hermeneias* the treatise is divided according to the consideration of the enunciation and its parts.(1) After a preliminary chapter on signification and different ways of signifying, (2)Aristotle treats first the principles of the subject i.e., the principles of the enunciation. These are of two kinds: material and formal. The material (or, as St. Thomas refers to them, "quasi material" (3) principles or integral parts of the enunciation are the nom and the verb, the former signifying the substance of a thing and the latter signifying an action or a passion proceeding from a thing. (4) Aristotle defines the noun as a vocal sound which signifies by convention, without time, no part of which signifies separately. (5) "Vocal sound" is the matter or subject on which the signification of the noun is imposed; it distinguishes the noun from sounds not emitted by animals. "Which signifies" distinguishes the noun from nonsense words. "By convention" manifests that this signification of a noun proceeds arbitrarily from the human will; the noun is distinct from sounds which are naturally significant, such as groans and cries. "Without time" distinguishes the noun from the verb, and this last phrase, "no part of which signifies separately," distinguishes the noun from speech *(oratio)* of which it is a part. The verb is defined in the same way, except that it signifies with time, since it signifies action. It is moreover, distinguished from the participle in that it is always a sign that something is predicated of another. The formal principle of the enunciation is speech, which is its genus.(6) The genus of the enunciation is then called its formal principle, because the more universal *in praedicando* since it is not of itself contracted to this or that species, is as a form including the species. A genus is logically superior to the species contained under it; since the species are as subjects of which the genus is predicated, the genus is their formal principle.

Having treated the principles of the subject, Aristotle now takes up the subject, i.e., the enunciation, in the rest of the book. This falls into two sections, the first is on the enunciation absolutely

considered, (7) the second is on the different kinds of enunciations. (8) The absolute consideration of the enunciation comprises three parts: its definition, (9) its division, (10) and its property of opposition.(11)

The enunciation is defined as speech in which the true or false is found.(12) This definition distinguishes the enunciation from incomplete speech *(orationes imperfectae)* as well as from questions, commands, prayers, and salutations which do not absolutely signify concepts in which the true or false is found.(13) The first division is into the enunciation which is simply one because what it signifies is one and the enunciation which is one only by conjunction because it signifies many. The latter, called a composite enunciation, is one only *secundum quid; simpliciter* it is many.(14) The second division is into the species of the enunciation: the affirmation and the negation. This division is primarily of the simple enunciation, but can also be applied *ex consequenti* to the composite enunciation.(15)

These divisions are followed by a treatment of opposition between the subjective parts of the enunciation, i.e., between affirmation and negation. First, Aristotle shows how enunciations are opposed to each other,(16) and, secondly, he answers a difficulty about whether in future singular enunciations in contingent matter one of the opposed enunciations must be true or false.(17) To show how enunciations are opposed to each other he takes up, first of all, the opposition of affirmation and negation absolutely considered, i.e., without reference to differences arising from the subject. This opposition of affirmation and negation is called contradiction.(18) In this connection, St. Thomas points out that affirmation and negation divide the enunciation on the part of its very form or mode of enunciating, whereas the true and the false divide it in comparison to things, e.g., "The crow is white" is affirmative in its mode of enunciating, but false; "The crow is not white" is negative and true.

...Philosophus assumit duplicem diversitatem enunciationis: quarum prima est ex ipsa forma vel modo enunciandi, secundum quod dictum est quod enunciatio vel est affirmativa, per quam scilicet enunciatur aliquid esse, vel est negative per quam significatur aliquid non esse; secunda diversitas est per comparationem ad rem, ex qua dependet veritas et falsitas intellectus et enunciationis. Cum enim

enunciatur aliquid esse vel non esse secundum congruentiam rei, est oratio vera; alioquin est oratio falsa.(19)

Next, Aristotle shows how enunciations are furthermore opposed by reason of their subjects.(20) This involves a new division of enunciations according to the quantity of the subject, i.e., according as something is predicated of many or of one only. Since a subject is either singular or universal, and since a predicate is said of a universal either universally, particularly, or indefinitely, there are four kinds of enunciations: singular, universal, particular, and indefinite.(21) Then, combining the qualities of affirmation and negation with the quantity of the subject, Aristotle shows that an affirmative universal and a negative universal are opposed as contraries, e.g., "Every man is white" and "No man is white."(22) However, when nothing is predicated universally of a universal subject, there cannot be an opposition of contrariety; therefore indefinite enunciations cannot be opposed as contraries.(23) A particular affirmative cannot properly be said to be opposed to a particular negative, because opposition demands the same subject in both enunciations, but a particular enunciation is opposed as a contradictory to the universal of the opposite quality, e.g., "Some man is white" is the contradictory of "No man is white."(24) Next, the author considers how these opposed affirmations and negations are related to truth and falsity: contraries cannot be simultaneously true, etc.(25)

After distinguishing the different modes of opposition, Aristotle shows that there is only one negation opposed to every affirmation, e.g., "Some man is not white" is the only negation of "Every man is white," because it alone removes the very universality of the universal enunciation.(26) Finally, Aristotle takes up the problem of whether one of the opposites must be determinately true .or false in all kinds of enunciations or not.(27) To treat this question it is necessary to observe that enunciations can be divided according to time into present, past, and future and according to their matter into necessary, impossible, and possible or contingent.(28) For enunciations in present or past time, either a universal or its contradictory particular is necessarily true and its opposite is false, in any kind of matter, e.g., "Some man is not white" is necessarily true, if "Every man is white" is false. This is also true for singular

enunciations which are opposed as contradictories, e.g., if "This man is white" is true, "This man is not white" is necessarily false. From the truth of a particular affirmation, however, the falsity of its negative cannot be inferred, e.g., "Some man is white" and "Some man is not white" can both be true. But for enunciations in future time a distinction must be made according to the matter of the enunciation. Future enunciations in necessary and impossible matter are determinately true or false in the same way as enunciations in present and past time. Likewise, in contingent matter, universals are false and particulars are true, as for present and past enunciations. It is for singular enunciations in future time that a problem arises, for, although a future singular enunciation in necessary matter is determinately true or false, it does not seem to be so in contingent matter.(29) The answer to this problem and the reasons for the answer take up the rest of this chapter in Aristotle and the rest of the first book of St. Thomas's commentary.

The remainder of the *Peri Hermeneias* (30) is devoted to the enunciation as it is diversified by the addition of something. First of all, something can be added to a part of the enunciation, i.e., to the subject or to the predicate. Sometimes such an addition does not take away the unity of the enunciation, as when the subject or predicate is rendered infinite by the addition of a negative.(31) Aristotle first takes up the simplest kind of enunciation which consists only of a noun and the verb "is," e.g., "Socrates is." (32) Since only the subject can be made infinite in this kind of enunciation, only two affirmations can be formed from it: "Socrates is" and "Non-Socrates is." There are also the two corresponding negations: "Socrates is not" and "Non-Socrates is not." These enunciations are said to be *de secundo adjacente,* (33) because "is" is the second diction in the enunciation; "is" signifies that "Socrates" really exists. There are also enunciations *de tertio adjacente* (34) in which "is" is not the principal predicate but serves to connect the principal predicate with the subject, e.g., "Socrates is white." In such enunciations, the predicate as well as the subject can be made infinite. If an enunciation is constructed from a finite noun, the verb "is," and a predicate which can be either finite or infinite, four enunciations are possible: "Man is just" with its negation, "Man is not just," and "Man is non-just" with its negation, "Man is not non-

just." (35) If, on the other hand, the subject is an infinite noun, four enunciations are also possible: "Non-man is just" with its negation, "Non-man is not just" and "Non-man is non-just" with its negation, "Non-man is not non-just." (36) No more than these twelve enunciations are possible. Since the subject of each can be singular, universal, particular, or indefinite, a total of forty-eight enunciations is possible from the point of view taken here. (37) Enunciations whose verbs are adjectival, (38) such as "Socrates runs," are affected by an addition to a part of the enunciation in the same way as simple enunciations, i.e., *de secundo adjacente*. This is true, despite the fact that from the point of view of what is signified such enunciations are the equivalent of enunciations *de tertio adjacente:* "Socrates runs" is equivalent to "Socrates is running."

Sometimes an addition takes away the unity of the enunciation. (39) An enunciation is multiple, if what is signified is multiple, even though the enunciation may appear to be simple. An enunciation can be multiple in four ways: (a) when the subject or predicate is one noun which is imposed on several things, which combine into one, but not insofar as they are one (b) when the several which combine into one are the subject or predicate insofar as they are distinct actualities; (c) when one noun is imposed of several things which do not combine into one; and (d) when the several which do not combine into one are the subject or predicate.(40) After distinguishing the multiple enunciations, Aristotle takes up their consequences.(41) He proposes first the problem of why some predicates are true of a subject both when the predicates are taken separately and whey they are joined, while others are true only separately, e.g., from the fact that Socrates is a man and is white it follows that Socrates is a white man but from the fact that he is good and is a musician it does not follow that Socrates is a good musician. (42) The second problem is whether from ay enunciation whose predicate includes several notions it is legitimate to infer several enunciations each having one of the notions for its predicate e.g., from "Socrates is a white man" it follows that he is white and that he is a man, but from "Socrates is a good musician" it does not follow that he is good. (43)

Secondly, an addition can be made, not merely to a part of the enunciation, but to its very composition. Such an addition is a mode,

and it distinguishes the modal enunciation from the *de inesse* enunciation. There are four of these modes: possible, contingent, impossible, and necessary.(44) The introductory paragraphs of Cajetan's commentary explain the distinction between the modal and the *de inesse* enunciations, which mode make an enunciation modal, the parts of the modal enunciation, and it definition.(45) The text of Aristotle covers the opposition of modals by reason of affirmation and negation(46) as well as their consequences. Thus, to the affirmation, "That man is white is possible," is opposed the negation, "That man is white is not possible."(47) A modal is negative only by addition of a negative to the mode, regardless of whether or not the dictum is negative.(48) The following is an example of the consequence of equipollent modals: that which is necessary to be is, consequently, no possible not to be, not contingent not to be, and impossible not to be.(49) Cajetan concludes this section with some paragraphs on the quantity peculiar to modals and their opposition by virtue of their quantity.(50)

Lastly, Aristotle treats the opposition of enunciations deriving from an addition made to a simple enunciation.(51) In this section, he asks whether the contrary of an affirmative enunciation is the negation of the same predicate or the affirmation of the contrary predicate, e.g., is the contrary of "Every man is just" "No man is just" or "Every man is unjust" ?

DIVISIONS OF THE ENUNCIATION

Six ways of dividing the enunciation can be gathered from the *Peri Hermeneias:* by reason of unity, quality, quantity, time, matter, and expression or non-expression of the mode of composition.

The *first* division is into the enunciation that is one (una *simpliciter)* and that which is composite (una *conjunctione).* The former is sometimes called categorical, and the latter hypothetical.(52) This is an essential division of the enunciation, because it is a division on the part of the copula.

The *second* is into affirmation and negation, which St. Thomas frequently asserts is the division of the enunciation into its species.

Quae quidem est divisio generis in species, quia sumitur secundum differentiam praedicati ad quod fertur negatio; praedicatum autem

est pars formalis enunciationis; et ideo hujusmodi divisio dicitur pertinere ad qualitatem enunciationis, qualitatem, inquam, essentialem, secundum quod differentia significat *quale quid*.(53)

The *third* division is by reason of a difference found in the subject of the enunciation, according as it is said of many or only of one. St. Thomas says this division pertains to the quantity of the enunciation, for quantity follows matter, and the subject is as matter in the enunciation.(54) But when the subject is a universal (i.e., it can be said of many) something can be predicated of it in three ways: universally, if the predicate belongs to the entire multitude in which the universal is found, e.g., "Every man is an animal" ; particularly, if the predicate is said to belong to an indeterminate individual that falls under the universal, e.g., "Some man is white"; or indefinitely, when something is predicated of a universal without any sign of universality or particularity. Thus from the point of view of quantity, the enunciation is divided into singular, universal, particular, and indefinite.(55)

The *fourth* division of the enunciation is according to time, i.e., into past, present, and future. As the third division was on the part of the subject, this is on the part of the verb, because every enunciation must have a verb or a form of a verb and must, therefore, consignify present past, or future time.(56) Both the third and fourth divisions are accidental because they are according to a part of the enunciation.

The *fifth* division of the enunciation is according to matter, i.e., according to the relationship of predicate to subject. If the predicate is in the, subject per se, the enunciation is said to be in necessary matter, e.g. "Man is an animal," or "Man is capable of laughter." If it is per s repugnant that the predicate be in the subject, the enunciation is said to be in impossible or remote matter, e.g., "Man is a horse." If the predicate is neither per se repugnant to the subject nor per se contained it, the enunciation is said to be in possible or contingent matter.(57)

The *sixth* and last division of the enunciation is into the *de inesse* and the modal enunciation, the former merely stating that the predicate, is or is not in the subject, the latter stating the mode in which the predicate does or does not belong to the subject, i.e.,

necessarily, impossibly, possibly or contingently.(58)The extremes of this division are the expression o the non-expression of the mode of composition of predicate with subject."

Notes

Onoma and rhema in the De interpretatione

"3.2. The expression of thought in speech

3.2.1. As we saw in 2.4.3, one of the words that Plato uses for giving verbal expression to what one holds true in one's mind is the verb *apophainesthai.* This verb, with *gnomon* or *doxan as* the expressed or unexpressed object, was familiar to every Greek and had the quite ordinary meaning of making known one's opinion. It is this word that plays a central role in Aristotle's treatment of the expression of

thought in speech, at least *in De interpretatione*. Together with the noun *apophansis,* it becomes a more or less technical term for the speech act of making known to others what one holds true in one's mind, of asserting that something is the case. This speech act is either an affirmation or a denial: *a kataphasis is an apophansis* in which it is asserted that one thing belongs to another, *an apophasis is an apophansis* in which one thing is separated from another *(De int. 17 a* 25). Both *kataphasis* and *apophasis* are species of the genus *phasis:* they are forms of saying *(phanai)* that something is or is not the case.

All these nouns suffer from a process-product ambiguity. Sometimes they indicate the activity of making known one's opinion by means of affirming or denying that something is the case. But they may also designate the utterance which is produced in the course of that activity. So *an apophansis is* defined as a significant spoken sound about whether something does or does not hold *(De int. 17* a 23). The two species of the genus *phasis, kataphasis* and *apophasis,* are defined *as logos kataphatikos* and *logos apophatikos, as* an affirmative or negative utterance *(Cat.* 12 b 8). Each is *a logos apophantikos,* an utterance used in the activity of revealing one's thought *(De int. 17 a* 8).

It is this utterance, as used for a special purpose, that is the typical unit of the *legein-level,* the Platonic *logos.* In contrast with other sorts of expressions which do not yet admit of truth or falsity, *a kataphasis* or *apophasis* and *a logos apophantikos* are the kind of units that are rightly called true or false *(Cat.* 2 a 7; *De int.* 17 a 3, 20 a 35).

3.2.2. The other sorts of expressions, which do not yet admit of truth or falsity and are for that reason incomplete and defective, are the units of Plato's *onomazein-level,* the *onomata* and *rhemata.* By uttering *an onoma* or *a rhema* one cannot reveal anything by one's utterance in such a way as to be making a statement *(De int. 17 a* 17). This 'not yet'-character of *onomata* and *rhemata is* a point to which Aristotle remarkably often returns.

In *Cat. 1* a 16 he distinguishes between expressions whose utterance involves a combination *(symploke)* and expressions that are uttered without combination. As examples are given: 'Man runs', 'Man wins';

'Man', 'Ox', 'Runs', 'Wins'. The expressions formed without any combination designate something belonging to one of the categories, and none of them is either true or false *(Cat*. 2 a 8, 13 b 10).

In *De int*. 16 a 9 a parallel is drawn between the mental sphere and the verbal sphere. In the mental sphere two kinds of thoughts are found, those

unaccompanied by truth or by falsity and those that necessarily have one or the other. In the verbal sphere *onomata* and *rhemata* which are pronounced without any addition -- for instance, 'Man', 'White' -- are like thoughts that are formed without any combination; they are not yet true or false. Even a word such as 'Goat-stag' does not yet signify anything true or false. It does so only when 'is' or 'is not' is added.

That the *symploke* must be of a special kind is shown by *De int* 16 b 1. When 'is' or 'is not' is added to a genitive or dative case (Philo's' or 'to-Philo), the combination does not yet yield a truth or falsehood. The oblique cases cannot play the role of naming the subject in a statement-making utterance.

Further examples of the 'not yet'-terminology are *De int*. 16 b 19 and 17 a 9. Verbs uttered by themselves signify something but they do not yet signify whether something is the case or not (Compare *De int*. 16 b 28: a word like 'Man' signifies something but not that something is the case or is not the case). The definition *(logos)* of man, without 'is' or 'was' or 'will be' or something of that kind, is not yet a statement-making utterance.

These passages are sufficient proof that Aristotle, probably inspired by Plato, is fully aware of the incomplete and defective character of *onomata* and *rhemata*. Measured against the relative independence of utterances by means of which expression is given to a belief that something is the case, and which therefore admit of truth or falsity, the meaning of *onomata* and *rhemata* is imperfect. A composite unit of the *legein-level,* which has the complete sense of a true or a false thought, is formed only when the open place accompanying each separate *onoma* or *rhema* is occupied by a proper complement.

Aristotle defines *onomata* and *rhemata* as spoken sounds significant by convention none of whose parts is significant in separation *(De*

int. 16 a 20, 16 b 6; *Poetics* 1457 a 10, 14). The difference between the two is that *an onoma* signifies without any reference to time, whereas *a rhema* additionally signifies time. Moreover, the *rhema is* a sign of something said of something else, the subject. The verb *legein* which Aristotle uses in this connection indicates both the predicative and the assertive function of the *rhema;* if someone says 'Callias runs', the component 'runs' is a sign that the speaker connects the activity of running with Callias, but also that he holds that this predicate actually belongs to Callias, at the time indicated. As for cases like 'Callias is running' or 'Man is just', where the word 'is' occurs as a third element, there the verb 'is' by itself is nothing, but it additionally signifies some combination *(synthesis)* which cannot be thought without the components *(De int* 16 b 25). This *synthesis,* of which the spoken sounds 'is' or 'is not' are the appropriate sign, is the mental activity of bringing together or separating two concepts which, at the same time, is an act of assenting to the combination, or of dissenting from it. Aristotle does not seem to distinguish between merely conceiving of a certain combination, in a neutral *state* of mind, and actually accepting or rejecting it; for him *a synthesis* is always a mental assertion. That the copula 'is' has this assertive force is confirmed by *Met*. 1017 a 31; although Aristotle speaks there of an emphatic use of Is' and 'is not', in the sense of 'Socrates *is* educated, he really is so', there is reason to believe that this emphatic use is only a strengthening of what is normally present in all cases. For *in De int*. 21 b 31 it is said that in utterances of the form 'Man is white', 'Man is not white' the parts 'is' and 'is not' determine the true; this presumably means that they lend assertive force to these utterances (The passage is, however, far from clear).

De int. 16 b 20 is also interesting because it is in these lines that we find the first trace of a distinction that later came to be known as the distinction between categorematic and syncategorematic words. Although verbs by themselves do not yet signify whether something is the case or not and therefore do not possess the degree of completeness and independence which is characteristic of the units of the *legein-level,* it is still true that most of them have a meaning of their own in the sense that both the speaker and the hearer, in pronouncing or hearing the word, will have a definite thought in

their minds, a thought that has some kind of self-sufficiency. The copula 'is', on the contrary, is not accompanied by any such distinct and relatively self-sufficient thought; it only adds a certain nuance to the meaning of the words to which it is joined. For this additional way of signifying Aristotle uses the word *prossemainein*. This verb also occurs *in De int* 20 a 13, in connection with 'every' and 'no'; these words additionally signify nothing other than that the affirmation or negation is about the name taken universally. Thus we have here the beginning of a trichotomy: expressions signifying that something is the case; verbs and nouns, which do not yet signify that something is the case but have some meaning of their own; and words like 'is', 'every', 'no', which do not signify *(semainein)* in either of those ways but only contribute to the meaning of other words." pp. 26-29

(...)

"3.6. Summary

This chapter clearly shows that the treatment of problems concerning acts and attitudes of holding something true and their objects with which Plato had made a modest but hopeful beginning in *Sophist* 261-264 was considerably extended and refined by Aristotle's efforts. By way of conclusion I shall give a synopsis of what we have found out about his conception of the bearers of truth and falsity.

In the first place that is true or false which is thought or believed to be the case. This bearer of truth or falsity may be designated by such expressions *as doxa, hypolepsis, doxazomenon (doxaston), hypolambanomenon (hypo-lepton),* or by *a hoti-clause* or an accusative and infinitive phrase. In so far as a thought or belief is expressed in words it is perhaps also referred to as the *pragma* that underlies an affirmation or negation; but Aristotle does not seem to make a clear terminological distinction between the thing believed or asserted and that which is actually the case in reality.

Although it is not denied that *logos* sometimes stands for that which is asserted, in the contexts that are most relevant to our subject the word usually has the sense of utterance. Utterances that are used to make statements are the second category of bearers of truth and

falsity, designated by such expressions *as logos apophantikos, logos kataphatikos, logos apophatikos, apophansis, kataphasis, apophasis,* and *protasis*. It is probable that Aristotle in speaking of utterances commonly has in mind what would nowadays be called utterance-tokens. There are, however, some passages in which the bearer of truth or falsity must be taken to be an utterance-type of a certain kind.(*)

As some of the terms for that which is thought or believed and for the utterances used to express it are also employed for the acts or attitudes of judging and believing and for the acts of uttering words with a special intention, the qualifications 'true' and 'false' can easily come to be applied to those acts and attitudes as well. Such cases are, however, exceptional and at any rate derivative." pp. 43-44

Annotated bibliography on Aristotle's *De Interpretatione* (*Peri Hermeneias*)

Studies in English

1. Ademollo, Francesco. 2010. "The Principle of Bivalence in *De Interpretatione* 4." *Oxford Studies in Ancient Philosophy* no. 38:97-113.

   Abstract: "In *De int*. 9 Aristotle argues that some declarative sentences are neither true nor false. This raises the problem of how we should understand the words of ch. 4, which introduces the declarative sentence as 'that in which being true or being false holds'. In this paper I remove the contradiction by arguing that in ch. 4 Aristotle does not intend to claim that *all* declarative sentences are either true or false, but rather that *only* they are either true or false, unlike other kinds of sentence; I defend the soundness of this interpretation on the linguistic and textual level; and I show how we can make good philosophical sense ot it."

2. Albritton, Rogers. 1957. "Present Truth and Future Contingency." *The Philosophical Review* no. 66:29-46.

   "Mr. Taylor refers, in his footnotes, to a recent article(1) in which Miss G. E. M. Anscombe denies that what he calls "Aristotle's opinion" was Aristotle's opinion. Her translation and commentary do not appear to have troubled Taylor's conviction that this opinion is maintained in the De Interpretatione. I had thought, like him, that it was. I am now

inclined to think that this was a mistake. Miss Anscombe has a strong case. Since Taylor says nothing in defense of his interpretation of Aristotle, I will not discuss the question in commenting on his article.2 Instead, I will treat the thesis of the article, and the arguments that he paraphrases from Aristotle, as Taylor's own, without pressing upon him the language of his direct quotations from the Oxford translation of the *De Interpretatione*." (p. 29)

3. Anscombe, G. E. M. 1956. "Aristotle and the Sea Battle. *De Interpretatione* Chapter IX." *Mind* no. 65:1-15.

Revised reprint in: J. M. E. Moravcsik (ed.), *Aristotle: A Collection of Critical Essays,* London: Macmillan, 1968, pp. 15-33 and in: *The Collected Philosophical Papers of G.E.M. Anscombe,* Vol. 1: *From Parmenides to Wittgenstein*, Oxford: Blackwell, 1981, pp. 44-55.

"Aristotle's point (as we should put it) is that "Either p or not p" is always necessary; this necessity we are familiar with. But - and this is from our point of view the right way to put it, for this is a novelty to us - that when p describes a present or past situation, then either p is necessarily true, or ~ p is necessarily true; and here "necessarily true" has a sense which is unfamiliar to us. In this sense I say it is necessarily true that there was not - or necessarily false that there was - a big civil war raging in England from 1850 to 1870; necessarily true that there is a University in Oxford; and so on. But "necessarily true" is not simply the same as "true"; for while it may be true that there will be rain tomorrow, it is not necessarily true. As everyone would say: there may be or may not. We also say this about things which we don't know about the past and the present. The question presents itself to us then in this form: does "may" express mere ignorance on our part in both cases?

Suppose I say to someone: "In ten years' time you will have a son; and when he is ten years old he will be killed by a tyrant." Clearly this is something that may be true and may not. But equally clearly there is no way of finding out. (Unless indeed

you say that waiting and seeing is finding out; but it is not finding out that it will happen, only that it does happen).

Now if I really said this to someone, she would either be awestruck or think me dotty; and she would be quite right. For such a prediction is a prophecy.

Now suppose that what I say comes true. The whole set of circumstances - the prophecy together with its fulfilment - is a miracle; and one's theoretical attitude (if one has one at all) to the supposition of such an occurrence ought to be exactly the same as one's theoretical attitude to the supposition that one knew of someone's rising from the dead and so on." (p. 53 of the reprint)

4. Åqvist, Lennart. 2003. "Future Contingents and Determinism in Aristotle's *De Interpretatione* IX: Some Logical Aspects of the So-Called Second Oldest Interpretation." *Logique et Analyse* no. 46:13-48.

   Abstract: "Dealing with the famous Chapter IX of Aristotle's *De Interpretatione*, the paper proposes a formal reconstruction of the so-called Second-Oldest Interpretation, which (i) is based on the indeterminist logic DARB [*] of historical necessity [Åqvist & Hoepelman (1981)]

   and which (ii) is inspired by the seminal work done by the scholars van Eck (1988) and von Kutschera (1986). It must be emphasized that the point of view from which *De Int*. IX is studied here is not so much that of a strict philologist engaged in Aristotelian scholarship

   as rather that of a modern philosophical logician concerned about systematic combinations of tense and modality. However, both points of view are of course respectable and justified in the case of *De Int*. IX, and, in the opinion of the present author, there ought to be more cross-fertilization between them."

   [* The purpose of this paper is to develop and to investigate some properties ofa system of so called deontic tense logic, i.e. a logic which combines tense operators, or temporal modalities, with operators expressing obligation and permission. (...) "We

call the proposed system DARB, where "D" suggests "deontic" and "ARB" the Latin *arbor* (meaning "tree")", Åqvist & Hoepelman (1981), p. 187].

"It is a very small particle of the philosophic and scientific cosmos that bears Aristotle's name, in fact, it is little more than one page of the whole corpus that I am going to consider, that one page out of 1500 where, in the frame of his logic, he formulates his general views on language. Yet, here, in the first four chapters of Peri hermeneias, he is not primarily interested in language, which is a natural - and therefore self-evident - instrument of expression and communication: he considers it only as the indispensable means of forming a proposition, which is part of a syllogism. The linguistic theory sketched here without any pretence to originality would not claim our serious attention and careful examination if those 48 Greek words in ch. 1 had not proved of such incredibly far-reaching influence in the development of linguistic thought. This influence was rendered possible by the steady tradition of the text, and this book is intended as its documentation. As far as I know there exist no modern translations of all the old commentaries I present, and so I hope to do some pioneer work in the field. As the list in ch. 1 shows, I offer only a selection: the works of eminent authors available in modern editions.

Up to Martinus de Dacia the material consists of explanations of the Philosopher's words, and it is obvious that the same words must often lead to the same explanations, the more so as the explainers did not want to criticize him, but to prove him right. This attitude was bound to lead to many parallelisms between the different texts. I could not omit all those repetitions if I did not want to present mere fragments to the reader. Fortunately the writers are different personalities with different styles and ways of handling the matter so that the reader does not only get acquainted with the medieval ways of thinking and argumentation, but also with the different forms of that sort of literature: the commentary, the exposition, the glosses,the paraphrase, and the questions. At the same time he can follow the development of the scholastic method. And with all the burden of formalism, traditionalism, and dependence on authority which the authors carry along, they have ideas of their own - more or less, of course - and all these chapters add up to a book on linguistic logic or the logic of language, which

makes an interesting section in the history of linguistics, being a museum of past views on language. And my serious advice is to wander through it and see what is there, so as to avoid presenting thoughts as new and progressive which are in fact very old - it is always a poor sight and a little ridiculous too.

I had to content myself with presenting the Greek and Latin material in English and adding my comment where I thought it necessary or at least desirable. I am not giving a philosophical exegesis, but an interpretation from the linguistic point of view. The *grammatica speculativa* and the *grammaire générale* or universal grammar could not be included, though I end with the latter (James Harris). From Aristotle on, the translation is always more or less an interpretation, sometimes not really possible, because there is no exact equivalent, for instance, of *onoma* and *rhema*. And the interpretation is a hazardous enterprise because of the distance of time (1500 years between us and our first commentator) and the lack of an elaborate terminology, which manifests itself in the polysemy of the essential terms, especially in the Latin commentaries, for instance: *forma, vox, intellectus, ratio*. And, also from Aristotle on, one often cannot be sure that the text is correct or whether by an error of the author, of the scribe, of the editor or, lastly, of the printer, there is something wrong with it - sometimes the only thing one knows (or thinks one knows). For all these reasons, and because I am neither an expert medievalist nor a logician, I can, despite several revisions of my text, not guarantee that my translation is always correct." (From the Preface)

6. Bäck, Allan. 1992. "Sailing through the Sea Battle." *Ancient Philosophy* no. 12:133-151.

   Abstract: "I wish to present a simple resolution of the problem of the sea battle treated in Aristotle's *On Interpretation* 9. Though my model is simple, the task is not. I am going to have to battle with the text and to wade through a sea of secondary literature. Let me, then, first present the solution, and then face these labors. I shall conclude with some reflections about certain problems that my solution makes."

7. Bluck, Richard. 1963. "On the Interpretation of Aristotle, *De interpretatione* 12-13." *Classical Quarterly* no. 13:214-222.

   "Chapters 12 and 13 of the *De Interpretatione* present some puzzles, which it is my purpose to try to solve. The latest commentator, Professor Jaakko Hintikka, attempts in *Acta Philosophica Fennica* XIV (1962), 5-22, to abolish the difficulties by taking certain verbs in an unusual way. He suggests that in these chapters ακολουθεἰν, which is usually taken to denote logical consequence, sometimes expresses simply compatibility (2Ib35-22a1, 22b11-I4, 22b17-22), sometimes equivalence (22a14 and 33, 22b22 ff., 23a18 ff.), and that at 22a38 ff., 22b30, and 23a17 ἔπεσθαι, which again is usually taken to denote consequence, in fact expresses compatibility. I propose to counter Hintikka's arguments and to maintain that both verbs express consequence; but as my main purpose is to give my own explanation of the general trend of Aristotle's remarks, I shall take the passages discussed by Hintikka in the order in which they occur in Aristotle's text.

   The root of the difficulties that arise is what appears, at least at first sight, to be a confusion about the meaning of 'possible' (δυνατὸν), which may mean 'contingent' or may include what is necessary. For convenience I shall keep in my translations to the rendering 'possible', and where necessary discuss the meaning of the word in the commentary that follows. Where either of the above-mentioned verbs occurs, I shall translate as though it expresses consequence, since I wish to show that good sense can thus be obtained." (p. 214)

8. Bobzien, Susanne. 2007. "Aristotle's *De Interpretatione* 8 is about Ambiguity." In *Maieusis. Essays in Ancient Philosophy in Honour of Myles Burnyeat*, edited by Scott, Dominic, 301-321. New York: Oxford University Press.

   "My goal in this paper is to shows that contrary to the prevalent view, in his *De Interpretatione* 8, Aristotle is concerned with homonymy; more precisely, with homonymy of linguistic expressions as it may occur in dialectical argument. The paper has two parts. In the first I part argue that in *Soph. el.* 175 b 39 - 176 a 5, Aristotle indubitably deals with homonymy in

dialectical argument; that *De Interpretatione* 8 is a parallel to *Soph. el.* 175 b 39 - 176 a 5; that *De Interpretatione* 8 is concerned with dialectical argument; that, hence, *De Interpretatione* 8, too, deals with homonymy in dialectical argument. In the second part I discuss objections that have been put forward against the view that *De Interpretatione* 8 is about homonymy and shows that they do not succeed." (p. 301)

9. Bolonyai, Gábor. 2005. "Aristotle on Sentence Types and Forms of Speech." *Acta Antiqua Academiae Scientiarum Hungaricae* no. 45:143-152.

   Summary: "According to *Hermeneutics* ch. 4, the analysis of non-assertive sentences such as wishes, commands, etc. belongs to rhetoric or poetics. They are, however, examined neither in the Rhetoric, nor in the Poetics, where in ch. 20 their treatment is explicitly excluded from the art of poetry and referred to that of delivery or performance. In this paper an explanation is given for this discrepancy, based on an interpretation of Aristotle's rejection of Protagoras' criticism of Homer."

   "Non-assertive sentences are first mentioned by Aristotle in chapter 4 of his *Hermeneutics*. Before addressing the logical analysis of sentences, he makes a distinction between sentences that are apt for logical examination and sentences that are not.

   The criterion of distinction is their capacity of being true or false. Assertions and negations do have this aptitude, while other types of sentences have a meaning, but can be neither true nor false." (p. 143)

11. Brandon, E. P. . 1978. "Hintikka on ἀκολουθεῖν." *Phronesis.A Journal for Ancient Philosophy* no. 23:173-178.

    "Hintikka has argued (1) that the term ἀκολουθεῖν, usually translated in logical contexts as 'follow from', is in fact less definite, sometimes possessing a wider sense of 'going together with', 'accompanying', 'being compatible with', 'conforming with', sometimes a stronger sense of 'logically equivalent with'.

These claims were originally used to clear up some difficulties in Aristotle's *De Interpretatione* 12-13, but they have subsequently been employed in an attempt to obtain a consistent interpretation of Pappus' remarks about the geometrical method of analysis and synthesis.(2)

It is not my intention to query the general claim that ἀκολουθεῖν and its cognates have a less definite meaning in ordinary Greek than 'to follow logically from'. What I do wish to show, however, is that Hintikka does not give sufficient grounds for disputing the traditional understanding of this term in the discussion of modal notions in the *De Interpretatione*. (3)" (p. 173)

(1) In 'On the Interpretation of De Interpretatione 12-13' originally published in *Acta Philosophica Fennica* 1962, reprinted with revisions as chapter III of his *Time and Necessity* (Oxford, 1973). All page references to this later version.

(2) J. Hintikka and U. Remes, *The Method of Analysis* (Dordrecht, 1974) passim, esp. ch. II.

(3) Thus my argument has no immediate consequences for the understanding of Pappus. It may be noted, however, that, as Hintikka and Remes show, the method of analysis Pappus seeks to characterise is in fact largely deductive, so that it would not be wildly irresponsible to suggest that the part of his characterisation that involves an 'upward' movement through ἀκολουθα somewhat misleading. Cf. Mueller's review of Hintikka and Remes, *Journal of Philosophy* 73 (1976) 158-62.

12. Brekle, Herbert E. 1970. "A Note on Aristotle's *De Interpretatione* 20b-21a." *Folia Linguistica* no. 4:167-173.

"This contribution is intended to be a discussion of a few passages of Aristotle's *de interpretatione* (20b-21a) where the Philosopher deals with the notion of 'simplicity of a proposition' and with certain relations holding between several types of predicates contained in a proposition. It is the aim of these remarks to clarify — as far äs possible — Aristotle's view of the problems just mentioned and, secondly, to venture an

explanation of one of the questions raised in terms of modern linguistics." (p. 167)

14. Butler, Ronald J. 1955. "Aristotle's Sea Fight and Three-Valued Logic." *Philosophical Review* no. 64:264-274.

    "Certainly the most formidable threat to the law of excluded middle in recent times came with the development of many-valued logics, and notably with Lukasiewicz's three-valued system." (p. 264)

    (...)

    "It becomes diagrammatically apparent that the introduction of "½" has to some extent modified the significance of both "1" and "0".

    The Harvard logician, Professor Donald Williams, supports this conclusion concerning the truth-values in Lukasiewicz's system. "Lukasiewicz," he writes, "seems to have believed at one time that we should abandon the ordinary meanings of 'true,' 'false' and 'not' in favour of something which does fit his three-valued logic, but he did this because he thought he had independent arguments, essentially Aristotle's, against the admission of truth about the future." (4)

    Nevertheless, when Aristotle discussed the application of the principle of excluded middle to contingent propositions about the future, I do not think he was suggesting that the usual meanings of "true," "false," and "not" should be modified in any way (nor, indeed, that the law of excluded middle, when formulated in a certain way, is subject to any exceptions at all). Aristotle's problem is that if "it is an irrefragable law that of every pair of contradictory propositions . . . one must be true and the other false," then "all that is or takes place is

    the outcome of necessity" (18b 26). (5) But determinism he could not accept, because there are real alternatives concerning the future, events which have a "potentiality in either direction"

(19a 10). If this were not so, "there would be no need to deliberate or to take trouble,

on the supposition that if we were to adopt a certain course, a certain result would follow, while, if we did not, the result would not follow" (18b 32). Instead of abandoning the law, however, he attempted so to formulate it that its application to the future is consonant with his view that some future events are not predetermined. Accordingly he concluded that "everything must either be or not be, whether in the present or in the future, but it is not always possible to distinguish and state determinately which of these alternatives must necessarily come about" (19a 27)." Abstract: "Much contemporary philosophy of language has shown considerable interest in the relation between our linguistic practice and our metaphysical commitments, and this interest has begun to influence work in the history of philosophy as well.(1) In his *Categories* and *De interpretatione,* Aristotle presents an analysis of language that can be read as intended to illustrate an isomorphism between the ontology of the real world and how we talk about that world. Our understanding of language is at least in part dependent upon our understanding of the relationships that exist among the enduring πράγματα that we come across in our daily

experience. Part of the foundations underlying Aristotle's doctrine of categories seems to have been a concern, going back to the Academy, about the problem of

false propositions: language is supposed to be a tool for communicating the way things are, and writers in antiquity were often puzzled by the problem of how we are to understand propositions that claim that reality is other than it is.(2) Aristotle's analysis of propositions raises a particular problem in this regard: if the subject of a proposition does not refer to anything, how can the proposition be useful for talking about a state of the world?

The problem falls into two separate but related parts: propositions whose subjects are singular terms and hence make claims about some particular thing, and propositions whose subjects are general terms and hence make claims about classes. In this paper I will explain Aristotle's treatment of each kind, focusing in particular on what has widely been perceived as a problem in his treatment of singular terms. My discussion of his treatment of general terms will be more brief, but will show that his treatment of them is consistent with his treatment of singular terms."

(1) An interesting treatment of this topic that illustrates how such concerns intersect with issues in the history of philosophy can be found in Diamond (1996), Introduction II (pp. 13–38). Whittaker (1996) also touches on these themes.

(2) On the treatment by ancient philosophers of the problem of falsehood see Denyer (1991).

    Revised and reprinted as Chapter 4: *The Signification of Names* in: D. Charles, *Aristotle on Meaning and Essence,* New York: Oxford University Press 2000, pp. 78-109.

    "Aristotle's discussion of names (*onomata*) and their meaning or signification (semainein) is part of his general account of linguistic signification, definition and thought. This is still a somewhat neglected area or study.

    (...)

    My starting-point will be Aristotle's discussion of the signification of names and 'name-like expressions' in the *Posterior Analytics* (*An. Post.*) and *de Interpretatione* (*Int.*). While be comments on these issues elsewhere (for example in the *Topics*, *Categories* (*Cat.*). *Metaphysics* (*Met.*), *Physics* (*Phys.*) and *Poetics*), *de lnterpretatione* and the *Posterior Analytics* suggest the basis for a relatively systematic view, which is clearly connected with his account of definition and thought (*noein*). It may well be that at other times Aristotle held other views on the same topics. But I shall focus mainly on *de Interpretatione* and the *Analytics*, and not attempt an overall survey of all his writings on these issues. The account which he offers there is a striking one which plays a major role in shaping his discussion of other central issues.

    ln this paper, l shall outline Aristotle's discussion of accounts of what names signify in the *Analytics* (section 2). and of names and similar expressions in *de Interpretatione* (3). This sketch will bring into sharper perspective his discussion of empty names and existence (4). and of permissible substitutions in knowledge (and belief contexts (5). Prom this vantage-point, I shall seek to articulate some of Aristotle's views on the interconnections between signification, thought and definition (6). In the final sections (7) and (8) I shall make a few remarks

about the role his account of signification plays in motivating certain of his other views, and about the philosophical problems which it faces. These final sections do not attempt an exhaustive treatment of the issues they raise, but aim merely to suggest avenues for further Investigation." (pp. 37-38)

    Summary: "In summary, we have seen that in chapter 9 of *De interpretatione* Aristotle argues that if one grants that the Principle of Bivalence holds for all future singular propositions, then fatalism results. For the semantic relation between propositions and corresponding reality is such that if a proposition is true, then necessarily reality must correspond to it, and if it is faise, then necessarily reality must fail to correspond to it. Hence, if a future singular proposition has a truth value, future reality must eventuate according as the proposition is true or false. Because contradictions cannot exist in reality, the relevant state of affairs and its opposite cannot both be actualized; so when the time of the event arrives, one or the other state of affairs must be realized. Hence, in an antiphasis of future singular propositions, both cannot be true, nor can both be false. But both can be indeterminate, in that they lack a truth value. Hence, not all future singular propositions are true or false.

    The joker in this deck, if we may call it that, would seem to be Aristotle's view of truth as correspondence.(137) It might be thought that a future singular proposition must be true if it corresponds to what will in fact be, and if not, then it is false. Accordingly, future-tense propositions must be as bivalent as past- or present-tense statements. But Aristotle apparently thought that if reality were as yet undetermined, then corresponding propositions were also indeterminate as regards

their truth value. Ackrill explains that Aristotle held to "a rather crude realistic correspondence theory of truth, and we might well expect him to think that if the state of affairs now is such that it is not settled whether x will or will not occur, then 'X will occur' is not now either true or false: there is not yet anything in the facts for it to correspond or fail to correspond with." (138) On such a view, the only future singular propositions which could now have a truth value would be ones about things which will happen necessarily as part of an everlasting cyclical process. In their case, although there is no future state of affairs now existent with which a proposition may correspond, nevertheless there are in the present the conditions which make the future realization of the state of affairs a necessity, and hence a future singular proposition may be truly asserted of it. But future contingent singular propositions have as yet no truth value. On the basis of the presently existing conditions all that may be truly said of a contingent future singular is "It is going to be." But in such a case, the truth of the proposition says nothing about the eventual actualization of the event-it may or may not occur. Aristotle does not explicity say that future contingent singular propositions become true or false; but he says they are not already true or false. Technically speaking, they do not become true or false; it is the present-tense version of the statements that comes to possess a truth value. It is not unlikely that this distinction did not concern Aristotle, but he does not in any event commit himself clearly to saying the future-tense versions come to be true or false. (139) When the time of the event arrives, then exactly one of the states of affairs is actualized and in the antiphasis one of the propositions becomes actually true in its present-tense version. Since future contingent singular propositions are not antecedently true or false, the argument for fatalism based on antecedent truth and the necessity of the semantic relation fails." (pp. 57-58)

    Appendix I. *De interpretatione* 14 143-152.

    "Ammonius (in *De int*. 251.27ff.) suspected that this chapter was either not by Aristotle or a dialectical exercise. The only visible reason for doubting its authenticity is that some of what it says conflicts with things said elsewhere in Aristotle, and that is not much of a reason. So let us take it as genuine (cf. Ackrill, *Cat. & De int*. p. 153).

    In any case, the chapter contains some astounding confusions. So either Aristotle is genuinely confused, or Ammonius' second alternative is right, and he is just trying out arguments. For present purposes, it does not matter which alternative we take." (p. 143)

    Appendix II. *De interpretatione* 11. 21a. 25-27 153-155.

    "Among too many other things, Aristotle is concerned in *De int*. 11 with patterns of inference in which the cancellation of a term yields a conclusion: it follows from 'this is a pale man' that this is pale, and that it's a man (21a18-20), but not from 'this is a dead man' that this is a man (a21-24). He says of the uncancelled term in the conclusion that it is used 'simply' (απλὸς a5, etc.): an alternative paraphrase might be 'on its

own'. Thus if you went (illicitly) from 'Socrates is a good cobbler' to 'Socrates is good', you would be concluding that Socrates is good simply, or that 'good' on its own applies to Socrates (cf. 20b35-36, 21a14-15).

We can represent this device (which, I think, is almost purely syntactic) with a linguist's boundary marker: your conclusion would be 'Socrates is good#'." (p. 153)

26. De Cuypere, Ludovic, and Willems, Klaas. 2008. "Meaning and Reference in Aristotle's Concept of the Linguistic Sign." *Foundations of Science* no. 13:307-324.

    Abstract: "To Aristotle, spoken words are symbols, not of objects in the world, but of our mental experiences related to these objects. Presently there are two major strands of interpretation of Aristotle's concept of the linguistic sign. First, there is the structuralist account offered by Coseriu (*Geschichte der Sprachphilosophie. Von den Anfängen bis Rousseau*, 2003 [1969], pp. 65-108) whose interpretation is reminiscent of the Saussurean sign concept.

    A second interpretation, offered by Lieb (in: Geckeler (Ed.) *Logos Semantikos: Studia Linguistica in Honorem Eugenio Coseriu* 1921-1981, 1981) and Weidemann (in: Schmitter (Ed.) *Geschichte der Sprachtheorie* 2. *Sprachtheorien der abendländischen Antike*, 1991), says that Aristotle's concept of the linguistic sign is similar to the one presented in Ogden and Richards's (*The meaning of meaning: A study of the influence of language upon thought and of the science of symbolism*, 1970 [1923]) semiotic triangle. This paper starts off with an introductory outline of the so-called *phýsei-thései* discussion which started during presocratic times and culminated in Plato's *Cratylus*. Aristotle's concept of the linguistic sign is to be regarded as a solution to the stalemate position reached in the *Cratylus*. Next, a discussion is offered of both Coseriu's and Lieb's analysis. We submit that Aristotle's concept of the linguistic sign shows features of both Saussure's and Ogden and Richards's sign concept but that it does not exclusively predict one of the two. We argue that Aristotle's concept of the linguistic sign is based on three different relations which

together evince his teleological as well empiricist point of view: one internal (symbolic) relation and two external relations, i.e. a likeness relation and a relation *katà synthéken*."

Essays on the Philosophy of Language in Honour of Professor Gabriel Nuchelmans*, edited by de Rijk, Lambertus Marie and Braakhuis, Henk Antonius, 27-61. Nijmegen: Ingenium Publishers.

    "Introductory

    This study is written in honour of a scholar who, among many other things, has laid the solid basis for the study of what may be considered the kernel of the semantics of the statement-making utterance, viz. the definition of the bearers of truth and falsity.

    In the first section I present a survey of Plato's semantics of the statement-making expression and a number of key notions involved. Next, I explore Aristotle's views of the matter, starting with a discussion of Aristotle's notion of *pragma* including that of being *qua* truth and not-being *qua* falsehood. In search for the nature of Aristotle's *logos,* I discuss this notion as it occurs on the *onomazein* level as well as the way in which it acts on the *legein* level. Next, I investigate the important notions of *synthesis* and *dihaeresis* and the role of *einai* as a monadic functor and *qua* syncategorematic container of categorial being. Finally, I attempt to present a characterization of Aristotle's statement-making utterance.

    (...) p. 27

    "Epilogue

    We may summarize what we have found as follows:

    1 For Plato,

    1.1 a *logos* is a composite expression consisting of a name *(onoma)* and an attribute *(rhêma)* which as such is not yet a statement-making utterance

1.2 a logos represents a state of affairs *(pragma),* i.e. an actual combination of some participata *(dynameis)* in the outside world

1.3 a *logos eirêmenos is* a statement-making utterance; it asserts that the pragma represented by the logos is actually the case.

2 For Aristotle,

2.1 a *logos* is a composite expression consisting of an *onoma* and *a rhêma* which represents both a notional and an ontological state of affairs. It may be characterized as a 'statable complex'

2.2 a *pragma is* a state of affairs either *ontologically:* state of affairs being part of the outside world or *semantically:* state of affairs conceived of and expressed by a logos

2.3 a *logos apophantikos* ('statement-making utterance') is a logos actually stated (either asserted or denied)

2.4 a logos may as such be used either on the *onomazein* level or on the *legein* level (qua *logos apophantikos*). Similarly, *phasis* (*kataphasis, apophasis*) may be used on either of these levels

2.5 *synthesis* is either synthesis1, = the act of uniting an onoma and a rhêma into a logos (on the *onomazein* level) or synthesis2 = the assertion of such a union accomplished in *a logos apophantikos,* (on the *legein* level), while *dihairesis* is always the denial of such a union (on the *legein* level)

2.6 the *esti* forming part of *a logos apophantikos is* not a copula, properly speaking. Rather, it is a sign of (it consignifies, to speak with *De interp*. 3,16b24-5) synthesis2. The onoma and rhêma are already united to make up a logos ('statable complex') by synthesis, and, then, the *esti* rather than acting as a dyadic copulative functor, is merely a monadic sign of the 'statable complex' being actually stated

2.7 The propositional structure found in the *logos apophantikos* may be described as follows:

linguistically: a logos expressing categorial being (i.e. syncategorematic being implemented by one or more of the ten categories of being) is stated (either affirmatively or negatively) by means of the monadic functor 'be' or 'not be'

semantically: the pragma represented by the logos is said to be (or not to be, respectively) part of the outside world (or: 'be (not) the case')." pp. 53-54 (notes omitted).

28. ———. 1996. "On Aristotle's Semantics in *De Interpretatione* 1-4." In *Polyhistor. Studies in the History and Historiography of Ancient Philosophy Presented to Jaap Mansfeld on his Sixtieth Birthday*, edited by Algra, Keimpe, Horst, Pieter van der and Runia, David, 115-134. Leiden: Brill.

    "By and large, in *De interpretatione* Aristotle is concerned with our capability to speak about all that presents itself to our mind. From chapter 4 onwards, he deals with the statement-making expressions (affirmation and negation), which are the main tools for conveying our thoughts about things. This discussion is prepared (chapters 1-3) by some important observations concerning the basic elements of such expressions, viz. *onoma* and *rhema*. The present contribution contains some comments on Aristotle's view of the proper nature of statement-making as put forward in *De interpretatione*. First, I would like to highlight Aristotle's, what Sir David Ross has called `frankly 'representative' view of knowledge' by discussing the terms *omoioma* and *pragma*. Next, I will discuss what is meant by a term's 'time-connotation', and finally I will examine the semantics of *onoma, rhema* and *logos*." (p. 115)

29. ———. 2002. *Aristotle: Semantics and Ontology. Volume I: General Introduction. The Works on Logic*. Leiden: Brill.

    From the Preface: "In this book I intend to show that the ascription of many shortcomings or obscurities to Aristotle resulted from persistent misinterpretation of key notions in his work. The idea underlying this study is that commentators have wrongfully attributed anachronistic perceptions of `predication', and statement-making in general to Aristotle. In Volume I, what I consider to be the genuine semantics

underlying Aristotle's expositions of his philosophy are culled from the *Organon*. Determining what the basic components of Aristotle's semantics are is extremely important for our understanding of his view of the task of logic -- his strategy of argument in particular.

In chapter 1, after some preliminary considerations I argue that when analyzed at deep structure level, Aristotelian statement-making does not allow for the dyadic 'S is P' formula. An examination of the basic function of `be' and its cognates in Aristotle's philosophical investigations shows that in his analysis statement-making is copula-less. Following traditional linguistics I take the `existential' or hyparctic use of `be' to be the central one in Greek (*pace* Kahn), on the understanding that in Aristotle hyparxis is found not only in the stronger form of `actual occurrence' but also in a weaker form of what I term `connotative (or intensional) be' (1.3-1.6). Since Aristotle's `semantic behaviour', in spite of his skilful manipulation of the diverse semantic levels of expressions, is in fact not explicitly organized in a well-thought-out system of formal semantics, I have, in order to fill this void, formulated some semantic rules of thumb (1.7).

In chapter 2 I provide ample evidence for my exegesis of Aristotle's statement-making, in which the opposition between `assertible' and `assertion' is predominant and in which `is' functions as an assertoric operator rather than as a copula (2.1-2.2). Next, I demonstrate that Aristotle's doctrine of the categories fits in well with his view of copula-less statement-making, arguing that the ten categories are `appellations' ('nominations') rather than sentence predicates featuring in an `S is P' formation (2.3-2.4). Finally, categorization is assessed in the wider context of Aristotle's general strategy of argument (2.5-2.7).

In the remaining chapters of the first volume (3-6) I present more evidence for my previous findings concerning Aristotle's `semantic behaviour' by enquiring into the role of his semantic views as we find them in the several tracts of the *Organon,* in particular the *Categories De interpretatione* and *Posterior*

Analytics. These tracts are dealt with *in extenso,* in order to avoid the temptation to quote selectively to suit my purposes."

    "Since nearly the time Aristotle wrote, interest has waxed and waned in his early work, *De lnterpretatione* ix; (1) recent controversy was sparked in 1951, when D. C. Williams discussed the problem of the sea fight in relation to modem logic, and although the flurry of journal articles has quieted down, the problems are not yet solved. One reason for this is that in this passage there is not only the difficulty of evaluating whether Aristotle is correct, but there is the added intrigue of trying to decipher just what it is that he is saying, or even with what issue he is primarily concerned. Many commentators believe he is supporting a correspondence theory of truth by denying the law of the excluded middle for future tense propositions; others believe he is concerned more with metaphysical contingencies and the threat of fatalism than with logical difficulties. Still others take the main point to be about the relation of tensed sentences to infinite past or future truth; and a few come full circle, interpreting Aristotle as not denying the excluded middle at all, only examining the question of whether the future will be like the past.

    In general, all of these fit into one of two broad areas of interpretation; either they are concerned with the distinction between 'necessarily (p or not p)" and "necessarily p or necessarily not p," or with the distinction between "necessarily (p is true or not p is true)" and "necessarily (p will be true or not p will be true)."(2) Because of these different readings of Aristotle it is not enough for us simply to present the text and

then examine different conclusions about it. Instead, we will consider the most important commentaries, tracing

the development of recent criticism as well as establishing the uniqueness of each position, and then draw our own conclusions based on these interpretations and our own reading of the text. (3) Due to the volume of material on the sea fight, not all commentaries can be discussed here; some, e.g., Albritton (4) and Ryle, (5) are omitted because they do not focus enough on Aristotle, while others, e.g., Strang (6) e and McKim (7), are not covered because their basic arguments are found elsewhere." (pp. 11-12 note 3 omitted. The authors summarized are: D. C. Williams, Linsky, Butler, Anscombe, Ackrill, Hintikka, and Frede.)

(1) The problem of the universal applicability of the excluded middle was debated by the Stoics and Epicureans, and specific commentaries on De lnterpretatione have come down to us from Ammonius and Stephanus. Both Alexander of Aphrodisias and Simplicius wrote commentaries on other Aristotelian works, and these often include remarks relevant to the problems of the sea fight.

"Aristotle and St. Thomas commonly divide logic according to the three operations of the human intellect, because logic is the art which directs man in the very act of reasoning that he might proceed in good order, with ease, and without error. (1) The first two acts of the mind are properly called acts of intellect rather than of reason, because they are not acts of discourse. The first act is the understanding of what is indivisible or incomplex, and is therefore called simple apprehension. By this act the intellect grasps the essence of a thing. The *Predicaments* of Aristotle treats the part of logic pertaining to this operation. The second act of the intellect is that of composition or division, in which truth or falsity is found. Aristotle treated what pertains to this act in the *Peri Hermeneias*. The third operation of the mind is properly called an act of reason, because in it the mind moves from a knowledge of a known truth to a knowledge of a truth previously unknown. This is the act of discourse, that is, of going from one to another. The remaining books of the *Organon* treat of what pertains to this act - the *Prior Analytics,* the *Posterior Analytics,* the *Topics,* and the *Sophistic Refutations*. Just as the first of these acts is ordered to the second, and the second to the third, so the *Predicaments* is ordered to the *Peri Hermeneias* and the latter to the *Prior Analytics* and the books that follow."     "The discussion of the Principle of Non-Contradiction (PNC) in Aristotle's *Metaphysics* Γ is usually taken to include three 'versions' of the principle: an ontological, psychological, and logical one. In this article I develop an interpretation of *Metaphysics* Γ3 and a parallel text, *De interpretatione* 14, in order to show that these texts are concerned with two related but different principles: a version of the Principle of Identity, and a corollary to this, which concerns the ability to accept two 'opposite' items at the same time. I argue that these principles must be considered separately in order to properly understand Aristotle's remarks about PNC in *Metaphysics* Γ, and in order to defend his approach in these remarks against certain objections raised against the discussion in *Metaphysics* Γ by Jan Łukasiewicz in his seminal study *Über den Satz des Widerspruchs bei Aristoteles*. The main result of my interpretation is to distinguish in the discussion of PNC in *Metaphysics* Γ three principles: one concerning linguistic items (words and statements), one concerning thoughts (δόξαι), and one concerning objects or states of affairs."     Abstract: "Abstract: This paper shows that Aristotle's *De Interpretatione* does not separate syntax from semantics (contra Boger 2004). Linguistic sentences are not syntactic entities, and non-linguistic meanings are not semantic propositions expressed by linguistic sentences.

    In fact, Aristotle resorts to a mental conception of meaning, distinguishing linguistic meanings in a given language from non-linguistic mental contents in relation to actual things: while the former are not the same for all, the latter are shared by everyone. Aristotle

    is not a modern logician, like Boole, Frege, or Russell, in so far as a mental conception of meaning does not reveal an abstract semantics for a syntactic language."

    Abstract: "In *De Interpretatione* 6-9, Aristotle considers three logical principles: the principle of bivalence, the law of excluded middle, and the rule of contradictory pairs (according to which of any contradictory pair of statements, exactly one is true and the other false). Surprisingly, Aristotle accepts none of these without qualifi cation. I off er a coherent interpretation of these chapters as a whole, while focusing special attention on two sorts of statements that are of particular interest to Aristotle: universal statements not made universally and future particular statements. With respect to the former, I argue that Aristotle takes them to be indeterminate and so to violate the rule of contradictory pairs. With respect to the latter, the subject of the much discussed ninth chapter, I argue that the rule of contradictory pairs, and not the principle of bivalence, is the

focus of Aristotle's refutation. Nevertheless, Aristotle rejects bivalence for future particular statements."

    Abstract: "This article deals with the communicational aspects of Aristotle's theory of signification as laid out in the initial chapters of the *De Interpretatione* (*Int*.). We begin by outlining the reception and main interpretations of the chapters under discussion, rather siding with the linguistic strand. We then argue that the first four chapters present an account of verbal communication, in which words signify things via thoughts. We show how Aristotle determines voice as a conventional and hence accidental medium of signification: words as 'spoken sounds' are tokens of thoughts, which in turn are signs or natural likenesses of things. We argue that, in this way, linguistic expressions may both signify thoughts and refer to things. This double account of signification also explains the variety of ontological, logical and psychological interpretations of the initial chapters of Int."

    "A few sentences near the beginning of De interpretatione (16a3-8) constitute the most influential text in the history of semantics. The text is highly compressed, and many translations, including the Latin translation in which it had its

greatest influence, have obscured at least one interesting feature of it. In this paper I develop an interpretation that depends on taking seriously some details that have been neglected in the countless discussions of this text.

The sentence with which De interpretatione begins, and which immediately precedes the text I want to examine, provides (as Ackrill remarks 1) the program for Chapters 2-6.

... we must settle what a name is [Chapter 2] and what a verb is [Chapter 3], and then what a negation [Chapters 5 and 6], an affirmation [Chapters 5 and 6], a statement [Chapters 4 and 5] and a sentence [Chapters 4 and 5] are. (16a1-2) (2)

But Aristotle says "First we must settle what a name is ...", and that is what he does in Chapter 2. The remainder of Chapter 1, then, may be thought of as preparatory to the main business of those chapters. And since their main business is to establish definitions, it is only natural to preface them with a discussion of the defining terms. At the beginning of Chapter 2, for instance, Aristotle defines 'name' in these terms: 'spoken sound', 'significant by convention', 'time', and 'parts significant in separation'. These terms continue to serve as defining terms beyond Chapter 2, and the remainder of Chapter 1 (16a3-18) is devoted to clarifying them. The special task of the text I am primarily concerned with is the clarification of the proximate genus for the definitions in Chapters 2-6: "spoken sound significant by convention" (3)." (p. 3)

(1) In the notes to his translation (J. L. Ackrill, Aristotle's Categories and De Interpretatione, Clarendon Press, Oxford, 1963; reprinted with corrections, 1966), p. 113.

(2) I am using Ackrill's translation, the only one in English that shows an understanding of the text.

(3) Cf. Ackrill, op. cit., Notes, p. 115: "'A spoken sound significant by convention' gives the genus under which fall not only names but also verbs (Chapter 3) and phrases and sentences (Chapter 4)".

    Abstract: "Regarding the famous Sea Battle Argument, which Aristotle presents in *De Interpretatione* 9, there has never been a general agreement not only about its correctness but also, and mainly, about what the argument really is. According to the most natural reading of the chapter, the argument appeals to a temporal concept of truth and concludes that not every statement is always either true or false. However, many of Aristotle's followers and commentators have not adopted this reading. I believe that it has faced so much resistance for reasons of hermeneutic charity: denying the law of universal bivalence seems to be overly disruptive to logical orthodoxy – the kind of logical orthodoxy represented by what we now call classical propositional logic, much of which Aristotle clearly supports in many texts. I intend to show that the logical-semantic theses that the traditional reading finds in *De Interpretatione* 9 are much more conservative than they may seem to be at first glance. First, I will show that they complement, and do not contradict in any way, the orthodox definitions of the concepts of truth and statement that Aristotle advances in other texts. Second, by resorting in an anachronistic vein to concepts and methods peculiar to contemporary logic, I will show that a trivalent modal semantics conforming to those theses can be built for a standard formal language of the classical propositional calculus. It is remarkable that reasonable concepts of logical truth and logical consequence that may be defined on the basis of this trivalent modal semantics are coextensive with their orthodox counterparts, the concepts of tautology and tautological consequence of classical bivalent and extensional semantics."

"Boethius' commentaries on *de Interpretatione* provided the Middle Ages with their introduction to the theory of meaning. Boethian semantics is developed on the basis of the distinction made by Aristotle in *De Interpretatione* 1, between the signification of terms and that of affirmations and negations – defined, remember, as the species of simple assertions. On this account of them affirmations signify mental states in which the mental items signified by their component significant terms are combined and negations signify mental states in which they are separated. Missing in the theory is an account of compound propositions showing how their meanings are obtained from the meanings of their components. Such an account requires a notion of unasserted propositional content. With it we may also locate what is common to different speech acts and explain how it is that they differ. The relevant differences are the differences in what we now call their force." (p. 211)

    Abstract: "There are (at least) two persistent exegetical puzzles in *De Interpretatione* 9: (1) What exactly is the content of the determinist argument Aristotle deals within this text? and (2)

How does Aristotle go about rebutting his determinist opponent's thesis? This article takes another look at *De Interpretatione* 9, and it proposes answers for both of these questions. In particular, it argues for two things. First, in this difficult chapter Aristotle considers, among other things, an argument for logical fatalism. According to this argument, if the Rule of Contradictory Pairs applies unrestrictedly to all future singular statements, then every future state of affairs is now necessitated. And second, Aristotle undermines the fatalist's position by showing that his opponent commits a grave mistake: he fails to acknowledge

the distinction between the necessity of the present and absolute necessity."

    French revised version: *Aristote et la signification*, in: *Philosophie Antique,* 4, 2004, pp. 5-25.

    "Studies of ancient semantics are inclined to concentrate on the significations of individual words. But most ancient thinkers are likely to be misrepresented by such an approach. In Aristotle's classic treatment of the subject, I shall argue, the primary signifier is the sentence, and individual words are considered only secondarily, in so far as they contribute to the sentence's function. Moreover, this emphasis is to be found elsewhere in the Platonic tradition of which, in this respect, Aristotle is a part - not just in Plato himself, but also in the Stoics. In fact only the Epicureans, among ancient thinkers, can be seen to make individual word-meaning primary.

    This difference, if it can be established, should not cause surprise, since it merely reflects the general metaphysical outlook of the thinkers in question. Plato, Aristotle and the Stoics are teleologists, who regard the whole as ontologically prior to the part: the part can only be fully understood by reference to its function within the whole. (1) Epicurus by contrast is an atomist. He standardly treats parts as discrete items which, in coming together, generate larger complexes - be they atoms forming phenomenal bodies, or humans forming societies - but which in no sense have that as their pre-existing

nature or function. Even bodily parts like hands and tongues came into being before any functions - including their communicative functions - were found for them. (2) On this same anti-teleological model, Epicurus regards the central core of language as an original set of naturally uttered "names" (probably nouns, adjectives and verbs), correlated to individual objects or contents of experience, and only at a later stage supplemented and inflected into a full-scale language. (3)

In developing this contrast, I shall concentrate primarily on Aristotle's *De interpretatione,* whose opening chapters became in antiquity a *locus classicus* on signification. This is not because I believe that the *De interpretatione* must have directly influenced any of the other thinkers in the story. While we cannot positively exclude the possibility of its influence in the fourth and third centuries, perhaps even on Plato himself, I see no clear signs of it. The reason for my choice is that the *De interpretatione* is, if I am right, the most seriously misunderstood text in ancient semantics. If I can make out my case with regard to it, it will provide a valuable perspective on the other philosophers in question." (pp. 87-88)

   Repris dans Albert Menne, Niels Öffenberger (Hrsg.), *Über den Folgerungsbegriff in der aristotelischen Logik,* Hildesheim: Georg Olms, 1982, pp. 182-205.

"Décrire les effets de cette formalité sans formalisme, ce serait sans doute reprendre l'examen de toute la syllogistique aristotélicienne. Je me propose ici d' étudier une incidence particulière avec quelque détail : le problème que posent le sens et l'usage de la proposition particulière, notamment en rapport avec le rôle qu'elle joue dans les procédures par lesquelles est démontrée la non-concluance des couples de prémisses autres que ceux des modes syllogistiques valides. J'espère en effet montrer que les textes relatifs à ces questions manifestent une modification significative de l'attitude d'Aristote, et qu'ils permettent de saisir sur le vif le travail du logicien, d'abord victime des équivoques du langage naturel, prenant ensuite de ces équivoques une conscience progressive, sous la poussée interne des problèmes eux-mêmes, et parvenant enfin à les maîtriser. Au terme de cette évolution, la proposition particulière abandonne celles de ses connotations usuelles qui perturbent son maniement logique, et n'est plus définie que par sa place dans un système d'oppositions, avec toutes les conséquences que cela comporte."

Résumé: "Après avoir rappelé les principales concordances et divergences entre la terminologie logique latine avant et après Boèce, on examine deux choix propres soit à l'auteur du « Peri hermeneias » (PH) transmis sous le nom d'Apulée, soit à la première tradition logique de langue latine : celui de « pars » (« particula ») et celui de « formula » (« forma » chez Martianus Capella), choix auquels Boèce substituera « terminus » et « figura », pour rendre le notion de « terme » (ὅρος chez Aristote) et celle de « figure (du syllogisme) » (σχῆμα chez Aristote). Dans chaque cas, on passe en revue la distribution des emplois dans le PH et chez Martianus, en signalant les attestations antérieures ou postérieures à ces traités. On s'interroge enfin sur les raisons possibles du choix effectué par l'auteur du PH et maintenu ou modifié par Martianus Capella."

    "Pendant les années 2003-2005 les membres du Centre Léon Robin ont décidé de consacrer leurs heures de travail commun à une étude du *De interpretatione*. Chaque mois, un samedi matin a été consacré à une séance close où nous avons lu ensemble le texte d'Aristote; chaque mois, un vendredi après-midi s'est tenue une conférence publique sur le thème: "Le *De interpretatione* et sa réception". Le présent livre en rassemble, sous une forme revue, une sélection.

    Inutile de dire que le livre ne donne pas une histoire de la fortune du *De interpretatione:* une telle histoire remplirait deux volumes chacun de cinq cents pages. Inutile de dire que le livre n'offre pas de récit continu: les recueils de conférences ne sont pas comme cela. Mais il vaut la peine de dire que le livre possède une certaine cohérence, qu'il possède une unité thématique.

    Après une introduction générale de la main de Suzanne Husson qui a édité le recueil, le premier chapitre, écrit par Pierre Aubenque, ancien directeur du Centre Léon Robin, discute de la nature et de la spécificité du traité aristotélicien; ensuite, six chapitres présentent six échantillons, les résultats de six sondages pris dans l'histoire du *De interpretatione*. Deux des

sondages ont été faits sur l'Antiquité, deux sur le Moyen Âge, deux sur l'époque moderne. Les échantillons font ressortir l'influence du traité sur l'histoire des sujets qu'il a abordés: sur la théorie des parties du discours, par exemple, ou sur la conception de la signification. Ils font également ressortir l'influence du traité sur des sujets apparemment éloignés de ses propres intérêts: sur les attaques contre l'astrologie, par exemple, ou sur le développement d'une logique qui reconnaît plus de deux valeurs de vérité. Ils démontrent comment ce ne furent pas seulement les doctrines professées dans le traité qui déterminèrent la pensée de ses lecteurs mais aussi les détails-parfois même des variantes textuelles ..."     Résumé : "Cet article a un double propos, historique et méthodologique. Après avoir (1) esquissé brièvement ce qu'on pourrait appeler la « préhistoire » de la théorie des parties du discours en Grèce — préhistoire qui s'achève avec Platon — , puis (2) rappelé les étapes du développement qui nous conduit, au seuil de l'ère chrétienne, à une liste de huit parties (nom, verbe, participe, article, pronom, préposition, adverbe, conjonction), j'examinerai (3), chez le grand grammairien alexandrin du 2e siècle de notre ère, Apollonius Dyscole, quels sont les critères et les principes mis en oeuvre dans les opérations de classement grammatical des mots de la langue grecque. Une question retiendra plus spécialement mon

attention dans cette dernière partie : dans les cas où un même signifiant semble pouvoir légitimement prétendre à figurer dans plus d'une classe, que fait le grammairien grec ? quel discours tient-il ? pour justifier quelle décision ?"

"2. D'Aristote aux grammairiens : l'inventaire des parties du discours

Après le coup d'envoi platonicien, les contributions décisives au développement de la théorie sont celles d'Aristote (2.1.), des Stoïciens (2.2.) et des grammairiens d'Alexandrie (2.3) Je me limiterai ici, faute de place, à des indications brèves sur ces apports successifs, en renvoyant chaque fois le lecteur à des exposés plus détaillés : sur l'ensemble de cette histoire, on pourra se reporter à Steinthal *1890-91, Robins *1966, Pinborg *1975.

2.1. Aristote

La réflexion aristotélicienne sur la langue est dispersée dans l'ensemble de son oeuvre : bonne étude synthétique de McKeon 1946-47. Pour les parties du discours, les deux textes principaux sont les chap. 2 à 4 du *De interpretatione* (voir le commentaire d'Ackrill, Oxford 1968) et le chap. 20 de la *Poétique* (voir Pagliaro *1955, Morpurgo-Tagliabue 1967 et Dupont-Roc & Lallot *1980).

Aristote fait fond sur l'analyse platonicienne du logos en *onoma* + *rhëma* . Il précise la définition du verbe en en faisant un mot « qui signifie en plus le temps » (*prossëmainon khronon, De int* . 16 b 6) et enrichit l'inventaire des « parties de l'expression » (*mere lexeôs* , *Poét*. 1456 b 20) de deux nouvelles unités : la « conjonction » (*sundesmos*) et l'« articulation » (*arthron*) (3). Le texte où ces derniers termes sont définis (*Poét*. 1456 b 37 sqq.) étant très confus, il n'est pas possible d'établir de manière sûre quelles classes de mots ils désignaient au juste. Quoi qu'il en soit, les termes eux-mêmes manifestent l'attention portée par Aristote aux mots qui, d'une façon ou d'une autre (conjonctive, prépositive, anaphorique...), remplissent dans le discours une fonction connective.

Un autre apport important d'Aristote à la théorie linguistique est le concept de « cas » (*ptôsis*). Aristote désigne par là, tant pour le verbe que pour le nom, toute forme qui s'écarte, pour le nom, du nominatif (exprimant la fonction sujet) et pour le verbe, de l'indicatif présent (prédicat par excellence de la proposition assertive).

Fondée sur des critères à la fois morphologiques et sémantico-logiques, la notion de « cas » était appelée à jouer un rôle important dans la description de la morphologie nominale." (p. 15)

(3) Il y a doute sur l'authenticité de l'attestation de *arthron* chez Aristote. D'après les témoignages (reflétant sans doute la même source) de Denys d'Halicarnasse, *De comp. verb* . ch. 2, et de Quintilien, *Inst. or* . I 4.18, Aristote ne distinguait que trois parties du discours :

nom, verbe et conjonction. Aujourd'hui encore la question reste controversée.

28. Sedley, David. 2004. "Aristote et la signification." *Philosophie Antique* :5-25.

    Resumé : "Aristote dit au début du *De interpretatione* que les mots symbolisent des pensées, qui, à leur tour, ressemblent aux choses. Le présent article soutient qu'Aristote parle alors principalement de la signification des phrases entières et au mieux de façon secondaire de la sémantique des mots individuels. Cette proposition est défendue en attirant l'attention sur un changement dans la signification de « signe » et des termes apparentés ; changement qui a lieu au cours du premier chapitre, qui nous permet de séparer la manière dont les mots « signifient » des pensées (déclaratives, interrogatives, etc.) en les exprimant, de la manière plus étroitement sémantique dont on dit par conséquent qu'ils signifient des choses. La déclaration initiale célèbre d'Aristote ne trouve pas son application principale dans la grammaire rudimentaire des noms et des verbes qui suit dans les chapitres 2-3, mais plus loin dans le traité et surtout dans le chapitre 14, où elle est invoquée pour établir, dans la perspective de la dialectique, que la relation entre une phrase et sa négation est la plus forte de toutes les contrariétés. On explique aussi l'insistance d'Aristote, dans ce même traité, sur le caractère conventionnel de la langue : car, dans des chapitres 8 et 11, c'est à cause du caractère conventionnel de la langue et de l'échec qui en résulte de toute tentative pour le langage de correspondre systématiquement à la distinction des choses entre elles, que ce qui est, d'un point de vue grammatical superficiel, une phrase simple peut s'avérer constituer en réalité deux ou plusieurs phrases, autrement dit, signifier (c'est-à-dire exprimer) deux ou plusieurs pensées différentes. L'importance primordiale accordée par Aristote à la signification des phrases entières s'explique ainsi par le rôle du *De interpretatione* en tant qu'ouvrage subordonné à la dialectique, discipline pour laquelle la relation entre les paires d'affirmations contradictoires est fondamentale. En outre, en le comparant avec le lekton stoïcien, on montre que la prépondérance accordée par Aristote à la phrase entière reflète le cadre téléologique de sa pensée."

Resumé : "L'objectif de cet article est de montrer l'unité du chapitre 14 du *Peri Hermeneias* , chapitre dans lequel Aristote retourne au fondement de l'échange dialectique, à savoir la *doxa* . Je montre ainsi que ce chapitre expose progressivement les trois conditions sémantiques que des points de vue doivent respecter pour être contraires : le sujet doit être le même, l'objet doit aussi être le même, mais le mode de prédication doit être contradictoire."

32. ———. 1991. "Interprétation et langage dans la tradition aristotélicienne." In *Historia philosophiae Medii Aevi. Studien zur Geschichte der Philosophie des Mittelalters* , edited by Mojsisch, Burkhard and Pluta, Olaf, 1029-1045. Amsterdam: R. Grüner.

A la lumière des analyses qui précèdent, qu'en est-il maintenant du titre *peri hermeneias* ? Ce titre correspond-il au contenu de l'ouvrage?

La question posée ne vise pas directement l'authenticité Aristotélicienne de la formule: il est vrai cependant, qu'un titre qui ne traduirait pas bien le contenu du traité, aurait peu de chances d'avoir été rédigé par le Stagirite. Par contre, il est

probable que l'ouvrage ait reçu un certain titre de la part de son auteur et si le titre traditionnel correspond au contenu de l'écrit, il peut très bien remonter à l'auteur lui-même. Quoi qu'il en soit de la question d'authenticité, nous croyons pouvoir conclure que le titre donné recouvre bien le contenu du traité, dont le sujet principal est l'énonciation catégorique et ses composants. En se basant sur les analyses de Boèce et d'Ammonius, on peut dire que tous ces éléments correspondent à l'idée d'interprétation telle qu'elle est expliquée dans le traité:

1. L'énonciation y est conçue comme l'interprétation d'un contenu de pensée. Toutefois si le langage se rapporte directement à un objet pensé, il se réfère indirectement au réel: il en résulte que le discours énonciatif est aussi une interprétation de la réalité. Il l'est à un double niveau: le contenu particulier de chaque énonciation se rapporte à un sujet déterminé du monde et en exprime certaines caractéristiques; on peut donc le considérer comme un acte d'interprétation. Par ailleurs, il y a la structure même du jugement, qui, elle aussi, est une interprétation à un niveau plus fondamental de la physionomie du réel.

2. Les noms et les verbes constituent à leur tour un acte d'interprétation. Selon Aristote, la signification des mots est conventionnelle: elle est le résultat de la vie en communauté, où les hommes sont amenés à se mettre d'accord sur des notions fondamentales de la vie morale et sociale. Ammonius croit que le sens des mots n'est pas purement artificiel, mais qu'il est adapté à la nature des choses. Quoi qu'il en soit, le fait d'appliquer au réel des noms et des verbes est un acte d'interprétation. Exprimer le réel dans les catégories du langage implique toujours un acte interprétatif.

La doctrine aristotélicienne sur la nature du langage justifie donc le titre de *peri hermeneias."* .

Chapitre 3: Le problème des futurs contingents 17; 3.1 La solution d'Aristote 17; 3.1.1 Bivalence et fatalisme logique 17; 3.1.2 La position d'Aristote est-elle cohérente ? 21; 3.1.3

Réponse aux difficultés 23; 3.2 Le nécessitarisme de Spinoza 28; 3.2.1 Une démonstration par l'absurde 28; 3.2.2 Critique de la preuve 31; 3.2.3 Le possible comme marque de l'ignorance 33; 3.2.4 Critique du nécessitarisme de Spinoza 36; 3.3 La solution de Leibniz 39; 3.3.1 Le critère logique du possible 40; 3.3.2 Introduction au problème de la prescience divine 43-44.

"Aristote entend répondre au raisonnement de ceux qui, comme Diodore Kronos, adoptent ce que l'on appelle « le fatalisme logique» sans pour autant nier ni la logique, ni l'intuition du sens commun. C'est la raison pour laquelle il expose [*] dans un premier temps l'argument du fatalisme logique, puis, après avoir souligné les raisons pour lesquelles il ne rejette pas la loi classique du tiers exclu, il apporte son analyse et sa solution au problème logique des futurs contingents. On verra que la solution d'Aristote consiste à donner préciser la signification du terme de « vérité » relativement à notre compréhension naturelle du temps et des modalités. En fait, c'est parce que l'idée de Jacques le Fataliste selon laquelle « tout est écrit sur le grand rouleau » est inacceptable, qu'il est nécessaire de comprendre la cohérence de nos principes logiques avec notre représentation du temps et de l'action dans le temps.

Examinons dans un premier temps, avec Aristote, l'argument du fatalisme logique. Celui-ci, comme il apparaît clairement à la lecture des premières lignes du chapitre IX, est directement dérivé de l'application universelle du principe de bivalence à toutes les propositions, quel que soit le sujet et le temps de celles-ci. Le principe de bivalence n'est pas nommé comme tel par Aristote, mais c'est bien ce principe auquel il fait référence pour expliquer l'argument du fatalisme logique." (p. 19)

   APPENDICE - IL PAPIRO PARIGINO 2

   Testo e traduzione 86; Commento 107; Bibliografia 122-126.

"Questo saggio studia l'analisi logica delle frasi negative nelle due tradizioni più importanti della logica greca, la tradizione analitica aristotelica e la tradizione dialettica nel suo esito stoico.

La prima parte del lavoro è un esame dell'asserzione negativa in Aristotele, con particolare riferimento al *De interpretatione*. La seconda studia l'uso preposto della negazione di frase nella tradizione dialettica e la teoria stoica al riguardo. In appendice è dato un commento del Papiro Parigino 2, la cui preparazione mi ha spinto a occuparmi più in generale della negazione stoica e quindi del complesso di problemi legati alla teoria logica della negazione proposizionale nel pensiero greco. Riporto anche il testo e la traduzione, che si fondano sulla nuova edizione del papiro, a cura di Cristina Donnini e di Serena Funghi, pubblicata a parte nel presente volume. Il frammento testimonia l'uso dialettico della negazione preposta e documenta inoltre un tipo particolare di ambiguità relativo a tale uso e discusso in logica stoica come ambiguità κατὰ διάστασιν o di divisione." "Il presente volume fornisce un panorama pressoché completo del materiale, relativo al *De interpr*. 9 di Aristotele, pubblicato tra il 1930 e il 1973.

Sono stati presi in esame gli studi specifici sull’argomento, quelli sulla logica aristotelica, le storie generali di storia della logica, gli studi sullo stoicismo e infine tutta una serie di lavori in cui il riferimento ad Aristotele è occasionato dalla trattazione dei temi del determinismo e del fatalismo o di alcuni problemi di logica e di epistemologia.

Alle indicazioni bibliografiche tratte da l’*Année Philologique* si aggiungono pertanto quelle ricavate, nel corso del lavoro, da varie riviste e quelle desunte dagli studi presi in esame.

Si è cercato di semplificare il più possibile il simbolismo, in modo che il volume fosse immediatamente utilizzabile anche da coloro che non fossero esperti di logica formale." (Presentazione , p. 7).

"Nel capitolo 9 del *De interpretatione* Aristotele discute un’argomentazione che fa parte del cosiddetto determinismo logico, in quanto stabilisce un nesso tra la necessità di tutte le

cose e la verità/falsità delle proposizioni. Si tratta, come è noto, di un testo molto problematico, che ha suggerito interpretazioni molto diverse sia dell'intero capitolo sia dei principali punti (1). Le principali questioni sulle quali gli interpreti si sono trovati in disaccordo sono sostanzialmente le seguenti:

1) quale sia esattamente l'argomentazione; 2) se Aristotele ne accetti o meno la validità; 3) quale sia la «soluzione» aristotelica; 4) se Aristotele ha ragione o meno nel derivare dal determinismo logico il fatalismo, l'affermazione cioè che per l'uomo è inutile prendere decisioni ed agire, poiché in ogni caso accadrà ciò che è necessario che accada." (p. 59)

In den Schriften, die Aristoteles zugeschrieben und im Corpus Aristotelicum (CA) zusammengefaßt werden, gibt es so manche Stelle, die wegen der Knappheit ihrer Formulierung oder wegen Zweifeln an der Überlieferung des Textes schwer zu interpretieren ist und daher immer wieder zu neuen Deutungsversuchen anregt. Zu diesen Stellen gehört zweifellos die zweite Hälfte des Kapitels 3 der dem "Organon" zugerechneten Schrift "De Interpretatione".

Dazu hat Hans Wagner 1971 eine Interpretation veröffentlicht (1). Mit dieser Interpretation Wagners möchte ich mich hier auseinandersetzen und mit zwei weiteren Interpretationsvorschlägen: dem von Wolfram Ax (2), der einen Gegenvorschlag zu dem wichtigsten Punkt der Interpretation Wagners darstellt, und zu dem Vorschlag von Hermann Weidemann (3), der auf einer Auseinandersetzung mit den Deutungen von Wagner und Ax beruht.

Die Auseinandersetzung mit diesen drei Auslegungen wird mich, vereinfacht gesagt, zur traditionellen Auslegung zurückführen, von der sich Wagner distanziert, auf die Ax wieder zurückkommt, und von der Weidemann wieder weggeht; mein Zurückkommen auf die traditionelle Auslegung wird allerdings mit einigen Präzisierungen dieser Auslegung verbunden sein." De Interpretatione 7 und 9." *Philosophiegeschichte und logische Analyse / Logical Analysis and History of Philosophy* no. 2.

Abstract: "Die von Aristoteles in *De Int* . 7 eingeführte „indefinite Aussage“ verweist nach meiner Deutung auf ein Universale, welches anteilig an widersprüchlichen akzidentellen Prädikaten teilhat. Dem korrespondiert auf semantischer Ebene die graduelle Wahrheit beider Widerspruchsglieder. In gleicher Weise ist für Aristoteles auch die Aussage, daß ein Individuum zu einem Zeitpunkt seiner kontingenten

Zukunft so-und-so bestimmt sein wird, nach *De Int* . 9 offenbar als graduell-wahr einzustufen. Das Einzelne kann hinsichtlich seiner kontingenten Zukunft nämlich noch nicht betrachtet werden, sofern es faktisch wäre, sondern nur, sofern es zeitübergreifend ein Universale exemplifiziert. In diesem Zusammenhang werden zugleich fundamentale Bezüge zwischen indefiniter Aussage einerseits und Aristotelischer Modallogik, Statistik und Wissenschaftstheorie andererseits deutlich."

   Resumen: "Se estudia el problema de los futuros contingentes que Aristóteles expuso en *De interpretatione* 9, así como su implicación con otros conceptos capitales de su filosofía, como « sustancia », « verdad » y « dialéctica ». Se muestra que, para Aristóteles, este problema no tiene solución dentro de un marco formal, sino que su resolución radica en la noción de « verdad material ». En efecto, no debemos entender que Aristóteles plantea la resolución del problema en un contexto puramente lógico, ya que entonces daría la impresión de que adoptó arbitrariamente una postura indeterminista. En realidad, Aristóteles insiste en la existencia de determinados problemas que no tienen sentido al margen de la comprobación fáctica."

Estudos em Português

1. Buarque, Luise. 2021. "A retórica do capítulo IX do tratado Da Interpretação." *Journal of Ancient Philosophy* no. 15:190-206.

Abstract: "This paper analyses the argumentative strategy of the ninth chapter of the treatise *De Interpretatione* in the light of Aristotle's *Rhetoric*. The subject of the 'future events' developed in chapter IX brings up themes that are proper not only to philosophical thought, but also to political practice, forensic rhetoric, deliberative rhetoric and even tragic poetry. In this paper, it is argued that Aristotle uses the dialectical method and certain rhetorical techniques to touch the various discussions related to the subject addressed. He erects a hypothetical adversary and a thesis to refute, condensing some positions that were probably scattered in the most diverse textual and oratory sources of his time. Moreover, he builds the thesis of his hypothetical opponent from premises established in previous chapters of his own treatise. With this, he can simulate the defense of his opponent's thesis before demolishing it. Thus, according to the hypothesis defended here, the philosopher does not in fact commit himself to the arguments presented between 18a35 and 18b25, but only simulates the defense of the reasoning which he will soon refute. In addition, it is also concluded that chapter IX is part of the argumentative chain of the treatise, having as a peculiar characteristic, not the theme or nature of the arguments exposed, but the rhetorical method it employs."

Bibliography on the Ancient and Medieval Commentaries on Aristotle's *De Interpretatione*

Bibliography

1. Adamson, Peter. 2006. "The Arabic Sea Battle: al-Fārābī on the Problem of Future Contingents." *Archiv für Geschichte der Philosophie* no. 88:163-188.

   Abstract: "Ancient commentators like Ammonius and Boethius tried to solve Aristotle's "sea battle argument" in *On Interpretation* 9 by saying that statements about future contingents are "indefinitely" true or false. They were followed by al-Farabi in his commentary on *On Interpretation*. The article sets out two possible interpretations of what "indefinitely" means here, and shows that al-Farabi actually has both conceptions: one applied in his interpretation of Aristotle, and another that he is forced into by the problem of divine foreknowledge. It also explains the relevance of al-Farabi's remarks as a link between the non-statistical modal theories of Philo and Avicenna."

   Supplementary volume 17 to Canadian Journal of Philosophy.

   "This paper compares the views of a number of Arabic and thirteenth-century Latin commentators on Aristotle's *Peri Hermeneias* on the status of logic as a linguistic art and its relation to grammar. The discussion considers the commentators' general positions on the logician's treatment of linguistic topics, and their attempts to reconcile the dual claim of logic to be both a linguistic and a rational art. These general principles are then traced through the treatment of a number of particular themes in the *Peri Hermeneias's* linguistic sections: The definition of the noun,the cases of the noun, and the indefinite or infinite noun (i.e., of the form non-X). The article concludes that, although there are basic differences between the Latin and Arabic traditions stemming from the presence in the Latin world of a philosophical theory of grammar, authors in both traditions are adamant that a balance must be maintained between the linguistic and rational characterizations of logic."

"The majority of the twenty essays of the present volume were originally delivered at the Xth European Symposium on Medieval Logic and Semantics held at Nijmegen, 22 - 26 June, 1992, that was devoted to the tradition of Aristotle's *Peri hermeneias* in the Latin Middle Ages. Circumstances made it impossible to publish the proceedings immediately after the symposium. Since the editors were, nevertheless, aware that the material presented was extremely important for further studies on the history of medieval logic, semantics and philosophy of language, they decided, some time ago, to ask the contributors to update, revise or rewrite their essays in preparation for the publication of this collection. Although some authors have partially drawn on material found in this collection for publications elsewhere, most of the information contained in these essays remains new, including the many detailed descriptions and editions of unedited works that will constitute a greatly appreciated resource in the study of medieval philosophy." 6. Diebler, Stéphane. 2002. "Les canons de Proclus: problèmes et conséquences de l'interprétation syriano-proclienne du *De interpretatione*." *Dionysius* no. 20:71-94.

   "Ammonius' commentary on the third section of Aristotle's *De interpretatione* offers insight into the hermeneutical and logical debates of the 5th-cent. Neoplatonic school in Athens. These debates reveal one of the rare cases of a theory that was developed by Proclus in contradiction to that of his teacher Syrianus, and in the course of which the authoritative status of *De interpretatione* as a carefully composed, syntagmatic work was itself put into question. Ammonius was concerned to establish the coherence of Int. 19 B 19-20 B 12. According to his interpretation, this section falls into two further sections, arranged around two types of logical sequences : the first section (19 B 19-20 A 6) is explained according to an interpretation that derives from Syrianus ; the second (20 A 20-20 B 13) recalls the canons of Proclus."

Abstract: "This article considers three medieval approaches to the problem of future contingent propositions in chapter 9 of Aristotle's *De interpretatione*. While Boethius assumed that God's atemporal knowledge infallibly pertains to historical events, he was inclined to believe that Aristotle correctly taught that future contingent propositions are not antecedently true or false, even though they may be characterized as true-or-false. Aquinas also tried to combine the allegedly Aristotelian view of the disjunctive truth-value of future contingent propositions with the conception of all things being timelessly present to God's knowledge. The second approach was formulated by Peter Abelard who argued that in Aristotle's view future contingent propositions are true or false, not merely true-or-false, and that the antecedent truth of future propositions does not necessitate things in the world. After Duns Scotus, many late medieval thinkers thought like Abelard, particularly because of their new interpretation of contingency, but they did not believe, with the exception of John Buridan, that this was an Aristotelian view."

    Contents: Acknowledgements IX; Sigla X; Abbreviations and Editions XI; Introduction 1; I. Aristotle: *Peri Hermeneias* I, 16a3-9; 7; II. Boethius' Translation 49; III. Orandi Ordo 64; IV. Cogitabilis Oratio 93; Afterword 142; Bibliography 150; Index Locorum 155; Index Nominum et Rerum 162-165.

    "The present work is divided into four chapters, taking as its starting point the lines of Aristotle's *Peri Hermeneias* around which Boethius' theory of signification turns. The first chapter of the study plunges in *medias res*, and for that the reader's patience is requested. The Greek text is both difficult and compressed, and necessarily brings into consideration questions of the history of transmission and commentary, as well as numerous aspects of Aristotle's thought both in this and in other works. But since Boethius translated either all or part of the *Peri Hermeneias* before commenting upon it, and then revised the translation for the second commentary; and since in his translation, as in all translations, there is an element of

"commentary" upon the meaning of the original, it has been thought necessary to come to a clear understanding of what Aristotle wrote before proceeding to the translation and commentaries. After careful examination of the Greek passage and of the questions it poses, there follows in the second chapter an analysis of Boethius' Latin translation of the same, and of the interpretation implicitly contained therein." (pp. 1-2)

25. ———. 2010. "On the Composition and Sources of Boethius' Second *Peri hermeneias* Commentary." *Vivarium* no. 48:7-54.

Abstract: "The paper is in three parts, prefaced by general remarks concerning Boethius' logical translations and commentaries: the text of the *Peri Hermeneias* as known to and commented on by Boethius (and Ammonius); the organizational principles behind Boethius' second commentary on the *Peri Hermeneias*; its source(s). One of the main purposes of the last section is to demonstrate that the *Peri Hermeneias* commentaries of Boethius and Ammonius are, although part of a common tradition, quite independent of one another, and special consideration is given to the question of how Boethius interpreted and shaped the doxographical material concerning Aspasius, Herminus, and Alexander that had been handed down to him by Porphyry."

"Sifting through the interpretations of earlier commentators was painstaking and laborious, Porphyry's interpretation of 19b22-24 alone requiring, as we have seen, seventeen pages of commentary. By about the year 515 Boethius' attention must have been turning toward other projects, to new translations and commentaries, the theological tractates, logico-rhetorical monographs, and so on. If the Peri Hermeneias were allowed to consume so much time and energy, what would become of the rest of the *Organon* and Aristotle, not to mention Plato? Even for a treatise as rich and complex as the *Peri Hermeneias* Boethius may have had finally to calculate his "point of diminishing returns." He may have grown impatient with the project, his copy of Porphyry may have failed, or both. Had he known of the premature end that awaited him, he might have thought differently about how to weight the commentary, might have sought compensation in other projects for problems left

unsolved in connection with the *Peri Hermeneias*; but as it is, he left a work which, despite its imperfections, has proved to be one of his most fascinating and influential." (p. 54)

26. ———. 2011. "Preliminary Observations on the Textual Tradition of Boethius' First *Peri Hermeneias* Commentary." In *Logic and Language in the Middle Ages: A Volume in Honour of Sten Ebbesen*, edited by Fink, Jakob Leth, Hansen, Heine and Mora-Márquez, Ana María 13-26. Leiden: Brill.

    "In editing the first of Boethius' two commentaries on Aristotle's *Peri Hermeneias* Carl Meiser essentially worked from a single witness, F (below), which he ranked both *antiquissimus* and *optimus*. (1) Readings from three other munich manuscripts, e (MS Bayer. Staatsbibl. clm 14401, s. XI), M (below), and T (MS Bayer. Staatsbibl. clm 18479, s.XI), he reported *perpetuo more* but with varying degrees of accuracy. (2) He further consulted two st. Gall manuscripts, G (below) and S (MS Stiftsbibl. 817, s. XI-XII) *omnibus locis paulo difficilioribus* — citing them only infrequently, however, in his critical apparatus. from *Peri Hermeneias* 17b20 on, F preserves excerpted lemmata, and Meiser correctly recognized that the supplemented versions found in other witnesses violate Boethius' intention. (3)

    But F is in fact neither *antiquissimus* nor *optimus*, and Meiser's edition suffers from a particular failure to distinguish between the three versions of Boethius' *Peri Hermeneias* translation, two of which form his commentary lemmata. Hence a full assessment of the evidence seems called for. In what follows, I hope to shed some light on certain salient characteristics of the textual tradition." (p. 13)

"Les propositions indéterminées du chapitre VII de *Peri Hermeneias* sont des particulières traduites par des universelles fausses. La cause de cette bizarrerie est dans le maître, et non dans les traducteurs. Aristote mutile un système naturel de propositions dont l'intégrité est restaurée par l'hexagone de Robert Blanché. Celui-ci ajoute deux postes au carré: Y (quantité partielle) et U (exclusion de la quantité partielle). Le carré représente A (totalité) et E (quantité zéro), mais pas avec la tierce quantité Y. Or, la quantité partielle (Y) est essentielle: c'est celle des particulières naturelles contenant notoirement plus d'information que les particulières logiques.

U (exclusion de la quantité partielle) est le signifié commun aux deux phrases qu'Aristote élimine du système naturel."

32. ———. 2004. "La transmission d'Aristote par les Arabes à la chrétienté occidentale: une trouvaille relative au *De Interpretatione*." *Revista Española de Filosofia Medieval* no. 11:181-195.

    "*Some men are not white* and *Some men are white* versus *No man is white* are illegitimately identified to the two pairs of logical contradictories constituting the logical square: *A* versus *O* and *I* versus *E*, respectively. Thus, the level of natural language and that of logic are confused. The unfortunate Aristotelian alteration is concealed by the translation of propositions known as *indeterminates*. To translate these, which, semantically, are *particulars*, all scholars, except for Paul Gohlke, employ the two natural *universals* excluded by the Master! The work of Isador Pollak, published in Leipzig in 1913, [*Die Hermeneutik des. Aristoteles in der Arabischen übersetzung des Ishiik Ibn Honain*] reveals the origin of this nearly universal translation mistake: the Arabic version upon which Al-Farabi unfortunately bases his comment. In adding the vertices *Y* and *U* to the four ones of the square, the logical hexagon of Robert Blanché (*) allows for the understanding of the manner in which the logical system and the natural system are linked."

33. ———. 2005. "Isidor Pollak et les deux traductions arabes différentes du *De interpretatione* d'Aristote." *Revue d'Études Anciennes* no. 107:29-46.

    "Dans le chapitre VII du *De interpretatione*, Aristote mutile un système naturel de trois couples de contradictions naturelles. Il évince le couple où deux universelles naturelles "Les hommes sont blancs", "Les hommes ne sont pas blancs" s'opposent contradictoirement. Conséquence grave: les deux couples de contradictoires naturelles, qu'Aristote considère exclusivement, sont identifiés illégitimement aux deux couples de

contradictoires logiques constituant le carré logique. Cette mutilation est dissimulée par la traduction des propositions dites "indéterminées". L'ouvrage d'Isidor Pollak, publié à Leipzig en 1913 (*Die Hermeneutik des Aristoteles in der arabischen Übersetzung des Ishak Ibn Honain, Abhandlungen für die Kunde des Morgenlandes*, 13,1), révèle l'origine de cette faute de traduction quasi universelle: la version arabe sur laquelle al-Farabi fonde son commentaire."

    "There can be no doubt whatsoever about Boethius's exceptional merits for transmitting Aristotle's logic to us. But while 'Aristotelian' logic is in many respects synonymous with 'Aristotelico-Boethian' logic, the question can be raised whether Aristotle himself was an 'Aristotelian'. To give just one example: from Lukasiewicz onwards there has been much debate among scholars about the telling differences between traditional syllogistic and that of the *Prior Analytics*. (1)

    In this paper I intend to deal with two specimens of Boethius's way of commenting upon Aristotle's text. They are found in his

discussion of *De interpretatione*, chapters 2 and 3, which present Aristotle's views of *ónoma* and *rhema*. (2) One concerns the semantics of indefinite names, the other that of isolated names and verbs." p. 227

(1) Jan Lukasiewicz, *Aristotle's Syllogistic from the Standpoint of Modern Formal Logic*, Oxford, 1951. G. Patzig, *Aristotle's Theory of the Syllogism. A logico-philological study of Book A of the Prior Analytics*, Dordrecht, 1969.

(2) *Rhema* properly stands for 'what is said of', including not only our 'verb' but also adjectives, when used in attributive position. One should realise, however, that 'verb' refers to a word class, rather than a semantic or syntactical category, as *rhema* does.

"Conclusion. Returning now to Boethius' manner of commenting upon Aristotle's texts, the following points can be made:

[1] In the wake of Ammonius, (3) Boethius explains [*De int.*] 16b22-25 on the apophantic level, i.e. in terms of statement-making, instead of framing significative concepts, i.e. on the onomastic level.

[2] Whereas in Ammonius' report of the predecessors, Alexander and Porphyry, as well as his own exposition of the issue, there are many clues to the previous alternative reading and interpretation on the onomastic level, Boethius does not even refrain from cleansing the text (including his 'quotations'), by changing, at any occurrence, '*ens*' into '*est*'.

[3] In doing so, Boethius decisively influenced the commentary tradition on account of the purport of *De int*. 3, 16b19-25. He effectively contributed to the common verdict on this paragraph in terms of 'a curious medley'.

[4] As far as the semantics of the indefinite verb (3, 16b14-15) is concerned, Boethius' apparently adhering to the so-called 'Ammonii recensio' was far less desastrous for the common understanding of Aristotle on this score, and, in effect, merely

provided us with some stimulating Medieval discussions of the semantics of term infinitation.

[5] Finally by way of speculative surmise, it might be suggested that both the fact that Boethius dealt with the 'Ammonii recognise' without reading it in his lemma of 16b14-15, as well as his rather ruthlessly interfering in the quotations of the pre-Ammonian sources, should make it more plausible that Boethius had extensive, but incomplete marginal notes to his Greek text of Aristotle at his disposal, rather than a full copy of Ammonius' commentary (or those of other Greek commentators).

To comment upon Aristotle's work naturally includes developing his lore. But nothing can ever guarantee that this will happen *ad metem auctoris*. (4)"

(3) It is unmistakably plain that in *De int*. ch. 3, Boethius is strongly influenced by what he read in Ammonius (or in marginal notes on Ammonius' view).

    "A la lumière des analyses qui précèdent, qu'en est-il maintenant du titre *peri hermeneias*? Ce titre correspond-il au contenu de l'ouvrage?

    La question posée ne vise pas directement l'authenticité Aristotélicienne de la formule: il est vrai cependant, qu'un titre qui ne traduirait pas bien le contenu du traité, aurait peu de chances d'avoir été rédigé par le Stagirite. Par contre, il est probable que l'ouvrage ait reçu un certain titre de la part de son auteur et si le titre traditionnel correspond au contenu de l'écrit, il peut très bien remonter à l'auteur lui-même. Quoi qu'il en soit de la question d'authenticité, nous croyons pouvoir

conclure que le titre donné recouvre bien le contenu du traité, dont le sujet principal est l'énonciation catégorique et ses composants. En se basant sur les analyses de Boèce et d'Ammonius, on peut dire que tous ces éléments correspondent à l'idée d'interprétation telle qu'elle est expliquée dans le traité:

1. L'énonciation y est conçue comme l'interprétation d'un contenu de pensée. Toutefois si le langage se rapporte directement à un objet pensé, il se réfère indirectement au réel: il en résulte que le discours énonciatif est aussi une interprétation de la réalité. Il l'est à un double niveau: le contenu particulier de chaque énonciation se rapporte à un sujet déterminé du monde et en exprime certaines caractéristiques; on peut donc le considérer comme un acte d'interprétation. Par ailleurs, il y a la structure même du jugement, qui, elle aussi, est une interprétation à un niveau plus fondamental de la physionomie du réel.

2. Les noms et les verbes constituent à leur tour un acte d'interprétation. Selon Aristote, la signification des mots est conventionnelle: elle est le résultat de la vie en communauté, où les hommes sont amenés à se mettre d'accord sur des notions fondamentales de la vie morale et sociale. Ammonius croit que le sens des mots n'est pas purement artificiel, mais qu'il est adapté à la nature des choses. Quoi qu'il en soit, le fait d'appliquer au réel des noms et des verbes est un acte d'interprétation. Exprimer le réel dans les catégories du langage implique toujours un acte interprétatif.

La doctrine aristotélicienne sur la nature du langage justifie donc le titre de *peri hermeneias.".*

Aristotle's *Prior Analytics*: the Theory of Categorical Syllogism

Modern interpretations of Aristotle's syllogistic

"When modem logicians in the 1920s and 1930s first turned their attention to the problem of understanding Aristotle's contribution to logic in modern terms, they were guided both by the Frege-Russell conception of logic as formal ontology and at the same time by a desire to protect Aristotle from possible charges of psychologism. They thought they saw Aristotle applying the informal axiomatic method to formal ontology, not as making the first steps into formal epistemology. They did not notice Aristotle's description of deductive reasoning. Ironically, the formal axiomatic method (in which one explicitly presents not merely the substantive axioms but also the deductive processes used to derive theorems from the axioms) is incipient in Aristotle's presentation.

Partly in opposition to the axiomatic, ontically-oriented approach to Aristotle's logic and partly as a result of attempting to increase the degree of fit between interpretation and text, logicians in the 1970s working independently came to remarkably similar conclusions to the effect that Aristotle indeed had produced the first system of formal deductions. They concluded that Aristotle had analyzed the process of deduction and that his achievement included a system of natural deductions including both direct and indirect deductions which, though simple and rudimentary, was semantically complete.

Where the interpretations of the 1920s and 1930s attribute to Aristotle a system of propositions organized deductively, the

interpretations of the 1970s attribute to Aristotle a system of deductions, extended deductive discourses, concatenations of propositions, organized epistemically. The logicians of the 1920s and 1930s take Aristotle to be deducing laws of logic from axiomatic origins; the logicians of the 1970s take Aristotle to be describing the process of deduction and in particular to be describing deductions themselves, both those deductions that are proofs based on axiomatic premises and those deductions that, though deductively cogent, do not establish the truth of the conclusion but only that the conclusion is implied by the premise-set.

Thus, two very different and opposed interpretations had emerged, interestingly both products of modern logicians equipped with the theoretical apparatus of mathematical logic. The issue at stake between these two interpretations is the historical question of Aristotle's place in the history of logic and of his orientation in philosophy of logic. This paper affirms Aristotle's place as the founder of logic taken as formal epistemology, including the study of deductive reasoning. A by-product of this study of Aristotle's accomplishments in logic is a clarification of a distinction implicit in discourses among logicians—that between logic as formal ontology and logic as formal epistemology.

Aristotle's Logic: New Goals, New Results

Our understanding of Aristotle's logic has increased enormously in the last sixty years. It is gratifying to review the cascade of progress beginning with the independently achieved but remarkably similar advances reported in 1929 by Jan Łukasiewicz and in 1938 by James Wilkinson Miller. Penetrating examination and critical evaluation of the Łukasiewicz-Miller viewpoint in the 1950s and 1960s set the stage for work in the early 1970s by Timothy Smiley and myself. Subsequent work in the late 1970s and early 1980s by various people including Timothy Smiley, Robin Smith, Michael Scanlan and myself can be seen as culminating, at least for the moment, in the 1989 translation and commentary on *Prior Analytics* by Robin Smith." (pp. 9-10)

From: John Corcoran, "The Founding of Logic. Modern Interpretations of Aristotle's Logic", *Ancient Philosophy*, 14, 1994, pp. 9-24.

"Jan Łukasiewicz, by his own account, entered the lists in 1923 as an interpreter of ancient logic from the standpoint of modern formal logic. In that year he began defending his view of the contrast of Stoic logic with Aristotelian logic; this view appeared in print for the first time in 1930.(1) This was followed by the Polish version in 1934, and the German in 1935, of his landmark paper, 'On the History of the Logic of Propositions' [1967]. During the same period Łukasiewicz was lecturing on Aristotle's syllogistic. An authorized version of his lectures on this and other logical topics was published by students at the University of Warsaw in 1929, republished in Warsaw in 1958, and finally translated into English in 1963 under the title *Elements of Mathematical Logic* [1963]. Łukasiewicz elaborated his researches until he issued in 1951 his now famous monograph *Aristotle's Syllogistic from the Standpoint of Modern Formal Logic* [1951]. A second edition, enlarged but not revised, appeared in 1957, its author's death having occurred in the previous year.(*)

Łukasiewicz thus has held the field for nearly half a century. Questions have been raised about some details of his interpretation, and corrections have been made of some of his mistakes in matters of fact, but, so far as I know, no one had brought a direct challenge against the main lines of Łukasiewicz's interpretation of Aristotle's syllogistic and its place in ancient logic until John Corcoran did so in 'A Mathematical Model of Aristotle's Syllogistic' [1973]. Indeed, so spectacular a *tour de force* was Łukasiewicz's book that, despite his own protestations that he was setting out the system merely "in close connexion with the ideas set forth by Aristotle himself" ([1951], p. 77) and "on the lines laid down by Aristotle himself" ([1951], p. VIII), his account has gained wide acceptance as the definitive presentation of Aristotle's syllogistic, and some writers lead one to believe that Aristotle's system is no more and no less than what Łukasiewicz proposes.

Łukasiewicz's view, very briefly put, is this: The logic of Aristotle is a theory of the relations A, E, I, and O (in their mediaeval senses) in the field of universal terms ([1951], p. 14). It is a theory of special relations, like a mathematical theory ([1951], p. 15). As a logic of terms, it presupposes a more fundamental logic of propositions,

which, however, was unknown to Aristotle and was discovered by the Stoics in the century after him ([1951], p. 49). Aristotle's theory is an axiomatized deductive system, in which the reduction of the other syllogistic moods to those of the first figure is to be understood as the proof of these moods as theorems by means of the axioms of the system ([1951], p. 44).

Corcoran has proposed, on the other hand, that Aristotle's syllogistic is not an axiomatic science but rather a natural deduction system, and that the theory is itself fundamental, presupposing neither the logic of propositions nor any other underlying logic.

Corcoran's proposals have a good deal to recommend them. First, Corcoran provides a faithful reconstruction of Aristotle's method. Although Łukasiewicz gives a system that does arrive at Aristotle's results, obtaining and rejecting laws corresponding to the moods which Aristotle obtains and rejects, his derivations, by substitution and detachment from axioms, have nothing in common with Aristotle's own method. Indeed, Łukasiewicz must say that Aristotle's proposals about method are wrong, and that Aristotle did not and could not use the technique of perfecting syllogisms, which Aristotle claims over and over again that he is using.(2) Corcoran, on the other hand, not only makes perfect sense of the doctrine of perfecting syllogisms, but he is willing to take Aristotle at his word instead of being content to elaborate a system allegedly in close connexion with Aristotle's ideas. The upshot is that Corcoran succeeds, as Łukasiewicz did, in reproducing Aristotle's results, and he succeeds, as Łukasiewicz did not, in reproducing Aristotle's method step by step, so that the annotated deductions of his system D are faithful translations of Aristotle's exposition. Corcoran's concern for method is prompted by his belief that Aristotle shared this concern. I think there can be no doubt that he is correct. Aristotle sets out his method in detail which if concise is yet minute, and when, at the beginning of Chapter XXX of the first book of the *Priora* (46a4), he summarizes his work so far, he speaks not of the same results in philosophy and every kind of art and study whatsoever, but of the same method (οδός) in all these branches of inquiry.

Corcoran's interpretation also has the virtue of making sense of Aristotle's views concerning the place of syllogistic in his doctrine as

a whole. While Łukasiewicz apparently held that syllogistic was a science which must take its place beside the other sciences in the Aristotelian scheme, Corcoran proposes to take syllogistic as the underlying logic of the demonstrative sciences. Łukasiewicz held further that syllogistic itself presupposes propositional logic as an underlying logic -- of which Aristotle, however, was ignorant. Corcoran, by contrast, suggests that syllogistic is a fundamental logical system, presupposing no other." (pp. 133-135)

Contemporary evaluations of Aristotle's logic

"As a kind of summary of our research we present a review of what we take to be the fundamental achievements of Aristotle's logical theory. In the first place, he clearly distinguished the role of deduction from the role of experience (or intuition) in the development of scientific theories. This is revealed by his distinction

between the axioms of a science and the logical apparatus used in deducing the theorems. Today this would imply a distinction between logical and nonlogical axioms; but Aristotle had no idea of logical axioms (but cf. 77a22-25). Indeed, he gave no systematic discussion of logical truth (Axx is not even mentioned once). In the second place, Aristotle developed a natural deduction system which he exemplified and discussed at great length. Moreover, he formulated fairly intricate metamathematical results relating his central system to a simpler one. It is also important to notice that Aristotle's system is sound and strongly complete. In the third place, Aristotle was clear enough about logical consequence so that he was able to discover the method of counter instances for establishing invalidity. This method is the cornerstone of all independence (or invalidity) results, though it probably had to be rediscovered in modern times (cf. Cohen and Hersh). In the fourth place, his distinction between perfect and imperfect syllogisms suggests a clear understanding of the difference between deducibility and implication -- a distinction which modern logicians believe to be their own (cf. Church, p. 323, fn. 529). In the fifth place, Aristotle used principles concerning form repeatedly and accurately, although it is not possible to establish that he was able to state them nor is even clear that he was consciously aware of them as logical principles.

The above are all highly theoretical points -- but Aristotle did not merely theorize; he carried out his ideas and programs in amazing detail despite the handicap of inadequate notation. In the course of pursuing details Aristotle originated many important discoveries and devices. He described indirect proof. He used syntactical variables (alpha, beta, etc.) to stand for content words -- a device whose importance in modern logic has not been underestimated. He formulated several rules of inference and discussed their interrelations.

Philosophers sometimes say that Aristotle is the best Introduction to philosophy. This is perhaps an exaggeration. One of the Polish logicians once said that the Analytics is the best Introduction to logic. My own reaction to this remark was unambiguously negative -- the severe difficulties in reading the Analytics form one obstacle and I felt then that the meager results did not warrant so much study. After carrying out the above research I can compromise to the

following extent. I now believe that Aristotle's logic is rich enough, detailed enough, and sufficiently representative of modern logics that a useful set of introductory lectures on mathematical logic could be organized around what I have called the main Aristotelian system.

From a modern point of view, there is only one mistake which can sensibly be charged to Aristotle: his theory of propositional forms is very seriously inadequate. It is remarkable that he did not come to discover this for himself, especially since he mentions specific proofs from arithmetic and geometry. If he had tried to reduce these to his system he may have seen the problem (cf. Mueller, pp. 174-177). But, once the theory of propositional forms is taken for granted, there are no important inadequacies attributable to Aristotle, given the historical context. Indeed, his work is comparable in completeness and accuracy to that of Boole and seems incomparably more comprehensive than the Stoic or medieval efforts. It is tempting to speculate that it was the oversimplified theory of propositional forms that made possible the otherwise comprehensive system. A more adequate theory of propositional forms would have required a much more complicated theory of deduction -- indeed, one which was not developed until the present era." (pp. 122-123)

"*Prior Analytics* 1.38 is a difficult text that offers a way of handling qua propositions in formal syllogistic. By 'qua proposition' I mean a proposition that contains a qualifying term, phrase, or clause. Many such propositions have a qua connector like 'qua', 'insofar as', 'in virtue of the fact that', 'with respect to', although in some cases a construction like an accusative of respect occurs

instead of an explicit connective.(1) Still, all qua propositions may be paraphrased by explicit qua connectives. So the class of qua propositions is a grammatical class of propositions of the form *'S* is *P* qua *M'* The *Prior Analytics* chapter deals with a specific logical type of qua propositions, and its syllogistic properties.(2)" (p. 453)

   "In previous articles ([4], [5]) it has been shown that the deductive system developed by Aristotle in his "second logic"

(cf. Bochenski [2, p. 43]) is a natural deduction system and not an axiomatic system as previously had been thought [6].

It was also pointed out that Aristotle's logic is self-sufficient in two senses: First, that it presupposed no other logical concepts, not even those of propositional logic; second, that it is (strongly) complete in the sense that every valid argument formable in the language of the system is demonstrable by means of a formal deduction in the system. Review of the system makes the first point obvious. The purpose of the present article is to prove the second. Strong completeness is demonstrated for the Aristotelian system." (p. 696)

10. ———. 1973. "A Mathematical Model of Aristotle's Syllogistic." *Archiv für Geschichte der Philosophie* no. 55:191-219.

"Our purpose in the present article is to present a mathematical model designed to reflect certain structural aspects of Aristotle's logic. Accompanying the presentation of the model is an interpretation of certain scattered parts of the Prior and *Posterior Analytics*. Although our interpretation does not agree in all respects with those previously put forth, the present work would have been impossible without the enormous ground work of previous scholars - especially Jenkinson, Łukasiewicz and W. D. Ross - to whom we are deeply grateful.

Our interpretation restores Aristotle's reputation as a logician of consumate imagination and skill. Several attributions of shortcomings and logical errors to Aristotle are seen to be without merit. Aristotle's logic is found to be self-sufficient in several senses. In the first place, his theory of deduction is

logically sound in every detail. (His indirect deductions' have been criticized, but incorrectly on our account.) In the second place, Aristotle's logic presupposes no other logical concepts, not even those of propositional logic. In the third place, the Aristotelian system is seen to be complete in the sense that every valid argument statable in his system admits of a deduction within his deductive system, I. e. every semantically valid argument is deducible.

In the present paper we consider only Aristotle's theory of non-modal logic which has been called "the theory of the assertoric syllogism" and "Aristotle's syllogistic." Aristotle presents the theory almost completely in Chapters 1, 2, 4, 5 and 6 of the first book of *Prior Analytics,* although it presupposes certain developments in previous works - especially the following two : first, a theory of form and meaning of propositions having an essential component in *Categories* (Ch. 5, esp. 2a 34- 2b 7) ; second, a doctrine of opposition (contradiction) more fully explained in *De Interpretatione* (Ch. 7, and cf. Ross, p. 3)." (p. 191)

11. ———. 1974. "Aristotelian Syllogisms: Valid Arguments or True Universalized Conditionals?" *Mind* no. 83:278-281.

"For centuries it was thought that Aristotle's 'syllogistic' was a codification of valid arguments. Early in the 1950s, however, Łukasiewicz [8] offered the view that it was certain true universalized conditional sentences that were being codified. (The traditional notion of a valid argument has been explicated (Mates, [8]) essentially as follows. An argument is a couple (P, c) where P is a set of (closed) sentences and c is a sentence: (P, c) is valid if c is a logical consequence of P. This explication obviously covers the technical use of the terms 'valid' and 'argument' in logic (cf. Corcoran, [2]). If p and q are open sentences and Q is a string of universal quantifiers one for each variable free in (p v q) then Q(p =) q) is a universalized conditional.) Łukasiewicz rested his case on the proposition that all syllogisms formulated in the relevant corpus involve an equivalent of the 'if . .. then' connective ([8], p. 2). Austin, in his review of the Łukasiewicz work [I], was able to weaken the Łukasiewicz case by citing a few references to syllogisms as

arguments while agreeing that Łukasiewicz was largely correct in his observation that syllogisms were formulated as conditionals. Several scholars (cf. [1] [11]) have further weakened the Łukasiewicz case by pointing out that in many circumstances it would be natural to assert the validity of an argument by saying that if the premises

were true then the conclusion would necessarily also be true. Prior regards Lukasiewicz's evidence as 'flimsy' (cf. [11], p. 25) whereas Patzig ([9], pp. 1-4) finds it convincing. In any event, however, neither case seems sufficiently convincing to make it possible to regard the issue as settled.

Additional information bearing on the issue can be obtained by considering howv the syllogisms are established in the corpus. In normal contexts, arguments are established (as valid) by deducing the conclusion from the assumption of the premises using presupposed rules of inference, whereas sentences are established (as true) by deducing them from other sentences previously accepted as true. Thus one is lead to reconsider the locations in the corpus where syllogisms are established to see which mode of validation seems to be used." (p. 278)

"In the present article we attempt to show that Aristotle's syllogistic is an underlying logic which includes a natural deductive system and that it is not an axiomatic theory as had previously been thought. We construct a mathematical model which reflects certain structural aspects of Aristotle's logic and we examine both the mathematical properties of the model and the relation of the model to the system of logic envisaged in certain scattered parts of *Prior* and *Posterior Analytics*.

Our interpretation restores Aristotle's reputation as a logician of consummate imagination and skill. Several attributions of shortcomings and logical errors to Aristotle are shown to be without merit. Aristotle's logic is found to be self-sufficient in several senses. In the first place, his theory of deduction is logically sound in every detail. (His indirect deductions have been criticized, but incorrectly on our account.) In the second place, Aristotle's logic presupposes no other logical concepts, not even those of propositional logic. In the third place, the Aristotelian system is seen to be complete in the sense that every valid argument expressible in his system admits of a deduction within his deductive system; i.e., every semantically valid argument is deducible.

There are six sections in this article. The first section includes methodological remarks, a preliminary survey of the present interpretation and a discussion of the differences between our interpretation and that of Łukasiewicz. The next three sections develop the three parts of the mathematical model. The fifth section deals with general properties of the model and its relation to the Aristotelian system. The final section contains conclusions." p. 85

"As a kind of summary of our research we present a review of what we take to be the fundamental achievements of Aristotle's logical theory. In the first place, he clearly distinguished the role of deduction from the role of experience (or intuition) in the development of scientific theories. This is revealed by his distinction between the axioms of a science and the logical apparatus used in deducing the theorems. Today this would imply a distinction between logical and nonlogical axioms; but

Aristotle had no idea of logical axioms (but cf. 77a22-25). Indeed, he gave no systematic discussion of logical truth *(Axx* is not even mentioned once). In the second place, Aristotle developed a natural deduction system which he exemplified and discussed at great length. Moreover, he formulated fairly intricate metamathematical results relating his central system to a simpler one. It is also important to notice that Aristotle's system is sound and strongly complete. In the third place, Aristotle was clear enough about logical consequence so that he was able to discover the method of counter instances for establishing invalidity. This method is the cornerstone of all independence (or invalidity) results, though it probably had to be rediscovered in modern times (cf. Cohen and Hersh). In the fourth place, his distinction between perfect and imperfect syllogisms suggests a clear understanding of the difference between deducibility and implication -- a distinction which modern logicians believe to be their own (cf. Church, p. 323, fn. 529). In the fifth place, Aristotle used principles concerning form repeatedly and accurately, although it is not possible to establish that he was able to state them nor is even clear that he was consciously aware of them as logical principles.

The above are all highly theoretical points -- but Aristotle did not merely theorize; he carried out his ideas and programs in amazing detail despite the handicap of inadequate notation. In the course of pursuing details Aristotle originated many important discoveries and devices. He described indirect proof. He used syntactical variables (alpha, beta, etc.) to stand for content words -- a device whose importance in modern logic has not been underestimated. He formulated several rules of inference and discussed their interrelations.

Philosophers sometimes say that Aristotle is the best introduction to philosophy. This is perhaps an exaggeration. One of the Polish logicians once said that the *Analytics* is the best introduction to logic. My own reaction to this remark was unambiguously negative -- the severe difficulties in reading the *Analytics* form one obstacle and I felt then that the meager results did not warrant so much study. After carrying out the above research I can compromise to the following extent. I now

believe that Aristotle's logic is rich enough, detailed enough, and sufficiently representative of modern logics that a useful set of introductory lectures on mathematical logic could be organized around what I have called the main Aristotelian system.

From a modern point of view, there is only one mistake which can sensibly be charged to Aristotle: his theory of propositional forms is very seriously inadequate. It is remarkable that he did not come to discover this for himself, especially since he mentions specific proofs from arithmetic and geometry. If he had tried to reduce these to his system he may have seen the problem (cf. Mueller, pp. 174-177). But, once the theory of propositional forms is taken for granted, there are no important inadequacies attributable to Aristotle, given the historical context. Indeed, his work is comparable in completeness and accuracy to that of Boole and seems incomparably more comprehensive than the Stoic or medieval efforts. It is tempting to speculate that it was the oversimplified theory of propositional forms that made possible the otherwise comprehensive system. A more adequate theory of propositional forms would have required a much more complicated theory of deduction -- indeed, one which was not developed until the present era." p. 130-131

13. ———. 1989. "Argumentations and Logic." *Argumentation* no. 3:17-43.

Abstract: "Argumentations are at the heart of the deductive and the hypothetico-deductive methods, which are involved in attempts to reduce currently open problems to problems already solved. These two methods span the entire spectrum of problem-oriented

reasoning from the simplest and most practical to the most complex and most theoretical, thereby uniting all objective thought whether ancient or contemporary, whether humanistic or scientific, whether normative or descriptive, whether concrete or abstract. Analysis,

synthesis, evaluation, and function of argumentations are described. Perennial philosophic problems, both epistemic and

ontic, related to argumentations are put in perspective. So much of what has been regarded as logic is seen to be involved in the study of argumentations that logic may be usefully defined as the systematic study of argumentations, which is virtually identical to the quest of objective understanding of objectivity."

14. ———. 1994. "The Founding of Logic. Modern Interpretations of Aristotle's Logic." *Ancient Philosophy* no. 14:9-24.

"Conclusion.

The tendency of interpreters to find an epistemically-oriented theory in Aristotle has been overwhelming. With the exception of James Wilkinson Miller's 1938 book and the writings of Jan Łukasiewicz and those directly influenced by these two, few interpreters have found a theory of formal ontology in Aristotle's Prior Analytics. Down through the ages, with these exceptions, interpreters have agreed that Prior Analytics is about methods of determining validity and invalidity of arguments. People studied Prior Analytics in order to learn more about deductive reasoning and in order to improve their own reasoning skills.

Despite the overwhelming tendency to interpret the syllogistic epistemically it wasn't until the early 1970s that it occurred to anyone to wonder whether Aristotle had a developed theory of deductive reasoning with a well worked-out system of deductions comparable in rigor and precision with the systems then familiar from mathematical logic. Of the logicians that studied Prior Analytics from this point of view, two of them published articles in same twelve-month period with remarkably similar systems affirming in clear and unequivocal terms the epistemic nature of Prior Analytics: Corcoran 1972 and Smiley 1973.

The simpler of the two articles holds that Aristotle's theory of deductions recognizes two kinds of extended deductions of conclusions from arbitrarily large premise sets: direct deductions and indirect deductions. A direct deduction of a conclusion from given premises begins with the premises and proceeds by chaining together simple one-premise and two-

premise inferences until the conclusion is reached. An indirect deduction of a given conclusion from given premises is in effect a direct deduction of a pair of contradictory opposites from the premises augmented by the contradictory opposite of the conclusion. This view is spelled out in more detail in the introduction to Smith's 1989 translation of Aristotle's Prior Analytics.

According to the ontic interpretation the syllogistic is a system of true propositions about inclusional relations among classes. It is a system which is organized deductively, axioms followed by deduced theorems, by employment of an underlying logic never explicitly mentioned by Aristotle. It is a system whose place in the Organon, in Greek philosophy, and in the history of philosophy raises many problems. When we turn to the epistemic interpretation the changes are dramatic. From the epistemic perspective the syllogistic is a system of deductions or chains-of-reasoning. It is organized according to an initial-versus-derivative structure with the derivative components as chainings of initial components. It is a system which can be seen to explain epistemic processes of deduction presupposed by the Socratic hypothetical method, by the so-called method of analysis, by the axiomatic method and even by dialectic itself. According to the epistemic interpretation, the focus of the syllogistic is on methods as opposed to results; it concerns the process of deduction rather than conclusions per se. One might say that it concerns how to think rather than what to think. And it is a step toward understanding the nature of proof as opposed to persuasion and toward fulfilling the demand made by Socrates in the Phaedo for a techné logiké. This step made by Aristotle was so firm, so detailed, and so well-developed that it warrants the title of THE FOUNDING OF LOGIC." (pp. 19-20)

15. ———. 2003. "Aristotle's *Prior Analytics* and Boole's *Laws of Thought*." *History and Philosophy of Logic* no. 24:261-288.

"*Prior Analytics* by the Greek philosopher Aristotle (384 - 322 BCE) and *Laws of Thought* by the English mathematician George Boole (1815 - 1864) are the two most important surviving original logical works from before the advent of

modern logic. This article has a single goal: to compare Aristotle's system with the system that Boole constructed over twenty-two centuries later intending to extend and perfect what Aristotle had started. This comparison merits an article itself. Accordingly, this article does not discuss many other historically and philosophically important aspects of Boole's book, e.g. his confused attempt to apply differential calculus to logic, his misguided effort to make his system of 'class logic' serve as a kind of 'truth-functional logic', his now almost forgotten foray into probability theory, or his blindness to the fact that a truth-functional combination of equations that follows from a given truth-functional combination of equations need not follow truth-functionally. One of the main conclusions is that Boole's contribution widened logic and changed its nature to such an extent that he fully deserves to share with Aristotle the status of being a founding figure in logic. By setting forth in clear and systematic fashion the basic methods for establishing validity and for establishing invalidity, Aristotle became the founder of logic as formal epistemology. By making the first unmistakable steps toward opening logic to the study of 'laws of thought' -- tautologies and laws such as excluded middle and non-contradiction -- Boole became the founder of logic as formal ontology."

16. ———. 2009. "Aristotle's Demonstrative Logic." *History and Philosophy of Logic* no. 30:1-20.

    "Demonstrative logic, the study of *demonstration* as opposed to persuasion, is the subject of Aristotle's two volume *Analytics*. Many examples are geometrical. Demonstration produces *knowledge* (of the truth of propositions). Persuasion merely produces *opinion*. Aristotle presented a general *truth-and-consequence conception of demonstration* meant to apply to all demonstrations. According to him, a demonstration, which normally proves a conclusion not previously known to be true, is an extended argumentation beginning with premises known to be *truths* and containing a chain of reasoning *showing* by deductively evident steps that its conclusion is a *consequence* of its premises. In particular, a demonstration is a *deduction* whose premises are known to be true. Aristotle's *general* theory

of demonstration required a prior *general* theory of deduction presented in the *Prior Analytics*. His general *immediate-deduction chaining*

conception of deduction was meant to apply to all deductions. According to him, any deduction that is not immediately evident is an extended argumentation that involves a chaining of intermediate immediately evident steps that *shows* its final conclusion to follow logically from its premises. To illustrate his general theory of deduction, he presented an ingeniously simple and mathematically precise *special* case traditionally known as the *categorical syllogistic*."

"In recent years there have been expressed two views about the nature of an Aristotelian syllogism. The first view, which may be called the inference account, is that an Aristotelian syllogism is a valid inference composed of two premisses and a conclusion; and the second, which may be called the statement account, is that an Aristotelian syllogism is a conditional statement whose protasis is a conjunction of propositions and whose apodosis is a proposition made necessary by that

conjunction.1 Opposed to these views is what I call the premiss account, according to which an Aristotelian syllogism is a pair of premisses put forward in support of a conclusion which necessarily follows from that pair of premisses. An Aristotelian syllogism, on the premiss account, is an argument or proof, but it is an argument for, or proof of, a proposition. It is not an argument or a proof in the sense of being an inference, which is the process or the result of the process of drawing a conclusion from a pair of premisses. Aristotle's conception of the syllogism is tied to the conception of philosophical investigation he inherits from Plato." (p. 320)

(1) The inference account is expressed most recently by W. D. Ross, *Aristotle's Prior and Posterior Analytics* (Oxford, Oxford University Press, 1949), and by W. and M. Kneale, *The Development of Logic* (Oxford, Oxford University Press, 1962). The statement account is

expressed by J. Łukasiewicz, *Aristotle's Syllogistic* (2nd ed., Oxford, Oxford University Press, 1951), and most recently by G. Patzig, *Die Aristotelische Syllogistik* (2nd ed., Gottingen, Vandenhoeck & Ruprecht, 1963).

31. Engelmann, Edward M. 2007. "Aristotle's Syllogistic, Modern deductive Logic, and scientific Demonstration." *American Catholic Philosophical Quarterly*:535-552.

    Abstract: "This article investigates the nature of Aristotelian syllogistics and shows that the categorical syllogism is fundamentally about showing the connection, in the premises of the syllogism, between the major and minor terms as stated in the conclusion. It discusses how this is important for the use of the syllogism in scientific demonstration. The article then examines modern deductive logic with an eye to they way in which it contrasts with Aristotelian syllogistics. It shows how modern logic is about making necessary connections between each proposition by means of external or second order rules. In the syllogism, on the other hand, the necessity between the premises as a whole unit and the conclusion is based on the internal middle term. The article concludes with a discussion of Günther Patzig's claim that Aristotelian syllogisms are best thought of as tautological propositions. If this were the case, then the differences asserted to exist between syllogistic and modern logic would not hold. However, it is shown that Patzig's assimilation of syllogistics to modern deductive logic is illegitimate."

    "Aristotle's thesis that universals must always inhere in a primary substance, a particular, has been used recently as evidence that he, like many contemporary logicians, rejected the predication of terms to universal, i.e., nonsingular, subjects. Yet this would force Aristotle to treat quantifiers as ranging

over bare, unsorted, particulars. But Aristotle took the notion of an unsorted particular as nonsense. His thesis about the status of universals can no more serve as evidence that he took all subjects as particulars than can his thesis that every particular satisfies some universal serve as evidence that he took no subjects as particular."

    "In the Aristotelean philosophical tradition, elenctic argumentation *(Elenchos)* is conceived as a form of dialectical foundation of a thesis.

    It takes place in the context of discussion for and against a given thesis and consists in showing that, as the denier of this thesis argues against the opponent, he is unable to maintain his position unless he presupposes the thesis itself, which thus prevails and is consequently proven. As is well known, Aristotle used this form of argumentation in many areas of his inquiry, since he regarded it as an extremely effective technique not only in the speculative sciences but in the physical and practical sciences as well. Particularly fortunate - because of its subsequent widespread use and because of the broad reflection that it stimulated - was Aristotle's application of this form of dialectical argumentation in Book Four of the *Metaphysics* in order to justify the principle of non-contradiction. Apart from its historical influence, this application is of especial importance because it evidences Aristotle's intention to prove, not any thesis whatsoever, but a logical principle, and this expresses his claim for an epistemically absolute proof - in the form of self-proof - of the principle itself.

It does not appear, however, that elenctic proof of the non-contradiction principle can be accomplished successfully. In fact, demonstration that this proof is impossible is the purpose of the present essay, in which I propose a formalization of the argument - i.e. a formal reconstruction of the argument intended to give it a sufficiently precise specification - which highlights the conceptual difficulties that lie at its root."     "Aristotle's syllogistic is extended to include denumerably many quantifiers such as more than 2/3' and exactly 2/3.' Syntactic and semantic decision procedures determine the validity, or invalidity, of syllogisms with any finite number of premises. One of the syntactic procedures uses a natural deduction account of deducibility, which is sound and complete. The semantics for the system is non-classical since sentences may be assigned a value other than true or false. Results about symmetric systems are given. And reasons are given for claiming that syllogistic validity is relevant validity."

    "The task I have set myself in this paper can be described as bridging the gap between Aristotle's syllogistic and Lesniewski's ontology. I propose to suggest a number of successive extensions of syllogistic culminating in a system of what may be regarded as basic ontology. In this way I hope to throw new light on the significance of the Aristotelian logic. At the same time I hope to add a little to the understanding of Lesniewski's ontology, which interestingly enough was conceived by its originator as a modernised continuation of the ancient and medieval tradition."

    "Łukasiewicz' second axiomatization of the assertoric syllogism ("Aristotle's syllogistic", 1957) consists of four axioms of assertion and one of rejection. n arithmetic interpretation is presented proving the independence of the latter. Łukasiewicz himself demonstrated all five consistent by means of an arithmetization due to Leibniz. This arithmetization, we are told by Louis Couturat ("La logique de Leibniz", 1901) was thought by Leibniz himself to have been invalid. Whether and why Leibniz in fact took this (mistaken) view, is discussed briefly."

69. Martin, John N. 1997. "Aristotle's Natural Deduction Reconsidered." *History and Philosophy of Logic* no. 18:1-15.

    "John Corcoran's natural deduction system for Aristotle's syllogistic is reconsidered. Though Corcoran is no doubt right in interpreting Aristotle as viewing syllogisms as arguments and in rejecting Lukasiecwicz's treatment in terms of

conditional sentences, it is argued that Corcoran is wrong in thinking that the only alternative is to construe Barbara and Celarent as deduction rules in a natural deduction system. An alternative is presented that is technically more elegant and equally compatible with the texts. The abstract role assigned by tradition and Łukasiewicz to Barbara and Celarent is retained. The two 'perfect syllogisms' serve as ` basic elements' in the construction of an inductively defined set of valid syllogisms. The proposal departs from Łukasiewicz, and follows Corcoran, however, in construing the construction as one in natural deduction. The result is a sequent system with fewer rules and in which Barbara and Celarent serve as basic deductions. To compare the theory to Corcoran's, his original is reformulated in current terms and generalized. It is shown to be equivalent to the proposed sequent system, and several variations are discussed. For all systems mentioned, a method of Henkin-style completeness proofs is given that is more direct and intuitive than Corcoran's original."

    "Corcoran, it seems to me, has made a very important contribution to our understanding of Aristotle's logic, and the suggestions offered in what follows should not be construed as impugning in any substantive way the value of that contribution.

    Of the many points Corcoran raises, I intend to take up four: (1) whether syllogistic is a science; (2) whether the theory of propositional forms presupposed by syllogistic is adequate; (3) whether Aristotle had a doctrine of logical truth; and (4)

whether Aristotle considered reasoning natural or conventional." (p. 136)

87. Novak, Joseph A. 1980. "Some recent work on the assertoric syllogistic." *Notre Dame Journal of Formal Logic* no. 21:229-242.

    "Over the last few decades there have been many attempts to approach the Aristotelian syllogistic by utilizing the techniques of contemporary formal logic. The aim of this paper is to examine the most significant of these attempts and evaluate their fidelity to and consistency with Aristotle's own basic exposition of the syllogistic as expressed in the *Prior Analytics* (Book I, 1-2; 4-6).

    Two major approaches to the formalization of the assertoric syllogistic can be distinguished in the literature. The first and older approach construes the syllogistic as an axiomatic system, while the second and more recent approach considers the syllogistic as a natural deduction system. Since many of the attempts of the first sort fail to be mentioned in current discussion, this paper will try to summarize them and only make a concluding reference to the second approach which is readily accessible in the more recent publications.

    There are two main issues which must be confronted in the case of each attempt to present Aristotle's assertoric syllogistic as an axiomatic system: first, whether the method of representation, i.e., the logical alphabet and the well-formed formulas of the system, conforms to Aristotle's own approach; second, whether the specific formulas chosen as axioms and definitions, the

rules of inference, and the manner of proof, etc., are faithful to or at least consistent with Aristotle's writings. Although it might appear that the first issue, a discussion of the logical symbols employed, is

not of any real value, one must remember that Aristotle's logic seems tied to some basic philosophical or, better, metaphysical presuppositions. That there can be a close link between certain symbolical representations and some ontological positions is clear in the case of some other philosophers.

One instance in the twentieth century is Gustav Bergmann whose espousal of a bare particularist theory of individuation is linked to his employment of a type of Russelian formal language (Bergmann, G., *Meaning and Existence,* University of Wisconsin Press, Madison, 1960).

Attempts at presenting the syllogistic in a formal way have proceeded along four lines: first, the attempt to present the syllogistic by means of the first-order predicate calculus; second, the classic attempt of Łukasiewicz to develop the syllogistic; third, the attempt to present the syllogistic as a theory of classes; fourth, Lejewski's attempt to relate the syllogistic to Lesniewski's ontology. Each of these attempts will be treated below in light of the two issues raised above."

"Aristotle's work in formal logic has received a great deal of scholarly attention; nevertheless, it remains largely misunderstood. Aristotle's logic has often been equated with traditional "Aristotelian" logic (a usage as unhistorical as "Platonic" love or "Epicurean" tastes), or, which is even worse, judged and evaluated in accordance with how closely it follows or "fails" to follow that traditional logic. Even when efforts have been made to understand Aristotle's logic in its own right, Aristotle has usually been very shabbily treated. He has commonly been accused of errors that he never made at all, such as neglecting or overlooking the fourth figure. Even his way of conceiving the syllogism as a linear array of three terms has been lost on minds handicapped by later, but not thereby better, ways of thinking.

Although I hope that this book will contribute towards a better understanding of what Aristotle did and did not accomplish in his syllogistic, I have by no means attempted to treat Aristotle's syllogistic in its entirety. (For one thing, I have confined myself to the assertoric syllogistic and not gone into the modal logic at all.) The principal task of this book has been to explore the consequences of accepting the Aristotelian syllogism as a linear array of three terms. This approach to Aristotle sheds light on many hitherto mysterious aspects of Aristotle's logic; it provides new insights into what Aristotle was doing in the *Prior Analytics* and enables us to correct numerous misconceptions about his logic.

My treatment of the *Prior Analytics* has been quite sympathetic, and my conclusions are generally favorable; indeed, one of the aims of this book is to exonerate Aristotle's work in formal deductive logic." p. V

    Abstract: "This paper presents a tree method for testing the validity of inferences, including syllogisms, in a simple term logic. The method is given in the form of an algorithm and is shown to be sound and complete with respect to the obvious denotational semantics. The primitive logical constants of the system, which is indebted to the logical works of Jevons, Brentano and Lewis Carroll, are term negation, polyadic term conjunction, and functors affirming and denying existence, and use is also made of a metalinguistic concept of formal synonymy. It is indicated briefly how the method may be extended to other systems."

    "In *Prior Analytics* I 23 Aristotle presents a completeness proof for syllogistic logic, or so I maintain. I reconstruct the crucial step, which I take to be his highly condensed argument that every syllogistic-style deduction with more than two premises can be reduced to a series of syllogisms proper. I detect two big holes in the argument, but show that they can be filled without recourse to anachronistically modern methods. I end with a principle about the ordering of terms, and discuss the connections between it, Platonic division and Aristotle's exclusion of the fourth figure." (p. 25)

"I consider the proper interpretation of the process of ecthesis which Aristotle uses several times in the "Prior analytics" for completing a syllogistic mood, i.e., showing how to produce a deduction of a conclusion of a certain form from premisses of certain forms. I consider two interpretations of the process which have been advocated by recent scholars and show that one seems better suited to most passages while the other best fits a single remaining passage. I also argue that "ecthesis" for Aristotle means 'setting out' the case to be proved using letters. Aristotle's remarks about the use of letters in mathematical proofs suggest that he had some understanding of rules equivalent to universal generalization and existential instantiation; the 'proofs through ecthesis' are so-called because they rest on the latter rule, with which use of letters is involved in a special way." (p. 113)

108. ———. 1982. "The Axiomatic Method and Aristotle's Logical Methodology." *Southwest Philosophical Studies* no. 8:49-59.

Abstract: "I argue that Aristotle developed the syllogistic in the "Prior Analytics" in order to use it in resolving the question, presented in "Posterior Analytics" A 3, whether proof of every proposition is either necessary or possible. His method, which rests on an analysis of the possible structure of proofs derived from the study of syllogisms in the "Prior Analytics", resemble modern proof theory in both style and purpose."

115. Steinkrüger, philipp. 2015. "Aristotle's assertoric syllogistic and modern relevance logic." *Synthese* no. 192:1413-1444.

    Abstract: "This paper sets out to evaluate the claim that Aristotle's Assertoric Syllogistic is a relevance logic or shows significant similarities with it. I prepare the grounds for a meaningful comparison by extracting the notion of relevance employed in the most influential work on modern relevance logic, Anderson and Belnap's Entailment. This notion is characterized by two conditions imposed on the concept of validity: first, that some meaning content is shared between the premises and the conclusion, and second, that the premises of a proof are actually used to derive the conclusion. Turning to Aristotle's Prior Analytics, I argue that there is evidence that Aristotle's Assertoric Syllogistic satisfies both conditions. Moreover, Aristotle at one point explicitly addresses the potential harmfulness of syllogisms with unused premises. Here, I argue that Aristotle's analysis allows for a rejection of such syllogisms on formal grounds established in the foregoing parts of the Prior Analytics. In a final section I consider the view that Aristotle distinguished between validity on the one hand and syllogistic validity on the other. Following this line of reasoning, Aristotle's logic might not be a relevance logic, since relevance is part of syllogistic validity and not, as modern relevance logic demands, of general validity. I argue that the reasons to reject this view are more compelling than the

reasons to accept it and that we can, cautiously, uphold the result that Aristotle's logic is a relevance logic."

"The three Parts of this book deal respectively with the formal analysis of Aristotle's non-modal syllogistic; with the inter-relations between various syllogistic systems, their subsystems and extensions; and with the most fundamental question about the syllogism, *viz.* What is it?

Part One aims to effect a synthesis of recent work (both logical and philological) on the non-modal sections of the *Prior Analytics,* within the framework of a new formal system which combines features of Lukasiewicz's `axiomatic' approach with features of the 'natural deduction' approach of Corcoran and Smiley.

This system is identified, in Part Two, as one of a family which also includes the semantically complete systems of Łukasiewicz and Corcoran. Extended systems are also considered, in which rejected formulae are axiomatised, and negative or singular terms added. In particular, formal analyses are given of Aristotle's own logics of negative and singular terms, and it is shown that the whole system of categorical syllogisms can be based on a system of singular syllogisms with the Aristotelian rules of *ecthesis*.

The multiplicity of syllogistic systems discussed in Part Two gives rise to the search (carried out in the third Part) for properties *essential* to the syllogism, which would recur in any genuinely syllogistic system. A complex syntactic property of the categorical syllogism is first described, then a semantic one, and finally one which I will term epistemological (without wanting to sink into psychologism). The principal standpoint in this Part is a purely theoretical one - the semantic discussion being within the context of the contemporary debate on entailment, and the epistemological one belonging to the theory of fallacies. But the historical approach of the first two Parts is not wholly abandoned, and a detailed account is given of those parts of the *Prior Analytics* (not often read) which include Aristotle's own attempts at metatheory.

With some reluctance, and in the interests of brevity, I have adopted a style of exposition which is generally dogmatic rather than dialectical, in that it seeks merely to state the truth rather

than to allow the true view to emerge in stages from partial truths or mistaken opinions. Also, interpretations or theories which seemed to me *wholly* wrong have in general not been mentioned: there are just too many of them. On the other hand, I have tried to include reference to what seemed to me the most important contributions of the ancient and medieval commentators.

I have proceeded (as Aristotle would have said) from what is best known in itself, to what is best known for us, beginning with the basis of an uninterpreted formal system, and ending with a statement of the function of the syllogism and the use of the system. So, in a sense, the reader will not know why the beginning is as it is, until he has come to the end. For the benefit of readers who can't stand the suspense, I have tried to make the end independently intelligible, so that they can begin there, and then go to the beginning, ending in the middle with a kind of *syllogismus interruptus*." pp. 11-12

124. ———. 1991. "The Two Barbaras." *History and Philosophy of Logic* no. 12:135-149.

    Abstract: "This paper examines three recent discussions of Aristotle's system of syllogisms with apodeictic and assertoric premisses. Though they contain no cross-references, and though they arrive at disparate interpretations, all three pieces share a common aid. That aim is to construct an intuitively graspable interpretation of Aristotle's modal syllogistic which is based on metaphysical considerations. I argue that none of these authors has succeeded in this; nevertheless, I share their broad aim, and attempt to show that a more satisfactory interpretation can be formulated by combining and developing elements drawn from all three."

125. ———. 1993. "Apodeictic Ecthesis." *Notre Dame Journal of Formal Logic* no. 34:193-208.

127. ———. 1998. "How to base apodeictic syllogistic on essentialist theory." *Philosophiegeschichte und Logische Analyse = Logical*

Analysis and History of Philosophy no. 1:171-185.

Abstract: "Essentialist theories are based on notions of necessity and essentiality. Kinds and Quasi-Kinds can be defined in terms of these notions. Aristotle's essentialism asserts that (1) Kinds are unions of Quasi-Kinds, (2) Kinds that can overlap are necessarily included in a common Kind, and (3) Kinds partition into sub-Kinds. Truth-conditions for the apodeictic propositions of Aristotle's modal syllogistic are stated in terms of necessity and essentiality, but independent of theses (1)-(3). While the basic insights motivating Patterson's and Nortmann's interpretations of modal syllogistic are sound, nonetheless there are significant mistakes in the detail. Given (1)-(3), truth-conditions for apodeictic propositions can be stated in terms of essentiality, but independently of the notion of necessity, thus confirming Johnson's interpretation."

137. ———. 1988. "How many syllogisms are there?" *History and Philosophy of Logic* no. 9:77-85.

"The incompleteness and artificiality of the 'Traditional logic' of the textbooks is reflected in the way that syllogisms are commonly enumerated. The number said to be valid varies, but all the numbers given are of a kind that logicians should find irritating. Even the apparent harmony of what is almost invariably said to be the total number of syllogisms, 256, turns out to be illusory. In the following, it is shown that the concept of a "distribution-value", which is related to the traditional theory of distribution, and the familiar concept of "quantity" together suffice to produce a far better way of enumerating syllogisms and a more complete understanding of the systematic features of syllogistic logic."

Stoic Logic: The Dialectic from Zeno to Chrysippus

The Stoic philosophy of language

"The nature of the Stoics' philosophy of language is the most tantalizing problem in the history of semantics. We know enough of it to say that it was by far the most intricate and probably the most insightful theory of its kind in antiquity and for centuries afterward; but we cannot be certain what its details were, and even its leading principles are sometimes obscured by vague or conflicting testimony. Those Stoics who had most to say about language were, naturally, the logicians, and the difficulty of determining the exact character of what they had to say stems from the fact that none of the many works of the Stoic logicians is extant. The best surviving sources (which date from almost five hundred years after the period of greatest development in Stoic logic and semantics) are Sextus Empiricus, *Outlines of Pyrrhonism*, Book II, and *Adversus Mathematicos*, Book VIII; and Diogenes Laertius, Book VII. Under these circumstances it is seldom possible to assign a particular doctrine to a particular Stoic, but much of the best of their logic and semantics is very likely to be the work of Chrysippus (c. 280–206 BCE). Under the Stoic division of philosophy into physics, ethics, and logic, logic was divided into rhetoric and dialectic, and dialectic further divided into an account of language (περὶ της φωςης) and an account of things signified (περὶ των σημαινόμενων). Both these subdivisions contain material relevant to semantics. In their account of language the Stoics distinguished vocal sound generally, "which may include mere noise," from the sort that is articulate (ἔςαρθρος), that is, capable of being embodied in written symbols (ἐγγάμματος).

Articulate sound, in turn, may be non-significant—for instance, "blityri"— or significant (σημαντηή); but for any articulate sound to be considered a sentence (λόγος) it must be significant and a product of someone's reason (Diogenes Laertius 7.55–57).

Within that same branch of their dialectic the Stoics recognized five kinds of words and distinguished their semantic or syntactic functions. They were the first who clearly separated (1) names, such as "Socrates," from (2) appellatives (προσηγορίαι), such as "man." (Cf. Aristotle's similar but significantly different distinction in *De Interpretatione*, Ch. 7.) A name "*points out* a kind proper to an individual," while an appellative "*signifies* a common kind." (3) A verb "*signifies* a predicate"; (4) a conjunction "*binds together* the parts of a sentence"; (5) an article (possibly also what would now be called a relative pronoun) serves to "*distinguish* the gender and number of nouns" (Diogenes Laertius 7.58). Thus the function of conjunctions and articles is purely syntactic, the semantic function of (proper) names is different from that of appellatives (or common names), and the appellative and the verb—the standard ingredients of the simplest kind of logicians' sentence—have one and the same kind of semantic function. The appellative occurring in a sentence signifies a subject and the verb a predicate or "something attachable (συστακτόν) to the one or more subjects."

Obviously the division between the accounts of language and of things signified was not exclusive, but the transition from the one account to the other as the Stoics conceived of them may be seen in the claim that all we utter (προφέρειν) is sounds, while what we express (λέγειν) is matters of discourse (πράγματα), or *lekta* —"expressibles" (Diogenes Laertius 7.57). It is the doctrine of the *lekton* around which the Stoics organized their account of things signified. In its novelty, importance, and difficulty that doctrine overshadows all the considerable remainder of their philosophy of language." (p. 757).

The rediscovery of Stoic logic

"The first reactions to the negative appraisal of Stoic philosophy have come not from historians or philosophers specializing in antiquity, but from logicians being interested in the development of ancient logic.

(...)

Now in addition to what has been said in connection with the nineteenth-century misinterpretations and misconceptions, let me quote another view about the specific reasons for the disappreciation as well as for the rehabilitation of Stoic logic; it is found in I. M. Bochenski's *Ancient Formal Logic* (Amsterdam, 1951), and it clearly portrays the difference in attitude of the logicians of the twentieth century towards the Stoic logical system:

Modern history of Logic had been started during the XIXth century, but its state was very bad at that time -- indeed until 1930 approximately -- because of two phenomena. On one hand, most of the historians of logic took for granted what Kant said on it; namely that 'formal logic was not able to advance a single step (since Aristotle) and is thus to all appearance a closed and complete body of doctrine'; consequently, there was, according to them, no history of logic at all, or at the most, a history of the decay of Aristotelian doctrines. On the other hand, authors writing during that period were not formal logicians and by 'logic' they mostly understood methodology, epistemology and ontology. . . . We may place the beginning of recent research in our domain in 1896 when Peirce made the discovery that the Megarians had the truth-value definition of implication. (pp. 4-5)

Now whether it is Peirce to whom we owe the revival of interest in Stoic logic or not, what certainly is the case is that, from the early decades of the twentieth century on, given the important developments in the field of symbolic logic, it has finally become obvious that Stoic logic differed essentially from Aristotelian logic and should be studied on its own merits. The articles and books on Stoic logic which since then have been published, have examined in detail the Stoic contribution to the development of a logical calculus:

J. Łukasiewicz, 'Zur Geschichte der Aussagenlogik', Erkenntnis, 5 (1935).

B. Mates, *Stoic Logic* (Berkeley, 1953).

M. Frede, *Die stoische Logik* (Gottingen, 1974).

M. Frede, 'Stoic vs. Aristotelian syllogistic', Archiv fur Geschichte der Philosophie, 56 (1974), 1-32." (pp. 15-17)

From: Katerina Ierodoakonou, "Introduction. The Study of Stoicism: Its Decline and its Revival", in: K. Ierodiakonou (ed.), *Topics in Stoic Philosophy*, Oxford: Clarendon Press 1999.

"Modern mathematical logic has taught us to distinguish within formal logic two basic disciplines, no less different from one another than arithmetic and geometry. These are, the logic of propositions and the logic of terms. The difference between the two consists in the fact that in the logic of propositions there appear, besides logical constants, only propositional variables, while in the logic of terms term variables occur.

The simplest way of making this difference clear is to examine the Stoic and the Peripatetic versions of the law of identity. To avoid misunderstanding let me at once say that, so far as our sources indicate, the two laws of identity were only incidentally formulated by the ancients, and in no way belong to the basic principles of either logic. The Stoic law of identity reads "if the first, then the first", and is to be found as a premiss in one of the inference-schemata cited by Sextus Empiricus. (1) The Peripatetic law of identity is "a belongs to all a", and is not mentioned by Aristotle, but can be inferred from a passage in Alexander's commentary on the Prior Analytics. (2) Using variable letters we can write the Stoic law of identity in the form "if p then p"; the Peripatetic law can be recast in the form "all a is a". In the first law the expression "if ... then" is a logical constant, and "p" a propositional variable; only propositions such as "it is day" can be

meaningfully substituted for "p". This substitution yields a special case of the Stoic law of identity: "if it is day, it is day". In the second law the expression "all ... is" is a logical constant, and "a" a term variable; "a" can be meaningfully replaced only by a term, and, in accordance with a tacit assumption of Aristotelian logic, only by a general term at that, such as "man" Upon substitution we get a special case of the Peripatetic law of identity: "all man is man". The Stoic law of identity is a thesis of the logic of propositions, whereas the Peripatetic law is a thesis of the logic of terms.

This fundamental difference between the logic of propositions and the logic of terms was unknown to any of the older historians of logic. It explains why there has been, up to the present day, no history of the logic of propositions, and, consequently, no correct picture of the history of formal logic as a whole. Indispensable as Prantl's 3) work is, even today, as a collection of sources and material, it has scarcely any value as an historical presentation of logical problems and theories. The history of logic must be written anew, and by an historian who has fully mastered mathematical logic. I shall in this short paper touch upon only three main points in the history of propositional logic. Firstly I wish to show that the Stoic dialectic, in contrast to the Aristotelian syllogistic, is the ancient form of propositional logic; and, accordingly, that the hitherto wholly misunderstood and wrongly judged accomplishments of the Stoics should be restored their due honour. Secondly I shall try to show, by means of several examples, that the Stoic propositional logic lived on and was further developed in medieval times, particularly in the theory of "consequences". Thirdly I think it important to establish something that does not seem to be commonly known even in Germany, namely that the founder of modern propositional logic is Gottlob Frege.

(...)

The fundamental difference between Stoic and Aristotelian logic does not lie in the fact that hypothetical and disjunctive propositions occur in Stoic dialectic, while in Aristotelian syllogistic only categorical propositions appear. Strictly speaking, hypothetical propositions can be found in Aristotle's syllogistic also, for each proper Aristotelian syllogism is an implication, and hence a

hypothetical proposition. For example, "If a belongs to all b and c belongs to all a, then c belongs to all b". (7) The main difference between the two ancient systems of logic lies rather in the fact that in the Stoic syllogisms the variables are propositional variables, while in Aristotle's they are term variables. This crucial difference is completely obliterated, however, if we translate the above-mentioned Stoic syllogism as Prantl does (I, p. 473):

If the first is, the second is

But the first is

Therefore the second is.

By adding to each variable the little word "is", which occurs nowhere in the ancient texts, Prantl, without knowing or wishing it, falsely converts Stoic propositional logic into a logic of terms. For in Prantl's schema only terms, not propositions, can be meaningfully substituted for "the first" and "the second". As far as we can judge from the fragmentary state of the Stoic dialectic that has come down to us, all Stoic inference-schemata contain, besides logical constants, only propositional variables. Stoic logic is therefore a logic of propositions. (8)" (pp. 197-200)

Notes

(1) Sextus, *Adv. Math*. VIII 292 (missing in Arnim): *ei to poton, to poton*. Good as H. von Arnim's collection is (*Stoicorum veterum fragmenta* [SVF], vol. II, Leipzig 1903), it does not begin to serve as source material for Stoic dialectic.

(2) Alexander, *In anal. pr*. comm., ed. Wallies, p. 34, 1. 19.

(7) Aristotle, *An. pr. II*. 11. 61b34

(8) I have defended this interpretation of the Stoic dialectic since 1923; see J. Łukasiewicz, "Philosophische Bemerkungen zu mehrwertigen Systemen des Aussagen-kalkuls", *Comptes rendus des séances de la Société des Sciences et des Lettres de Varsovie* 23 (1930), cl. III, pp. 51-77. ["Philosophical Remarks on Many-Valued Systems of Propositional. Logic", pp. 153-178 of this volume.] I rejoice in having found in H. Scholz, *Geschichte der Logik* (Berlin, 1931), p. 31, a supporter of this point of view.

From: Jan Łukasiewicz, "On the History of the Logic of Proposition" [1934], translated in: *Selected Works*, edited by Ludwik Borkowski, Amsterdam: North-Holland 1970, pp. 197-217 (Greek text omitted).

"I have compiled thus many quotations on purpose, for, although they illuminate one of the most important problems of logic, it nevertheless appears that many of them were either unknown to the historians of logic, or at least not sufficiently appreciated. The reason for this is in my opinion that the history of logic has thus far been treated by philosophers with insufficient training in logic. The older authors cannot be blamed for this, as a scientific logic has existed only for a few decades. The history of logic must be written anew, and by an historian who has a thorough command of modern mathematical logic. Valuable as Prantl's work is as a compilation of sources and materials, from a logical point of view it is practically worthless. To give only one illustration of this, Prantl, as well as all the later authors who have written about the logic of the Stoa, such as Zeller and Brochard, have entirely misunderstood this logic. For anybody familiar with mathematical logic it is self-evident that the Stoic dialectic is the ancient form of modern propositional logic. (26)

Propositional logic, which contains only propositional variables, is as distinct from the Aristotelian syllogistic, which operates only with name variables, as arithmetic is from geometry. The Stoic dialectic is not a development or supplementation of Aristotelian logic, but an achievement of equal rank with that of Aristotle. In view of this it seems only fair to demand of an historian of logic that he know something about logic. Nowadays it does not suffice to be merely a philosopher in order to voice one's opinion on logic.

Notes

(26) I have already expressed this idea, in 1923, in a paper read to the first congress of Polish philosophers in Lwow. A short summary of it appeared in *Przeglqd Filozoficzny* 30 (1927), p. 278. [Łukasiewicz develops his historical analysis of Stoic logic in his article "On the History of the Logic of Propositions" (pp. 197-217 of this book).]" (p. 178)

From: Jan Łukasiewicz, "Philosophical Remarks on Many-Valued Systems of Propositional Calculus" [1930], translated in: *Selected*

Works, edited by Ludwik Borkowski, Amsterdam: North-Holland 1970, pp. 153-178.

"In the first comprehensive history of western logic Prantl (1) described Stoic logic as "dull," "trivial," and "pedantic." Prantl's dismissal of Stoic logic was accepted by most interpreters of Stoicism for three quarters of a century. However, since the publication of Łukasiewicz's article, "*On the History of the Logic of Propositions*" in 1934, (2) Prantl's evaluation has been largely abandoned. Bochenski's remark, "The development of formal logic in antiquity reached its peak in the works of the thinkers belonging to the Megaric and Stoic Schools," exemplifies well the radical rehabilitation of the Stoics as logicians. (3) The cause of this rehabilitation is not the discovery of new texts, but rather the twentieth-century revolution in the subject of logic itself. Łukasiewicz and others, working with a full understanding of modern logic, have succeeded in retrieving from the ancient texts a Stoic logical theory of startling originality which rivals the achievement of Aristotle, the founder of logic. The failure of Prantl and his successors to accomplish this retrieval stems not from their obtuseness or stupidity but from the fact that the background scientific knowledge needed to understand the Stoic achievement was not available to them.

A factor contributing to Prantl's low opinion of Stoic logic was the character of the ancient texts themselves. There are no primary sources for Stoic logic analogous to Aristotle's Prior Analytics, and the ancient secondary sources are brief and usually hostile in their treatment of the subject. In many cases Prantl's evaluations simply repeat or develop remarks in the sources themselves. The unsatisfactoriness of the sources (on this see Mates, *Stoic Logic* 8-10) makes any but a tentative reconstruction of Stoic logic impossible. Unless an indication is given to the contrary, what I describe will be the most certain features of the theory.

One of the uncertain features is chronology. The history of Stoicism proper covers five centuries during which the logical theory, like other doctrines of the school, underwent modification and development. In the case of logic we know of some disagreements within the school and some ideas that can be ascribed to individuals,

but most of our sources refer simply to "the Stoics," as if there were a single, unambiguous Stoic logical theory. Commentators have tended to assign the major Stoic achievements in logic to Chrysippus (c. 280 B.C .- c. 206 B.C.), the third leader of the Stoa, of whom it was said, "If there were a dialectic among the gods, it would be none other than the Chrysippean one." (Diogenes Laertius 7.180. At 7.198 Diogenes mentions that Chrysippus wrote 311 books on logical matters.) In general I shall not attempt to assign logical doctrines to specific persons, but simply speak of "Stoic logic." Occasionally, however, it will be necessary to refer to possible disagreements within the school." (pp. 1-2)

From: Ian Mueller, "An Introduction to Stoic Logic", in: John M. Rist (ed.), *The Stoics*, Berkeley: University of California Press 1978, pp. 1-26.

"Zeno, the founder of the Stoic school of philosophy, is said to have been influenced primarily by two of the Socratic schools, the Cynics and the Megarians. (*) From the Cynics, according to the usual account, he took his moral teaching; from the Megarians, his logic. In view of our present subject, we shall omit all discussion of the Cynics and devote our attention to the Megarians.

The Megarian school was founded by Euclid, a follower of Socrates and a somewhat older contemporary of Plato. (See fig. 1.)

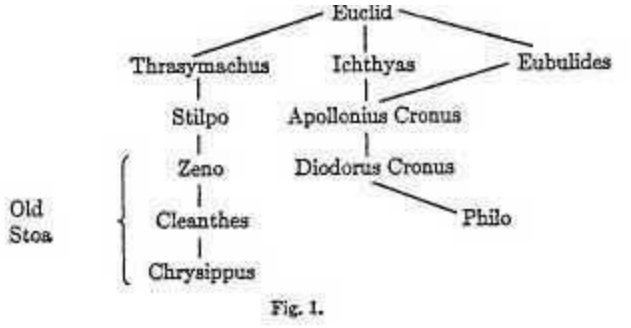

Fig. 1.

Among the pupils of Euclid were: Eubulides, a famous logician to whom the antinomy of The Liar is sometimes ascribed; Ichthyas, the successor of Euclid as head of the school; and Thrasymachus of Corinth, who is known primarily as the teacher of Stilpo. Stilpo, a contemporary of Aristotle, enjoyed a great reputation as a lecturer. He is supposed to have been somewhat influenced by the Cynics. His most famous pupil was Zeno, founder of Stoicism. Another important branch of the Megarian school consisted of Eubulides, Apollonius Cronus, Diodorus Cronus, and Philo, in that order. The latter two are very important in connection with Stoic logic, mainly for their views on the truth-conditions of conditionals.

Diodorus, a native of lasus in Caria, lived at the court of Alexandria in the reign of Ptolemy Soter. His surname or nickname "Cronus" ("old fool") is variously explained. According to one story, it was given to him by Ptolemy on account of his inability to solve a problem of logic put forth by Stilpo at a royal banquet. In fact, Diodorus is said to have taken his defeat so much to heart that he went home, wrote a treatise on the subject, and died in despair. According to another account, Diodorus took the surname from his teacher, Apollonius Cronus. At any rate, Diodorus was certainly not regarded as an old fool in antiquity. On the contrary, he was so celebrated for his dialectical skill that he was called "the logician" and "most logical one". This epithet gradually became a surname, and was even applied to his five daughters, who were also distinguished as logicians.

Little is known of the philosophy of Diodorus save two important definitions (and examples illustrating these): (1) a proposition is possible if and only if it either is true or will be true; (2) a conditional proposition is true if and only if it neither is nor was possible for the antecedent to be true and the consequent false. It is known that he

constructed the famous "Master" argument (*kurieuon logos*) to justify his definition of "possible." It is also known that he entered into a controversy with his pupil Philo over the truth-conditions for hypothetical propositions; this controversy was perpetuated and enlarged within the Stoic school.(**)

Philo of Megara, the pupil of Diodorus, was also very famous as a logician. Almost nothing is reported of his life except that he was a friend of Zeno. Chrysippus later wrote treatises against both him and his master. Philo disagreed with Diodorus concerning the nature of possibility and especially concerning the criterion for the truth of conditional propositions. Regarding the first, he thought (as against Diodorus) that a piece of wood at the bottom of the sea should be considered combustible even if it will never be burned. In regard to conditionals, he gave exactly the modern truth-table definition: a conditional is false if it has a true antecedent and a false consequent; in the other three cases it is true.

Zeno himself apparently lived ca. 350-260 B.C., but the dates are very uncertain. Like all the other major Stoic philosophers before the Christian era, he was not a native of Greece proper. (His birthplace was at Citium, in Rhodes.) Few facts are known about him, but where the facts leave off, legend begins. It is said that he was greatly respected for his personal characteristics dignity, modesty, sincerity, affability. Presumably because of a life of moderation, he lived to the ripe old age of ninety-eight, and, as the story has it, he died in the following way. As he was leaving the school one day, he stumbled and broke his toe. Beating his hand upon the ground, he addressed himself to the gods: "I'm coming of my own accord. Why then do you bother to call me?" Then he perished by holding his breath.

Also according to the legends, Zeno devoted much thought and energy to proposed reforms in language. This aroused ire in certain quarters, and it was pointed out that he was proposing to reform a language which he himself could hardly speak. As he was fond of coining new words, much of the technical vocabulary of Stoic logic may well be attributed to him. It was said that he used new terms in order to conceal his plagiarism of the views of his predecessors; Cicero repeats this charge at least fourteen times. His writings, which

were not numerous and were written in a very poor style, have been lost (excepting, of course, a few fragments).

The second head of the Stoic school was Cleanthes, known throughout antiquity as a man of strong character, great energy, and weak intellect. According to one story, he was a prize fighter who came to Athens with four drachmas in his pocket and entered the school of Zeno. He accepted Zeno's teaching in every detail and passed it on unchanged. At the age of ninety-nine or so, he died by starving himself to death.

Cleanthes was succeeded by Chrysippus, often said to have been the greatest logician of ancient times. Chrysippus was regarded as the second founder of Stoicism; according to an old saying, "If there had been no Chrysippus, there would have been no Stoa." He was born in 280 B.C. in Cilicia; the date of his death may be conjectured as 205 B.C. Without doubt, he was the best student his Stoic professors ever had. While in training, he thought of so many skeptical arguments against Stoicism that he was accused by the later Stoics of supplying Carneades with ammunition for attacking them. Chrysippus wrote 750 books, if the list given by Diogenes can be trusted. Of these we possess only the titles and a small number of fragments. But the titles alone show that he wrote on almost every important aspect of propositional logic. There are many ancient complaints that Chrysippus' books were dry and repetitious, and written in a very poor style. Yet they were widely read. He did not, like Cleanthes, merely repeat the words of his predecessors; there is a story that when he was a student of logic he wrote to Cleanthes, "Just send me the theorems. I'll find the proofs for myself."

It seems likely that Chrysippus was responsible for the final organization of Stoic logic into a calculus. When the five basic undemonstrated argument-types are cited, the name of Chrysippus is usually mentioned; in one place it is expressly stated that Chrysippus restricted the number of these types to five." (pp. 5-7)

From: Benson Mates, *Stoic Logic*, Berkeley: University of California Press 1953.

Summary of Benson Mates, Stoic Logic (1953)

Chapter I. *Introduction*: "The aim of this study is to present a true description of the logic of the Old Stoa. It repeats most of Łukasiewicz's published conclusions on the subject and offers additional evidence for them. It also (1) describes the Stoic semantical theory and compares it with certain similar modern theories, (2) attempts to give a better account of the heretofore misunderstood Diodorean implication, (3) points out the Stoic version of the conditionalization principle, and (4) discusses the contention of the Stoics that their propositional logic was complete. In appendices it offers and justifies new translations of some important fragments pertaining to Stoic logic. The Stoic authors in whose work we shall be interested primarily are Zeno, Cleanthes, and Chrysippus. Closely associated with them were Diodorus Cronus and Philo, of the Megarian school. Since the writings of these men have been lost, and since our sources usually do not distinguish between the views of the various Stoics, we are forced to treat the entire Old Stoa as a unit. This, of course, creates many difficulties. The best of our sources are Sextus Empiricus and Diocles Magnes (*apud* Diogenes Laertius). We also derive bits of information from Cicero, Gellius, Galen, Boethius, Apuleius, Alexander of Aphrodisias, Simplicius, Philoponus, Origen, Proclus, Stobaeus, Epictetus, Seneca, and a few others. Of these, only Epictetus and Seneca were favorably inclined toward Stoicism, and they, unfortunately, restricted their attention almost entirely to ethics. It is thus remarkable that the fragments of Stoic logic, transmitted by unsympathetic hands, are as clear and consistent as they are." (p. 1)

Chapter II. *Signs, sense, and denotation*: "The Chapter is divided into two sections. The first contains an account of the Stoic

distinction between the sign, the significate (called the "Lekton"), and the physical object to which the sign refers. Various types of signs and their corresponding Lekta are described in detail. In the second section the Stoic theory is compared with the modern theories of Frege and Carnap and is shown to bear marked resemblance to them, particularly in regard to what Carnap calls the "intension" of linguistic expressions. Numerous dissimilarities are also indicated, the most important of which are: (1) the Stoics restricted the denotation of expressions to bodies; (2) the Stoics did not take truth-values as the denotations of sentences." (p. 11)

Chapter III. *Propositions, truth, and necessity*: "This Chapter is divided into three sections. The first defines and classifies propositions and discusses their fundamental properties. A proposition is said to be "a complete Lekton assertoric in itself." Its most basic property is that of being true or false and not both. Propositions are classified as atomic and molecular; each of these classes in turn is divided into several subclasses. The absence from Stoic logic of examples beginning with "all" is noted. In the second section, the many Stoic usages of the words "truth" and "true" are taken up *seriatim*. All these usages are definable in terms of the usage referring to propositions. The third section deals with Stoic notions of necessity and possibility, as found in the fragments of certain (Megarian) philosophers to whom the notions were originally due. It is shown that a reference to time plays a very important role in Diodorus' view of possibility. (This is closely connected with his position in the controversy over implication, to be discussed in chap. IV.) A brief account of what is known of the famous "Master" argument of Diodorus is included, together with a few remarks on the views of Philo and Chrysippus regarding possibility." (p. 27)

Chapter IV. *Propositional connectives*: "The Stoics gave truth-functional definitions of all the more important propositional connectives, and defined also some non-truth-functional connectives. These definitions, and the various controversies over them, form the subject matter of the present chapter. The first section, on implication, contains an account of the four-sided argument over the truth-conditions for hypothetical propositions. It is shown that Philo's type of implication was exactly the same as the modern "material implication." Diodorean implication is defined and

distinguished from Chrysippean implication, which is the ancient equivalent of what is now called "strict implication." The connection between Diodorus' views on implication and on necessity is shown. In. the second section we are concerned with disjunction. The Stoics distinguished between inclusive and exclusive disjunction, gave truth-functional definitions of both types and also a non-truth-functional definition of the latter type. The third section considers conjunction, along with several other connectives. In the fourth section, we see how implication was defined in terms of conjunction and negation; also, how exclusive disjunction was defined in terms of negation and equivalence. Certain. difficulties in the evidence for these definitions are pointed out." (p. 42)

Chapter V. *Arguments*: "This Chapter consists of five sections. In the first, "argument" is defined as "a system of propositions composed of premises and a conclusion." A valid argument, according to the Stoics, is an argument such that the negation of its conclusion is incompatible with the conjunction of its premises. A true argument is a valid argument which has true premises, and a demonstration is a special kind of true argument. Another subclass of the valid arguments contains the so-called "undemonstrated" arguments; of these, five types were called "simple" and the innumerable others were called "non-simple," or "derived." To achieve generality in their discussions of propositional logic the Stoics made use of inference-schemas containing the numerals "first," "second," and so on as propositional variables. The second section contains an exposition of the five basic undemonstrated argument-types, as they are described in some twelve sources. The third section discusses an important Stoic principle which is closely related to the so-called "deduction theorem." In the fourth section is an account of the Stoic method of deriving non-simple undemonstrated arguments from simple ones; examples are considered in detail. Note is taken of the assertion of the Stoics that their propositional logic was complete. The fifth section describes the Stoic classification of invalid arguments and also considers briefly the famous paradox of The Liar, which was the subject of much Stoic writing. The classification is found to be poor, but the Stoic version of The Liar is stronger than the usual Epimenides paradox." (p. 58)

Chapter VI. *Evaluations of Stoic logic*: "In this concluding chapter we consider the traditional evaluations of Stoic logic, together with some of the confusions upon which they are based. The first section concerns some typical adverse criticisms by Prantl and Zeller. Unfortunately, these cannot be challenged by attacking the relevance or accuracy of the evidence for them, since there is no evidence for them. But it is apparent that Prantl and Zeller did not understand Stoic logic. The second section discusses the great confusion which exists in regard to the meaning of the technical term *sunemménon*. Third, there is a short conclusion." (p. 86)

Appendix A. *Translations*: "This Appendix consists of translations of some of the fragments which comprise our sources for Stoic logic. I have included only the fragments upon which relatively important sections of this study rest, and, of these, only passages which have not already been adequately translated into English." (p. 95)

Appendix B. *Glossary*: "This Glossary is not intended to be a complete list of the technical terms in Stoic logic. It includes only terms that appear in a sufficient number of contexts to establish their technical usage. Further, only a few of the more important occurrences of each term are cited. Usually these will include a definition or at least a passage of relatively clear meaning. Other glossaries of Stoic terminology are as follows:

R. G. Bury, *Sextus Empiricus*, volume 3. This glossary is almost worthless in regard to logical terminology.

I. M. Bochefiski, *Elementa Logicae Graecae*, pp. 99 ff. (Greek-Latin). Good.

J. W. Stakelum, *Galen and the Logic of Propositions*, pp. 92-93 (Greek-English). Good.

See also the *Index Verborum* in volume 4 of *Stoicorum Veterum Fragmenta*. Most of the Aristotelian commentators are well indexed, but unfortunately the indices for Sextus are very incomplete, and there are none for Diogenes Laertius." (p. 132)

From: Benson Mates, *Stoic Logic*, Berkeley: University of California Press 1953.

Sources for Stoic Logic

"Except for a few fragments, all the writings of the earlier Stoics have been lost. We must therefore depend on secondary sources. But that is only half of the difficulty. Since none of the later Stoics had much to say about logic, we are in the very unsatisfactory position of having to depend on the accounts of men who were without exception opponents of the Stoics. In view of this, it is all the more remarkable that Stoic logic makes as excellent a showing as it does. Perhaps the saving circumstance was that the essentials of Stoic logic were brought together in handbooks not long after the time of Chrysippus. Such handbooks were commonly entitled "Introduction to Logic" (*eisagogé dialektiké*), and evidently had a very wide circulation. Whatever accuracy and sense remain in the bits of Stoic logic which have filtered down to us probably derive from the fact that our sources made use of the handbooks.

The difficulties created by the loss of the Stoic writings are even greater than might at first appear. Since our sources do not distinguish between the views of the various Stoics but rather tend to ascribe the sayings of any of them to all of them, we must treat the school as a whole, even though we know that this procedure will lead to apparent inconsistencies. Also, it is obvious that technical writings such as those on logic suffer from being reported at second hand; of all our sources, Sextus is the only one who seems to have had some understanding of the theory he was reporting. Another serious difficulty arises from the fact that our best sources are at least four hundred years later than Chrysippus. By this time the mixture and confusion of Stoic logic with that of Aristotle were well under way, producing strange conglomerates like that found in Galen's *Institutio Logica*. Since we do not possess the information necessary for disentangling the two doctrines, we can only make the best of it.

Far and away our most important source for Stoic logic is Sextus Empiricus, a Greek physician and Skeptic, who lived in the first half of the third century of the Christian era. Almost nothing is known of his life. Two of his works are extant, the *Outlines of Pyrrhonism*, in three books, and *Against the Mathematicians*, in eleven books. Most of his discussion of Stoic logic is to be found in Book II of the *Outlines* and Book VIII of *Against the Mathematicians*; the accounts

given in these two places are often identical. Sextus is our only intelligent source. But even with him there is a fly in the ointment: he quotes the Stoics only to refute them. We may expect, therefore, that any parts of Stoic logic which he found either too difficult or too good to refute will be absent from his account. Also, he emphasized those matters on which Stoic opinions differed, with the result that we get no clear statement of the logical doctrine of any one man.

The next best picture of Stoic logic is that given by Diogenes Laertius, author of *Lives of Eminent Philosophers*. There is no information whatever on his own life, but since Sextus and Saturninus are the latest writers he quotes, it is sometimes guessed that he lived in the third century of the Christian era. As is well known, Diogenes is wholly unreliable on many subjects. It is therefore fortunate for us that in writing his life of Zeno (Book VII) Diogenes had recourse to a book written by Diodes Magnes, a scholar of the first century B.C., who seems to have had a fair knowledge of Stoic logic. The most serious deficiency of Diogenes' account is its extreme brevity; what there is of it is as excellent as anything to be found in Sextus.

All our other sources for Stoic logic are relatively unsatisfactory. Scattered references to the Stoa will be found throughout the twenty volumes of Galen's works,(8) but discussions of any extent are rare. The little treatise called *Historia Philosopha* contains the remains of a good account of the five basic undemonstrated argument-types. However, it has been necessary for editors to reconstruct the text on the analogy of corresponding passages in Sextus; consequently it has little independent value. There is also the handbook, *Institutio Logica*, ascribed to Galen by the manuscripts. Prantl has vehemently challenged its authenticity; Kalbfleisch has "proved" it genuine with equal vigor.(9) In any case, the treatise is of considerable interest to historians of logic. Although it is a mixture of Aristotelian and Stoic logic, its account of the five basic types of argument is clear and agrees exactly with our other information. Its criticism of these, however, is typically Peripatetic and typically confused. The treatise contains a few further hints about the views of the Stoics, but nothing else of value for our purpose.

Other scraps of information are to be found in the writings of Cicero, Gellius, and the many Aristotelian commentators.(10) Most of these

scraps fit consistently into the picture, but they are too brief to be of much help.

The work of the later Aristotelian commentators reveals extreme confusion between Stoic and Aristotelian logic, and hence is of very little use as a source.

All our sources have one characteristic in common: the more interesting the logic becomes, the more corrupt the text becomes. Because of the technical terminology and the very unusual sentences with which the Stoics sometimes illustrated their points, the origin of these textual difficulties is understandable -- but the difficulties remain. Especially is this noticeable in Galen's *Institutio Logic*a, where occasionally the whole thread of argument is lost.

In view of all these difficulties, the reader may well wonder whether there is enough evidence to justify the attempt to give a complete account of Stoic logic. He may answer this question for himself by reading the following chapters and, if he is interested, by checking the exposition against the Stoic passages which are cited. He will find that no effort has been made to conceal or minimize evidence contrary to the various theses proposed; the price exacted by this procedure is that the account is not always as simple and clear as one might desire." (pp. 8-10)

Notes

(8) The best exegetical study of the logic of Galen is by Stakelum, *Galen and the Logic of Propositions* [1940]. See especially the summary, pp. 90-91. [*cited below*]

(9) Prantl, *Geschichte der Logik im Abendlande*, [1855] pp. 591-610; Kalbfieisch, "Ueber Galens Einleitung in die Logik," [1897] pp. 681-708.

(10) The relevant writings of these authors are listed in the Bibliography. An excellent critical discussion of Apuleius, Alexander of Aphrodisias, Sextus, Diogenes Laertius, Themistius, Boethius, Ammonius, Simplicius, and Philoponus as sources of information about ancient logic may be found in Bochenski, *La Logique de Théophraste*, [1947] chap. I.

From: Benson Mates, *Stoic Logic*, Berkeley: University of California Press 1953.

"Conclusion.

It is evident from the *Introduction to Dialectic* that Galen was perfectly familiar with Stoic formal logic. It is equally evident that he was not a Stoic. Because he began his studies in the Stoic school, his terminology was Stoic, and the powerful Stoic influence of his period confirmed him in Stoic usage. His strong formalistic tendency also manifests his Stoic training. His later profession of Aristotelianism, however, becomes certain in his Peripatetic interpretation of Stoic propositions.

Galen presents exactly the forms of Stoic compound propositions, which he calls "hypothetical"; but his explanation are not Stoical, because he follows the Peripatetic practice of examining the matter of the propositions; instead of the Stoic custom of considering only the conjunctions. To the traditional Chrysippian propositions he adds the disjunctive and the not-excluding alternative propositions. His *Introduction* is also one of the earliest sources for the doctrine on equivalence and conversion of compound propositions.

Although his interpretation of Stoic propositions is not strictly formal, Galen's presentation of the hypothetical syllogisms is in accord with the most rigid Stoic formalism. He clearly explains the unfamiliar Stoic terminology pertinent to syllogisms, and he accepts four of the five traditional indemonstrable formulae. These he supplements with the disjunctive and the not-excIuding alternative syllogisms. He completes the treatment of the Stoic syllogism with his extraordinary doctrine on the conversion of hypothetical syllogisms.

Galen's teaching on the logic of propositions is a complete record of the state of Stoic logic in the second century. He not only summarizes the doctrine of the centuries immediately preceding but indicates the direction actually followed by subsequent logicians. His tendency to interpret Stoic Logic according to Peripatetic principles finds its culmination in classical logic. As this tendency so to interpret Stoic logic became more and more pronounced, the logic of the Stoa declined more and more until, having eventually lost its

distinctiveness as a branch of dialectics, it was completely absorbed into Peripatetic logic. He proves himself beyond all doubt an independent thinker and not a mere compiler, for the logic of propositions comes from his hands colored by the touch of his originality. The study of this elementary logical treatise makes us strongly desire to know some of more extensive works of Galen, the great logician, who has given us *The Introduction to Dialectic*." (pp. 90-91)

From: James W. Stakelum, *Galen and the Logic of Propositions*, Romae: Angelicum, 1940.

Ancient theories of meaning

"There were three ancient theories of meaning:

(1) According to the Peripatetics, words mean thoughts, and thoughts stand for things.

(2) According to the Epicureans, words directly mean things.

(3) According to the Stoics, words mean sayables, (1) and sayables stand for things.

The Stoics agree with the Peripatetics and disagree with the Epicureans in maintaining that a semantic theory must be three-tiered. The Stoics disagree with the Peripatetics insofar as the intermediate items in their three-tiered theory are sayables and not thoughts.

Thus far, mere caricature: each of the theories I have sketched requires further elucidation; and each of the sketches would be regarded as wildly inaccurate by some scholars. I shall not attempt to replace the caricatures by professional portraits; rather, I want to address one particular problem which the caricatures raise. If the Peripatetic and Stoic theories differ insofar as thoughts differ from sayables, then -- we may well wonder -- what exactly is the difference between sayables and thoughts, and how is Stoic saying related to Stoic thinking?

Several scholars, both ancient and modern, have denied that there is any substantive difference between the Peripatetic and the Stoic theories of meaning on the grounds that sayables are simply

thoughts under a different name. Thus according to Simplicius, some people held that

the argument in the Categories is about thoughts *(peri noematon);* for Aristotle plainly says that it is about things which are said *(peri ton legomenon),* and things which are said, or sayables, are thoughts, as the Stoics too held. (*in Cat*. 10.2-4 = *FDS* 703) (2)

More recently it has been maintained that a sayable is "that which is merely an expressed thought"; for sayables "exist only insofar as they are thought and expressed in words. As ideas in the mind ... the *lekta* ... should be interpreted ... as something ... akin to the ideas of, for instance, classical British empiricism -- as a kind of mental images which precede and accompany our words and give them meaning" (3)

A weaker thesis has also found favour: sayables are not to be identified with thoughts, but they are logically dependent upon the activity of thinking. For "every species of *lekton* requires the utterance of some expressible object present to the mind. Does this entail that*lekta* only persist as long as the sentences which express them? ... there is no evidence to show that *lekta*, as distinct from the speaker and his reference, persist outside acts of thought and communication". (4)

These theses about sayables and thoughts are not mere conjectures. For there are several ancient texts which associate sayables with thoughts, and these texts have been taken to support either the strong view that sayables actually are thoughts or the weaker view that sayables are parasitic upon thoughts.

The issues are complicated, both from a philosophical and from an exegetical point of view. I shall first make a few abstract remarks; then look at the Peripatetic theory of meaning; and finally turn to the texts which associate thoughts with sayables." (pp. 47-48)

Notes

(1) I use the unlovely word "sayable" for the Greek *lekton*. I take it that *lekta* stand to saying as thoughts stand to thinking; but no decent English word stands to "say" as "thought" stands to "think".

(2) Note that Simplicius does not subscribe to this view of *lekta* (pace Long [1971] 80): he ascribes it to unnamed interpreters of Aristotle's *Categories*, and at e.g. *in Cat*. 397.10-12 he implicitly distinguishes*lekta* from *dianoemata*.

The Stoic classification of arguments

"In Sextus Empiricus' *Outlines of Pyrrhonism* (6) one finds the following Stoic definitions of the expressions 'premises', 'conclusion', and 'argument'

(i) 'premises': the propositions assumed for the establishment of the conclusion,

(ii) 'conclusion': the proposition which is established by the premises (7),

(iii) 'argument': a whole composed of premises and a conclusion.

In terms of these definitions the questions I shall be attempting to answer are: for the Stoics what are the conditions under which the premises in an argument logically imply its conclusion? And, if the premises of an argument in fact imply its conclusion but not evidently so, how according to the Stoics may this relation of logical consequence be made evident? Before dealing with these questions, however, I present several classifications of Stoic arguments (see the outline of these classifications below).

The first division of the first classification of arguments is into valid and invalid arguments. An argument is valid "when the conditional having as its antecedent the conjunction formed from the premises of the argument and as its consequent the conclusion of the argument is true" (*P.H*. ii.137). An example of a valid argument is

(1) If it is day, it is light. It is day.

Therefore it is light.

Arguments which do not satisfy this condition are invalid.

Next valid arguments are divided into those which are true and those which are not true. A true valid argument is one of which both the conclusion and the premises are true (*P.H.* ii.138). An example of a true valid argument is (1) above when set forth during the day. Arguments which do not satisfy this condition are not true. An example of a not-true argument is the following when made during the day:

(2) If it is night, it is dark.

It is night.

Therefore it is dark.

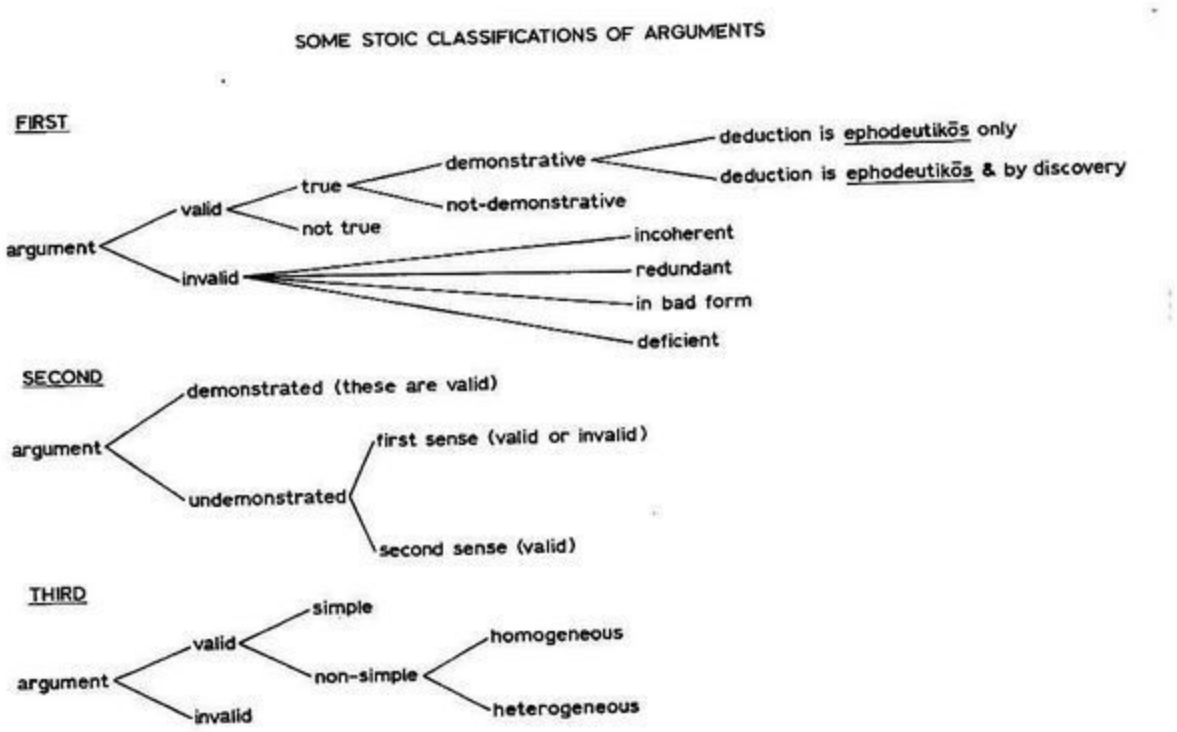
Of true valid arguments some are demonstrative and some are not demonstrative. Demonstrative arguments are "those which conclude something non-evident through pre-evident premises".(8) An example of a demonstrative true valid argument, preserved by Sextus (*P.H.* ii.140), is

(3) If sweat flows through the surface of the skin, there exist imperceptible pores.

Sweat flows through the surface of the skin.

Therefore there exist imperceptible pores.

An argument not satisfying this condition is not demonstrative. Argument (1) is an example of an argument which is valid, true when set forth during the day, and not demonstrative. It will be shown subsequently that there was another kind of argument called undemonstrated, which provides an additional important category of arguments. It is not to be confused with a not-demonstrative argument.



Of demonstrative true valid arguments "some lead us through the premises to the conclusion *ephodeutikos* only" (*P.H.* ii.141). I am not sure precisely what '*ephodeutikos*' means. Etymologically the word suggests 'advancing over a path towards something' and when the expression attaches to the word 'argument' a reasonable candidate

for the 'something' would be the conclusion of the argument. But 'advancing over a path towards a conclusion' is a metaphorical description of arguments generally and it fails to bring out what is peculiar to the type of argument to which the label is here attached. I simply transliterate the expression. A kind of this type argument is said to be one which "depends upon belief and memory". One might well ask, 'What kind of argument doesn't?' An example of an argument which depends on belief and memory is

(4) If someone said to you that this man would be wealthy, this man will be wealthy.

This god said to you that this man would be wealthy. Therefore this man will be wealthy.

Sextus' comment on this argument is that we "assent to the conclusion not so much on account of the necessity of the premises as because we believe the assertion of the god" (*P.H.* ii.141-142).

Contrasted with this type argument are those which "lead us to the conclusion not only *ephodeutikeis* but also by way of discovery" (*P.H.* ii.142). An example of such an argument is (3). The element of discovery in this argument is the disclosure of the existence of pores through the fact that sweat flows through the surface of the skin. The element of belief in the argument, apparently sufficient to provide the *ephodeutikeis* component, is the "prior assumption that moisture cannot flow through a solid body" (*P.H.* ii.142).

The components of a 'demonstration' may be derived from one component of each division in this first classification, for a demonstration is a valid and true argument having a non-evident conclusion and disclosing that conclusion by the power of the premises (*P.H.* ii.143). I am uncertain as to the point of the last clause in Sextus' report. It appears to imply that the conclusion is obtained without the aid of assumptions external to the premises of the argument, although this would involve the existence of a class of demonstrative arguments different from those which are *ephodeutikeis*.

A second Stoic classification of arguments is also reported by Sextus, and it, too, ought to be kept in mind when thinking about deduction in Stoic logic. This classification begins from a division of arguments into demonstrated and undemonstrated. I take a demonstrated argument in this context to be one whose validity has been made evident. I say more subsequently about how the validity of arguments is made evident. An argument is undemonstrated in one of two senses. The first sense is the contradictory of that of 'demonstrated'. In this sense, then, an argument is undemonstrated if it has not been demonstrated (*Adv. Math.* viii.223), i.e., on my interpretation, if it has not been shown to be valid. In a second sense an argument is undemonstrated if it is immediately evident that it is valid (ibid.). This distinction may be brought out by noticing that the first sense is temporal inasmuch as an argument which is undemonstrated in that sense in 100 B.C. may be demonstrated in 50 B.C., while the second sense is non-temporal.(9) An argument is undemonstrated in this second sense if it exhibits one of five forms of argument which are referred to respectively as the first undemonstrated, the second undemonstrated, etc. These forms are also called inference schemata, and I have more to say about them

below. For now I merely give the forms with illustrative examples (Gould, *The Philosophy of Chrysippus*, pp. 83-85):

The first undemonstrated

(5) If the first, the second.

The first.

Therefore the second.

If it is day, there is light.

It is day.

Therefore there is light.

The second undemonstrated

(6) If the first, the second.

Not the second.

Therefore not the first.

If it is day, there is light.

There is not light.

Therefore it is not day.

The third undemonstrated

(7) Not both the first and the second.

The first.

Therefore not the second.

Not both it is day and it is night.

It is day.

Therefore it is not night.

The fourth undemonstrated

(8) Either the first or the second.

The first.

Therefore not the second.

Either it is day or it is night.

It is day.

Therefore it is not night.

The fifth undemonstrated

(9) Either the first or the second.

Not the first.

Therefore the second.

Either it is day or it is night.

It is not day.

Therefore it is night.

A third classification divides valid arguments first into simple and non-simple (*Adv. Math.* viii.228). A simple valid argument is one having the form of one of the five undemonstrated argument forms. A non-simple valid argument is one 'woven together' out of simple valid arguments in order that it may be known to be 'valid' (*Adv. Math.* viii.229). There are two kinds of non-simple arguments, one formed from two or more simple arguments all of the same form, and the other composed from two or more simple arguments not of the same form. The former is a homogeneous non-simple and the latter, a heterogeneous non-simple argument (*ibid.*). An example of a homogeneous non-simple argument is

(10) If it is day, then if it is day it is light.

It is day.

Therefore it is light.

For upon analysis it may be seen to have been compounded from two simple arguments having the form of the first undemonstrated. Analysis of this argument is carried out in accordance with the following 'dialectical theorem' :

(11) Whenever we have premises from which a certain conclusion can be validly deduced, potentially we have also that conclusion among

the premises, even if it is not stated explicitly.(10)

One analyzes (10) by drawing the conclusion from the first two premises in accordance with the first undemonstrated inference schema, thus getting

(12) If it is day, then if it is day it is light.

It is day.

Therefore if it is day, it is light.

Then by the theorem stated in (11) one gets as premises

(13) If it is day, then if it is day it is light.

It is day.

If it is day, it is light.

And by another application of the first inference schema one gets the conclusion in (10)." (pp. 152-157)

Notes

(6) ii.135-136. This work will be referred to in the remainder of the paper as *P.H.*

(7) Thomas has rightly pointed out that the intent here must have been something like "the proposition which is allegedly established by the premises". Otherwise every conclusion would be the conclusion of a valid argument.

(8) *P.H.* ii.140. Sextus reports (*P.H.* ii.97-98) that the 'dogmatists' distinguished three kinds of non-evident objects. Some are absolutely non-evident; these are those which are not of the sort to fall under our apprehension, e.g., that the stars are even in number. Some are on occasion non-evident; these are of a sort to be evident but are made non-evident on occasion by external circumstances, e.g., as a city in which I am not present now is to me. Finally, some are naturally non-evident; these are naturally incapable of falling under our clear apprehension, e.g., that there are imperceptible pores.

(9) I am indebted to John Corcoran for having suggested to me this feature of the distinction.

(10) *Adv. Math*. viii.231. I discuss this theorem below (p. 18) in conjunction with other Stoic rules of inference.

The Stoic Doctrine of *Lekta* (Sayables)

The place of the doctrine of lekta in the Stoic dialectic

SVF = Hans von Arnim, *Stoicorum Veterum Fragmenta*, Lipsia 1903-1905 (the standard collection of the Fragments of ancient Stoics).

"In moving from the theory of knowledge to the other topics which the Stoics include within the third branch of their philosophy, it must be noted that they draw a sharp distinction between logic and language. All the remaining topics can be grouped either on one side of this distinction or the other. The Stoics define language as utterance. Language is sound. It is corporeal, material, and sensible. (135) Hence, language is part of the world of real being. Words, real beings themselves, are natural signs of natural objects. Logic, on the other hand, falls within the category of the incorporeals. Logical statements are *lekta*. (136) They have meaning, but since they are not corporeal, they do not have full being. They exist only intramentally. The *lekta* include predicates, arguments, syllogisms, and fallacies. They are not natural signs of natural objects.

This classification of logical statements as *lekta* has important implications for the way in which the Stoics handle dialectic, or logic as a formal branch of philosophical investigation.(137) Their logic is propositional. The variables in Stoic syllogisms are propositions, in contrast to the variables in Aristotelian syllogisms, which tend to be terms and classes. The Stoics are sensitive to the grammatical precision of their logical propositions; they elaborate a more precise

way of expressing negation than had been used hitherto, prefixing a negative word to the entire proposition and not just to the verb. Thus, instead of saying "It is not day," they say "Not: it is day." While less idiomatic, this is a more unambiguous way of specifying what is being negated, similar to the usage "Not-p" in modern symbolic logic. Indeed, the technical ingenuity of Stoic logic is considerable, resulting in a number of ideas which had been neglected in Aristotle's logic.

Since *lekta* are not natural signs of natural objects, the Stoic preference in logic is for hypothetical syllogisms.(138) Unlike the categorical, deductive, or inductive syllogisms used by Aristotle, the hypothetical syllogism does not begin with an axiomatic statement about a general class of beings, nor does it conclude with a statement about the fixed, essential nature of things. For the Stoics, such a procedure would have been in conflict with a propositional logic whose aim is to demonstrate the logical tenability of the conclusions of one's premises, not their empirical or ontological verifiability. At the same time, and although they are *lekta*, the Stoics' hypothetical syllogisms are compatible with the physics which they espoused, for their syllogisms deal with the changing relations between concrete individual events rather than with a changeless structure of fixed essences.(139) The five main types of syllogisms used by the Stoics may be schematized as follows:

Conditional: "If it is light, it is day."

Conjunctive: "It is light and it is day."

Disjunctive: "Either it is light or it is day."

Causal: "It is light because it is day."

Likely: "It is more likely that it is day than that it is night."

In all cases both the initial premises and whatever conclusions may follow from them refer to transient events. Having demonstrated a proposition by means of these syllogisms, one has still not claimed to have said anything about an enduring natural phenomenon. This is a perfectly reasonable choice for the Stoics given both their physics of dynamic events and their conception of the *lekta*." (pp. 53-55)

Notes

(136) See the references cited in note 35 above; Diogenes Laertius, *Lives* 7. 63-81.

(137) The traditional view of Stoic logic, treating it as beneath consideration because of its departures from Aristotelian logic, is stated clearly by Carl Prantl, *Geschichte der Logik im Abendlande* (Leipzig, 1927), 1, 401-96. It has been superseded by a positive reinterpretation of Stoic logic, marked by two trends. One understands Stoic logic and its differences from Aristotelian logic in the light of its connections with the rest of the Stoic system. The most important studies in this area are Urs Egli, *Zur stoischen Dialektik* (Basel, 1967), pp. 93-104; Michael Frede, *Die stoische Logik,* Abhandlungen der Akademie der Wissenschaften in Göttingen, philosophisch-historische Klasse, 3:88 (Göttingen, 1974); and Virieux-Reymond, *La logique et l'épistimologie des Stoïciens*. See also Bréhier, *Hellenistic and Roman Age,* pp. 41 fr.; V. Brochard, *Études de philosophie ancienne et de philosophie moderne,* nouv. ed. I Paris, 1926), pp. 220-51; Carlo Diano, *Forma ed evento: Principii per una interpretatione del mondo greco (*Venezia*,* 1952), pp. 9-20; Edelstein, *Meaning of Stoicism,*pp. 27-29; Goldschmidt. *I.e système stoïcien,* pp. 82 83; Josiah 13. Gould, "Chrysippus: On the Criteria for the Truth of a Conditional Proposition," *Phronesis,* 12 (1967)*,* 152-61; *Chrysippus,* pp. 66-88; Charles H. Kahn, "Stoic Logic and Stoic Logos," *Archiv für Geschichte der Philosophie,* 51 (1969), 158-72; Lorenzo Pozzi, "Il nesso di implicazione nella logica stoica," Atti del convegno di storia della logica, Parma, 8-10 ottobre 1972 (Padova, 1974), pp. 177-87; Giulio Preti, "Sulla dottrina del *semeion* nella logica stoica," *Rivista critica di storia della filosofia*, 2 (1956), 5-14; Reymond, "La logique stoïcienne," *Revue de Théologie et de Philosophie*, n.s. 17 (1929), 161-71; Carlo Augusto Viano, "La dialettica stoica," *Rivista di filosofia*, 49 (1958), 179-227; Antoinette Virieux-Reymond, "Le 'sunemménon' stoïcien et la notion de la loi scientifique," *Studia Philosophica*, 9 (1949), 162-69.

The second group consists of scholars primarily interested in modern logic, who have rediscovered Stoic logic because of the affinities they perceive between it and the school of Carnap and Frege. The essay which began this movement is Jan Łukasiewicz, "Zur Geschichte der

Aussagenlogik," *Erkenntnis*, 5 (1935), 111-31. The most important technical treatment of Stoic logic within this or any other perspective is Benson Mates, *Stoic Logic* (Berkeley, 1953). See also Nimio de Anquin, "Sobre la logica de los Estoicos," *Sapientia*, 11 (1956), 166-72; Oskar Becker, *Zwei Untersuchungen zur antiken Logik* (Wiesbaden, 1957); I. M. Bochenski, Ancient Formal Logic (Amsterdam, 1951), pp. 77-102; William Kneale and Martha Kneale, *The Development of Logic* (Oxford, 1962), pp. 11376; Leo Lugarini, "L'orizzonte linguistico del sapere in Aristotele e la sua trasformazione stoica," *Il Pensiero*, 8 (1963), 327-51; Jürgen Mau, "Stoische Logik. Ihre Stellung gegenüber der aristotelische Syllogistik und dem modernen Aussagekalkül," *Hermes*, 85 (1957), 147-58; Mario Mignucci, *Il significato della logica stoica*, 2a ed. (Bologna, 1967); Jan Mueller, "An Introduction to Stoic Logic," in *The Stoics*, ed. Rist, pp. 1-26.

(138) *SVF*, 2, 182, 207-08, 213, 215, 241-42, 245.

(139) For the parallels in physics see *SVF*, 2, 13, 114, 395-97. Good analyses of this point can be found in Jacques Brunschwig, "Le modèle conjonctif," *Les Stoiciens et leur logique*, Actes du Colloque de Chantilly, 18-22 septembre 1976 (Paris, 1978), pp. 61-65; Edelstein, *Meaning of Stoicism*, pp. 27-29; Michael Frede, "Stoic vs. Aristotelian Syllogistic," *Archiv für Geschichte der Philosophie*, 56 (1974), 1-32; Goldschmidt, *Le système stoïcien*, pp. 82-83; Gould, "Chrysippus," *Phronesis*, 12 (1967), 152-61; Chrysippus, pp. 66-88; A. A. Long, "Dialectic and the Stoic Sage," in *The Stoics,* ed. Rist, pp. 101-24; Virieux-Reymond, "Le 'sunemménon' stoicien," *Studia Philosophica*, 9 (1949), 162-69. William H. Hay, "Stoic Use of Logic," *Archiv für Geschichte der Philosophie*, 51 (1969), 145-57 argues unconvincingly that the Stoic syllogisms also reflect an interest in abstract subjects and universal conclusions.

(140) *SVF,* 2, 368-75. On the other hand, Andreas Graeser, "The Stoic Categories," *Les stoiciens et leur logique*, pp. 199-221; "The Stoic Theory of Meaning," in *The Stoics*, ed. Rist, p. 78 sees the categories as linguistic expressions signifying syntactical classifications.

From: Marcia L. Colish, *The Stoic Tradition from Antiquity to the Early Middle Ages. I. Stoicism in Classical Latin Literature*, Leiden: Brill 1985.

The lekton as what is said or predicated of something

"4.1.1 According to *SVF* 1, 89, Zeno of Citium, the founder of the Stoic school, made a distinction between a cause, which is a body or *soma,* and that of which it is the cause, which is called *symbebekos,* consequence, or *kategorerna,* predicate. Stobaeus, who gives this information, cites as examples of causes or bodies practical wisdom*(phronesis),* the principle of life *(psyche),* and self-control *(sophrosyne);* and as examples of what is caused by these bodies being wise *(phronein),* living *(zen),* and being temperate *(sophronein).* For the Stoics a body or *soma is* everything that acts or undergoes action *(SVF* II, 336, 340). What is done or undergone by such agents or patients, the action or passion, is a *kategorema,* which in contrast with the somatic agents or patients is characterized as asomatic (*asomaton*) Sextus *M* IX, 211) gives the following examples. The lancet and the flesh are bodies; the lancet is the cause of an asomatic *kategorema,* namely being cut, with respect to the flesh. Fire and wood are bodies; the fire is the cause of an asomatic *kategorema,* namely being burnt, with respect to the wood. Further examples can be found in *SVF* II, 349, where it is also added that the flesh is the cause of the cutting with respect to the lancet.

The verbal character of that which is caused was stressed by the Stoics against those who maintained that it could be indicated by nominal expressions (SE, *PH III,* 14). If the sun or the sun's heat makes the wax melt, we have to say that the sun is the cause, not of the melting of the wax *(tes chyseos),* but of the wax being melted, of a *kategorema* which is indicated by an infinitive *(tou cheisthai).* Clement of Alexandria *(SVF* III, 8, p. 263) even makes an explicit distinction, in a somewhat similar context, between 'is cut' *(temnetai),* which is the actual *kategorema,* and the infinitive 'to be cut', which is the name (*ptiptosis*) of the *katkategorema."* pp. 45-46

(...)

"The strongest proof that the term *lekton* was used to designate that which is said or predicated of something, as a synonym of *kategorema* and in the typical frame of the Stoic theory of predication, is the fact that it is so often qualified by the attribute *asomaton*. In many contexts one can make sense of this characterization only by taking *lek ton* as standing for the action or passion, the *pragma* which is signified by the verb, in contrast with the *somata* which perform or undergo the action. It is therefore time to try to throw more light upon the ontological and psychological aspects of that which the Stoics called *asomaton*.

4.1.5. As for the ontological aspects, I shall confine myself to a rough outline; for details and controversial points I refer to Bréhier (1962), Goldschmidt (1969), Hadot (1968 and 1969), and Rist (1969). At the top of the Stoics' ontological hierarchy we find the *ti*. These somethings are divided into the *on* and the *me on,* the sphere of the existent and the sphere of the non-existent. To the *on* belong the *somata,* the things that can perform or undergo actions. In terms of the Stoic categories a soma is composed of *hyle,* matter, and *poiotes,* determining quality. To the *me on* belong the void, place, time, and the *lekta*. These four *asomata* do not have an independent existence of their own; they are only thought and said. A *lekton,* as we have seen, belongs to *a soma (hyparchein)* when the *soma* actually performs or undergoes the action concerned, but in itself it does not have the same kind of existence as *a soma* has. What is predicated of *a soma* is an event that occurs at the periphery of the domain in which bodies act and are acted upon; the actuality of the event entirely derives from the body by which it is caused. In terms of the Stoic categories the *lekton* has to be associated with the *pos echon,* the ways of behaving of a body, and the *pros ti pa's echon,* its ways of behaving in relation to something else.

4.1.6. Turning now to the psychological side of the aromatic *lekton,* I first call attention to a passage (DL VII, 51) in which two divisions of presentations *(phantasiai)* are mentioned. One is into those of living beings possessed of reason and speech *(logikai)* and those of living beings that are deprived of these faculties*(alogoi)*. The presentations of the first group are also called *noeseis,* in a broad sense of that word (Cf. *SVF* II, 89). The second division divides presentations into those of sense-perception *(aisthetikai)* and those of thought in the

narrower sense *(dia tes dianoias)*. To the latter group belong the presentations of *asomata* and of the other things that are apprehended only by means of the *logos*. Parallel to this second division into presentations of sense-perception and presentations of thought we often find a distinction between *periptosis* and *metabasis:* between direct acquaintance by means of the senses (for instance, with something white or black, sweet or bitter) and the formation of ideas, which consists in a kind of transition from sense-perception to something else. The *metabasis* is characteristic of man (SE, *AM* VIII, 276, 288; Epictetus, *Dissertationes* I, 6, 10). This creative power of the human mind amounts, however, to no more than the faculty of compounding, transposing, augmenting, or diminishing the materials afforded us by the senses; it is impossible to find in thought anything which one does not possess as known by experience (SE, *AM* VIII, 58, 60). Sextus gives the following examples of *metabasis (AM* I, 25, III, 40, VIII, 59, IX, 393, XI, 250). Because of a likeness of Socrates, which has been seen, we conceive of Socrates, who has not been seen. Starting from the common man we move on to a conception of a giant. By decreasing the size of the common man we grasp a conception of a pygmy. By way of composition we derive from man and horse the conception of a thing we have never perceived, a centaur. DL VII, 52-53, gives a more extensive list of possibilities. The queer thing is that he contrasts *periptosis* not with *metabasis* generally, but with such species of *metabasis*(in Sextus's sense) as resemblance, analogy, transposition, composition, and opposition. *Metabasis* occurs as one of the species: some ideas are formed by transition, for instance *lekta* and place, both *asomata*. This may be just a mistake; or the word *metabasis* may have been used by some in a generic sense and by others in a more special sense, without much further difference of meaning.

Now the *lekton* was defined as that which exists *kata logiken phantasian,* by way of a presentation which is typical of a living being possessed of reason and speech (DL VII, 63; SE, *AM* VIII, 70). Sextus adds that *a logike phantasia* is a presentation in which it is possible to set the thing presented before the mind by means of speech*(logos)*. This can be connected with what DL, VII, 49, says: first comes the presentation and then follows thought *(dianoia),* which is capable of expressing things in speech *(eklaletike)* and

expresses that which it undergoes by the influence of the presentation, by means of an utterance. From elsewhere *(SVF II,* 236) we know that the Stoics called the *noemata* by the name of *ekphorika,* things capable of being expressed in words.

The view that the thinking faculty is capable of forming, on the basis of the materials offered by sense-perception, new presentations which are arrived at by a process of *metabasis* and exist only in so far as they are thought and expressed in words, was illustrated by means of the following simile (SE, *AM* VII, 409). A trainer or drill-sergeant who is teaching a boy rhythm and how to make certain motions sometimes takes hold of the boy's hands and at other times stands at a distance and offers himself as a model for the boy's imitations, by making certain rhythmical motions. In the same way some of the objects presented produce the impression in the soul as it were by touching and contact with it (such as white and black and *somata* generally), whereas others are not of this nature, since in their case the principal part of the soul has presentations which are not caused by them but are formed on the occasion of their occurrence *(tou hegemonikou ep'autois phantasioumenou kai ouch hyp'auton), as is* the case with asomatic *lekta*. Sextus cites this simile in connection with the question of how presentations of asomatic *lekta* are possible. Since *an asomaton* neither effects nor suffers anything, it cannot produce presentations in the soul. The Stoics apparently solved this problem by pointing out that just as the boy makes both movements which are caused by the trainer and spontaneous movements, so the soul has both presentations that are caused by *somata* and spontaneous presentations -- for instance, of *lekta*. The *lekta* do not cause their presentations, but those presentations are produced by the soul itself, although this spontaneous production is limited to certain operations on the impressions of sense-perception.

That *lekta* are merely thought and that nothing directly corresponds to them in the world of existing *somata is* confirmed by *SVF* II, 521. The Stoics considered time and *asomata* generally as existing only in thought, without the reality of bodies which consists in causal activity. It looks as if this were contradicted by a passage in Plutarch *(De communibus notitiis contra Stoicos* 1084 c), where such activities as walking and dancing *(ton peripaton, ten orchesin)* are counted among the *somata*. This can be connected with what Seneca

(Epistula 113, 23; *SVF* II, 836) tells us about a controversy between Cleanthes and Chrysippus concerning the nature of walking *(ambulatio).*Cleanthes contended that it is *pneuma* which has been sent down from the principal part of the soul into the feet; Chrysippus maintained that it is the principal part of the soul itself *(a soma).* To solve the apparent contradiction we probably have to distinguish between the *Om* as far as it is in a certain state or is disposed in a certain way *(pos echon)* and that state itself, considered on its own. If the action or passion is regarded as realized in *a soma, it* is, as it were, an aspect of that *soma.* This point of view was strongly emphasized by Chrysippus, here and elsewhere. But if the action or passion is contrasted with the *soma,* as that which is caused or undergone by it, it is seen to have a status of its own; from this point of view it is something asomatic and a mere product of thought.

4.1.7. It may be concluded, I think, that at least one of the ways in which the word *lekton* was used by Stoic philosophers was to designate that which is said or predicated of something. The *lekton* or *kategorema* is an asomatic *pragma,* an action or passion which is performed or undergone by a *soma.* From an ontological point of view the *lekton-kategorema-pragma* is totally different from the *soma. Somata are* the real things which are characterized by their capacity of acting and being acted upon. The actions or passions themselves are merely thought and expressed in words; they are presentations which are spontaneously formed by a transition from sense-experience and made known by spoken sounds, without having a direct counterpart in somatic reality. Given this ontological and psychological peculiarity of the *lekton,* it is not unlikely that almost from the beginning the word *lekton* could also be taken as referring to that which is only (thought and) said. If the *lekton* as such does not really exist and is nothing but a spontaneous product of thought, it is quite natural to see it not only as that which is said of a *soma,* but also as that which is merely an expressed thought, only something said." (pp. 51-55)

Sesto Empirico (Dai *Lineamenti pirroniani II*, Dal *Contro i matematici VIII*) (1986); Va. Alessandro di Afrodisia (Dal *Commento agli Analitici primi,* Dal *Commento ai Topici*) (1986); Vb. Plotino, i Commentatori aristotelici tardi, Boezio (1987); VI. Cicerone (Testi dal *Lucullus*, dal *De Fato*, dai *Topica*) (1986); VIIa. Galeno (Dalla *Introduzione alla dialettica*) (1986); VIIb. Le Testimonianze minori del sec. II. d.C.: Epitteto, Plutarco, Gellio, Apuleio (1987); VIII. *Testimonianze sparse ordinate sistematicamente* (1987).

"Il presente lavoro tenta una ricostruzione sintetica della logica stoica considerata nei suoi rapporti storici e nella sua cornice sistematica: non è pertanto una interpretazione della logica stoica nella prospettiva della logica moderna né propriamente una esposizione di un momento della storia della logica, bensì intenderebbe presentare un momento della storia della filosofia.

In particolare, esso nasce da un decennale contatto con tutte le fonti antiche relative alla logica stoica e vuole introdurre alla lettura di tali fonti. I testi di Crisippo, di Diogene Laerzio, di Sesto Empirico, dei commentatori di Aristotele (innanzitutto di Alessandro di Afrodisia), di Cicerone, degli scrittori del sec. Il d.C. che ci informano sulla logica stoica (innanzitutto di Galeno) sono stati raccolti, ordinati per autore e vagliati, nonché tradotti e commentati; sono state anche raccolte e ordinate secondo il contenuto secondo il quale si sviluppa l'esposizione nel presente lavoro le testimonianze che si trovano sparse nei più vari autori (anche negli autori che si potrebbero ritenere scarsamente significativi), e sono state anch'esse tradotte e commentate." (Dalla Prefazione al primo volume).

Stoic Lexicon

Lexicon IV: *Stoics*, Edited by Roberto Radice in collaboration with Lucia Palpacelli, Chiara Pisoni, Ilaria Ramelli, Laura Stochino, Francesca Scrivani and Emmanuele Vimercati. Electronic edition by Roberto Bombacigno, Milano: Biblia 2007, 4 vols. (4040 p.) 1 CD-ROM + License.

Complete edition in the original language, index lemmatized, (also available on CD-ROM) of the works of the Stoic philosophers, Greek and Latin.

Bibliographies on Stoicism

1. Egli, Urs. 1979. "Bibliographie zur Stoischen Sprachwissenschaft (Dialektik)." In *Die Grammatik der Stoiker*, 182-216. Braunschweig: Vierweg & Sohn.

   Appendix to the German translation by Karlheinz Hülser of: Rudolf Traugott Schmidt, *Stoicorum grammatica,* Halle, 1839.

2. Epp, Ronald H. 1985. "Stoicism Bibliography." *Southern Journal of Philosophy* no. 23 Suppl.:125-171.

   Recovering the Stoics. Spindel Conference 1984.

   The bibliography contains 1169 titles.

   "This bibliography cites the most important secondary literature on Stoic philosophy. It is not exhaustive in part because the term Stoic has such a bastardized legacy.

   What has been selected are important contributions to the Stoic tradition as theory and practice. This literature is concentrated in a half dozen modern European languages accessible to English language scholars, and is largely confined to the twentieth century.

A generous sense of what is philosophical has been employed; works that are exclusively historical, philological, or literary have been excluded. The following forms of scholarship were generally ignored:

(a) primary sources, translations, and commentaries, (b) encyclopedia and dictionary entries, (c) dissertations, (d) book reviews, and (e) standard histories.

Several oddities should be noted. All serials titled by a single term (e.g. *Phronesis)* will be fully cited, whereas multi-term serials (e.g. *Classical Quarterly)* are abbreviated according to *L'Annee Philologique,* and listed here with other serials on pages 126-13 1. Since rules of capitalization are varied, I have favored a minimalist approach, and when the work of a single author is collected (e.g. Max Pohlenz's *Kleine Schriften),* a single citation replaces the separate citations contained therein. Indexes of key English and selected Greek subjects complete user access to this bibliography, and regrettably indexes to Latin terms and the primary literature could not be included." (From the *Preface* by R. H. Epp).

3. Baldassarri, Mariano. 1993. "Logica stoica: bibliografia." In *Studi di filosofia antica. Vol. II*, 139-172. Como: Libreria Noseda.

4. Gourinat, Jean-Baptiste. 2000. *La dialectique des Stoiciens*. Paris: Vrin.

   Bibliographie: *Textes antiques* 335-341; *Textes modernes* 341-357.

5. ———. 2005. "Bibliographie d'orientation." In *Les Stoiciens*, edited by Romeyer Dherbey, Gilbert and Gourinat, Jean-Baptiste, 545-572. Paris: Vrin.

6. Brunschwig, Jacques. 2006. "Bibliographie complémentaire." In *Les Stoïciens et leur logique*, edited by Brunschwig, Jacques, 475-484. Paris: Vrin.

   Actes du Colloque de Chantilly 18-22 septembre 1976.

   Première édition 1978; deuxième édition, revue, augmentée et mise à jour (reproduit la pagination de l'édition originale).

"Nous n'avons pas reproduit dans ce volume la bibliographie de la première édition, qui aurait rendu celle-ci pléthorique; nous avons donc laissé à leur place, et sous leur forme initiale, toutes les références antérieures à 1976, *telles qu'elles se trouvent dans le texte et dans les notes des articles eux-mêmes*. En revanche, nous regroupons ici, par ordre alphabétique des noms des auteurs, les références complètes des études qui ont été mentionnées, sous forme abrégée, dans les compléments apportés aux textes et aux notes par les auteurs et réviseurs de la présente deuxième édition; nous y ajoutons quelques publications récentes particulièrement marquantes. On ne trouvera donc dans ce qui suit, sauf exceptions justifiées par leur importance, que des titres publiés depuis 1976."

Annotated Bibliography on the Ancient Stoic Dialectic (First Part: A - G)

Bibliography

1. Acerbi, Fabio. 2003. "On the Shoulders of Hipparchus: A Reappraisal of Ancient Greek Combinatorics." *Archiv for History of Exact Sciences* no. 57:465-502

   "My interest here is to reconstruct the way Hipparchus' numbers were arrived at, trying en passant to convince the reader that time has come for a reappraisal of ancient Greek combinatorics. I shall provide only a *resumé* of the striking (to modern eyes) interpretation of the numbers in terms of Stoic logic, leaving a wider discussion of the logico-philosophical background for a separate study.The present work is organized as follows. The rationale beyond the identification of 103049 as the tenth Schröder number is briefly summarized in Sect. 2. Section 3 presents a short discussion of the Plutarchean passage, focussing on the technical lexicon employed, and an outline of the interpretation in terms of Stoic logic. Section 4 contains a discussion of combinatorial results in ancient Greek sources, with additional evidence with respect to the one usually adduced, the data being organized in such a way as to follow Hipparchus' probable calculations. Section 5 offers some provisional conclusions." (p. 467)

2. Achard, Martin. 2001. "*Logos Endiathetos* et théorie des Lekta chez les Stoiciens." *Laval Théologique et Philosophique* no. 57:225-233

"En guise de préliminaire à ce type d'exploration théorique, et en guise aussi de réponse, bien modeste il va sans dire, aux voeux exprimés par Panaccio dans l'introduction de son ouvrage(11), nous voudrons dans le présent article formuler quelques remarques sur deux des hypothèses interprétatives avancées par notre auteur au sujet de la conception stoïcienne du logos endiathetos, et répondre, comme par avance, à certaines objections qui pourraient être soulevées contre celles-ci. Nos développements nous permettront de signaler, en conclusion, un fait assez intéressant concernant l'histoire de l'élaboration des catégories grammaticales traditionnelles et le rapport pouvant exister entre celles-ci et les catégories de la pensée conceptuelle." (p. 225)(11) « J'espère seulement que le travail accompli [dans mon livre] paraîtra, comme je le crois, suffisamment fécond pour qu'on veuille bien se donner la peine de le compléter ou de le corriger là où il demande à l'être » {Paris, Seuil 1999, p. 14).

3. Alessandrelli, Michele. 2013. *Il problema del 'lekton' nello Stoicismo antico. Origine e statuto di una nozione controversa*. Firenze: Olschki

   "According to Michael Frede's interpretation, the notion oflekton was developed in the context of the Stoic theory of causality, and conceived as a metaphysical entity. The author of the book challenges this developmental explanation, upholding the linguistic origin of the notion oflekton, that would have been always conceived by the Stoics as a purely semantic entity – that is, as the incorporeal meaning of a corporeal linguistic voice."

4. Allen, James. 2001. *Inference from Signs. Ancient Debates About the Nature of Evidence*. New York: Oxford University Press

   Contents: Abbreviations XI; Introduction 1; Study I: Aristotle on Sign-inference and Related Forms of Argument 13; Study II: Rationalism, Empiricism, and Scepticism: Sextus Empiricus' Treatment of Sign inference 87; Study III: The Stoics on Sign-inference and Demonstration 147; Study IV: Epicurean Sign-inference in Philodemus 194; Conclusion 242; Bibliography

255; Index Locorum 265; General Index 276-279."...Study II has three tasks: first, to free the philosophical views that Sextus reports, especially the Stoic position, from the framework he used to classify them; second, to examine the debate about the nature of sign-inference between partisans of commemorative and indicative signification that was carried on in medicine; and last, to examine the sceptical credentials of the commemorative sign which Sextus embraces on behalf of Pyrrhonism.""Study III examines the Stoic theory of signs, now freed from the distorting influence of Sextus' framework. There I argue that, contrary to the expectations created by Sextus, it belongs among low views of signification and has more affinities with commemorative than indicative signification. But while the medical Empiricists distinguish a higher form of inference, indicative signification, only to repudiate it, the Stoics, like Aristotle, recognize superior forms of inference that they classify under the head of 'demonstration'. The Stoic distinction between signs and demonstrations takes a different form from Aristotle's, however, in a way that reflects some fundamental epistemological differences between Aristotle and the Stoa.And we shall see, as others have noticed before, that there was room within the Stoic position for disagreement and development: there were in fact a number of related Stoic positions, which seem to have differed mainly over whether and how demonstrations enter intoscientific explanation." (pp. 9-10)

5. Annas, Julia. 1980. "Truth and Knowledge." In *Doubt and Dogmatism. Studies in Hellenistic Epistemology*, edited by Barnes, Jonathan, Burnyeat, Myles and Schofield, Malcolm, 84-104. Oxford: Clarendon Press

   "In the debate on the question, 'What is the criterion of truth ?'(1) the answer provided by the Stoics was, in the main,(2) *katalepsis* or *kataleptike phantasia*. l shall translate these as 'apprehension' and 'apprehensible presentation'. (3) These are problematic concepts, asdifficult as the much-debated question of 'the criterion of truth' itself. This discussion tries to bring out some ways in which the debates were clouded by the Stoic failure to distinguish clearly between questions about what we

can know and questions about what is the case, and to realize that truth is a metaphysical notion, not an epistemological one." (p. 84)(1) Graeser [75], 68 (cf. Hartmann [47], 4) holds that the question of a criterion of truth was not one the Stoics faced until forced to do so by the challenge of their opponents in the sceptical Academy. But this cannot be right; Zeno was forced by Arcesilaus' criticisms to modify his definition of the apprehensible presentation (e.g. *Acad*. II 77, Numen. *apud* Eus. PE XIV 5-6, esp. 732 a and 733 a-c), so he already defended a theory of apprehensible presentations as the criterion. (Possibly he was attacking the Epicurean view that all presentations (not just all perceptions) were true; see *SVF* II 78, and Striker [133].)(2) *DL* VII 54 offers what look like various alternative criteria, but these are not rivals to the apprehensible presentation (see Rist [33], 133-4, Long [69]). The word 'criterion' itself did not imply that what was put forward was a guarantee of truth, rather than just a means or way of judging (see Striker [21]); but the Stoics did think of a criterion as a guarantee (see above n. 1).(3) I do not want here to go into the vexed question of whether the word καταλεπτικε had a suggestion of activity (as in 'apprehensive') or of passivity (as in 'apprehensible'). On this see Sandbach [121], 14-15, Graeser [75], 45-50.References[21] Striker, G. *Kriterion tes Aletheias* (Gottingen, 1974); Nachrichten der Akademie der Wissenschaften in Gifttingen, Phil.-hist. klasse, 1974, Nr. 2, 47-110.[37] Rist, J. *Epicurus, An Introduction* (Cambridge, 1972). 6. Aubert, Sophie. 2008. "Cicéron et la parole stoïcienne : polémique autour de la dialectique." *Revue de Métaphysique et de Morale*:61-91

Résumé: "Sous la République, la parole stoïcienne fit l'objet, de la part de Cicéron, d'analyses aussi nombreuses et précises que polémiques. La coexistence d'un style syllogistique et d'un autre plus ample au sein d'un même discours conduisit l'Arpinate à discréditer la rhétorique des Stoïciens au point de ne plus reconnaître à ces philosophes qu'un seul mode d'expression – le mode dialectique, dont il conteste la validité tant sous l'angle de la pratique philosophique, jugée inefficace, que du point de vue de l'éloquence, celle-ci étant foncièrement inappropriée à tous les auditeurs. Dans le *De Oratore*, Crassus analyse le mode d'expression philosophique des Stoïciens sous un angle oratoire, alors qu'il étudie l'éloquence philosophique des Académiciens et des Péripatéticiens sans chercher à examiner si elle conviendrait à un orateur. Dans le *Brutus*, le personnage éponyme insiste quant à lui sur le caractère prétendument unitaire d'une éloquence stoïcienne censée être identique à Rome et à Athènes, au cours d'entretiens philosophiques ou de discours oratoires. La description du style de Diogène de Babylonie par Antoine confirme pour finir la réduction du style des Stoïciens à la dialectique ainsi que son incapacité à charmer, émouvoir ou même enseigner, sa sécheresse, son obscurité (due à un constant décalage entre le fond et la forme du discours), son inutilité dans le cadre de l'invention et de la topique, et surtout sa propension à l'autodestruction. Pour autant, la dialectique du Portique était bien dotée d'une fonction heuristique, et non uniquement défensive ou agonistique."

7. Baldassarri, Mariano. 1993. "Un trattatello Plutarcheo di dialettica stoica: De E Delphico Cap. VI." In *Studi di filosofia antica. Vol. II*, 43-65. Como: Libreria Noseda

   Prima edizione in tedesco in: Klaus Döring, Theodor Ebert (hersg.), *Dialektiker und Stoiker. Zur Logik der Stoa und ihrer Vorläufer*, (1993), pp. 33-46."Del passo plutarcheo or ora presentato in traduzione [*] vediamo di effettuare un inquadramento rapido nel contesto dell'opuscolo e, soprattutto, una accurata analisi in vista di alcune conclusioni significative (i).Il dialogo s'imposta, come è noto, sul significato da dare alla E di grandi dimensioni sospesa come dono votivo al di sotto del

frontone del tempio di Apollo in Delfi tra le colonne del pronao." (p. 43)(...)"Questo capitolo sesto si presenta dunque come un trattatello di dialettica stoica. Compito primo della dialettica è la soluzione delle ambiguità (e dei sofismi) ossia la ricerca ed il conseguimento della verità: il rettamente discutere in vista del rettamente intendere. La dialettica ha come unità elementari non gli enunciabili completi non assertorii bensì le proposizioni logiche (semplici o non semplici); e delle non semplici la proposizione più caratteristicamente deduttiva è la proposizione condizionale, la quale si imposta sulla congiunzione caratteristicamente connettiva 'se': mentre le bestie hanno conoscenza dei fatti, soltanto l'uomo (che è fornito di ragione) conosce e giudica la connessione necessaria di un fatto con un altro fatto, il conseguire di un fatto ad un altro fatto, ossia il rapporto — positivo o negativo — del conseguente (del secondo) con l'antecedente (col primo) sia per presenza implicita del conseguente nell'antecedente sia per coerenza del conseguente con l'antecedente. Sorge così il primo anapodittico: aggiungendo alla proposizione condizionale, che pone la connessione e costituisce la premessa maggiore, l'affermazione dell'effettivo darsi dell'antecedente mediante la premessa minore, si afferma nella conclusione l'effettivo darsi del conseguente (o si ottiene il secondo anapodittico: negando nella minore il darsi del conseguente, si nega nella conclusione il darsi dell'antecedente). Per questa via (ma anche per la via della proposizione congiuntiva e della proposizione disgiuntiva, ossia mediante gli anapodittici terzo, quarto e quinto) si può realizzare la dimostrazione, che è verità (e sapere organizzato o scienza). E la dimostrazione è conoscenza, attraverso ciò che presentemente è, di ciò che in passato fu, in quanto causa appunto del presente, e di ciò che in futuro sarà, in quanto effetto appunto del presente: la ragione è ricerca della causa, e la sillogistica (innanzitutto la sillogistica della dialettica mantica) ha il suo fondamento nel principio ontologico di causa (nella serie eterna delle cause)." (p. 56)[*] *De E Delphico* 6, pp. 386D-387D; tr. it. Plutarco, *L'E di Delfi,* a cura di Claudio Moreschini, Napoli, D'Auria, 1998.

16. ———. 1999. "Aristotle and Stoic Logic." In *Topics in Stoic Philosophy*, edited by Ierodiakonou, Katerina, 23-53. Oxford: Clarendon Press

    Reprinted in: J. Barnes, *Logical Matters: Essays in Ancient Philosophy II,* Oxford: Clarendon Press, 2012, pp. 382-412."Were Aristotle's logical writings known to the early Stoic logicians, and did Aristotle's logical ideas have any influence on the development of Stoic logic? The evidence which bears on this question is perplexing: there are numerous pertinent texts which favour an affirmative answer; yet as we approach them they seem, like so many will-o'-the-wisps, to retreat -- and we are stumbling in a treacherous marsh.But the question is not without its fascination, in as much as it concerns the historical relations between two magnificent monuments to Greek philosophical acumen; and it may stand some discussion. Section I presents some general ruminations. Section II deals with the preliminary question of whether the Stoics could in principle have read Aristotle. Section III assembles a sample of the evidence which suggests that the Stoics did in fact read and study their Aristotle. And the remaining sections try to assess the value of this evidence.The question is a historical one, and it invites consideration of a certain type of historical explanation. It is not merely a matter of whether the Stoics were aware of the

Peripatetic achievement in logic: it is a matter of whether this awareness influenced their own logical thoughts and caused them to think in this way rather than in that." (p. 23)

17. ———. 2005. "What Is a disjunction?" In *Language and Learning: Philosophy of Language in the Hellenistic Age. Proceedings of the Ninth Symposium Hellenisticum*, edited by Frede, Dorothea and Inwood, Brad, 274-298. Cambridge: Cambridge University Press

    Reprinted in J. Barnes, *Logical Matters. Essays in Ancient Philosophy II*, Oxford: Clarendon Press 2012, pp. 512-537."That the Stoics were the instigators of the emphasis put on linguistic observations in ancient philosophy is uncontested. To what degree they are rightly accused of paying more attention to expressions rather than to things is quite another matter, despite the fact that this reproach was voiced repeatedly in antiquity by authorities such as Galen and Alexander of Aphrodisias and has lasted through the nineteenth century AD. If the Stoics have enjoyed a better press since the twentieth century it is because they were taken to be logicians for logic's sake, committed formalists who stopped just short of inventing the appropriate type of artificial language. That this picture needs revision is argued by Jonathan Barnes (*What is a disjunction*?') in a painstaking investigation of the treatment of connectives in Apollonius Dyscolus' essay with that title and Galen'sInstitutio logica. Barnes shows that Apollonius' text is coherent and thereby undermines a long-standing prejudice about the Stoic impact on the development of traditional grammar: contrary to what has been assumed (via an unwarranted textual emendation in a crucial passage of Apollonius Dyscolus) Apollonius does not criticise the Stoics' meddling with grammar, but rather their insufficient interest in some of its finer points. Far from adopting a purely formalistic stance, the Stoics distinguished between natural and non-natural disjunctions and colligations. They used these considerations not only to distinguish between natural and occasional disjunctions, but also between grammatical and semantical nonsense. Since no other text besides Apollonius' attributes the conception of 'natural disjunctions' to the Stoics

it is a question whether it actually is of Stoic origin rather than derived from the Peripatetics or an invention by certain grammarians. As Barnes shows, the interconnections and boundaries between natural language and formal logic did not only play a crucial role in the treatment of disjunctions by Apollonius Dyscolus. They are also the basis of Galen's criticism of Stoic logic on the differentiation between complete and incomplete conflict and implication, whose intent was to show what is and what is not a legitimate use of conjunctions. If that distinction is at stake, then Galen's view on disjunctions and conjunctions turns out to be coherent, despite initial appearances to the contrary. The differing parties accused each other of not having paid sufficient attention to thepragmata; however, their complaint is not that the facts in the world have been ignored, but rather that the meaning of the terms has not received sufficient attention." From the *Introduction* by Dorothea Frede and Brad Inwood (pp. 11-12).

Part II discusses Stoic

modal logic: the Stoic definitions of their modal notions (possibility, impossibility, necessity, non-necessity); the logical relations between the modalities; modalities as properties of propositions; contingent propositions; the relation between the Stoic modal notions and those of Diodorus Cronus and Philo of Megara; the role of 'external hindrances' for the modalities; the temporal dependency of the modalities; propositions that change their modalities; the principle that something possible can follow from something impossible; the interpretations of the Stoic modal system by B. Mates, M. Kneale, M. Frede, J. Vuillemin and M. Mignucci are evaluated."For a shorter, updated, English version of Part I see "Stoic Logic", in K. Algra et al. (eds), *The Cambridge History of Hellenistic Philosophy*, Cambridge: Cambridge University Press 1999, pp. 92-157.For a shorter, updated, English version of Part II see "Chrysippus' Modal Logic and its Relation to Philo and Diodorus", in K. Döring, Th. Ebert (eds.), *Dialektiker und Stoiker*, Stuttgart: Franz Steiner1993, pp. 63-84.

23. ———. 1996. "Stoic Syllogistic." *Oxford Studies in Ancient Philosophy* no. 14:133-192

    "For the Stoics, a syllogism is a formally valid argument, and the primary function of their syllogistic is to establish the formal validity of arguments. Stoic syllogistic can be understood as a system of formal logic that relies on two types of argumental rules:' first, five rules (the accounts of the indemonstrables) which were used to determine whether any given argument is an indemonstrable argument (anapodeiktos logos), i.e. an elementary syllogism the validity of which is not in need of further demonstration (D.L. 7.79), since its validity is evident in itself (Sextus,M. 2. 223);2 second, one unary and three presumably binary argumental rules, called themata, which allow one to establish the formal validity of non-indemonstrable arguments by analysing them in one or more steps into one or more indemonstrable arguments (D.L. 7. 78). The function of these rules is not to generate non indemonstrable syllogisms from indemonstrable ones, but rather to reduce given non-indemonstrable arguments to indemonstrable syllogisms. Moreover, the Stoic method of

deduction differs from standard modern ones in that the direction is reversed. The Stoic system may hence be called an 'argumental reductive system of deduction'.In the following I present a reconstruction of this system of logic. The rules or accounts used for establishing that an argument is indemonstrable have all survived, and the indemonstrables are among the best-known elements of Stoic logic. However, their exact role and logical status in Stoic syllogistic are usually neglected. I expound how they are integrated in the system of deduction. The state of evidence for thethemata is dismal -- although perhaps not hopeless. I suggest a reconstruction of thethemata, based on a fresh look at some of the sources, and then offer a reconstruction of the general method of reduction of arguments and some general remarks on Stoic syllogistic as a whole and on the question of its completeness (much of which will not depend on the particular formulation of thethemata I propose, but on more general considerations for a reconstruction).Stoic logic is a propositional logic, and Stoic negation and conjunction are truth-functional. This has, naturally, led to comparisons with the 'classical' propositional calculus (as e.g. presented inPrincipia Mathematica), including repeated examinations of Stoic syllogistic on completeness in the modern sense. The Stoic theory of deduction invariably comes out as deficient, inferior, or simply outlandish in such comparisons, which has evoked adjusting additions and modifications -- tacit or explicit -- in previous reconstructions of the system. I suggest that this is the wrong approach; that the classical propositional calculus is the wrong paradigm; that Stoic logic has to be considered first of all in its own light; and that, if one looks for comparisons with contemporary logic, one can find some rather more interesting parallels when turning one's attention to non-truth-functional propositional logics." (pp. 133-134)(1) By an argumental rule I mean a rule that produces arguments from (zero or more) arguments, as opposed to a rule that produces propositions from (zero or more) propositions.(2) The accounts of the indemonstrables, when interpreted as rules, are nullary argumental rules.

24. ———. 1997. "The Stoics on Hypotheses and Hypothetical Arguments." *Phronesis.A Journal for Ancient Philosophy* no.

42:299-312

"In the list of Chrysippus' logical writings in Diogenes Laertius, in its fourth section of works on arguments(λογοι), e find ten books on hypothetical arguments (υποθετικόι λογοι, D. L. VII 196). The questionI shall follow up in this paper is: what were these Stoic hypothetical arguments about which Chrysippus had so much to say? Little has been written on this issue, the situation of the sources being not exactly favourable. No example of an hypothetical argument assigned to Chrysippus or any other early Stoic has survived, nor do we have any Stoic definition.One way of approaching the issue is to look and see what arguments were called "hypothetical arguments" or "hypothetical syllogisms" after Chiysippus, and to examine whether these are the same kind of arguments Chrysippus wrote about." (p. 299)

26. ———. 2002. "Pre-Stoics Hypothetical Syllogistic in Galen's *Institutio Logica*." In *The Unknown Galen*, edited by Nutton, Vivian, 57-72. London: Institute of Classical Studies, University of London

    "The text of the *Institutio Logica* (*IL*) or *Introduction to Logic* is not found in Kuhn [*] because its sole surviving manuscript was first published, not long after its discovery, in 1844, and thus too late for inclusion in Kuhn. Moreover, some have thought the work to be spurious.(1)The reasons given for this assumption were on the whole unconvincing. I take it for granted that the *Institutio Logica* is by Galen.In this paper I trace the evidence in the *Institutio* for a hypothetical syllogistic which predates Stoic propositional logic. It will emerge that Galen is one of our main witnesses for such a theory. In the *Institutio*, Galen draws from a number of different sources and theories.There are the so-called ancient philosophers (οι

παλαιοι των Φιλοσοφων); there is the Stoic Chrysippus, whose logic Galen studied in his youth.(2) There are the ‘more recent philosophers’ (οι νεωτεροι), post-Chrysippean Stoics or logicians of other schools who adopted Stoic terminology and theory.(3) There are from the 1st century BC the Stoic Posidonius and the Peripatetic Boethus, both of whom Galen may have counted among the ‘more recent philosophers’. Again, in some passages Galen seems to draw from contemporary logicaltheories of non-Stoic make, presumably of Peripatetic or Platonist origin; and in others he explicitly introduces his own ideas.(4) But apart from Plato, who is generously credited by Galen with the use of the later so-called second hypothetical syllogism, the only promisingcandidates for pre-Stoic proponents of a hypothetical syllogistic are the above-mentioned 'ancient philosophers'. In the following I concentrate on their theory."[* Karl Gottlob Kühn, *Claudii Galeni Opera Omnia*. Leipzig: C. Cnobloch, 1821-1833, 19 volumes, reprinted Hildesheim: Georg Olms,1964-1997].(1) E.g.     "As Susanne Bobzien shows, the Stoics had philosophical reasons for the development of strategies to handle `lexical' ambiguities, because they regarded fallacies of ambiguity as complexes of propositions and sentences that straddle the realm of linguistic expression (the domain of language) and the realm of meaning (the domain of logic); moreover, there is also

a pragmatic component because being deceived is a psychological disposition that can be reduced neither to language nor to meaning. Not all arguments are, after all, as transparently fallacious as is the example that exploits the ambiguity of 'for men/manly' and concludes that a 'garment for men' must be courageous because manliness is courage. Bobzien provides a detailed analysis of the relevant passages, lays bare textual and interpretative difficulties, and explores what the Stoic view on the matter implies for their theory of language. She points up that the Stoics believe that the premisses of the fallacies, when uttered, have only one meaning and are true, and thus should be conceded; hence no mental process of disambiguation is needed, while Aristotle, by contrast, assumes that the premisses contain several meanings, and recommends that the listeners explicitly disambiguate them. Bobzien proffers two readings of the Stoic advice that we 'be silent' when confronted with fallacies of ambiguity, and explicates how each leads to an overall consistent interpretation of the textual evidence. Finally, she demonstrates that the method advocated by the Stoics works for all fallacies of lexical ambiguity." (From the *Introduction* by Dorothea Frede and Brad Inwood, (pp. 10-11)

30. ———. 2019. "Stoic Sequent Logic and Proof Theory." *History and Philosophy of Logic* no. 40:234-265

    Abstract: "This paper contends that Stoic logic (i.e. Stoic analysis) deserves more attention from contemporary logicians. It sets out how, compared with contemporary propositional calculi, Stoic analysis is closest to methods of backward proof search for Gentzen-inspired substructural sequent logics, as they have been developed in logic programming and structural proof theory, and produces its proof search calculus in tree form. It shows how multiple similarities to Gentzen sequent systems combine with intriguing dissimilarities that may enrich contemporary discussion. Much of Stoic logic appears surprisingly modern: a recursively formulated syntax with

some truth-functional propositional operators; analogues to cut rules, axiom schemata and Gentzen's negation-introduction rules; an implicit variable-sharing principle and deliberate rejection of Thinning and avoidance of paradoxes of implication. These latter features mark the system out as a relevance logic, where the absence of duals for its left and right introduction rules puts it in the vicinity of McCall's connexive logic. Methodologically, the choice of meticulously formulated meta-logical rules in lieu of axiom and inference schemata absorbs some structural rules and results in an economical, precise and elegant system that values decidability over completeness. "

31. Bobzien, Suzanne, and Dychoff, Roy. 2019. "Analyticity, Balance and Non-admissibility of Cut in Stoic Logic." *Studia Logica* no. 107:375-397

    Abstract: "This paper shows that, for the Hertz–Gentzen Systems of 1933 (without Thinning), extended by a classical rule T1 (from the Stoics) and using certain axioms (also from the Stoics), all derivations are analytic: every cut formula occurs as a subformula in thecut's conclusion. Since the Stoic cut rules are instances of Gentzen's Cut rule of 1933, [*] from this we infer the decidability of the propositional logic of the Stoics. We infer the correctness for this logic of a "relevance criterion" and of two "balance criteria", and hence(in contrast to one of Gentzen's 1933 results) that a particular derivable sequent has no derivation that is "normal" in the sense that the first premiss of each cut is cut-free. We also infer that Cut is not admissible in the Stoic system, based on the standard Stoicaxioms, the T1 rule and the instances of Cut with just two antecedent formulae in the first premiss." 35. Boersma, Gerald P. 2014. "The Logic of the Logos: A Note on Stoic Logic in *Adversus Praxean* 10." *Journal of Early Christian Studies* no. 22:485-498

    "Tertullian sees logic as inhering in language, and he takes this notion from the Stoic tradition. I will argue that it is this Stoic link between logic and language that enables Tertullian to make sense of the scriptural language that distinguishes between the divine persons. After briefly considering the nature of Stoic dialectic, I will analyze the presence of Stoic dialectic in *Adversus Praxean* 10, and conclude by remarking on the theological significance of Stoic dialectic in this passage. Studies on the place of Stoic thought in Tertullian have tended to focus on his appropriation of this philosophical tradition in his ethics and anthropology. There remains a lacuna in any real engagement with the place of Stoic dialectic in his thought." (p. 486)

37. Brittain, Charles. 2005. "Common Sense: Concepts, Definition and Meaning in and out of the Stoa." In *Language and Learning: Philosophy of Language in the Hellenistic Age. Proceedings of the Ninth Symposium Hellenisticum*, edited by

Frede, Dorothea and Inwood, Brad, 164-209. Cambridge: Cambridge University Press

"Charles Brittain also focuses on an important aspect of the philosophical analysis of language: its relation to reality and to the conceptual apparatus in the human mind, which on most theories connects reality to language. To the naive mind, a concept like 'common sense' would not seem to be in need of development since it must have been in place since the dawn of human reasoning. Nor is that the issue of Brittain's paper. Instead, he focuses on the development of atheory of common sense that is based on the connection between a stock of rational conceptions that is the common possession of all humans and the words which map naturally onto those conceptions and so give expression to them. The Stoics themselves did not maintain that everyone can acquire conceptions that successfully capture the essence of things; such success presupposes the uncorrupted mind of the wise; so these normative concepts do not seem to be an obvious source for a theory of common conceptions that are open to all. As Brittain contends, it would nevertheless be wrong to attribute such a theory to the later Platonists despite the fact that they advocated the existence of universally acceptable word-meanings that are open to every human being's grasp. For Platonists regarded these meanings as mere accidental features of the thing in question. What was needed to establish a theory of common sense was a combination of the two theories: the 'preliminary definition' of a term with universal acceptance that lays claim to at least a partial grasp of the thing's essence. En route to this solution Brittain offers,inter alia, a reconstruction of the mechanism at work in the formation of common concepts with abstract and general contents and seeks to solve the conundrum of how definitions of the words corresponding to the concepts are formed. He does so by carefully sifting through different sources that employ Stoic vocabulary (such as 'preconceptions' or 'common conceptions') but that differ significantly from the Stoic view that all humans have at least a partial grasp of a thing's essential properties, rather than mere accidental properties. This assumption paves the way towards a

theory of 'common sense' that establishes a direct connection between the concepts and the objects of the world and explains how ordinary language-speakers have at least an outline understanding of the world. Such a theory, so Brittain argues, is the upshot of Cicero's treatment of preconceptions, in the basis of definitions. The rendering of 'preconception'(prolepsis) as shared by all - bycommunis mens and finally bycommunis sensus - justifies the attribution to Cicero of at least 'a fragment of a theory of common sense' in civic and political matters that everyone in principle can understand. This was a theory that deeply influenced the later rhetorical tradition and thereby became a lasting asset in cultural history." (From the *Introduction* by Dorothea Frede and Brad Inwood, (pp. 8-9)

    "A novel kind of meaning shows up, apparently independently, in the philosophy of the Stoics and of Peter Abelard (1079–1142). For the Stoics it is the *lekton*, or 'sayable' (or, more precisely, the *axioma*, or'assertible', which is one type of *lekton*), and for Abelard it is the *dictum*. The extent of similarity between their doctrines is surprising, especially because there is no evidence of a historical connection between them: as far as we know, Abelard did not have access to any Stoic writings, or reports of Stoic views, on the topic of linguistic content. (1) The similarity is more surprising still, given that Abelard was working within the context of Aristotle's logic, which contains no comparable doctrine. Historians of philosophy have noticed this similarity.(2) When the comparison is drawn it is with reference to the fact of their shared recognition of this new type of content—propositional content. But there are other remarkable points of similarity in their views. First, both seem to have been motivated, at least in part, by the need to disambiguate the notion of'predication in the ancient philosophical tradition. Second, both the Stoics (at least beginning with Chrysippus, the third head of the school) and Abelard were driven by a commitment to anti-realism, and by the need to present an anti-realist, or at least deflationary,

metaphysics. After a brief outline of each of their doctrines, I will compare their views on the points mentioned here." (p. 55) (1) While Augustine's *De dialectica* contains some version of the Stoic doctrine, his treatise does not appear to have circulated until the thirteenth century. Another possible source might have been Cicero, but I know of no evidence to support such a transmission. (2) Martin (2004), who cites Nuchelmans (1973) and Schenkeveld (1984). See also Jacobi (1983) and Lenz (2005). But see Nuchelmans (1973: 152): it is hardly necessary to add that the Abelardian term *dictum* has nothing to do with the Stoic term *lekton*.'"Conclusion. In conclusion, what happens to this new type of linguistic content after Abelard? Theories of propositional content emerge, disappear, and re-emerge throughout the medieval and scholastic periods. The interest is preserved in the continuation of the logical tradition, still rooted in Aristotelian logic, beginning in the twelfth century. Some theorists seemed to have been entirely unconcerned with the ontological implications and underpinnings of these sorts of linguistic content. For example, the author(s) of a thirteenth-century logical textbook called the *Ars Burana* explain(s) that it is best considered to be an extrapredicamental thing (that is, not countenanced in what exists in an Aristotelian ontology of substances and accidents): Note that whether it is called a *dictum propositionis* or the *significatum propositionis* or the *enuntiabile*, it is the same. The enuntiable is that which is signified by the proposition . . . If you inquire what kind of thing it is, whether it is a substance or an accident, it must be said regarding the enuntiable, just as regarding the predicable, that it is neither a substance nor an accident nor is it of any other category. For it has its own per se mode of existing. And it is called 'extrapredicamental', not for the reason that it does not belong to any category, but because it does not belong to any of the ten categories that Aristotle distinguished. It is therefore of a certain category which can be called the 'enuntiable category'. (53) Later, some philosophers attempted to defend a view that took the opposite tack— that is, to defend a view of propositional realism, only to encounter some of the same sorts of anti-realist challenges.(54)" (p. 71) (53) *Ars Burana* (1967: 208). "The purpose of this note is to raise and clarify certain questions concerning deduction in Stoic logic. Despite the fact that the extant corpus of relevant texts is limited, it may nevertheless be possible to answer some of these questions with a considerable degree of certainty. Moreover, with the answers obtained one might be able to narrow the range of possible solutions to other problems concerning Stoic theories of meaning and inference.The content of this note goes somewhat beyond the comments I made during the discussion of Professor Gould's paper 'Deduction in Stoic Logic', in the symposium. I am grateful to Professors Gould and Kretzmann for pointing out the implications of those comments as well as for encouraging me to prepare them for this volume.One of the obstacles to a careful discussion of Stoic logic is obscurity of terminology. Clarification of terminology may catalyze recognition of important historical facts. For example, in 1956 a modern logician suggested (incorrectly) in a historical note [Alonzo Church, *Introduction to mathematical logic*, Princeton. 1956, fn. 529] that the distinction between implication and deduction could not have been made before the work of Tarski and Carnap. But once historians had clarified their own terminology it became obvious that this distinction played an important role in logic from the very beginning. Aristotle's distinction between imperfect and perfect syllogisms is a variant of the implication-deduction distinction and Gould

'Deduction in Stoic Logic' suggests the existence of a parallel distinction in Stoic logic." (p. 169)

58. Crivelli, Paolo. 1994. "Indefinite Propositions and Anaphora in Stoic Logic." *Phronesis.A Journal for Ancient Philosophy* no. 39:187-206

    "If I utter in succession the sentences 'Someone is ringing at the door' and 'He is looking for you', my utterance of the pronoun 'he' is anaphoric on my utterance of the indefinite description 'someone', and the proposition expressed by my utterance of 'He is looking for you' is anaphoric on the indefinite proposition expressed by my utterance of 'Someone is ringing at the door'. Propositions anaphoric on indefinite propositions are very important in Stoic logic because they can be parts of indefinite conditionals and indefinite conjunctions, which are 'universal' and 'particular' propositions.In this paper I aim at establishing two main results concerning the Stoic conception of indefinite propositions and propositions anaphoric on them: the verb υοτατττειν belongs to the jargon of Stoic logic and expresses the operation of subordination, which yields the definite propositions that are relevant to the truth or falsity of a given indefinite proposition; the standard ('sentential') truth conditions of conditionals and conjunctions yield the expected ('quantificational') truth conditions of indefinite conditionals and conjunctions, i.e. truth conditions suitable for 'universal' and 'particular' propositions." (p. 187)

59. ———. 1994. "The Stoic Analysis of Tense and of Plural Propositions in Sextus Empiricus, *Adversus Mathematicos* X 99." *Classical Quarterly* no. 44:490-499

    "*Adversus Mathematicos* (*M*.) x is the second book dedicated by Sextus to the discussion of the physical doctrines put forward by dogmatic philosophers. An extensive section (*M*. X 85-120) deals with Diodorus Cronus' arguments concerning movement.*M*. X 99 occurs within the report of a debate on motion and time between Diodorus and some unnamed opponents. The passage is probably corrupt (as was already noticed by Heintz) [*] and contains some observations on plural propositions and tense which have not yet been

satisfactorily explained. In this paper I argue that Diodorus' critics are Stoics, propose a new emendation of the text, and attempt a plausible account of the remarks on plural propositions and tense. Thereby some light is shed on a hitherto unexplored region of Stoic logic." (p. 490)[* Werner Heintz, *Studien zu Sextus Empiricus*, Halle, 1932.]

61. ———. 2010. "The Stoics on Definitions." In *Definition in Greek Philosophy*, edited by Charles, David, 359-423. New York: Oxford University Press

    "The present study is a reconstruction of the Stoic theory of definition. The topic is vast and the sources are scarce. My focus is on the epistemological and semantic aspects of the Stoic theory of definition.The study's first section explains how important definitions were for the Stoics. The second section expounds the different locations of the study of definitions within the Stoic system of philosophical disciplines. The third section discusses the epistemological side of the theory of definitions on which one of these locations relies. In particular, it addresses two roles played by definitions: sharpening our conceptions in such a way that they are more successfully applied to or withheld from entities, and endowing our conceptions with a systematic structure that makes them suitable for instruction. The fourth section discusses the link between definition and essence: it argues that the Stoics do not think that definitions reveal the essence of what is defined. The fifth section discusses the position of definitions within Stoic philosophy of language: definitions are not linguistic expressions, but sayables of a special kind (distinct from statables)." (p. 359)

    Repris dans: J. Croissant, *Études de philosophie ancienne*, Bruxelles: Ousia 1986, pp. 297-345."Le chemin que nous avons

suivi nous a conduits à interpréter la quatrième formule de Sextus comme l'expression d'un lien causal entre l'antécédent et le conséquent, avec cette précision supplémentaire, qui fait corps avec le texte de Galien, que la proposition ypothétique dans laquelle s'exprime l'endeixis procède à partir de l'effet pour découvrir la cause. Nous débouchons donc sur une présence du lien causal dans la proposition hypothétique qui est à l'opposé de l'interprétation de J. Moreau (126) qui voit dans l'*emphasis* l'inclusion dynamique de l'effet dans la cause, disons plutôt de l'ultérieur dans l'antérieur. Alors que mes réflexions m'ont orientée vers le domaine médical, J. Moreau a cherché à retrouver dans la logique stoïcienne la trace et la mise en forme de la conception stoïcienne de l'ordre du monde et des raisons séminales qui président à son déroulement. Les deux positions impliquent en outre une métaphorisation d'emphasis, un peu différente de part et d'autre, sous l'identité du "περιεχεται δυναμει". C'est aux lecteurs qu'il appartiendra de juger." (pp. 116-117)(126) [Joseph Moreau, "Immutabilité du vrai, nécessité logique et lien causal", *Les Stoïciens et leur logique* (Actes du Colloque de Chantilly, septembre 1976), Paris, Vrin, 1978, pp. 347-360] Cf. p. 84.

Summary: "For the Stoics, the *lekton* is as an intermediary between the thought and the object. They do not exist independently of the mind, but, at the same time, the mind does not create them. Due to this status, they guarantee intersubjectivity of the rational discourse. They are incorporeals that do not exist, but subsist and the Stoic Logos-God guarantees their permanent subsistence. The *Iekta* are semantico-syntactic entities. Their role is analogous to the role of an interlingua used as a tool for automated translation of languages."

    "In his discussion and refutation of the logical theories of dogmatist philosophers in *Adversus Mathematicos* (M.) 8, Sextus Empiricus treats us, among other things, to an account of a classification of propositions (M. 8.93-129). The doctrine reported on here is usually taken to form part of Stoic logic.(1) Together with its apparent counterpart in Diogenes Laertius (D.L.) 7.68-76, this Sextian report is used to reconstruct a theory supposedly held by Stoic philosophers. In what follows I shall try to refute this view and I shall argue that Sextus' report encapsulates a doctrine worked out not by the Stoic, but by the Dialectical school whose most prominent members seem to have been Diodorus Cronus and Philo.(2)First I shall try to show that the two reports by Sextus and by Diogenes resp. are quite different indeed as to their systematic content and that, therefore, both reports must be drawn from different sources. In a second step it is then argued that Sextus' account is based on Dialectical material. Finally, I shall compare the Dialectical classification to be found in Sextus to the Stoic one in Diogenes with an eye to exploring these two divisions as different phases within the development of propositional logic." 72. ———. 1983. "The Stoic Theory of Arguments." In *Meaning, Use, and Interpretation of Language*, edited by Bäuerle, Rainer, Schwarze, Christoph and von Stechow, Arnim, 79-96. Berlin: Walter de Gruyter

    Contents: 1. Relevance of the topic; 2. Concepts involved; 2.1 Arguments; 2.2 Simple and logical concepts; 2.3 A hypothesis on Stoic deduction theory; 3. A commentary on Sextus' passage on invalidity [Adv. Math. 8, 292-294]; 3.1 The context; 3.2 The passage; 4. Deductions; 5. Completeness; 6. Conclusion; Appendix: Possible existence of cut free systems; Bibliography."1. Relevance of the TopicThe Stoic theory of arguments to my mind illustrates one point: If certain ancient doctrines had been properly understood, the corresponding modern theories would have been developed sooner. We would

have had a propositional logic by 1800, we would have had a serious syntax long before transformational grammar. Stoics, in addition, had already something like a speech act theory. In one or two cases modern theories have directly been elaborations of Stoico-Megarian developments: First, Prior's tense logic was influenced by reflections on Diodorus. Second, Kripke's semantics for modal logic was directly influenced by Prior's exposition of the theory of modality of Diodorus Kronos. Compare his truth definition of modal statements with that of Kripke:p is possible now iff p is true now or will be true later (Diodorus).p is possible in our world iff p is true in a world accessible from ours (Kripke).Kripke replaced points of time by possible worlds and the relation "to be now or later" by the accessibility relation. It is not impossible that further study of Stoic theories will contribute in a similar way to modern discussions.It has been proved by Lukasìewìcz and Mates that the Stoic theory of what they called syllogisms contained something we might call propositional logic in modern terms. Mates also brought up the problem of deciding whether1) Stoics contended that their propositional logic was complete; and whether2) Stoic logic actually was complete according to modern criteria (Mates 1961, 81-82).As to the first question, the evidence that Mates adduces is not wholly conclusive, for the passages are little more than consequences of the definition of syllogisms (= valid arguments): According to this definition a syllogism is either a basic syllogism (*anapodeiktos*) or derived from basic syllogisms by the deductive rules(themata) (DL 7.78). From this definition follows that every syllogism (which is not basic) is derived from the basic ones -- the passages adduced by Mates say just that. If it is not clear whether the Stoics actually held that their propositional logic was complete, Becker's attempt toprove the completeness of Stoic logic by reconstructing the missing pieces of the deductive apparatus may seem futile. He has also been severely criticised by Mueller, Frede and others because it is not clear(a) whether the Stoic conditional signei is to be taken as a truth-functional connective or not,(b) how the Chrysippean exclusion of arguments with but one premise can be reconciled with Becker's full use of such arguments in his proofs of semantic

completeness,(c) whether the completeness extended from the part of the system involving only conjunction and negation to other connectives.I now want to reopen the question by arguing that a kind of completeness is indeed to be found in Stoic passages (though not in those Mates adduced) and that an examination of the sources renders some plausibility to the thesis that the Stoics had a system of deduction rules which can be proved adequate according to modern criteria." (pp. 79-80)

73. ———. 1986. "Stoic Syntax and Semantics." In *The History of Linguistics in the Classical Period*, edited by Taylor, Daniel J., 281-306

    Also published in: *Historiographia Linguistica*, 13, 1986 and in J. Brunschwig (ed.), *Les Stoiciens et leur logique*, Paris, Vrin, 1986, pp. 135-147 (2nd edition 2006, pp. 131-148)."Let me now summarize the main points of my exposition of Stoic syntax:1. Stoic *loquia (lekta)* are designated by expressions of a normalized Greek. They have the same structure as these Greek expressions. Thus in most technical uses they serve approximately the same purpose as "semantic structures" or "semantic representations" in modem linguistics and philosophy of language.2. There is an infinity of *loquia* derived by a finite number of recursive rules of four types, lexical, inclusion, combination and transformation rules. Semantic categories like statement, predicate and subject are used in the formulation of these rules which enable us to build complex *loquia* of the various categories from atomar ones *(asuntheta)*. The structure of a compound *loquium* may be revealed by using Chomsky or Montague analysis trees.3. This infinity of *loquia* is related with real things by an analogue of modern model theory. General terms are said to denote individuals according to a variant of multiple denotation theory. Deictic subjects are assigned values, like their modern analogues: individual variables by an assignment *(deixis)*. Statements are either true or false. Complex expressions are valuated in function of their syntactic composition and the values of their parts.4. Denotations of Greek expressions are determined indirectly. *E.g*. appellatives signify appellative subjects, which refer to individuals. Thus appellatives indirectly denote these

individuals too.5. All this would have to be refined by taking into account tense.6. By neglecting tense, plural and subjectivization, Stoic *loquium* theory becomes an analogue of modern first order predicate logic bya) the introduction of n place predicates with arbitrary *n,*b) the introduction of a means to handle relative clausesStoic syntax and related model theory thus proves interesting and comparable to modern treatments." 75. Evans, John David Gemmill. 2011. "The Old Stoa ont the Truth-Value of Oaths." *Cambridge Classical Journal* no. 20:44-47

"Recent works on Stoic logic report that among complete λεκτα only a sub-class was regarded as capable of being true or false: by contrast with statements (αξιωματα), such other sentences as questions, orders and oaths do not bear a truth-value.(1) But the situation is a good deal more complicated than that, at least in the case of oaths, which I propose to examine.In characterising all such utterances as 'sentences' I do not wish to beg questions which will be discussed below. Surface grammar, with its distinctions of indicative, imperative, interrogative and optative, can mislead us as to the real force of an utterance. In the case of oaths there seems to be no preferred form of expression; and it is a matter for deeper philosophical probing to determine their true relation to other speech-acts.The standard view derives its best support from a passage in Diogenes Laertius, which expressly denies truth-value to non-statements.(2) But a similar report in Sextus Empiricus is not so clear. After giving a scheme of complete λεκτα which sets the declarative (αποφαντικον) co-ordinate with the questioning, cursing etc. types, he says that only some of them - namely αξιωματα - were regarded as bearing truth-values.(3) Although the passage may suggest that the declarative λεκτα are identical with the αξιωματα, it does not actually say this, and thus leaves it unclear which types of complete λεκτα do not bear a truth-

value. Ammonius' report of the topic says that the non-statement types 'are all bearers of falsity and truth and might be subsumed under the declarative';(4) but the grammar of his sentence makes it uncertain whether this is his or the Stoic view."     Abstract: "It has been noted before in the history of logic that some of Frege's logical and semantic views were anticipated in Stoicism. In particular, there seems to be a parallel between Frege's *Gedanke* (thought) and Stoic *lekton*; and the distinction between complete and incomplete lekta has an equivalent in Frege's logic.However, nobody has so far claimed that Frege was actually influenced by Stoic logic; and there has until now been no indication of such a causal connection. In this essay, we attempt, for the first time, to provide detailed evidence for the existence of this connection. In the course of our argumentation, further analogies between the positions of Frege and the Stoics will be revealed. The classical philologist Rudolf Hirzel will be brought into play as the one who links Frege with Stoicism. The renowned expert on Stoic philosophy was Frege's tenant and lived in the same house as the logician for many years."

Logic, 21 and 22 April, 1972, edited by Corcoran, John, 151-168. Dordrecht: Reidel

"In their logical theory Stoic philosophers made use of a simple but important distinction alleged to hold among valid arguments, a distinction to which Aristotle had first called attention.(1) They distinguished those arguments whose validity is evident from those whose validity is not evident and so needs to be demonstrated. The Stoics, having supposed that the distinction obtains, raise and answer the question, how does one demonstrate the validity of those arguments whose validity is not plain? The Stoics appear to have set forth both a discursive method of demonstration and a test for validity. In this paper I examine these two facets of Stoic logic.(2)The paper is in three parts. The first is essentially terminological and taxonomic. There I record Stoic definitions of logical terms and I give three Stoic classifications of arguments, appending samples from the writings of Sextus Empiricus.(3) This provides and puts on exhibit an array of typically Stoic arguments to which I refer in the second part of the paper. There I examine Sextus' contention that the disagreement among the Stoics over the criterion of truth for a conditional proposition renders inefficacious the test that had been set forth as sufficient for judging the validity of an argument, and I argue that Sextus' charge has to be qualified. Even if an unqualified form of Sextus' accusation could be established, its importance, I maintain, would be diminished by the fact that the Stoics didn't make extensive use of this test anyhow. As I show in the third part of the paper, the Stoics ordinarily claim to prove the validity of all valid arguments(4) not by means of a test but by means of a calculus of propositions(5) having its base in a theory of deduction, which includes a language consisting of connectives and variables, axiomatic inference schemata, and rules of derivability. I conclude with a statement about the Stoic theory of deduction in relation to systems of logic developed in the 19th and 20th centuries and to Aristotelian syllogistic." (p. 151)(1) *Prior Analytics* I.24b22-26, 27a16-18. The distinction between plainly valid syllogisms and non-evidently valid syllogisms is for Aristotle the distinction

between 'perfect' syllogisms, on the one hand, and 'imperfect' syllogisms, on the other. A perfect syllogism is one in which, as Aristotle frequently puts it, the necessity (of the conclusion if the premises be assumed) is evident. That the Stoics presupposed this distinction is made clear in Part III of this paper.(2) I wish to thank my colleagues, James A. Thomas and Harold Morick, for helpful critical remarks on an earlier draft of this paper. I am also enormously indebted to John Corcoran for many incisive remarks and helpful suggestions on two later versions of the paper.(3) Sextus is the richest source we have for a knowledge of Stoic logic. Being a Sceptic he is extremely critical of the Stoics. He also tends to be tediously repetitious. He appears to have quoted and paraphrased with care, though there aren't always non-circular ways of checking this. As Mates has observed (*Stoic logic* (1961), p. 9), "any parts of Stoic logic which he found either too difficult or too good to refute will be absent from his account", but even so there is enough material in Sextus to extract a fairly good account of the elements of Stoic logic.(4) Mates refers in several places (pp. 4, 58, 82) to and gives evidence for the Stoics' claim that their propositional logic was complete.(5) The Stoics didn't call their logic a calculus of propositions (Diogenes Laertius groups Chrysippus' books dealing with the subject under the heading 'Logic in Relation to Arguments and Moods', *Vitae* VII. 193); but Stoic logic shares so many similarities with modern propositional logic, calling their logic 'a calculus of propositions' while anachronistic is at least not baneful, and it is, in fact, in my view illuminating to use this expression to refer to Stoic logic.

    Reprinted in: A. Graeser, I*ssues in the Philosophy of Language Past and Presen*t, Bern: Peter Lang, 1999, pp. 121-144."Whether or not the Stoics conceived of any "science" corresponding in scope and methods to formal semantics in the sense described, for example, by J. Moravcsik (1) seems hard to determine. Evidence regarding this issue is scanty, particularly in view of the fact that some of the isolated testimonies relating to the Stoic theory of meaning are extremely difficult to assess and still require good deal of extensive analysis. From the meager reports concerning the bare essentials of this theory as incorporated into later manuals and elsewhere, it would appear, however, that in the course of their school's history the Stoics developed a fairly detailed semantic theory. It is a theory of meaning that has invited comparison with modern theories and obviously stood it well. In fact, it is generally agreed that the Stoic account of semantics is superior to and more sophisticated than the more influential one offered by Aristotle in theDe Interpretatione (16a3-18).(2) It is also considered to figure among the very few definitely modern-minded contributions to the systematic study of philosophical problems carried out by ancient Greek thinkers.Semantics in general, according to Stoic philosophers, seems to be an integral part of what they called "Logic" or "Dialectic" respectively, that is, the study of the utterance and the study of the utterance as meaningful. It is integral inasmuch as the Stoic conception of logic is one that depends again on their theory of meaning. In the analysis of meaning three components seem to been distinguished. The components or aspects under consideration are: first, the sign (sèmainon, i.e., that which signifies) which is a phoneme or grapheme; second, the significate (sémainomenon, i.e., that which is signified) which is expressed by the sound which we apprehend as it arises in our mind; and third, the external object referred to." pp. 77-78(1) *Understanding Language* (The Hague, 1975) 21.(2) On this most influential text in the history of semantics, see N.

Annotated Bibliography on the Ancient Stoic Dialectic (Second Part: H - Z)

Bibliography

1. Hájek, Alan. 2009. "Two Interpretations of Two Stoic Conditionals." *Logical Analysis and History of Philosophy* no. 12:206-221

   "Four different conditionals were known to the Stoics. The so-called ‘first’ (Philonian) conditional has been interpreted fairly uncontroversially as an ancient counterpart to the material conditional of modern logic; the ‘fourth’ conditional is obscure, and seemingly of little historical interest, as it was probably not held widely by any group in antiquity. The ‘second’ (Diodorean) and ‘third’ (Chrysippean) conditionals, on the other hand, pose challenging interpretive questions, raising in the process issues in philosophical logic that are as relevant today as they were then.This paper is a critical survey of some modern answers to four of the most tantalizing of these questions; the issues that I will discuss arise out of interpretations of the Diodorean and Chrysippean conditionals as expressions of natural law, and as strict implications.I will reject these interpretations, concluding with my own proposal for where they should be located on a ‘ladder’ of logical strength." "To sum up. I began by reporting briefly the present widely held opinion that Stoic logic was a logic of propositions. I reminded us that in twentieth-century logic, the logic of propositions, consists of rules governing inferences according to their sentence-connectives and that it by no means exhausts the rules of logic. Rather propositional functions or predicates are added to that, and in turn many-place predicates are added. Some investigators have supposed that Stoic logic was confined to a logic of propositions. That restriction may be suggested by the concentration of the Stoics on singular propositions as those which express what exists most clearly and by their claim that all inferences depend on their logic. If, however, the Stoics had no more logic than the logic of propositions, they had no way of accounting for believing (much less for knowing) non-simple propositions in conditional or disjunctive forms, so that such non-simple propositions would be useful in inference.Evidence was introduced that the Stoics had and used a rule of instantiation in conditional propositions. This led us to see a use for their rules about the three kinds of simple propositions, those with indefinite subjects,tis,ti, 'someone,' 'something;' those with definite subjects, demonstrative articles such asoutos,touto, 'this one', 'that thing' and those with intermediate subjects, 'Socrates', 'Dion',anthropos, 'a man'.There is further evidence that the Stoics claimed to be able to rephrase universal propositions of the Peripatetic form as conditional propositions with indefinite subjects. Some philosophers from other schools acknowledged that the conditionals followed from the standard universal. There was disagreement about the converse. The charge was made that the Stoics failed to acknowledge eternal forms and that they replace them by things which existed in the mind only, or rather since they were corporealists in the body of the knower only. Another paper would be required to discuss the place of

these grasps in the Stoic account of knowledge and of ethics, for action involves how I take things." (pp. 155-156)

   "Aristotle, the founder of logic, nowhere defines the concepts of argument and of validity. He simply uses them in his definition of a syllogism as 'an argument in which, certain things being posited, something other than those things laid down results of necessity through the things laid down.'(1)(...)Between Aristotle, writing in the fourth century BCE, and Boole, writing more than two millennia later,(3) only one logician published a system of logic. That was Chrysippus (c. 280–207 BCE), the third head of the Stoic school. Chrysippus's system of propositional logic was dominant for 400 years, until bits of it were eventually absorbed into a confused amalgamation with Aristotle's categorical logic, a bowdlerization nicely described by Speca.(4) For centuries the system from which these surviving bits were extracted was forgotten. Only the careful work of such scholars as Mates,(5) Frede,(6) Hülser,(7) and Bobzien(8)One can show that a conjunction follows from its conjuncts, but not has allowed us to appreciate once again the achievement of Chrysippus.Despite its rigour and soundness, the system is oddly incomplete.One can show that a conjunction follows from its conjuncts, but not that either conjunct follows from the conjunction. One can detach the antecedent from a conditional, but not put it back on; in other words, there is no deduction theorem, no rule of 'conditional proof' or 'ifintroduction.' One can show what follows from an exclusive disjunction and the affirmation or denial of one of its disjuncts, but not what the exclusive disjunction follows from. Further, there is no evidence that anybody ever tried to extend the system.Why was Stoic propositional logic so incomplete? I shall argue that many of its peculiarities can be explained by

the rather restrictive accounts of argument and of validity that Chrysippus adopted as the foundation of his system. The omissions from the system were not accidental oversights, or not just accidental oversights, but were dictated by the requirement that everything demonstrable in the system be a valid argument. With much more complex and restrictive accounts of argument and of validity than those adopted by Woods (*) in his reconstruction of Aristotle's earlier logic, Chrysippus was forced into a much more restrictive formal system than contemporary classical propositional logic." 7. Hülser, Karlheinz. 1983. "The Fragments on Stoic Dialectic: A New Collection." In *Meaning, Use, and Interpretation of Language*, edited by Bäuerle, Rainer, Schwarze, Christoph and Stechow, Arnim von, 235-249. Berlin: Walter de Gruyter

"For the Stoics dialectic was the discipline where they developed their theory of cognition and of language as well as some kind of grammar und formal logic. All those topics were formed into a system and a lot of remarkable statements made about them. Hence, Stoic dialectic had much influence, and founded the western tradition of systematic linguistic theory. But the original writings of the Stoics are, nevertheless, lost. Thus, in order to study the origins of systematic linguistic thought, we have to collect the testimonies and fragments on Stoic dialectic from many scattered sources, i.e. from later authors who mentioned, reported or criticized Stoic ideas. In the last centuries this task was performed by different scholars. I only mention Rudolf T. Schmidt (1) and -- above all -- Hans v. Arnim whose '*Stoicorum veterum fragmenta*' is the famous standard collection of fragments on all the three parts of Stoic philosophy up to now (2). With regard to Stoic dialectic Prof. U. Egli came up with the idea that it would be worth the trouble to collect the fragments once again. He applied for a research program, sponsored by the 'Deutsche Forschungsgemeinschaft (DFG)', and asked me to realize what he had in mind, the result of which is a new collection of fragments on Stoic dialectic, the subject of this paper.The formal data of this new collection are the following ones: The collection which amounts to 1257 fragment-numbers (plus ca. 70 additional a-numbers) embraces about 1800 texts, the greatest part of which is quoted in Greek or Latin as well as translated into German; various commentaries are inserted. All this comes to 978 crowded typewritten pages. Superadded are some indices and an introduction by the editor. The book is entitled *Die Fragmente zur Dialektik der Stoiker* - zusammengestellt, ins Deutsche übersetzt und teilweise kommentiert - von K. Hülser (the abbreviation of which will be FDS), and is forthcoming: In 1982 it is published in 8 volumes within the publications of the 'Sonderforschungsbereich 99' at the University of Konstanz (Fed. Rep. of Germany). This edition, though it has a small number of copies and no ISBN-number, serves its purpose as a citable on for the time being (available in the library of the University of Konstanz), but will be replaced by a more 'genuine' one as soon as possible. [*]As for the kind and the

content of the new collection, three approaches will be offered in the following. The first one starts from the function of collections of fragments in general; it will explain why v. Arnim's collection is insufficient and a new one necessary, and consequently it leads to certain requirements concerning FDS. The second approach, then, starts from the arrangement of fragments in FDS and will show some systematic aspects of Stoic dialectic connected with it. The third one eventually is centered on the problem of intended completeness; in some cases this aim, being unterstood systematically, leads to interesting results though it widens the concept of fragments." (pp. 235-236)(1) R. T. Schmidt, *Stoicorum grammatica*, Halle 1839; repr. Amsterdam 1967. A German translation with an introduction and some additional notes by K. Hülser was published in Braunschweig / Wiesbaden 1979, completed by a bibliography on Stoic dialectic by U. Egli.(2) H. v. Arnim, *Stoicorum veterum fragmenta* Vol. IV (Indices, by M. Adler), Leipzig 1903-1905, 1924; repr. Stuttgart 1964.[* The definitive edition is: *Die Fragmente Zur Dialektik Der Stoiker,* Stuttgart: Frommann-Holzboog 1987-88, 4 volumes.]

9. Iacona, Andrea. 2023. "Valid Arguments as True Conditionals." *Mind* no. 132:428–451

   Abstract: "This paper explores an idea of Stoic descent that is largely neglected nowadays, the idea that an argument is valid when the conditional formed by the conjunction of its premises as antecedent and its conclusion as consequent is true. As will be argued, once some basic features of our naïve understanding of validity are properly spelled out, and a suitable account of conditionals is adopted, the equivalence between valid arguments and true conditionals makes perfect sense. The account of validity outlined here, which displays one coherent way to articulate the Stoic intuition, accords with standard formal treatments of deductive validity and encompasses an independently grounded characterization of inductive validity."

10. Ierodiakonou, Katerina. 1990. *Analysis in Stoic Logic*, University of London, London

    Unpublished dissertation (a PDF version can be downloaded from British Library Document Supply Service).Abstract: "This thesis focusses on the notion of analysis in Stoic logic, that is to say on the procedure which the Stoic logicians followed in order to reduce all valid arguments to five basic patterns. By reconsidering the uses of its Aristotelian homonym and by examining the evidence on the classification of Stoic arguments, I distinguish two methods of Stoic analysis and I discuss their rules: (i) the analysis of non-simple indemonstrables, which constitutes a process of breaking up an argument by means of general logical principles ; and (ii) the analysis of (yllogistic) arguments, which replaces demonstration and is effected by employing standard well-determined rules. The ancient sources provide us with concrete examples illustrating the first type of analysis; however, there is no single text that reports the exact procedure of analysing (syllogistic) arguments. Modern scholars have reconstructed in different ways this type of Stoic analysis; I deal with all of them separately and show that the proposed reconstructions are insightful but historically implausible. Based on the textual materiel concerning the notion of analysis not only in its Stoic context but also in some other of its uses, and especially in mathematical practice, I suggest an alternative reconstruction of the Stoic method of reducing valid arguments to the basic indemonstrables."

    "The Stoic logical system is commonly presented as based on five types of argument called “indemonstrables” (ἀναπόδεικτοι), and undoubtedly, our knowledge of them is

more certain than that of any other aspect of Stoic logic (*M*. 8.224-227; P. 2.157-158; D.L. 7.80-81 =FDS 1131,1128,1036). Fundamental though it may have been, however, even this part of Chrysippean doctrine has not escaped significant development overtime. In fact, there are brief remarks in our main sources that explicitly suggest the existence of alternative lists of indemonstrable arguments accepted by different groups of Stoic logicians:εἰσί δὲ καὶ ἀναπόδεικτοί τινες, τω μὴ χρὴ£ειν ἀποδείξεως, ἄλλοι μεν παρ' ἄλλοις, παρά δὲ τω Χρυσίππω πέντε (D.L. 7.79);πολλούς* μέν αναπόδεικτους ὀνειροπολουσιν, πέντε δὲ τούτους μάλιστα εκτίθενται (*?*. 2.157 = FDS 1128).Fortunately enough, some interesting passages, also belonging to the later tradition, elaborate extensively on the criticisms and alterations, which the standard list has undergone in the centuries following its introduction. The present paper concentrates on these texts and points out only a few of the issues raised by these accounts of unorthodox developments of the doctrine of the five basic indemonstrables. More specifically, I intend to focus on two alternative lists of indemonstrable arguments that differ from Chrysippus' list in adding extra types of inference as well as in objecting to the usefulness and application of others."     "Conclusion. As I indicated at the beginning of the chapter, it was only towards the middle of the twentieth century that Stoic logic began to be studied on its own merits and not as an appendix to Aristotle's syllogistic. To a great extent it was the revival of interest in the logical contributions of the Stoics that convinced scholars to investigate more carefully the other parts of Stoic philosophy, namely ethics and physics. The literature on Stoic logic that has since been published has managed to reconstruct a logical calculus, which still surprises us with its sophistication and its similarities to modern systems of logic. At the same time, though, it also has become clear that we

should not fail to take seriously into account what differentiates Stoic logic from its modern counterparts. For only in this way can we get a better understanding of how the history of logic has evolved in close connection to the other parts of philosophy, and more importantly, only in this way do we have a chance to appreciate the peculiar features and insights of ancient logic."     '"I turn now to the principal claim of Professor Hay's paper (*): that the logic of the Stoics was not exclusively a logic of propositions but that it included arguments whose major premiss was, in effect, a universally quantified conditional, "(x) (If Ax, then Bx)," instead of the ordinary conditional composed of two self-contained sentences "If A, then B." Hay brings evidence of three sorts to bear in favor of this thesis. (1) First of all, there are the logical and historical considerations already

alluded to: how could the Stoics have claimed to reduce all valid arguments, including the Aristotelian syllogism, to their five undemonstrated schemata, if they did not have some device equivalent to quantification"? (2) Secondly, there is the question of the epistemic function of logic: where the major premiss is a conditional such asIf Plato lives, then Plato breathes interpreted truth-functionally, and I am able to draw the conclusionPlato breathes, how could I be in a position to know or believe the conditional premiss without already knowing or believing the conclusion? (For the truth of the conditional depends upon the truth of the consequent in this case, since the antecedent is taken as true.) But the epistemic problemwill not arise in this form if the major premiss may be universally quantified. I do not need to know that Socrates breathes - I do not need to know anything about Socrates at all - in order to agree that if anything is alive, that same thing (or animal) breathes. (3) Furthermore, Hay calls our attention (and apparently for the first time) to several decisive texts in which the Stoics make theoretical use of generalized conditionals of the form 'If anyone is born under the Dog Star, he will not die at sea.' Finally (4) Hay suggests that the Stoic motive for the alleged reformulation of universal propositions as conditionals was their desire to avoid positing essences or classes or universals of any sort.I am inclined to believe that Hay's principal thesis is correct, at least in principle; but it raises new problems almost as serious as those it solves. First of all, did the Stoics realize that they were introducing quantification when they offered a conditional compounded in this way of two indefinite propositions? If so, this seems to defeat their claim that all valid arguments could be reduced to their five undemonstrated forms. But if they didnot see this, they were poorer logicians than Aristotle at a crucial point they will have set up a propositional calculus only at the cost of distorting the facts concerning quantification. We seem to be faced with a dilemma. Either Stoic logic is based solely on the propositional connectives, and then it is epistemically sterile. (This appears to be Mueller's view.) Or else it involves generalized conditionals and a rule of instantiation, but then it is defective as logic since we are left without any account of the quantified conditional.

(a) I suspect that the latter is likely to be true, and that by formulating indefinite conditionals to achieve generality, and then instantiating for a definite, ostensibly indicated subject, the Stoics believed that they could in fact do without quantification, i. e. without any theory involving 'all' and 'none.' " (pp. 163-164)(*) [*Stoic Use of Logic*, 1969](a) I have oversimplified in order to put the problem sharply. It is worth noting that the decisive text fromDe Fato is explicitly meta-linguistic: "If G (a generalized conditional) is true, then C (an ordinary conditional) is also true" (see Hay, note 15). Therefore arguments making use of such a rule of instantiation will be valid but not necessarily reducible to one of the five undemonstrated schemata (compare the examples in Mates, p. 64 and p. 65 n. 32). In the Symposium discussion in St. Louis several suggestions were made for reconstructing the Stoic generalized conditional without quantification theory, as the meta-linguistic representation for a "bundle of individual conditionals" (Quine,Methods of Logic, p. 13), much as an axiom schema may represent an infinite set of individual axioms. I leave it to others to decide how far such a suggestion can be worked out systematically.

22. Labarge, Scott. 2002. "Stoic Conditionals of Necessity and Explanation." *History and Philosophy of Logic* no. 23:241-252

    Abstract: "An examination of a particular passage in Cicero's *De fato* (*Fat*. 13-17) is crucial to our understanding of the Stoic theory of the truth-conditions of conditional propositions, for it has been uniquely important in the debate concerning the kind of connection the antecedent and consequent of a Stoic conditional should have to one another. Frede has argued that

the passage proves that the connection is one of logical necessity, while Sorabji has argued that positive Stoic attitudes toward empirical inferences elsewhere suggest that that cannot be the right interpretation of the passage. I argue that both parties to the debate have missed a position somewhere between them which both renders a connection between antecedent and consequent that is not merely empirical and makes sense of the actual uses to which the Stoics put the conditional. This will be an account which grounds the connection between antecedent and consequent in *aprolêpsis*, a special kind of concept which plays a special epistemological role for the Stoics, especially in grounding scientific explanations. My contention will be that Stoic conditionals are true when there is a conceptually necessary connection between antecedent and consequent such that the former explains the latter via *aprolêpsis*."

23. Leeman, Anton Daniël. 1954. "Posidonius the Dialectician in Seneca's Letters." *Mnemosyne* no. 7:233-240

    "In this article, which is the fourth and last of a series of papers on some aspects of the relations between Posidonius and Seneca's later epistles, I shall discuss a number of dialectical passages in these epistles, their philosophical source - Posidonius, as I hope to establish - and finally, the philosophical attitude of this source (1).In my examination of Seneca's conception of dialectics, I have already stressed his scepticism and distrust of this way of arguing (III). In his earlier letters especially he appears to regard dialectics as a waste of time. More than once he indicates how, in his opinion,the sophisms of the dialecticians ought to be treated, viz. with the help of striking examples from history and every-day life, in the form of rhetorical *sententiae*. This opinion, however, does not keep him from paying more and more attention to dialectical disputations.He apparently records them from technical, philosophical sources." General conclusions 193; Bibliography 197; Index Nominum 209-214."This study examines the dialectical origin of syntactical description in our traditional grammar. Two famous texts take pride of place in containing the first descriptions of a 'clause' in Greek literature, namely Plato's *Sophist* and Aristotle's *Peri hermeneias*. These descriptions arose in the context of a more general inquiry into the nature of truth and language which gave rise to the first speculations on the form of the logical proposition in Greek Antiquity. By establishing as the unit of propositional analysis a combination of two linguistic items, *Onoma* (`name', 'noun') and *rhema* (`verb', 'predicate') these

philosophers laid the foundation for the doctrine of the parts of speech which later constituted the core of ancient grammar. Their concern was to establish the two functional constituents of the proposition, roughly the subject and the predicate, by means of which true and false statements could be made. The object of their concern -- the minimal statement consisting of a noun and a verb -- came to figure as the point of departure for syntactical analysis when it began to be pursued in independent grammatical treatises. In the grammar of Apollonius Dyscolus (2nd century A.D.), which is our first extant grammatical treatise on syntax, syntactical description proceeds from the minimal self-sufficiency (*autoteleia*) of the linguistic expression. But the description of the minimal sentence by Apollonius bears witness to the distinctly Stoic origin of the notion of self-sufficiency." (p. 11)

Glossary 132; Bibliography 137; Indices -141-148."There are those who cannot write history without praising and blaming.Such persons, if they are favorably impressed by the newer studies of ancient and medieval logic, will feel that just as Prantl and Zeller praised Aristotelian logic and disparaged that of the Stoics, so now we should praise the Stoic logic and condemn the Aristotelian.There are also those who cannot write history without embracing certain huge generalizations which are supposed to make history intelligible.This sort of investigator will admit that Prantl, Zeller, and many others have been greatly misled by one such generalization, according to which Hellenistic times were times of decadence and decay in all

branches of learning, and especially in philosophy. But he will conclude nothing more than that Prantl, Zeller, and the others have embraced the wrong generalization.In other words, he would propose that we excogitate another (and presumably better) hypothesis about Greco-Roman history and then proceed as before.Both tendencies are inimical to honest historical writing. There is no reason whatever to believe that an adequate history of logic or of anything else will have the relatively simple structure of a novel. The great generalizations, which are supposed to make the chaos of events intelligible, are, at best, of heuristic value. It must be remembered that they require more evidence than would be required for the support of any of the particular conclusions to be deduced from them. Hence, any conclusion based on such a generalization either can be established without the generalization or else is not warranted at all. But these grand views may well have no heuristic value either, for, as is amply demonstrated by the comments of Prantl and Zeller on Stoic logic, they sometimes have the effect of blinding the scholar to facts which he would otherwise be able to see.It is difficult to understand how any historian motivated by a desire to discover the truth (rather than by the desire to tell a good story) could share the satisfaction of Prantl and Zeller over the loss of the Stoic writings." 37. ———. 1988. "The Stoic Notion of Relatives." In *Matter and Metaphysics. Fourth Symposium Hellenisticum (Pontignano, August 21-28, 1986)*, edited by Barnes, Jonathan and Mignucci, Mario, 129-221. Napoli: Bibliopolis

    "The fragments of the Stoics which are explicitly concerned with a theory of relations are few, scattered and difficult to interpret. The largest of them is preserved in Simplicius' commentary on the *Categories* (165.32 ff.;SVF ii 403) and it expounds an important distinction which the Stoics made between two kinds of relatives. This doctrine is attributed to the

Stoics, but no representative of the school is mentioned. Echoes of it are reflected in some sceptical arguments reported by Sextus Empiricus (*M* VIII 455-456) and Diogenes Laertius (IX 87-88) (1). Besides, there are some related passages in the scholia on Dionysius Thrax's *Ars grammatica* which are supposed to go back to Apollonius Dyscolus (II century A.D.), where, although the Stoics are not explicitly named, Stoic material is believed to be used and referred to (2). There is also a text of Sextus (*M* VIII 453-454; *SVF* II 404) in which a general definition of relatives is attributed by him to the Dogmatists and reasons can be given for saying that his Dogmatists must be identified with the Stoics. Finally, some passages in which the name of Chrysippus is tied to questions which are supposed to concern our problems are difficult to interpret and on closer inspection they reveal themselves not to pertain to the theory of relatives (3).In the face of this complicated situation in our sources, I will examine first Simplicius' passage, trying to disentangle it from spurious connections with other parts of the Stoic doctrine which have generated more than one misunderstanding of it. Secondly, I will inquire to what extent a possibly general definition of relatives implied in Simplicius' distinction is consistent with the statements reported by other sources, in order to determine whether Simplicius' report can be inserted in a coherent framework.This sketch of the plan of our inquiry shows that we confer a central role on Simplicius' passage, and this assumption might be disputed, since Simplicius is a late authority and no Stoic master of the first generation is mentioned in it. We will discuss these problems later. Whatever their solution might be, it must be pointed out that Simplicius' text is almost the only one in which a relevant aspect of the Stoic doctrine of relatives is expounded and discussed. The other sources are much vaguer and mostly concerned with a general characterization of the notion of relative. Therefore, it is difficult in this situation not to confer a special position on Simplicius passage." pp. 129-1301) These texts are not found in von Arnim's collection. They will be discussed in section VIII. (2) These passages too are not in von Arnim. We will examine them later (cf. sections XI-XII).(3) I am thinking especially of

three passages we will consider later, namely Varro *De lingua latina* X 59 (SVF a 155); Plutarch, *De Stoicorum repugnantibus* 1054EF (*SVF* II 550); Aulus Gellius *Noctes atticae* VII 1, 1-6 (*SVF* II 1169): cf. sections XIV and XV.

38. ———. 1993. "The Stoic *Themata*." In *Dialektiker und Stoiker. Zur Logik der Stoa und Ihrer Vorläufer*, edited by Döring, Klaus and Ebert, Theodor, 217-238. Stuttgart: Franz Steiner

    Reprinted in Andrea Falcon, Pierdaniele Giaretta (eds.), *Ancient Logic, Language, and Metaphysics: Selected Essays by Mario Mignucci*, New York: Routledge 2020, Part I, Essay III."One of the classical problems of Aristotle's syllogistic is how to interpret the reduction of imperfect to perfect syllogisms. Second- and third-figure syllogisms are imperfect, that is, not self-evident syllogisms, and they are shown to be valid by linking them to the perfect ones, namely the syllogisms of the first figure. (1) This link is normally interpreted as a deduction of imperfect syllogisms from perfect ones by means of some implicit rules of inference and some previously stated theorems mainly concerning the conversions of propositions. Aristotle does not make explicit the arguments by which imperfect syllogisms are derived from perfect syllogisms, and scholars have proposed different ways to formalize these deductions. (2) What is common to all these views is that they impose something on the text, that is, a formalization of an informal reasoning that is only sketched.It is the Stoics who produced a sort of formalization of a metalinguistic theory of deduction, although the Aristotelians, as usual, claimed that Aristotle had already thought of everything and that the Stoics merely copied him by adding a few useless details.(3) The Stoics presented five types of arguments, which they called ‘ἀναπόδβικτοι’, "indemonstrables." Among them were a version of *Modus Ponens,* a version of *Modus Tollens*, and three other elementary inferences of conjunction and disjunction." (p. 217) (1) Cf. Patzig (1969) 51 ff.(2) It is sufficient to refer to the reconstruction put forward by Lukasiewicz (1957) 51 ff. and, on the other hand, of the more recent proposal of Corcoran (1974a) 85-131, where natural deduction is used to formalize Aristotle’s proof. The Lukasiewicz approach has been

considerably improved by Patzig (1969) 137 ff.(3) l am thinking in particular of a passage from Alexander (*in AP*r. 284.12 ff.; cf. text [G]). We will discuss it in detail later.ReferencesCorcoran, J. (1974a). *Aristotle's natural deduction system*. In: Corcoran, J. (1974b) 85-131Corcoran, J. (ed.) 39. Milne, Peter. 1995. "On the Completeness of Non-Philonian Stoic Logic." *History and Philosophy of Logic* no. 16:39-64

    Abstract: "The majority of formal accounts attribute to Stoic logicians the classical truth-functional understanding of the material conditional and exclusive disjunction.These interpretations were disputed, some Stoic logicians favouring modal and/or temporal analyses; moreover, what comes down to us of Stoic logic fails to secure the classical interpretations on purely formal grounds.It is therefore of some interest to see how the non-classical interpretations fare. I argue that the strongest logic we have good grounds to attribute to Stoic logicians is not complete with respect to the non-classical interpretations of disjunction and the conditional."

40. Mueller, Ian. 1969. "Stoic and Peripatetic Logic." *Archiv für Geschichte der Philosophie* no. 51:173-187

    "We know that one of the issues dividing the Stoics and the Peripatetics concerned the use of logic. Alexander [of Aphrodisias] (1) insists that only Peripatetic logic is an organon for philosophy, an instrument for making unknown things known through known premisses. Since the Stoics called logic a part of philosophy, they may well have considered their propositional logic a theoretical discipline for which epistemological considerations were irrelevant. This modern attitude seems quite commensurate with the Stoics' presentation of logic. They seem to have been interested in technical devices and formalization for its own sake.I suggest,

then, that an important disagreement between the Peripatetic and Stoic logicians concerned the power of their respective logics to represent arguments. The Peripatetic claims were that all scientific proofs are categorical syllogisms and that the inference schemata of the Stoics represented techniques of argument having no place in science. The Stoic reply was that the first claim is false since there are very elementary relational arguments in mathematics which are not syllogisms. Moreover, they pointed out that all conclusive arguments, including categorical syllogisms, could be represented as propositional arguments by a (trivial) technical device. Formally the Stoics held an unassailable position, but they were vulnerable to attack on methodological grounds, since establishing the truth of the premisses of the newly formulated argument seemed to involve making an inference in terms of the old logic. The Peripatetics therefore insisted on the claim, believed for many centuries after them, that their logic was the instrument of science. We do not know the Stoic response to this claim, but it is reasonable to suppose that they retreated to the view that the theory of deductive inference was a technical discipline studied for some ethical end perhaps, but not as the method of scientific discovery." (p. 184)(1) *In Analyticorum Priorum* 1 ff.

41. ———. 1978. "An Introduction to Stoic Logic." In *The Stoics*, edited by Rist, John M. Berkeley: University of California Press

    "The charge of uselessness permeates the ancient literature on Stoic logic. Alexander [of Aphrodisias] is very concerned to defend Aristotelian logic as the tool(organon) of philosophy and science, a means for making unknown things known through known premises. For Sextus no logic is capable of serving these functions. The gist of both men's attack on Stoic logic is that with its arguments there is no way to establish the premises without first establishing the conclusion. The attack is usually made in terms of the first undemonstrable argument and depends upon the truth-functional interpretation of the conditional. Suppose one wishes to prove 'the second' by establishing 'the first' and 'If the first the second.' Then if 'the first' is established, the only way to establish 'if the first the second' is to establish 'the second,' i.e., to establish the

conclusion one is trying to prove. Similar objections could be raised against the other undemonstrable arguments. In each case, when the second premise is taken as true, then the obvious truth-functional argument for the first premise requires establishing the truth of the conclusion. There is no way out of this situation, a fact that strongly suggests that Sextus's insistence on applying the truth-functional interpretation to the conditional represents an argumentative device rather than an accurate reflection of standard Stoic doctrine. If the first premise of an undemonstrable argument expresses a stronger than truth-functional connection between its component propositions, there is no reason why the first premise cannot be established independently of the conclusion.Of course, the position I have just ascribed to the Stoics means that philosophically a great deal of weight must be placed on the knowledge of necessary connections between propositions. Many of Sextus's arguments are directed against the possibility of such knowledge. To consider these arguments would take us outside the domain of logic and into epistemology. The point I wish to make is that the Stoics could have claimed universality for their propositional logic without subjecting themselves to attacks on grounds of uselessness. But to what use did the Stoics put their logic? It is tempting to suppose that the Stoics might have treated logic as a technical discipline developed for its own sake. The picture of Chrysippus analyzing innumerable arguments into the undemonstrable points makes it seem certain that to some extent logic was pursued for its own sake. But at least some Stoics thought of logic as more than a self-sufficient technical discipline.(...)The most important inferences from signs would be those based on he first undemonstrable syllogism. Questions about the viability of inferences from sign to thing indicated or commemorated would almost certainly end up as questions about the connection asserted to hold in the first premise, i.e., as questions of metaphysics or epistemology. One cannot expect logic to settle such questions, nor is there any reason to think the Stoics expected it to. The thrust of their logic was to provide a framework in which questions of inferential validity could be settled and questions that fell outside of logic, e.g.,

whether sweat implies the existence of pores, made precise. It seems fair to say that Stoic achievement in this area remained unparalleled until the time of Leibniz." (pp. 22-25)

42. ———. 1979. "The Completeness of Stoic Propositional Logic." *Notre Dame Journal of Formal Logic* no. 20:201-215

    "In this paper I wish to pursue in more detail the question of the completeness of Stoic propositional logic. I shall bring out certain anomalies in Becker's [1957] argument which obscure the precise sense in which his system is complete. The Kneales' system (*) will be shown to be complete in a stronger sense than Becker's but not to be as historically plausible a reconstruction of the Stoic theory. In conclusion I shall suggest a modification of both systems which is historically more plausible than either and also complete in the stronger sense. In the course of the paper I will also discuss other logical and historical points about the systems.I shall take for granted the truth-functionality of the Stoic propositional connectives but disregard interdefinability relationships. I will also formulate the systems of Becker and the Kneales in ways which diverge slightly but unproblematically from their own presentations." 50. ———. 2004. "From Aristotle's Syllogistic to Stoic Conditionals: *Holzwege* or Detectable Paths?" *Topoi. An International Review of Philosophy* no. 23:113-137

    "This paper is chiefly aimed at individuating some deep, but as yet almost unnoticed, similarities between Aristotle's syllogistic and the Stoic doctrine of conditionals, notably between

Aristotle's metasyllogistic equimodality condition (as stated at *Prior Analytics* I 24, 41b27-31) and truth-conditions for third type (Chrysippean) conditionals (as they can be inferred from, say, Sextus Empiricus *Outlines of Pyrrhonism* II 111 and 189). In fact, as is shown in §1, Aristotle's condition amounts to introducing in his (propositional) metasyllogistic a non-truth-functional implicational arrow ", the truth-conditions of which turn out to be logically equivalent to truth-conditions of third type conditionals, according to which only the impossible (and not the possible) follows from the impossible. Moreover, Aristotle is given precisely this non-Scotian conditional logic in two so far overlooked passages of (Latin and Hebraic translations of) Themistius' Paraphrasis of *De Caelo* (CAG V 4, 71.8-13 and 47.8-10 Landauer). Some further consequences of Aristotle's equimodality condition on his logic, and notably on his syllogistic (no matter whether modal or not), are pointed out and discussed at length. A (possibly Chrysippean) extension of Aristotle's condition is also discussed, along with a full characterization of truth-conditions of fourth type conditionals."

51. ———. 2006. "*Boethiana*. La logica stoica nelle testimonianze di Boezio: nuovi strumenti di ricerca." *Elenchos* no. 27:377-408

    "In view of the importance of Boethius' "In Ciceronis Topica" as a source for Stoic logic, argues for the constitution of an index of divergent readings between the editions of Orelli (Zurich 1833) and Migne, including those omitted by Stangl (1882). Such an index would show that while Orelli's edition is better, sometimes the reading of Migne is to be preferred. Includes considerations on the gradual Stoicization of Aristotelian syllogistics, on Boethius' reliability as a source for Stoic logic, and on the genuine *editio princeps* of Boethius' "De topicis differentiis" (Rome 1484, rather than Venice 1492."

    Chapter 4. The Stoic *lekton* 45; 5. The Stoic *axioma* 75-88."The Stoic conception of the bearers of truth and falsity centres around the notion of *axioma*. As an *axioma* is a species of the genus *lekton*, I shall first discuss the nature of the *lekton*. It will be maintained that the word *lekton* must have had several shades of meaning, although the deplorable state of our sources makes it impossible to reach a high degree of certainty about the exact borderlines between these different nuances and their ascription to definite authors or periods." (p. 45)"As we saw in the foregoing chapter, an *axioma* is a complete and independent *pragma* which is expressed in a speech act of asserting. The complete and independent *pragma* is the thought of an action or passion and its indispensable complements. In so far as this *pragma* is put into words it is a *Iekton*; in so far as it is expressed in a speech act of asserting it is an *apophanton* or *axioma*, an asserted thought-content. A *pragma* such as 'Plato liking Dion' can be expressed in different speech acts: for instance, in a yes-or-no question, 'Does Plato like Dion?', in a wish, 'May Plato like Dion', or in an assertion, 'Plato likes Dion'. On the other hand, the same type of speech act, say asserting, may be related to different *pragmata*; for I

may assert many different things. Reflections of this kind must have led the Stoics to a distinction between the generic element of the *pragma* or *Iekton* and the specific element of the speech act in which a certain thought is expressed.As a rule, then, an *axioma* is a thought-content which is in fact asserted. Nevertheless, the Stoics used the name *axioma* also for the antecedent and consequent of a conditional, although as parts of the composite whole these are not actually asserted. This may be accounted for by the fact that *axioma* originally meant that which is assumed or taken to be true. Or, as I suggested at the end of 4.2.5, the Stoics may have regarded the antecedent and consequent as potential *axiomata*, just as they held that a privative assertion of the form 'Un(kind he is)' contains the potential *axioma* 'Kind he is'. Such an assertable would lie somewhere between the neutral *pragma* or Iekton and the factually asserted *axioma*." (p. 75)

    "1. The problemTo the best of my knowledge, there is no positive definition of *elenchos* in the surviving evidence on Stoic logic. What we find instead is the well-known definition of irrefutability (ἀνελεγξία) as that "strength in the *logos*, so as not to be carried off by it into the contradictory" (ισχύν εν λόγω, ώστε μή ἀπάγεσθαι ὑπ' αὐτου εις* τό αντικείμενου) (Diogenes Laërtius 7.47). Yet, an account of the former could be inferred turning upside down the latter. For, if an irrefutable *logos* is a *logos* that cannot be carried off into the contradictory because of its strength, conversely a refutable *logos* might plausibly be a *logos* that can be carried off into the contradictory because of its weakness. Accordingly, to carry the *logos* of an interlocutor off into the contradictory (to 'refute' it) might mean to reduce it to the contradictory of what it assumes to be the case and hence to self-contradiction. If so, *elenchos* should not be thought of here in terms of a generic dependence on the intention of those who use it. More specifically, it should be taken as the procedure by which in the Socratic fashion inconsistent and paradoxical consequences are drawn starting from the interlocutor's own assumptions - from the premisses of his logos.(1) But what would an operation of this sort mean in a philosophical system like the Stoic one? What sort of *elenchos* would we be faced with? In what follows an attempt is made to look into the matter from the standpoint both of the logical theories of the Stoics and the technical strategies they are said by the ancient sources to have adopted in their arguments." 62. Roberts, Louis. 1970. "Origen and Stoic Logic." *Transactions and Proceedings of the American Philological Association* no. 101:433-444

    "A principle of Neoplatonic theurgy was that in working magic spells one must never translate foreign words.(1) Origen, the Christian Neoplatonist of Alexandria, refers to this principle several times.These reference as well as numerous other problems cannot be understood apart from Origen's use of certain principles derived from Stoic logic. How deep in debt Origen was to Stoicism has not yet been determined, but his use of Stoic logic has been almost entirely ignored(.2)In this paper I shall indicate three areas in Origen's works which may have been greatly influenced by Stoic logic, the problem of

names, the question of the truth-value of propositions and the use of argument schemes.The thread connecting all three areas is the general Stoic doctrine of truth. I suggest that a good deal more Stoic logic may lurk hitherto undetected in Origen." (p. 433)(1) See E. R. Dodds, "Theurgy and its Relationship to Neoplatonism," *Journal of Roman Studies* 37 (1947) 63. Sufficient bibliography may be found in this article. The principal classical statement is Iamblichus, *De Myst*. 7, 5.(2) The chief work on the subject of Stoicism in the Fathers, Michel Spanneut, *Le stoïcisme des Pères de l'Église* (Paris 1957) ignores Origen completely, treating the period ending at A.D. 230. Other works which treat the problem but ignore the question of logic are: Henry Chadwick, *Early Christian Thought and the Classical Tradition* (New York 1966); A. H. Armstrong and R. A. Markus, *Christian Faith and Greek Philosophy* (New York 1960); Henry Chadwick, "Origen, Celsus and the Stoa," *The Journal of Theological Studies* 48 (1947) 34-48.

63. ———. 1972. "Lucretius 1.857-58 and Stoic Logic." *The Classical World* no. 65:215-217

"Let us consider lines 857-58 of Book 1:*at neque reccidere ad nilum res posse neque autemcrescere de nilo testor res ante probatas*The *res* of line 857 refers to something physical, whereas res in the next line refers to a series of previous proofs or propositions. I suggest that Lucretius is using res in line 858 in the Stoic logical sense of *pragmata* and that he is consciously doing so. The Stoic usage is given, for example, in a passage of Sextus Empiricus. The sense is "the meaning of the proposition" and it is contrasted with the physical bodies of "the sound" and the "object" or "existing referent."This is the same contrast we find in lines 857-58 above. The first *res* refers to physical bodies and the second to the *lekton* which Seneca explains as an *enuntiativum quiddam de corpore, quod alii effatum vocant, alii enuntiatum, alii dictum*.(5)The *enuntiativum* or proposition to which *res* in 858 refers is the series of proofs in 665-75. These lines are in turn a summary of arguments against creation *ex nihilo*." (p. 216)(5) *Ep. mor*. 117.13. The larger context reads: Sunt, inquit, naturae

corporum, tamquam hic homo est, hic equus. Has deinde sequuntur motus animorum enuntiativi corporum. Hi habent proprium quiddam et a corporibus seductum, tamquam video Catonem ambulantem. Hoc sensus ostendit, animus credidit. Corpus est, quod video, cui et oculos intendi et animum. Dico deinde: Cato ambulat.Non corpus, inquit, est quod nunc loquor, sed enuntiativum . . .

70. Speca, Anthony. 2001. *Hypothetical Syllogistic and Stoic Logic*. Leiden: Brill

    Contents: Acknowledgments VII; Abstract IX; Preface XI-XIII; 1. The Aristotelian Background 1; 2. The Greek Commentators on Aristotle 35; 3. Boethius:On hypothetical syllogisms 67; 4. Boethius:On Cicero's Topics 101; References 135; General index 139; Index locorum 141.Abstract: "Aristotle recorded his intention to discuss hypothetical syllogistic fully (*An. pr.*

50a39), but no such treatment by him has been available since at least A.D. 200, if even it ever existed. The contributions of his successor Theophrastus have also perished, as have those of his followers of the subsequent few centuries. At the same time, almost all of the surviving sources, especially the Greek commentators and Boethius, did not report hypothetical syllogistic accurately.Rather, they conflated it with Stoic logic, which it resembles in some respects, but from which it is significantly different. Modern scholars, who have not appreciated the nature or extent of this conflation, have unintentionally perpetuated the problem. As a result, the original form of hypothetical syllogistic has been misunderstood, and part of the influence of Stoic logic in late antiquity has remained unclear.This book is an account of the conflation of hypothetical syllogistic and Stoic logic. The first chapter is a study of Aristotle's remarks on hypothetical syllogistic, which suggest that it was not a sentential logic such as the Stoics would develop. The second chapter details the conflation as it appears in the Greek commentaries on Aristotle, which consists principally in a confusion between the original Peripatetic division of hypothetical statements and syllogisms, whose criteria are semantic, and the Stoic division of complex propositions and inference schemata, whose criteria are syntactic. The third and fourth chapters focus on Boethius's *On hypothetical syllogisms* and *On Cicero's Topics*, in which even further conflation demonstrates that hypothetical syllogistic and Stoic logic had completely ceased to retain their distinct natures by the end of antiquity."

71. Stakelum, James W. 1940. *Galen and the Logic of Propositions*. Romae: Angelicum

    "These pages, restrictedly entitled *Galen and the Logic of Propositions*, originally formed part of an academic dissertation, *Galen's Introduction to Dialectic*. The threefold purpose of the larger study was to present Galen's *Dialectic* in a clear light, to examine his doctrine and weigh its importance as to originality or historical precedent, and from these considerations to draw conclusions as to its influence on succeeding generations. The doctrine, scattered throughout the

Galenic text, was gathered under five headings: I. Galen's Introductory Remarks; II. Logic of Propositions; III. Aristotelian Term Logic; IV. Other Classes of Syllogisms; V. Applied Logic. Owing to the limited size of the volumes of this series, published under the sponsorship of Father I. M. Bochenski, O. P., it is impossible to publish here the whole result of the inquiry. Accordingly, we have selected for presentation our Introduction -- rearranged as Part One in several short chapters -- and the most important portion of our examination of Galen's *Dialectic*, dealing with the logic of propositions. The latter section is divided into three parts. A brief conclusion completes the essay.It is traditional to attribute to Galen an eminent position in the field of logic, but rarely do we find specific reasons assigned for this eminence. The composition of this dissertation has, for me, definitely determined Galen's position in the history of logic. It is hoped that it will serve a similar purpose for others."

73. Stump, Eleonore. 1987. "Boethius's in Ciceronis Topica and Stoic Logic." In *Studies in Medieval Philosophy*, edited by Wippel, John F., 1-22. Washington The Catholic University of America
"Besides what In *Ciceronis Topica* shows us about Boethius, it is also a valuable source for us as a witness to the thought and culture of his period.(...)"But perhaps the most interesting unexplored section in In *Ciceronis Topica* is Boethius's presentation of Stoic logic, and that is the part I want to concentrate on in this paper. Rather than dwell on the main theme of *In Ciceronis Topica*, the art of discovery and its instruments, the *Topics*, I want to focus instead on just that small part of Boethius's commentary in which he relates the *Topics* to Stoic dialectic or logic and reveals his understanding of that part of Stoicism. We are beginning to understand the

ancient art of discovering arguments, and it has garnered increasing attention among contemporary scholars. But as far as I know, Michael Frede (30) is alone among recent historians of philosophy in considering Boethius's contribution to our understanding of Stoic logic; and even he gives only a brief discussion of a small part of the relevant Boethian text. So in what follows I will concentrate on just the fifth book of *In Ciceronis Topica*, in which Boethius discusses the so-called undemonstrated modes or argument forms of the Stoics. I need to make plain here that my area of interest and expertise is Boethius and not the Stoics; but I think that in *In Ciceronis Topica* Boethius sheds some light on a vexing problem which has troubled students of Stoic logic for some time." (pp. 6-7) (30) Michael Frede, *Die stoische Logik*, (Göttingen: Vandenhoeck and Ruprecht, 1974), pp. 148-53, 160-62.

74. Tracy, Kevin. 2006. *The Development of Dialectic from Aristotle to Chrysippus*, University of Pennsylvania

Available at ProQuest Dissertation Express order number: 3225558.Abstract: "From Aristotle onward, formal logic was an element of ancient Greek dialectic (*dialektiké*). Aristotle'sPrior Analytics (4th century BCE) is the earliest evidence of a formal logic in antiquity. The evidence for the formal logic of the Stoic philosopher Chrysippus (3rd century BCE) is fragmentary; nonetheless it makes clear that not more than a century or so after *Prior Analytics*, Chrysippus revolutionized formal logic. The scholarship on Stoic logic has not yet presented the history of dialectic from Aristotle to Chrysippus as an intelligible narrative. Without such a narrative, one cannot explain what, in general, motivated the innovations of Chrysippus, what made Stoic logic coherent as a unified project, or what relationship that project had to earlier work in logic. This dissertation approaches the problem through the presentation and interpretation of the ancient source material. First it describes the logical doctrines of Aristotle, Theophrastus, and the 'Megarics' in such a way as to make clear what questions these predecessors left for Chrysippus. It then describes how Chrysippus addressed these questions. Finally, it uses the resulting narrative to give a detailed account of Stoic formal

logic. The dissertation yields five principal conclusions. First, neither the Peripatetics or the 'Megarics' described logical forms of propositional logic; Chrysippus was the first to do so. Second, the guiding aim of Chrysippus' logic was to avoid adopting a semantic stance in describing logical forms and explaining logical relationships. Third, the Stoics distinguished 'valid' (*hugies*) from 'true' (*aléthes*), so that *sunartésis* is a standard for the validity rather than the truth of the Stoic conditional (*sunhémmenon*). Fourth, the Stoics produced derivations for categorical arguments in their deduction system. Fifth, the Stoic deduction system is roughly analogous to the first-order fragment of Frege's system, except on two points: it most likely was not designed to accommodate the use of polyadic predicates with multiple quantifiers, although the possibility for doing so inheres in its approach to the analysis of propositions, and it uses the 'natural' approach rather than the 'axiomatic' approach of Frege."

77. ———. 1996. "Meaning and Role of the Expressible (Lekton) in Stoic Logic." In *Knowledge through Signs. Ancient Semiotic Theories and Practices*, edited by Manetti, Giovanni, 133-154. Turnhout: Brepols

    "In his critical survey of Stoic dialectic Sextus states that the doctrine of the expressible, which plays an important part in the theory of knowledge, has been repeatedly put into question: (1) the *lekton* is an incorporeal, together with time, place and empty space, it belongs to the group of incorporeal objects generally accepted by the Stoics. In their opinion incorporeals are not active, they are unable to effect or produce something: yet they are indispensable in view of a coherent understanding of the universe.(2) Within this framework it was agreed that each argument is composed of incorporeal expressibles, since it

is a combination of sentences which are considered to be complete *lekta*.(3) The question however was asked whether expressibles are really necessary, if they are totally ineffective. Even the meaning of the notion is questionable: it is obviously related to language, but it is not a component neither of spoken nor of written language. In other words it is not a verbal utterance and yet it is referred to by linguistic terms.(4) So it seems to have a definite function in the Stoic theory of knowledge." (p. 133)(1) Sextus,M 8. 336. The author states that the existence of expressibles has been heavily discussed: there was no agreement about this issue. In some other passage Sextus even speaks of an unending debate (8. 262). Sextus lived in the second half of the second century and in the beginning of the third A.D.: at that time Stoicism was still very influential. No other philosophical school ever accepted this doctrine, but it was not disregarded: philosophers had to cope with it especially in their dialectic.(2) Sextus,M 8. 262. An incorporeal object could not affect anything, nor could it be affected. For it could only be affected by something corporeal, and that is excluded, since corporeal and incorporeal are not on the same level.(3) Sextus,M 8. 260-261; 8. 404: every proof is composed of incorporeal expressibles. In Sextus' opinion a vicious circle is unavoidable.(4) Sextus,M 8. 264: according to Sextus *lekta* are signified and among them are also propositions, which are regarded as complete expressibles.

81. White, Michael J. 1986. "The Fourth Account of Conditionals in Sextus Empiricus." *History and Philosophy of Logic* no. 7:1-14

Abstract: "This paper develops an interpretation of the fourth account of conditionals in Sextus Empiricus's *Outlines of Pyrrhonism* that conceptually links it with contemporary 'relevance' interpretations of entailment. It is argued that the third account of conditionals, which analyzes the truth of a conditional in terms of the joint impossibility of antecedent and denial of consequent, should not be interpreted in terms of a "relative" incompatibility of antecedent and denial of consequent because of stoic acceptance of the truth of some conditionals of the form p → -p and its converse. Rather, It is suggested, ancient attempts to avoid the so-called paradoxes of implication involve the fourth account of conditionals. I hypothesize that this account is related to stoic attempts to define truth conditions for conditionals in terms of a theory of the concludency (validity) of arguments in opposition to the more common procedure (represented by the first three accounts of conditionals) of specifying truth conditions for conditionals 'semantically' and using those truth conditions in the development of a theory of argument validity."

   "There has been considerable growth in the understanding and estimation of Stoic logic in the last thirty years, yet an important dimension of this Stoic achievement has not been grasped. Stoic logic was broadly conceived to include their theories of knowledge and perception, and the theory of perception provides the starting point and foundation of their logic. It is essential to the structure and unity of that logic that the Stoics take perception to be propositional. Starting from a new interpretation of the Stoic conception of *phantasia* as propositional perception, this study offers a view of Stoic logic that brings out the continuity linking perception, predication, inferential signs and proof.

   For Plato and Aristotle the basic objects of perception are qualities. In effect they develop a phenomenological analysis, underpinned by a physiological conception of sensation. The Stoics take this over as an account of sensation, but they establish the theory of perception at a higher level of complexity. For the Stoics the objects of perception are not qualities nor discrete things or bodies but rather have the form of fact, event or situation, relating qualities to things and things to each other. In perceiving we are trying to make sense of things. This means that both inference (drawing on past perception) and judgment (i.e. judging that something holds in reality) are involved in perception from the start. Conversely,

the logical capacities of the mind, extending through logical signs to proof, carry forward a revelatory power inherent in perception.

The propositional character of perceptions does not derive from language. In the Stoic analysis perceiving picks out a focus or subject and links a predicate to it, and these are logical entities, strictly distinguished, terminologically and in their discrete treatment, from what are linguistic elements, the grammatical subject and predicate. What is predicated of the subject is generally doing or undergoing some action. This linking of elements within perception is at the same time propositional in the sense that it pro-poses something, that is, makes a truth- or reality-claim. What is perceived is by that very act taken to be the case, to be real.

To translate '*phantasia'* as 'perception' is unusual but justified, even required, in Stoic contexts. The term undergoes striking changes in meaning from Plato through Aristotle to the Epicureans, Sceptics and Stoics, which must be reflected in differing translations. For Plato it is misleading 'appearance', sensation wrongly taken as revealing reality. In some of the applications of the term in Aristotle the translation `imagination' seems appropriate, while in others something like `representation' or 'impression' is called for, either in a neutral sense or with a problematic cast akin to the Platonic and Sceptic versions.

In the Hellenistic schools '*phantasia'* (often in the plural) designates not a faculty but particular mental events. It is usually taken to mean `impression' or 'mental presentation'. This is apt for the Sceptics, for whom a further act would be needed to add belief to what is present to the mind and affirm it as real. But 'perception' is the translation called for by Stoic usage. To translate it as 'presentation' in Stoic arguments would be to concede a damaging point of contention to their Sceptic critics by eliding its intrinsic reality claim, its propositional character.

To understand what the Stoics are doing to and with the idea of *phantasia,* we must see it in relation to the different purpose

and character given the term first in Plato, then in Aristotle, and in those contemporary antagonists of the Stoics, the Sceptics and Epicureans. The starting point is Plato's origination of the notion *phantasia,* taken together with his analysis of predication or what constitutes 'statement', in the *Theaetetus* and *Sophist*. Building on the connection of *phantasia* and statement, the Stoics reverse the tendency which Plato embodies in his coinage in that they try to establish confidence in what *phantasia* reveals, whereas Plato took such confidence to be necessarily misplaced.

Indeed, the purpose of his coinage (derived from '*phainesthai',* 'to appear', meaning appearance in contrast to reality or being) was to embody the confusion of 'it seems to me' and 'it is' and so to show up the fundamental error of those who rely on the senses as revealing reality. To trust the senses as a basis of knowledge opens one to distortion from perspective and the illusory character of objects that never are the same." pp. 1-2.

    "(1) During the creative period of Stoicism grammar was still in its infancy as a determinate field of study. I mention this fact because, as is well known, the Stoics were enormously influential on the Graeco-Roman grammatical tradition, which extends from the later Hellenistic epoch into the Christian period of the Roman Empire. Recourse to the Stoic influence on that tradition, excellently facilitated now by Karlheinz Hülser's collection (1987), can give the impression that these philosophers were merely pioneers in starting what the grammarians carried forward more fully and systematically. I want to suggest that such an impression may be seriously misleading in two respects.(2) First, it implies, incorrectly I believe, that the Stoics approached language as a phenomenon calling *primarily* for the kind of grammatical and syntactical description later grammarians developed. Secondly, it fails to identify the philosophical considerations that underpin the Stoics' principal interests in language. The Stoics had some splendid intuitions about the phonetic, grammatical and semantic levels of linguistic structure. Although these bear directly on the development of traditional grammar, they also seem to have clear affinities with what contemporary experts in linguistics call universal grammar.

    The material I have chosen in order to make this point will be drawn primarily from sections of Diogenes Laertius' doxography of Stoicism (7.41-83). This is our only comprehensive account of "the logical part" of Stoic philosophy. I shall be dealing mainly with Diogenes' section "on utterance" (*peri phonés*) or "on signifiers" (*peri semainonton*), which forms the first part of the subdivision of "dialectic" (D.L. 7.55-62). The second part of that subdivision (D.L. 7.63-82) is "on

significations" (*peri semainomenon*). This division of dialectic into signifiers and significations has a clear rationale, as we shall see, but it too can yield misleading impressions, especially if it is taken to imply that the subdivisions are independent of one another or that there are no superordinate concepts that unite them. I shall argue that there are two such concepts, (*phantaisia* and *logos*, and that these together provide the foundations of the Stoic theory of language and logic.(3)

There is a third general point that I want to address. Scholars have become accustomed to making a sharp distinction between the Stoic concept of linguistic signs (words and sentences) and their concept of *semeion*.(4) They applied the latter term (as distinct from the term *semainon*) to a pattern of sign-inference from a fact or proposition that is evident to a fact or proposition that is non-evident. It so happens that nothing is said about sign-inference in Diogenes Laertius' doxography of Stoic logic.(5)

Whatever the explanation for this omission may be, it cannot be doubted that the Stoics classified sign-inferences under the "significations" heading of the division of dialectic. As such, they are not linguistic signs but a class of propositions *signified by* linguistic signs. The antecedent or "if' clause of a sign inference is a meaning or sayable (*lekton*), not the sentence by which this meaning is expressed, and what the "if' clause is the sign for is the truth value of its consequent and the connexion of that truth value to itself. However, what we should conclude from this is not that sign-inference is a function of logic *as distinct from* language, but that it is a normative function of language, i.e., language in its epistemic and truth-signifying capacity. Not only do sign-inferences require language for their expression; they are also tied to language as *lekta*, or sentence content. Correspondingly, language is tied to *lekton* (including sign inferences) for its semantic content. The Stoics appl,ÁÿÖ5òied the term *logos* both to significant utterances (linguistic signifiers) and to sign-inferences of the form: if *p,* then *q*. The presence of *logos* on both sides of the division of dialectic is hardly inadvertent. I take it as an indication that what the Stoics were seeking to elucidate was a unitary science

of discourse, which would comprehend both linguistic signs and sign-inferences without reducing one to the other." pp. 109-110

(1) (...) I have deliberately focused upon a limited range of texts, and I say virtually nothing about the antecedents of Stoic doctrines or their reception by later philosophers and grammarians. That is due in part to reasons of time and space, and also to the excellent studies covering these matters by Ax (1986), Frede (1977, 1978) and others. However, given the extremely fragmentary nature of our evidence, it also seemed to me important to focus rather narrowly on texts which have at least the appearance of being systematically Stoic and uncontaminated by other material. Hence my concentration on the "logical" doxography of Diogenes Laertius 7.

(2) The three studies from which I have learned most about the complex relation between Stoicism and the work of grammarians are Lloyd (1971) and Frede (1977, 1978).

(3) There is no novelty about this claim. Its implications are explored by Imbert (1978) and Manetti (1988), and I dealt with them at some length in Long (1971b). My main point here is to elucidate the primacy attached to *phantasia* in Stoic logic.

(4) See for instance Long (1971b: 84-88).

(5) This is noted and explored by Ebert (1991: 54 ff.).

Bibliography on Stoic grammar

1. Allen, James. 2005. "The Stoics on the Origin of Language and the Foundations of Etymology." In *Language and Learning. Philosophy of Language in the Hellenistic Age. Proceedings of the Ninth Symposium Hellenisticum*, edited by Frede, Dorothea and Inwood, Brad, 14-35. Cambridge: Cambridge University Press.

   "James Allen shows that this assumption explains the Stoics' preoccupation with etymology as part of their concern with a time 'when language was still young' and the product of a primordial wisdom. Since they held a naturalist rather than a conventionalist view the Stoics assumed that there had been a primary stock of words that somehow 'imitate' the nature of the objects in question and could therefore be used as a natural standard of correctness. Since they assumed that there had been a high level of rationality among humans at a primordial stage, the Stoics saw nothing unnatural in proposing the notion of an original 'name-giver' as a hypothetical construct. Such a construct escapes the sceptic's ridicule because it merely assumes that the human need and the ability to converse rationally with each other, which manifests itself in every individual at a certain age, must also have been part of the nature of the (assumed) first generation of human beings. The 'naturalness' of names consists, then, in their suitability for communication with others; though it presupposes a mimetic relation between words and certain kinds of objects, it is not confined to onomatopoetics; instead it makes use of other means to augment language by associations and rational derivations of further expressions that are gradually added to the original stock of words. This explanation, as Allen points out, may make the etymologies less interesting and relevant in our eyes; but though the Stoics did not assume mechanical laws of derivation that would allow them to recover the 'cradle of words', attempts at rational reconstruction of the relation between different expressions provided them with a means to discover and to correct later corruptions of thought and so to play a crucial role in philosophical progress. Despite certain similarities of concern with the naturalist position in the *Cratylus,* the Stoic position therefore differs in more significant

ways from the Platonic position than is usually acknowledged." From the *Introduction* by Dorothea Frede and Brad Inwood, (pp. 4-5)

   Nachdruck in: W. Ax: *Lexis und logos: studien zur antiken Grammatik und Rhetorik*, Hrsg. von Farouk Grewing, Stuttgart: Franz Steriner 2000, ss. 95-115.

   "Als Zenon von Kition (ca. 333/2-262/1 v. Chr.) etwa um das Jahr 300 seine Vorlesungen in der Stoa poikile in Athen begann, stand der Peripatos unter seinem Leiter Theophrast (ca. 372/69-288/5 v. Chr.) ohne Zweifel schon auf seinem Höhepunkt. 2000 Schüler - so berichtet Diogenes Laertios 5.37 - soll Theophrast gehabt haben, eine eindrucksvolle Zahl, auch wenn man die Gesamtzahl seiner Schüler, nicht die Besucherzahl einzelner Kurse darunter versteht. Daß er jedenfalls mehr Hörer als Zenon hatte, wissen wir von Zenon selbst. Es dürfte von vornherein einleuchten, daß eine derart angesehene und erfolgreiche Philosophenschule auf die sich zu dieser Zeit erst etablierende Stoa Zenons ihren Einfluß ausübte,

auch wenn für die älteren Stoiker, etwa für Zenon und Chrysipp (ca. 282/77-208/4 v. Chr.), kein peripatetisches Studium bezeugt ist.

Bevor ich jedoch auf diesen Einfluß unter dem Lemma Sprachtheorie zu sprechen komme, muß ich einige zeitliche und sachliche Präzisierungen vorausschicken, zunächst eine zeitliche. Ich beschränke mich auf den Zeitraum der sog. Älteren Stoa, also auf die Zeit von etwa 300 bis zum Tod des Diogenes von Babylon (ca. 240-ca. 150 v. Chr.). Diese Eingrenzung ist dadurch begründet, daß die stoische Sprachtheorie zur Zeit der bekannten und einflußreichen τἐχνη πσρὶ φωνὴς des Diogenes etwa um 200 v. Chr. den Punkt einer gewissen Fertigkeit im Ausbau des sprachbeschreibenden Systems, zugleich auch der Bestandsaufnahme des bis dahin Erarbeiteten erreicht hatte, den Punkt also, von dem aus die Wirkung auf die pergamenische und alexandrinische Grammatik beginnen konnte. Entsprechend kommen natürlich nur Peripatetiker bis zu diesem Zeitpunkt (um 200 v. Chr.) für mein Thema in Frage." (s. 11, die Hinweis wurden weggelassen)

"Although this testimony is isolated, the historians of ancient grammar, who are aware of the part played by the Stoics in the formation of an independent grammatical field, unreluctantly take for granted the indications of a scholium by Stephanos -- the commentator on Dionysios Thrax -- which imply the existence of stoic theory of verbal tenses; yet none of the reconstructions of this theory as the basis of the scholium can be taken as conclusive, for want of complementary documents. This paper offers neither a new reconstruction nor a critical survey of former ones, but tries to follow another path; it investigates whether elements which, in the scholium, are undoubtedly of stoic origin, did not stand up to the scholiast's skill in his attempt to integrate them within a framework which may be foreign to them."

21. Ebert, Theodor. 1987. "The Origin of the Stoic Theory of Signs in Sextus Empiricus." *Oxford Studies in Ancient Philosophy* no. 5:83-126.

    "In his critical discussion of the dogmatic philosophers Sextus Empiricus expounds a Stoic doctrine which has conveniently been labelled 'the theory of signs'. This chapter of Stoic philosophy offers a blend of logic and epistemology, a mixture bound to attract the interest of present-day 'ancient philosophers'. Hence, with the growing discussion focusing on the philosophy of the Hellenistic period, this part of Stoicism was to get a fair share of attention. (1) Controversy has been flourishing over the merits and weaknesses of this theory; it has been compared with tenets about the topic of signs held by earlier and later philosophers, yet in these discussions it has almost universally been taken for granted that there is a single theory of signs and that it can be attributed unqualifiedly to the Stoics. (2)

    Part of what I want to do in this paper is to challenge this assumption. I shall argue that the material relating to the

theory of signs which is preserved in Sextus does not reflect Chrysippan teaching, but goes back to Stoics antedating Chrysippus. To have a convenient term, I shall refer to the pre-Chrysippan Stoics as 'early Stoics'. (3) I shall further argue that the theory of signs of the early Stoics was a harvest not grown in the fields of Stoic philosophy, but that it originated from the 'Dialecticians', a group of philosophers confused for a long time with the Megarians and rediscovered as a group in its own right by David Sedley. (4) I shall further try to point out some modifications which this theory underwent as it was integrated into the epistemology of the early Stoics. I shall not discuss the doctrine of signs advocated by the opponents of the Epicureans in Philodemus' *de Signis* -- almost certainly Stoic philosophers -- a doctrine which has been ably discussed by David Sedley in a recent paper. (5)" pp. 83-84.

Natorp, *Forschungen zur Geschichte des Erkenntnisproblems im Altertum* (Berlin, 1884), 127 ff.; W. Heintz, *Studien zu Sextus Empiricus* (Halle, 1932), 42-51; G. Preti, 'Sulla dottrina del *semeion* nella logica stoica', *Rivista Cntica di Storia della Filosofia*, XI (1956), 5-14.

(2) The only exception known to me is D. Sedley who wants to 'put into abeyance the widespread belief that Stoic doctrine is under discussion by Sextus Empiricus throughout *M* VIII. 141-298 and *PH* II. 97-133' (Sedley, above n. 1, 241).

(3) The traditional division of Stoicism puts Chrysippus' Stoic predecessors together with his own school into the Old Stoa, separating it from middle Stoicism inaugurated by Panaetius. This classification seems to be based on Stoic ethics, and understandably so. After all, it was their moral philosophy which, beginning with Cicero, made the Stoics so immensely influential, and here the affinity between Zeno and Chrysippus is clearly stronger than the one between Chrysippus and Panaetius. Yet in logic and epistemology, there is no similar relationship between Chrysippus and his predecessors. Here the great break comes about with Chrysippus, and we should group Stoic philosophers in this field accordingly.

    "Let me now summarize the main points of my exposition of Stoic syntax:

    1. Stoic *loquia (lekta)* are designated by expressions of a normalized Greek. They have the same structure as these Greek expressions. Thus in most technical uses they serve approximately the same purpose as "semantic structures" or "semantic representations" in modem linguistics and philosophy of language.

    2. There is an infinity of *loquia* derived by a finite number of recursive rules of four types, lexical, inclusion, combination and

transformation rules. Semantic categories like statement, predicate and subject are used in the formulation of these rules which enable us to build complex *loquia* of the various categories from atomar ones *(asuntheta)*. The structure of a compound *loquium* may be revealed by using Chomsky or Montague analysis trees.

3. This infinity of *loquia* is related with real things by an analogue of modern model theory. General terms are said to denote individuals according to a variant of multiple denotation theory. Deictic subjects are assigned values, like their modern analogues: individual variables by an assignment *(deixis)*. Statements are either true or false. Complex expressions are valuated in function of their syntactic composition and the values of their parts.

4. Denotations of Greek expressions are determined indirectly. *E.g*. appellatives signify appellative subjects, which refer to individuals. Thus appellatives indirectly denote these individuals too.

5. All this would have to be refined by taking into account tense.

6. By neglecting tense, plural and subjectivization, Stoic *loquium* theory becomes an analogue of modern first order predicate logic by

a) the introduction of n place predicates with arbitrary *n,*

b) the introduction of a means to handle relative clauses

Stoic syntax and related model theory thus proves interesting and comparable to modern treatments."

"Excavating the prehistory of dynamic predicate logic in the Stoic theory of methodical arguments makes us aware of an interrupted tradition, in a way that is possible only by philological reconstruction and the use of similar facts

independently invented in modern times. That such interrupted traditions can become important has been shown by the use of ancient temporal logic and its resurrection in Kripke's (1963) semantics of modal logic. Kripke combined Prior's reconstruction of the Diodorean system of time-logical modality with ideas from Carnap on modal logic in order to get his semantic

characterization of the Lewis systems of modal logic. Modern developments offer scholars of classical logic a modern foil that can help them to understand ancient texts and to see interesting developments in them which otherwise would be incomprehensible.

The modern representatives of this tradition also gain an advantage from such research, in that they can build on a tradition which helps to strengthen confidence in the new methods.

The adherents of Stoicism gave their logic high priority, saying that if the Greek gods had a logic, then it must be that of Chrysippus. As we have seen, this logic was a form of dynamic predicate logic. It is equivalent to classical predicate logic and contains it as the static part. Classical predicate logic is according to Hilbert's thesis a privileged form of logic, and according to Quine it is the right regimentation of language. Perhaps the Stoic saying was not so false after all. But we can also learn something about our own form of predicate logic, classical and dynamic, because the Stoic developments can be considered as a finalized whole. Even if the Stoic version of dynamic predicate logic is no logic of the gods, it still is an important logic for human beings." p. 28

26. ———. 1978. "Principles of Stoic Grammar." In *The Stoics*, edited by Rist, John M., 27-75. Berkeley: University of California Press.

    Reprinted in: M. Frede, *Essays in Ancient Philosophy,* Oxford, Clarendon Press, 1987, pp. 301-337.

    "Historians of grammar have usually proceeded as if their subject had a continuous history starting in the fifth century B.C., with the Sophists. But even if one is willing to credit Sophists like Protagoras and Prodicus, and later philosophers like Plato and Aristotle, with a theory of language, It is obvious that their theories were not grammatical theories: they were not interested in finding out how a particular language, Greek, actually works in such detail as to be in a position even to attempt to start formulating the canons for correct Greek. Hence to treat them as part of one continuous tradition along with the later grammarians is to invite neglect of important questions. We may, for example, assume that those who actually started grammar had certain notions concerning the nature of language, and that these and other philosophical views influenced the way they set up their subject and thus also its later development. We may also assume that they had certain reasons for starting this enterprise and that these reasons influenced the way they went about it and hence, indirectly, the outlines of later grammar. For reasons of this sort it is important that we should have a better notion of the actual origins of the grammatical tradition.

    Now our question concerning the Stoics is important, since it has been claimed that it was the Stoics themselves who first formulated traditional grammar, To substantiate this claim it will not be sufficient to show that traditional grammar is Influenced in many respects by Stoic notions. For such a state of affairs would be completely compatible with the assumption that the Stoics still formed part of the earlier philosophical tradition, though they contributed more to this tradition than their predecessors, but that grammar itself only began among the classical scholars of Alexandria, who exploited the available philosophical tradition and the Stoic contributions to it. To

substantiate the claim that grammar originated with the philosophers we have to show that it formed a definite part of Stoic philosophy (the evidence seems to rule out the other schools of philosophy as plausible candidates). But the origin of traditional grammar is not the concern of this paper. Even if grammar originated with the Alexandrians, it would be important to know whether in matters of language the Stoics still formed part of the earlier philosophical tradition or whether they were already engaged in doing grammar. For the evidence on the Stoic theory of language is so fragmentary that the context of the fragments and testimonies makes an enormous difference to their interpretation and evaluation."

27. ———. 1993. "The Stoic Doctrine of the Tenses of the Verb." In *Dialektiker und Stoiker. Zur Logik der Stoa und ihrer Vorläufer*, edited by Döring, Klaus and Ebert, Theodor, 141-154. Stuttgart: Franz Steiner.

    "In traditional grammar, but also in modem linguistics, we talk of “the tenses of the verb”. We have inherited this notion from the Greek grammarians. The Greek grammarians, as a rule, distinguish 6 tenses of the verb: present, imperfect, aorist, perfect, plusquamperfect, and future. Sometimes they add a second aorist and the so-called Attic future. The linguistic phenomena which this grammatical doctrine tries to capture are notoriously difficult to understand. But the facts themselves are obvious enough: (i) Greek verbs have a pattern of inflection which in paradigm cases provides a characteristic form for each of the tenses distinguished, (ii) there are syntactical rules which govern the use of these tenses, and (iii) the choice of the tense very clearly affects the meaning of sentences, it makes a crucial difference to what gets said. One major difficulty is to understand how precisely the choice of tense does affect the meaning. There also is a good amount of controversy concerning the question to which extent this traditional grammatical scheme of the tenses of the verb, as originally developed for Greek, and then adapted by the Roman grammarians for Latin, is suitable for the classical languages; let alone for our modem languages. But in what follows it is not my primary concern to elucidate the linguistic phenomena

themselves, nor to answer the question of the adequacy of the traditional grammatical doctrine concerning these phenomena. I am just concerned to understand the traditional doctrine itself. Indeed, my aim here is even more modest: I will try to get clearer about the historical origins of the traditional scheme of tenses. Perhaps this will help us to come to a better understanding of the doctrine itself.

The first time we encounter this traditional doctrine in its fully developed form is in the *Ars grammatica* attributed to Dionysius Thrax (ed. G. Uhlig, Leipzig 1883), a treatise which presumably goes back to the end of the 2nd century B.C." (p. 141)

    Contents: Preliminary remarks IV--IX; Chapter I. Chrysippus 1; Chapter II. The *Techne concerning sounds* of Diogenes of Babylon 101; Chapter III. Aristarchus and the Aristarcheans 171; Chapter IV. The *Dialectica* of Augustine 249; Concluding

remarks 260; Appendix I 265; Appendix II 280; Bibliography 283-290.

Abstract: "This dissertation relates the history of the theory of the parts of speech from its origin in the Stoic school of dialectics through its passage into the Alexandrian school of literary criticism in the second century B.C.

It pays especial attention to the way in which the theory was transformed in that passage. The Stoics had used it as part of their general system of dialectics, intended to give an account of the truth of true sentences and the validity of valid deductions. The Alexandrians, whose main activity was textual criticism, used the parts of speech as a system of naming and classifying the forms of Greek. The dissertation argues that for each of these purposes a different theory is required, and that in the Alexandrian grammarians' application of the theory two different ways of analyzing language were confused.

The chief figures in this history are the Stoics, Chrysippus of Soloi (c. 281 to 208 B.C.) and his student, Diogenes of Babylon (c. 238 to 150 B.C.), and the Alexandrian, Aristarchus of Samothrace (c. 216 to 144 B.C.). One chapter is devoted to each of them.

The first chapter is a reconstruction of Chrysippus's version of the theory of the parts of speech. It discusses the terminology which he inherited, such as "element of logos," the forerunner of our phrase "part of speech," as well as the notions of noun, verb, conjunction and article. It examines Chrysippus's theory of the significate (alternatively called the *lekton*), which was described as being what "the barbarians, although hearing the sound, do not understand," and also as being "just what is true or false." The several parts of speech were distinguished according

to their association with significates.

The second chapter is a reconstruction of a lost work of Diogenes of Babylon, his *Techne Concerning Sound*. This was a handbook which treated language as a single topic, beginning with acoustics and proceeding to the parts of speech.

Diogenes's *Techne* probably was the vehicle by which the theory of the parts of speech reached Alexandria.

The third chapter discusses Aristarchus's adaptation of the parts of speech to the purposes of textual criticism, and some of the ways in which he used it in his own edition of the *Iliad*. It also considers the difficulty which the confusion within the theory caused for Aristarchus's successors. Finally it compares the grammatical theory of the Alexandrians with that of the great Indian grammarian Panini and his commentators.

The fourth and final chapter is devoted to a post-classical Latin text which has come down to us as the *De Dialectica* of Augustine. Its sources are obscure, but it appears to represent a development of Stoic theory later than Diogenes. It considers questions of metalanguage, and draws a distinction between use and mention very like the one made by Panini. This stage of Stoic theory did not pass into the grammatical tradition, but the *De Dialectica* was read during the medieval and Renaissance periods in Europe.

The dissertation contains two appendices. The first is a collection of fragments upon which the reconstruction of Diogenes's *Techne Concerning Sound* was based. The second discusses Aristarchus's pupil Dionysius Thrax, and the grammar attributed to him."

    "I will try to illustrate the dynamics of the passage as described by metabasis in a few stoic texts and several grammatical analysis of Apollonius Dyscolus. I believe the concept of « décrochement », which I borrow from Claude Lévi-Strauss, helps to clarify it. The adjective metabatikos qualifies the type of human representation, logical representation, which, in as much as it is « transitive », allows an information to open into another, as well as their mutual articulation, therefore founding the conception of the sign « if this, then this » and the possibility of the conditional « if it is day, there is light ». According to the grammarian Apollonius Dyscolus, metabasis intervenes in the analysis of the transitive diathesis and in the definition of the person. I will procède to show the part played by metabasis in the grammatical treatment of conjunction and how it allows to throw some light upon the obscure part of the definition of conjunction in the *Technè Grammatikè* attributed to Dionysus the Trhax."

Proceedings of the Ninth Symposium Hellenisticum*, edited by Frede, Dorothea and Inwood, Brad, 36-55. Cambridge: Cambridge University Press.

    "Anthony Long also elaborates on the influence of Plato's *Cratylus* on Stoic theory. But he goes much further than Allen with his hypothesis that the Stoics not only made use of Plato's dialogue, but did so in a way that justifies he presentation of

many central features of their linguistic theory as being he result of a revisionary reading of the *Cratylus*. It is a reading that makes Socrates' suggestions about the 'natural' relation of names to things much more coherent than they are in the dialogue itself. This also applies to their etymological explanation of the names of the gods that they suggested as a revision of a corrupted tradition and a return to the original name-givers' comprehension of the true nature of the universe. Given their `synaesthetic' reconstruction of the relation between phonetics and semantics, the Stoics could avoid the *Cratylus'* more absurd features of onomatopoetics, as Long shows by analysing different forms of 'naturalism', including 'formal and phonetic naturalism', and their application by the Stoics that not only ins hides names but also the famous *lekta* or 'sayables'. Long contends that the Stoics not only found a better balance between the phonetic and the formal constituents of meaningful discourse than emerges from Plato's dialogue itself, but restricted their use of etymology as a back-up to their theology, i.e. the naturalistic reconstruction of the names of the gods. As an additional witness to the sophistication of the Stoic linguistic theory Long adds an appendix on the four-fold semantic distinction (between *dicibile, res, verbum,* and *dictio)* in St Augustine's *De dialectica,* which he takes to be largely of Stoic origin.

The Epicureans also held that language is part of the natural emergence of human culture. But here the similarity between the Stoic and the Epicurean theory of language ends. For instead of an early stage of rationality and inspired `name-givers', the Epicureans proposed a quite different account of the evolution of language as part of their mechanical reconstruction of the order in nature, which includes an animal-like primitive stage of human beings. Unfortunately the information on this early stage in the development of humans as cultural beings in Epicurean theory is extremely meagre; attempts to reconstruct it have to rely on a few lines in Epicurus' *Letter to Herodotus* and in Lucretius' poem."    "The article questions the standard perception of Stoic philosophy as materialist and nominalist in nature. Rather than being materialistic, Stoic ontology represents a consistent

hylemorphism in which nothing exists without matter and which is intended to circumvent and the matter-form dualism in Aristotle's metaphysics and to avoid Aristotle's epistemological problem of the unknowability of matter. Similarly, Stoic semantics is not entirely nominalistic. Although Stoic universals ("ennoemata", "ennoiai") are "post rem", unlike word or sentence meanings ("lekta") they are nonmental noematic or conceptual structures."

"The formula "the elements of *logos*" in the Zeno quotation by Epictetus at Arrian, *Diss*. 4.8.12 need not, pace e.g. von Arnim, pertain to the parts of speech, but more probably means the elements, i.e. primary theorems of philosophical theory, or doctrine. Theory moreover should become internalized to the soul and "lived": philosophy is also the so-called "art of life". These theorems are to be distinguished but should reciprocally entail each other. Philosophy according to Zeno is both tripartite and one, and tripartite especially in that its parts (and subparts) cannot be transferred simultaneously: of necessity these have to taught and learned one after the other."

    "I I have attempted to sketch what Zeno left behind for Chrysippus to develop (63). Cleanthes has been mentionned in passing, and his contributions are, so far as we can see, largely limited to additional work of the same general sort as his master. He too took an interest in the work of Diodorus Cronus, and as we have seen, is the first recorded Stoic to have discussed the notorious Master Argument and its theory about

the possible and the necessary. Probably some form of a theory of *lekta* may be ascribed to him, as Clement of Alexandria tells us. But how much he said on the topic is beyond our ken; probably not very much. For I am personally even Inclined to think that it is more likely to have been Chrysippus who formally added *lekta* to the list of incorporeals, though such an addition might be implicit in the thought of anyone who postulated that there are "non-existents": subjects of *meaningful* discourse which cannot be put in category One, the category of what exists. For it is hard to see how that which does not exist can be corporeal. Perhaps it was from some such considerations that the notion of "meaning" itself arose, as well as the thesis that words may have a sense but no reference." p. 27

"Résumé. Avant le développement systématique que Chrysippe donna à la logique stoicienne, peut-on préciser l'eeuvre de Zénon dans ce domaine? Souhaitant donne à l'idée de nature un contenu plus positif que ne le faisait la morale cynique, il devait rencontrer l'hypothèque éléatique; il fut l'élève et le condisciple de plusieurs dialecticiens mégariques (bien qu'on ne lui attribue pas de position dans le problème du Dominateur et des possibles). Il a dû s'intéresser aussi à la théorie des signes et au problème du critère de validité du conditionnel, sur lequel il adopte la position de Philon (que Chrysippe abandonnera sous la pression des critiques de Diodore). Ce problème est lié à celui de la nature du sage; en reconnaissant dans l'aptitude à inférer un aspect fondamental de la nature humaine, Zénon accélérait sa rupture avec le cynisme. Des Mégariques, Zénon a hérité certaines divergences de vocabulaire et de fond avec la logique aristotélicienne; de Stilpon, notamment, il peut avoir reçu l'idée du primat de l'individuel, contre les Formes platoniciennes et peut-être aussi contre les universaux aristotéliciens. Parmi les domaines que Zénon n'a apparemment pas touchés, on peut compter: la théorie des signifiants et des signifiés; peut-être, la notion même du *lekton* (qui aurait été rajouté, après Zénon, aux trois incorporels primitifs, nés en terrain physique), et du même coup la classification systématique des *lekta*; enfin, la théorie des

indémontrables. En matière de théorie de la connaissance, c'est en revanche Zénon qui a jeté les bases de la doctrine stoïcienne; le problème était urgent, après le platonisme et le pyrrhonisme, comme le démontre l'attitude contemporaine d'Épicure.

Le Professeur Rist n'a pas souhaité rédiger de compléments pour la deuxième édition. (Note de l' éditeur)" pp. 27-28.

   Text, translation and commentary.

   "Although the *Hymn to Zeus* is often cited as one of the most important documents of early Stoic philosophy -- indeed the only text to survive more or less intact -- it has not yet received a detailed treatment in a monograph by itself. Besides its indubitable philosophical interest, the poem also provides crucial evidence for the way philosophy came to function as a form of religion from the Hellenistic period onwards. The present study strives to pay due attention to the most relevant factors which make this poem exceptional: the philosophical and moral ideas conveyed in poetic form, the religious underpinning given to Stoicism, and the intricate interaction with the preceding literary tradition. Cleanthes offers his own philosophical answer to the human moral dilemma in terms of

the Greek cultural heritage; the *Hymn to Zeus* should therefore not simply be interpreted against the background of Stoicism in general." (From the Preface).

   " Introduction. Chrysippus knew and discussed Philo's and Diodorus' concepts of the conditional (συνημμένον), and it is usually assumed that he developed his own in order to overcome their shortcomings. It is clear from the surviving testimonies that Chrysippus was acquainted with Philo's and Diodorus' modal notions as well and also that he developed his own in contrast with those of Diodorus and in some way incorporated Philo's modal notions.

The goal of this paper is to make clear the exact relations between the modal systems of the three logicians and to expound the philosophical reasons that might have led Chrysippus to modify his predecessors' modal concepts in the way he did. It should become apparent that Chrysippus in fact skilfully combines Philo's and Diodorus' modal notions, making only a minimal change to Diodorus' concept of possibility and obtaining thus a modal system which perfectly suits his Stoic philosophy.

A preliminary note: in order to understand the Hellenistic discussion of modalities, one has to ascribe to the Hellenistic logicians the idea that there is a 'right' modal system which 'fits the world' - or at least that different modal systems can have different degrees of adequacy in describing the world. It is this conception of modal logic that makes it such an important topic in Hellenistic philosophy. The 'right' modal theory will specify what is necessary and what is possible in the world and therewith to what extent the world is determined. Philo, Diodorus and Chrysippus provide different answers here." (P. 63)

    "This paper aims at analysing the logic and truth-conditions of the Chrysippean conditional. In its first part some influential interpretations of s*unártesis* are examined, their shortcomings are disclosed, and two distinct possible versions of the truth-

conditions of s*unártesis* are proposed and spelled out in outline. In the second part the question is investigated of whether the so-called Aristotle's thesis and Boethius' thesis can be regarded as genuine properties of the Chrysippean conditional, as some scholars have interestingly maintained. Textual evidence is exhibited suggesting that it is likely that such theses were valid in Stoic logic. Finally, the problem of how to reconcile the purported truth of these theses with some prima facie incompatible arguments attested by our sources is explored: some possible explanations for the alleged inconsistency are examined."

    "Introduction. Semantics as a philosophical discipline is the study of notions like meaning, reference and truth, i.e. of the relationship between language and the world, between what we say and what we talk about. A ‘semantic assertion’, in particular, is the ascription of a truth value to a proposition by applying semantic predicates like the adjectives ‘true’ and ‘false’ in their predicative use or position.1 A salient feature of ancient Greek, in this regard, is the occurrence both of semantic adjectives, like αληθή? and ψευδή?, and of semantic verbs, namely ἀληθεύω and ψεύδομαι {speak truly and speak falsely respectively).

    The philosophical import of Greek semantic verbs is at least threefold. First, they are a way of expressing basic semantic principles like Bivalence or the Correspondence and the Equivalence Theses. Second, they are the way of formulating semantic paradoxes like the Liar or the Truth-teller: for, presumably, the Greek Liar says nothing but ‘εγώ ψεύδομαι’ (T am speaking falsely’), and the Greek Truth-teller (by analogy)

nothing but ‘εγὼ αληθεύω’ (T am speaking truly’). Third, they are the main ‘non-logical’ ingredients of Stoic ‘semantic arguments’, namely of the ἀμεθόδω? περαίνοντε? λόγοι which have semantic verbs among their ‘non-logical constants’.

My overall aim in this paper is to show that in Stoic logic semantic principles are the ground both for the validity of the semantic arguments and for the formulation (and solution) of the semantic paradoxes. The paper falls into three main sections. First, an outline is given of Stoic semantic principles and arguments, mainly on the basis of Alexander of Aphrodisias’ and Galen’s testimony on the Stoic ‘unmethodicals’, and of Cicero’s report on the Stoic Liar. Second, on this basis a Stoic formulation of the Liar argument as a chain of semantic unmethodicals is provided. And finally, a Chrysippean solution to the Liar is suggested, mainly on the basis of Plutarch’s report on Chrysippus’ Liar and by analogy with the Truthteller. The ‘upsetting’ final result is that on Chrysippus’ view the Liar assertion ‘εγὼ ψεύδομαι’ (and nothing else) proves to be not only ‘ungrounded’ as to its truth value but also logically consistent, on a par with the Truth-teller." (p. 85)

27. Hankinson, R. J. 2007. "Self-refutation and the Sorites." In *Maieusis. Essays in Ancient Philosophy in Honour of Myles Burnyeat*, edited by Scott, Dominic, 351-373. New York: Oxford University Press.

    "More than twenty years ago, Myles Burnyeat (1982) published an important article on the sorites;(3) a few years earlier he had

written two ground-breaking pieces on Protagorean self-refutation.(4) So, if nothing else, at least the title of this article is an appropriate one for something written in honour of and out of admiration for my former graduate supervisor.

My aim is relatively modest. I do not seek to discern a generalized ancient 'solution' to the 'paradox',(5) or to offer one in my own voice (although I will make one or two tentative suggestions). My main purpose is to take seriously a passing hint of Cicero's, one which has generally been either ignored or treated simply as a joke,(6) that the sorites may be applied to itself, or to the more general notion of coherent argument, with potentially devastating results. I say 'potentially devastating', since it is unclear whether the threatened disaster must occur, and if it does, which of the opposing sides in the dispute it is potentially disastrous for. As such, the debate as I shall reconstruct it mirrors that between Sceptics and Dogmatists as to the question of whether sceptical arguments against argument are self-refuting, and if so, what the appropriate upshot of that ought to be.(7)" (pp. 351-352)

(3) 'Gods and Heaps'.

(4) 'Protagoras and Self-Refutation in Later Greek Philosophy' (1976a); 'Protagoras and Self-Refutation in Plato' (1976b).

(5) 'Paradox' in scare-quotes since the puzzle does not have the logical form of a true paradox: viz. of a sentence that is true if and only if it is false (rather, it has the form of an apparently sound argument with an apparently false conclusion: of course that's bad enough); 'solution' similarly flagged because I am doubtful whether the puzzle—or puzzles—as such can yield to a single authoritative diagnosis. But these issues are largely irrelevant to the concerns of the present paper.

(6) A partial exception to this general neglect is Myles himself (Burnyeat 1982: 327 n. 33). It was thinking about this footnote (and that of Barnes (1982: 57 n. 60)) that first started me down the road followed by this paper more than twenty years ago.

    Abstract: "Chrysippus claims that some propositions perish. including some true conditionals whose consequent is impossible and antecedent is possible, to which he appeals against Diodorus's Master Argument. On the standard interpretation. perished propositions lack truth values, and these conditionals are true at the same time as their antecedents are possible and consequents impossible. But

perished propositions are false. and Chrysippus's conditionals are true when their antecedent and consequent are possible, and false when their antecedent is possible and consequent impossible. The claim of the Master Argument that Chrysippus rejects, then, is stronger that usually supposed."

    "The paper explores the logical paradox of the sorites and its scope. By examining the original sources in Diogenes, Sextus, and Cicero and contemporary commentators (Barnes and Burnyeat), and elaborating upon the context in which the paradox arose (the debate between the Stoics and the Skeptics), I hope to illuminate what the paradox can and cannot accomplish. By focusing on the dialogical nature of the original presentation of the paradox, I outline a better understanding than has been offered previously of the strategy that the Stoics deployed, under their leader Chrysippus, in dealing with the skeptical challenge."

Abstract: "It is widely held that as a nego suppositum, Chrysippus' response to Diodorus Cronus' Master Argument is that the impossible "this man has died" follows from the possible "Dio has died". A principal claim of this article is that Chrysippus was not actually committed, against Diodorus, to the tenet that there are deductions and conditionals whereby from the possible the impossible follows. I argue that this is most likely part of a Chrysippean exemplum fictum of a real dialectical discussion and it merely reflects a Chrysippean dialectical strategy, a merely instrumental agreement (συγχώρησις) with Diodorus on the admissibility of some single-premised arguments. As historical evidence for my conjecture I highlight two key passages by Sextus Empiricus which help to understand that Chrysippus' real tenet was an ancient implicational counterpart of a deictic version of the Identity-Elimination Rule, whereas most likely, according to Diodorus the identitarian major premiss of this rule is redundant, so that it must be eliminated."

56. Papazian, Michael B. 2001. "Chrysippus and the destruction of propositions: a defence of the standard interpretation." *History and Philosophy of Logic* no. 22:1-12.

    "One of the most intriguing claims of Stoic logic is Chrysippus's denial of the modal principle that the impossible does not follow from the possible. Chrysippus's argument against this principle involves the idea that some propositions are 'destroyed' or 'perish'. According to the standard interpretation of Chrysippus's argument, propositions cease to exist when they are destroyed. Ide has presented an alternative interpretation according to which destroyed propositions persist after destruction and are false. I argue that Ide's alternative interpretation as well as some versions of the standard interpretation conflict with Stoic doctrines about the nature of propositions. I propose another version of the standard interpretation based on Frede's account of the Stoic theory of the proposition. I hold that this version of the standard interpretation both escapes Ide's objections and is consistent with Stoic logic and philosophy of language."

61. Vuillemin, Jules. 1983. "Le carré chrysippéen des modalités." *Dialectica* no. 37:235-247.

    "A sentence *p* is necessary, according to Chrysippus if *p* is true and, *p* being susceptible of being false, the external circumstances prevent it from being false. This explanation is used in order to construct the modal square or rather the two modal squares. Something is specific in the chrysippean logic: from the necessity of *p* we may validly conclude that it is impossible that *not p,* while the converse conclusion is not valid."

History of Ancient Logic in the Hellenistic Period

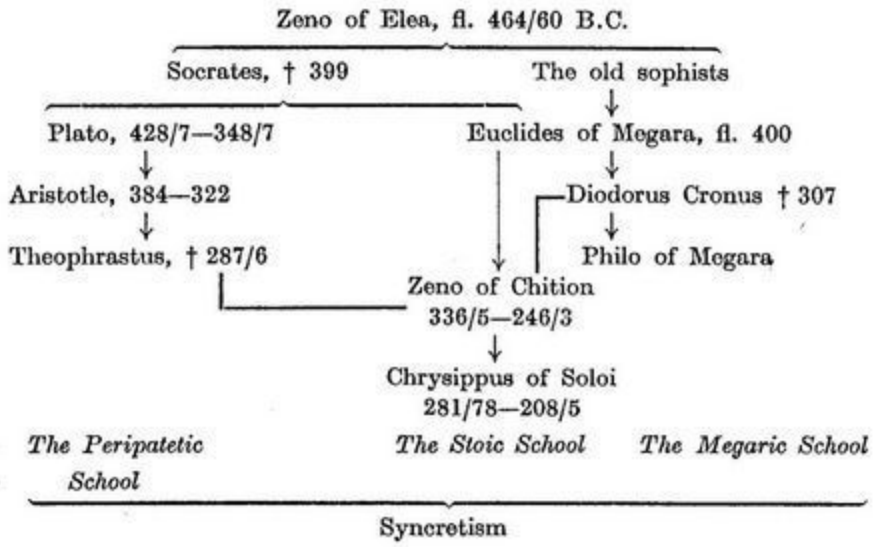
The succession of thinkers and Schools

The history of ancient philosophy covers about eleven centuries, from Thales who lived during the sixth century B.C. to Boethius and Simplicius who flourished at the beginning of the sixth A.D. From the point of view of the history of formal logic this long epoch may be divided into three periods.

(1) The pre-Aristotelian period, from the beginnings to the time at which Aristotle started writing his *Topics* (about 340 B.C.). There is no formal logic during this period, i.e. no *study* of logical rules or laws; but some of them are *used* consciously since Zeno of Elea, and Plato tries, if unsuccessfully, to build up a logic.



(2) The creative period, from the time of Aristotle's *Topics* to the death of Chrysippus of Soloi (205/8 B.C.). During this period Logic was founded and considerably developed.

(3) The period of schoolmasters and commentators, from the death of Chrysippus until the end of Antiquity. In that period no more creative work is done, as far as we know; moreover, a continuous decline of formal logic seems to take place. Boethius and Simplicius who are considered as the last ancient philosophers are also the last ancient logicians.

It appears, consequently, that out of the eleven centuries mentioned above only about 150 years are of real importance; but those years are of enormous importance -- they are, indeed, among the best years of logic in the whole history of humanity until now.

The succession of different trends of logical thought -- for there were several such trends -- can be briefly stated in the following terms. If Zeno is, according to Aristotle, "the inventor of dialectics", Socrates seems to have been the real father of formal logic ; at least both Plato and Euclides, the head of the Megaric School, claim to be his disciples. Plato was the teacher of Aristotle, the founder of formal Logic; Aristotle was succeeded by Theophrastus, Eudemus and some others, who, if far less important than he, are nevertheless productive logicians. This is one line of development of logic, the peripatetic. The other line starts with Euclid of Megara and in the second generation after him bifurcates into the properly Megaric School, with Diodorus Cronus, and Philo of Megara his pupil, as most important logicians on one hand -- the Stoic School founded by Zeno of Chition and having as chief thinker Chrysippus of Soloi on the other. After Chrysippus' death one hears no more of the Megaricians, and, later on, a syncretism of the Peripatetic and Stoic-Megaric Schools appears.

Here is a scheme which may help in comparing the respective dates and mutual influences; it contains only the most important names:" (pp. 9-10)

From: I. M. Bochenski, *Ancient Formal Logic*, Amsterdam: North-Holland 1951.

First philosophy and ontology

"Let us begin then -- according to our program -- with the question: What, in the Greek philosophy, is the relation between *First Philosophy* and reflexion on language?

Why -- to put the question directly -- did *ontology* become the *First Philosophy* at that time rather than *philosophy of language?* From our historical distance and level of reflexion one could consider the last question as somewhat curious, and one might answer it by calling attention to the fact that language as a condition of knowledge is much more difficult to grasp and to analyze than the realm of things given by the senses. At first -- one might say -- attention focuses on what can be shown in unreflective experience, in the so called *intentio recta* or *prima;* later one comes to reflect -- within the so called *intentio obliqua or secunda* -- on cognition itself as function of consciousness and, finally, one may reflect on the function of language as a condition of the possibility and intersubjective validity of knowledge.

Certainly, this answer is not false; we will even accept it as a guideline for understanding the sequence of periods in the history of philosophy. However, it must be stressed, that Greek philosophy itself went through this cycle of stages in a way. In the age of Socrates and the Sophists it already turns away from ontological questions about the nature (φύσις) and origin (ἀρχή) of things, and raises questions as to the correctness of names (ορθοτες ονομάτων), the function of speech (λόγος) and the meaning of words as concepts or definitions (ὁροί, δρισμοί). Plato, through whom we know about these discussions, already achieves the insight, that the truth is not to be sought in the quality of single names but that it is a function of their connection into a statement (λόγος) (5). And Aristotle especially in his "De Interpretatione" laid the foundations of a philosophy of grammar, which was further elaborated by the Stoics and thus decisively influenced the grammar of the schools in the western world up to the present day.

But why did not Plato already, as Wittgenstein suggests, look for the rule of the use of words in order to find an answer to the famous questions of Socrates into *what* courage or justice is? And why did he not see in his own definition of thinking as a voiceless dialogue of the soul with itself a clue to the fact that thinking is to be considered as a

function of communication by language? And Aristotle, who so often opens his questions about the essence (σὐσία) of being (όν) by an inquiry into the use of the words -- why did he not consider the possibility that his ontological categories are relative to the Greek language?

The answer to these questions, in my opinion, has to be a twofold one: On the one hand Plato and Aristotle would have had good reasons for being dissatisfied by doctrines which claim to "reduce" their question as to the *essence of things* to mere question about the *use of words*. (...) On the other hand, however, we must not overlook that Plato and Aristotle did not have a concept of language adequate to enable them to see that their very questions, not to speak of the answer, were dependent on the learned use of a certain language.

The classical philosophy of the Greeks had at its disposal essentially four concepts for comprehending the essence of human speech or communication: ὀνομα (name), σὐμβολον, σημεϊον (symbol or sign), δρος; (concept) and λὀγος; (speech, oratio, ratio, statement, etc.) (It is worth mentioning that it had no concept of a special language. Only the Romans had the word "lingua latina".) (7) By means of these four concepts it was impossible to grasp that meaning is essentially a function of a language. For these four concepts form two clusters between which the problem of linguistic meaning slips through: λὀγος (ratio) and δρος (concept) were a priori directed to something universal which was thought to be independent of the use of language; ὀνομα (name) and σὐμβολον or σημεἰον (sign), on the other hand, did in fact mean something which differs according to the use of different languages, but for Aristotle, at least, it had nothing to do with the meaning of thoughts; it was only a conventional means of designating, in the service of the "logos". (Perhaps it was precisely this progressive step of no longer asking for the correctness of single names but rather for the truth of statements that caused the Greek philosophers to overlook the cognitive function which languages have by virtue of the determinate meanings of their words and phrases.) (8)" (pp. 34-36)

Notes

(5) Cf. Plato, *Sophist* 261c - 262e

(6) Cf. Plato, *Sophist* 263d

(7) See J. Lohmann, "Über den paradigmatischen Charakter der griechischen Kultur", in: *Festschrift für H. G. Gadamer*, Tübingen 1960, pp. 171-89; see further J. Lohmann's papers in *Lexis,* I, 1948, pp.49-106, *Lexis,* III, 1, pp. 5-49, *Lexis,* III, 2, p. 169-217, and in: Festschrift fur L. Weisgerber, Düsseldorf 1958.

(8) So it is not quite surprising that the Neoplatonist tradition which interpreted Plato's "Cratylus" as defending the theory of the correctness of names had some beneficial influence by preserving the notion that words are not simply sounds arbitrarily used as signs. Finally, the strongest argument of the *θέσει*-theory of names was answered in the Neoplatonist tradition by the fruitful idea that the variety of words standing for the same things must not necessarily be explained by different conventions but could also be explained by a variety of experienced aspects of things. This view may be traced in, for instance, Nicolaus Cusanus, Leibniz and still in W. von Humboldt. Cf. K. O. Apel, "Die Idee der Sprache bei Nicolaus von Cues", in *Archiv für Begriffsgeschichte,* Bd. 1, Bonn 1955, pp. 200-221.

Logical form and logical matter

"The mediaeval distinction between material and formal consequence derives ultimately, both in name and in substance, from ancient texts. (60)

Form and matter, *eidos* and *hyle*, are Peripatetic twins, and the mediaeval distinction -- and hence the modern notion of 'formal' logic -- comes in the end from Aristotle.

These claims are indisputable -- but they are vague. If we inquire more closely into the business, dispute and controversy appear. For some historians of logic have claimed that the later Peripatetics, at least, had a clear understanding of the notion of logical form and hence of the essential nature of formal logic; (61) whereas others

have maintained, to the contrary, that the modern ideas of formal validity and of the logical form of an argument have no genuine counterparts in the ancient texts. (62) In fact -- and predictably --, the truth lies dully between these two exciting extremes; and if we are to see just how and where it lies, we must proceed by a plodding examination of the relevant texts.

Aristotle himself only once applies the concepts of matter and form to the syllogism: at *Phys* 195a18-19 he observes laconically that "the hypotheses are matter for the conclusion". (By "hypotheses" he here means "premisses".) The later commentators pick up the point. Alexander, it is true, was not happy with it, (63) and he does not make use of it in his own logical writings. But Philoponus had no such qualms: he repeats the idea that the premisses of a syllogism are, as it were, the stuff out of which the conclusion is made (64) Yet whatever we make of*Phys* 195a18-19, the text has nothing to do with the distinction between formal and material validity.

Several other logical applications of the twin concepts are found in the later commentators: thus the modal status or *skesis* of a proposition is called its 'matter'; (65) or the subject of a proposition stand to the predicate as matter to form; (66) or an unquantified proposition is matter, the quantifier form; (67) and so on. (68) None of these applications of the Aristotelian distinction is illuminating; and none is relevant here.

Alexander preferred to invoke matter and form in a different logical context; and it is his preferred distinction between logical matter and logical form which is to the present point. (69) The idea first appears early in Alexander's commentary on the *Prior Analytics*:

The figures of the syllogism are like a sort of common matrix. You may fit matter into them and mould the same form for different matters. Just as, in the case of matrixes, the matters fitted into them differ not in respect of form or figure but in respect of matter, so too is it with the syllogistic figures. (*in APr* (6.16-21).

Alexander says no more than this to explain what distinguishes the form from the matter of an argument. Similarly, the distinction enters his commentary on the *Topics* in its first pages (*in Top* 2.1-3.4) -- and again, there is no serious explanation. After their

Introduction, the concepts are used with frequency and without apology throughout the commentaries.

The twins reappear in the later Peripatetic commentators. Ammonius presents them in a cautious manner near the beginning of his commentary on the *Prior Analytics*:

In every syllogism there is something analogous to [*analogon*] matter and something analogous to form. Analogous to matter are the objects [*pragmata*] themselves by way of which the syllogism is combined, and analogous to form are the figures. (*in APr* 4.9-11).

As this passage suggests, Ammonius does not greatly like the term *hyle;* and to convey the Alexandrian distinction he will in fact more often employ the word *pragma*. (70) But his pupil Philoponus was content with the term *hyle* and he simply equates *pragmata* and *hyle* as though nothing turned on the point (*in APr*9.6.)

(...)

Thus the later authors used a variety of linguistic turns. But it would be rash to look for any substantial difference behind the linguistic facade. Boethius and the later Greeks adopted and deployed an established and apparently uncontroversial distinction. How the distinction was referred to and by what names it was called were questions of taste and style.

Alexander too had taken the thing for granted; and we must infer from his commentaries that earlier Peripatetics had applied the concepts of matter and form to logic. On independent grounds we may believe that Alexander's teacher, Herminus, (75) had probably spoken of the form and matter of arguments. (76) As far as I know, there is no other evidence for the use of matter and form in logical theory before Alexander: it is not found in Aristotle's own works; nor is there any text ascribing it to Theophrastus or Eudemus, or to Boethus or Aristo. But the silence proves little, and Alexander's attitude shows that by his time it was already thoroughly familiar. (77)

If we ask *why* some Peripatetic scholar thought to apply matter and form to logic, we can give no worthwhile answer. Was the idea part of a general attempt to systematise Aristotle, so that his customary

analytical concepts should be applied in every part of his philosophy? Was it rather reflexion on the *Analytics* themselves (perhaps on the sense and function of Aristotle's dummy letters (78) which encouraged the invocation of matter and form? Was it the influence of the Stoics, whose own distinction between a *logos* and a *tropos* might have put a Peripatetic in mind of matter and form? (79) There is no evidence from which to answer these questions." (pp. 39-43)

Notes

(60) For the links between the ancient and the mediaeval accounts see esp. Ebbesen pp. 95-101; cfr. Pinborg pp. 74-80. For the importance of the distinction in Arabic texts see Zimmermann pp. XXXVIII-XLI. (But Zimmemann claims too much for Al-Farabi. "Striking an individual note in the very first sentence of his *Commentary* al-Farabi says that the *De Int*. is about the "composition" [*ta'lif*], not the "matter" [*madda*], of propositions. I do not find this opposition of terms, which recurs as a kind of leitmotiv throughout the work, in the Greek commentaries; and the fact that it is usually in criticizing his predecessors that he invokes it confirms that here we have a new departure in the exegesis of the *De Interpretatione*" (pp. XXXVIII-XXXIX). Not entirely new, I think -- and in any case, the opposition of terms which al-Farabi deploys was thoroughly familiar to the Greek commentators on the *Analytics*.)

(61) Thus the Peripatetic commentators "show us that they had an excellent conceptual grasp of the essence of what is today called 'formal' logic" (Lee, p. 38); and Alexander had "a clear insight into the essence of formal logical laws" (Bochenski, p. 157).

(62) Thus "it seems that neither the Stoics nor the Peripatetics ever say that an argument is valid because of its logical form, which would be strange if they actually had thought that the validity had to be explained as being due to the form. And even when it is said that a certain form of argument is valid for every matter (i.e. for every suitable substitution of the letters), this does not seem to be the same as saying that the validity is due to the form" (Frede, p. 103). (In a note, Frede admits that there are apparent counterexamples to his thesis -- he cites Boethius, *Hyp syll* II ii 4-5, iii 6, iv 2 [see below, p. 42] --, and says that these passages "would have to be dealt with individually" (p. 368 n. 3).) -- I am not sure exactly what Frede

concedes and what he denies. But the main point appears to be this: the ancient logicians do not ever say of an argument that it is valid because of its form. Now, taken absolutely literally, this may well be true; at least, I have not come across a text in which a conclusion is said*sunaghestai dia to eidos*. But there are, as Frede allows, a few passages which say something very close to this (e.g. that a conclusion is drawn *dia ten plochen*); and there are numerous passages which imply something like it (e.g. passages which contrast syllogisms with arguments which conclude *dia ten hylen*). -- My own reasons for qualifying the enthusiastic view exemplified in the last footnote are not Frede's. Rather, first, I hold that the use of the matter/form distinction by Alexander (and the later commentators) is not always coherent [see below, pp. 58-65]. And secondly, I doubt if the ancients had any dear or coherent notion of form. They had (*contra* Frede) a rough and ready notion of formal validity; but (*contra* Lee) they had no precise and rigorous notion. (Of course, if the reflections in the previous Part of this paper are correct, then the ancients were in this respect no worse off than most moderns.).

Later Antiquity

"The last period of ancient logic is characterized by the following traits, some of which have already been touched upon (chapter 2 C). First of all, as far as we know, it is no longer a creative period: we cannot quote a single logician comparable -- not only with Aristotle, Diodorus or Chrysippus, but even with Theophrastus. Logic seems to have still been much studied, however, and its knowledge must have been widely spread. At the same time there was the unfortunate phenomenon of the struggle between the Peripatetic and the Stoic Schools. Slowly a mixture of both trends formed. Thus, we hear that Boethus of Sidon, pupil of Andronicus Rhodos, who lived at the time of Augustus and was the head of the Peripatetic School, asserted the priority of the Stoic undemonstrated in regard to the categorical syllogism; syncretism is often met with later on, e.g. in the *Dialectical Introduction* of Galenus. On the other hand there are still some rigid peripateticians who deny any merit to the Stoic-Megaric School; Alexander of Aphrodisias is an instance. In the long run, however, a kind of commonly received doctrine, composed of rather poor remains of both Aristotelian and Stoic-Megaric doctrines was formed. Yet the work of the commentators and authors of textbooks has not been, as it seems, completely irrelevant to logic -- here and there they probably were able to bring some complements and perfections of the old doctrines. Unfortunately, we know nearly nothing about their work.

The Logicians.

There follows here a (incomplete) list of important logicians who lived during that long period. Ariston of Alexandria is reported to have stated the "subaltern modes" of the syllogism (1); he lived during the II century A.D. Another important logician of the same period is the famous physician Galenus (129 - c. 199 A.D.); his "Dialectical Introduction" is the only ancient Greek textbook of logic preserved; it has been studied by Fr. Stakelum. His contemporary Apuleius of Madaura (125 A.D.) wrote among others a Latin book *Peri hermenias* which seems to be of great interest. Alexander of Aphrodisias, who lived during the third century, is probably one of the most penetrating logicians of the peripatetic School and one of the best commentators of the Organon in history. Porphyrius of

Thyrus (232/3 - beginning of the IV century) is another important commentator of Aristotle, if inferior to Alexander: his Introduction was destined to have a brilliant career during the Middle Ages. Sextus Empiricus (3rd century) our main source for the Stoic-Megaric School can hardly be called a logician, yet he knew logic well and some of his criticisms might be of interest. Later authors - such as Iamblichus of Chalkis c. 330), Themistius (330-390), Ammonius Hermeiou, the disciple of Proclus, David Ioannes Philoponus (died after 640), are of far lesser importance. But at the end of our period we have again some men of interest: Martianus Capella, who wrote between 410 and 439 his celebrated "De nuptiis Philosophiae et Mercurii" with a book devoted to logic; Simplicius, pupil of Ammonius, and the last important Athenian Philosopher (he was driven from Athens by a decree of Justinian in 529) is also an intelligent logician; finally Boethius, himself a not very good thinker, is highly important because of his influence on the Middle Ages, but also because of the mass of information his logical works contain." (pp. 103-104)

Notes

(1) *Apul. 193, 16ff.;* there is much confusion in this text.

From: I. M. Bochenski, *Ancient Formal Logic*, Amsterdam: North-Holland, 1951.

"Very little is known about the development of logic from c. 100 BCE to c. 250 CE. It is unclear when Peripatetics and the Stoics began taking notice of the logical achievements of each other. Sometime during that period, the terminological distinction between *categorical syllogisms*, used for Aristotelian syllogisms, and *hypothetical syllogisms*, used not only for those by Theophrastus and Eudemus but also for the Stoic propositional-logical syllogisms, gained a foothold. In the first century BCE, the Peripatetics Ariston of Alexandria and Boethus of Sidon wrote about syllogistic. Ariston is said to have introduced the so-called *subaltern* syllogisms (Barbari, Celaront, Cesaro, Camestrop and Camenop) into Aristotelian syllogistic (Apul.*Int*. 213.5–10), that is, the syllogisms one gains by applying the subalternation rules (that were acknowledged by Aristotle in his *Topics*): From “A holds of every B” infer “A holds of

some B" From "A holds of no B" infer "A does not hold of some B" to the conclusions of the relevant syllogisms. Boethus suggested substantial modifications to Aristotle's theories: He claimed that all categorical syllogisms are complete and that hypothetical syllogistic is prior to categorical (Gal.Inst.Log. 7.2), although we are not told prior in which way. The Stoic Posidonius (c.135–c.51 BCE) defended the possibility of logical or mathematical deduction against the Epicureans and discussed some syllogisms he called *conclusive by the force of an axiom*, which apparently included arguments of the type "As the 1st is to the 2nd, so the 3rd is to the 4th; the ratio of the 1st to the 2nd is double; therefore the ratio of the 3rd to the 4th is double," which was considered conclusive by the force of the axiom "things which are in general of the same ratio, are also of the same particular ratio" (Gal. *Inst. Log*.18.8). At least two Stoics in this period wrote a work on Aristotle's *Categories*. From his writings we know that Cicero was knowledgeable about both Peripatetic and Stoic logic; and Epictetus's discourses prove that he was acquainted with some of the more taxing parts of Chrysippus's logic. In all likelihood there existed at least a few creative logicians in this period, but we do not know who they were and what they created. The next logician of rank, if of lower rank, of whom we have sufficient evidence is Galen (129–199 or 216 CE), whose greater fame was as a physician. He studied logic with both Peripatetic and Stoic teachers and recommended to avail oneself of parts of either doctrine, as long as it could be used for scientific demonstration. He composed commentaries on logical works by Aristotle, Theophrastus, Eudemus, and Chrysippus, as well as treatises on various logical problems and a major work titled *On Demonstration*. All these are lost except for some information in later texts, but his *Introduction to Logic* has come down to us almost in full. In *On Demonstration*, Galen developed, among other things, a theory of compound categorical syllogisms with four terms, which fall into four figures, but we do not know the details. He also introduced the so-called relational syllogisms, examples of which are "A is equal to B, B is equal to C; therefore A is equal to C" and "Dio owns half as much as Theo; Theo owns half as much as Philo. Therefore Dio owns a quarter of what Philo owns." (Gal. *Inst. Log*. 17–18). All relational syllogisms Galen mentions have in common that they are not reducible in either Aristotle's or Stoic syllogistic, but it is difficult to

find further formal characteristics that unite them all. In general, in his*Introduction to Logic*, he merges Aristotelian Syllogistic with a strongly Peripatetic reinterpretation of Stoic propositional logic. The second ancient Introduction to logic that has survived is Apuleius's (second century CE) *De Interpretatione*. This Latin text, too, displays knowledge of Stoic and Peripatetic logic; it contains the first full presentation of the square of opposition, which illustrates the logical relations between categorical sentences by diagram. Alcinous, in his *Handbook of Platonism* 5, is witness to the emergence of a specifically Platonist logic, constructed on the Platonic notions and procedures of division, definition, analysis, and hypothesis, but there is little that would make a logicians heart beat faster. Sometime between the third and sixth century CE, Stoic logic faded into oblivion to be resurrected only in the twentieth century in the wake of the (re)discovery of propositional logic. The surviving, often voluminous, Greek commentaries on Aristotle's logical works by Alexander of Aphrodisias (fl. c.200 CE), Porphyry (234–c.305), Ammonius Hermeiou (fifth century), John Philoponus (c. 500), and Simplicius (sixth century), and the Latin ones by Anicius Manlius Severinus Boethius (c.480–524) have their main importance as sources for lost Peripatetic and Stoic works. Still, two of the commentators deserve special mention: Porphyry, for writing the *Isagoge* or *Introduction* (that is, to Aristotle's *Categories*), in which he discusses the five notions of genus, species, differentia, property, and accident as basic notions one needs to know to understand the *Categories*. For centuries, the *Isagoge* was the first logic text a student would tackle, and Porphyry's five predicables (which differ from Aristotle's four) formed the basis for the medieval doctrine of the *quinque voces*. The second is Boethius. In addition to commentaries, he wrote a number of logical treatises, mostly simple explications of Aristotelian logic, but also two very interesting ones: (1) His *On Topical Differentiae* bears witness of the elaborated system of topical arguments that logicians of later antiquity had developed from Aristotle's *Topics* under the influence of the needs of Roman lawyers. (2) His *On Hypothetical Syllogisms* systematically presents wholly hypothetical and mixed hypothetical syllogisms as they are known from the early Peripatetics; it may be derived from Porphyry. Boethius's insistence that the negation of "If it is A, it is B" is "If it is A, it is not B" suggests a suppositional understanding of the

conditional, a view for which there is also some evidence in Ammonius, but that is not attested for earlier logicians. Historically, Boethius is most important because he translated all of Aristotle's *Organon* into Latin, and thus these texts (except the*Posterior Analytics*) became available to philosophers of the medieval period." (pp. 407-409)

Bibliography of Ancient Logic in the Hellenistic Period

Selected bibliography on Hellenistic logic

Studies in English (A - F)

1. Ademollo, Francesco. 2015. "Names, Verbs and Sentences in Ancient Greek Philosophy." In *Linguistic Content: New Essays on the History of Philosophy of Language* , edited by Cameron, Margaret and Stainton, Robert J., 33-54. New York: Oxford University Press.

   "My purpose here is to investigate some ancient conceptions of the composition and structure of sentences, focusing on Plato and Aristotle, with short forays into other authors and ages. I shall concern myself mainly with two mutually connected issues.

   First, both Plato and Aristotle hold that a minimal simple sentence consists of two expressions of different kinds, which they call onoma and rhema; I shall try to make clear the nature and purport of this distinction, which is controversial. Secondly (but partly at the same time), I shall try to trace the emergence and early development, from Plato to the Stoics, of the idea that a simple declarative sentence has a signification of its own over and above the signification of its parts. Most individual details of what I am going to say are, I am afraid, not new; but perhaps the story as a whole deserves to be told. (1) As so often with stories about ancient matters, telling it will require some

detailed discussion and a modicum of philological excavation." (p. 33)

(1) For partly comparable and very valuable surveys, from which I have learnt much, see Nuchelmans (1973: 13-44) and Barnes (1996).

2. Allen, James. 2007. "Rhetoric and Logic." In *A Companion to Greek Rhetoric* , edited by Worthington, Ian, 350-364. Malden: Blackwell.

   "Logic was the property of the philosophers, and it is to those philosophers who also interested themselves in rhetorical argument that one must turn in order to explore the relations between logic and rhetoric in Greek antiquity. Though it has roots in Plato and Aristotle, the division of philosophy into logic, physics and ethics seems first to have been made explicitly in the second half of the fourth century, after which time it became standard (Sextus Empiricus, *Against the Mathematicians* 7.16). In the Stoic version of the division, which was especially influential, the logical part of philosophy was further divided into rhetoric and dialectic, and some Stoics also made a place for a separate part concerned with definition and another concerned with canons and criteria, i.e., epistemology (Diog. Laert. 7.41). The connecting thread is a common concern with logos, and the variety of items encompassed by the ancient discipline of logic reflects the range of the term logos, which can mean a word, a proposition, a definition, speech, a speech in the sense of an oration, an

argument or the faculty of reason. These were seen to form a unity because speech and thought were regarded as two aspects of logos. Speech is external logos, thought internal logos, according to the Stoics, who are in accord with older views like that of Plato, who defined thought as internal speech (Sextus Empiricus, *Against the Mathematicians* 8.275; Pl. *Sophist* 263e)." (p. 350)

3. Asmus, Conrad, and Restall, Greg. 2012. "A History of C:onsequenc:e Relation." In *Logic: A History of Its Central Concepts* , edited by Gabbay, Dov M., Pelletier, Francis Jeffrey and Woods, John, 11-61. Amsterdam: North-Holland.

   Volume 11 of the *Handbok of te History of Logic* .

   "Consequence is a, if not *the* , core subject matter of logic. Aristotle's study of the syllogism instigated the task of categorising arguments into the logically good and the logically bad; the task remains an essential element of the study of logic. In a logically good argument, the conclusion follows validly from the premises; thus, the study of consequence and the study of validity are the same.

   In what follows, we will engage with a variety of approaches to consequence.

   The following neutral framework will enhance the discussion of this wide range of approaches. Consequences are conclusions of valid arguments. Arguments have two parts: a conclusion and a collection of premises. The conclusion and the premises are all entities of the same sort. We will call the conclusion and premises of an argument the argument's *components* and will refer to anything that can be an argument component as a *proposition* . The class of propositions is defined functionally (they are the entities which play the functional role of argument components); thus, the label should be interpreted as metaphysically neutral. Given the platonistic baggage often associated with the label "proposition", this may seem a strange choice but the label is already used for the argument components of many of the approaches below (discussions of Aristotlean and Medieval logic are two examples). A consequence relation is a relation between collections of

premises and conclusions; a collection of premises is related to a conclusion if and

only if the latter is a consequence of the former."

4. Bailey, D. T. J. 2008. "Excavating Dissoi Logoi 4." *Oxford Studies in Ancient Philosophy* no. 35:249-264.

   "i begin with a necessary apology for the extreme obscurity of the text I shall discuss. The *Dissoi Logoi* , whose fourth chapter is the subject of this paper, is perhaps unique among texts in the history of philosophy for its murkiness. It is an anonymously authored philosophical work appearing to argue, among other things, for the sameness and then the difference of properties such as good and bad, just and unjust, true and false. Almost every aspect of it likely to interest scholars is monstrously undetermined. Thus:

   (1) Its date is unknown. Many suppose it to be a Sophistic moot book or the like from around the late fifth/early fourth century b.C.(1)

   Others take the location of its only manuscripts, always in the works of Sextus Empiricus, to indicate a dating anything up to six hundred years later. One scholar has suggested that it might have been written as late as the medieval end of the Byzantine era.(2)

   (2) Its original dialect is unknown. It is largely composed in Doric, but with numerous Atticisms and dashes of Ionic. (...)

   (3) Partly because of its content, and partly because of (1) and (2), its purpose is unknown. (...)

   Given (1), (2), and (3), it is almost impossible to say anything about the *Dissoi Logoi* that goes beyond mere conjecture. But it would be a pity to let caution silence all contributions to the understanding of this most mysterious text. In what follows, I discuss two issues—the meaning of the word logos3 in 4. 1–5, and the argument of 4. 6—with a view to assessing just how Sophistic this chapter is, and asking what there is about it that might have aroused interest in later Sceptical traditions. I shall

not count the exercise a failure if all I can achieve is to make this text even more intriguing than it has seemed beforehand."

(1) For a detailed discussion of one disagreement, even among those who view the text as belonging to the early Sophistic movement, see T.M. Robinson, *Contrasting Arguments: An Edition of the Dissoi Logoi* (Salem, NH, 1979), 34–41. I rely on this magnificent work of scholarship throughout.

(2) T.M. Conley, 'Dating the So-Called Dissoi Logoi: A Cautionary Note', *Ancient Philosophy* , 5 (1985), 59–65.

5. Baltussen, Han. 1992. "Peripatetic dialectic in the *De sensibus* ." In *Theophrastus: His Psychological, Doxographical and Scientific Writings* , edited by Fortenbaugh, William W. and Gutas, Dimitri, 1-19. New Brunswick (N. J.): Transaction Publishers.

"Once attention is directed towards Theophrastus' argumentation, the choice of Peripatetic dialectic as a normative model (or heuristic device), being a general theory of argumentation, seems obvious. But there are more specific reasons. Since the fundamental study of E. Weil(7) the picture of the function and content of the dialectical method has undergone considerable adjustment. Dialectic was rehabilitated against the dominant role of analytics and freed from sophistic qualifications which were undeservedly attached to it.(8) This caused a new interest in the *Topics,* the treatise in which Aristotle expounded his theory of dialectical reasoning.

Although today no overall agreement exists upon details of interpretation, it is still possible to summarize the main elements of the results so far. I have attempted to incorporate the various results into one description which will enable us to gain a new understanding of the dialectical procedure. I shall first focus on the goal of dialectic, passing on to its more specific function in 'doxographic' contexts. It may seem a small detour at the moment, but I hope it will prove to be a *reculer pour mieux sauter* ." (p. 3, note 9 omitted)

(7) E. Weil, 'La place de la logique dans la pensée aristotélicienne', *RMM* 56 (1951), 283-315 [= 'The Place of

Logic in Aristotle's Thought', repr. in J. Barnes et al. (edd.), *Articles on Aristotle, 1. Science* (London, Duckworth 1975), pp. 88-112]. I shall quote from the English translation. An earlier instance of a study that investigated the role of the search for principles in Aristotle's *Physics* is J.M. LeBlond, *Logique et Méthode chez Aristote,* Paris 1939. But the earliest (and least quoted) instance is H.D.P. Lee, 'Geometrical method and Aristotle's account of first principles', *CIQ* , 29 (1935), 113-24. The most recent contributions on the subject are by T.H. Irwin, *Aristotle's First Principles* (Oxford, Clarendon Press 1988) and A. Beriger, *Die aristotelische Dialektik. Ihre Darstellung in der Topik' und in den 'Sophistischen Widerlegungen und ihre Anwendung in der 'Metaphysik' M 1-3* (Heidelberg / Carl Winter 1989).

(8) As Weil (pp. cit. p. 89) summarized it: "... both [analytics and dialectic] are equally formal, both apply a method that is independent of the content, both use the syllogism as their principal tool".

6. Barnes, Jonathan. 1982. "Medicine, Experience and Logic." In *Science and Speculation: Studies in Hellenistic Theory and Practice* , edited by Barnes, Jonathan, Brunschwig, Jacques, Burnyeat, Myles F. and Schofield, Malcolm, 24-68. Cambridge: Cambridge University Press.

   Reprinted in J. Barnes, *Logical Matters: Essays in Ancient Philosophy II* , New York: Oxford University Press 2012, pp. 538-581.

   "The concept of 'experience' has a long history, going back through Aristotle to the Presocratic philosophers.3 I shall not attempt to write that history, nor to give an account of the precise way or ways in which the concept was understood by the Empirical doctors who took their sobriquet from it. I assume that an experience is a piece of general knowledge ('Pomegranates cure diarrhoea'), based upon a series of particular observations ('Pomegranates were good for Dio when he had diarrhoea'); and I assume, further, that in the eyes of the Empiricists the general knowledge was justified by its observational basis. In effect, then, the Empirical doctors were

committed to the acceptability of certain inductive inferences; and the soritical argument—or the sorites, as it is now customarily called—was used by the Dogmatists to cast doubt upon induction." (p. 540, notes omitted)

(...)

"What is fundamentally at issue here is a question about the nature of logic: is logic in a way prior to science and to experience, is it something which gives shape to experience and which cannot be modified by experience? or is logic rather parasitical upon science, constrained by the observed facts and open to modification in the light of empirical discovery? Those questions still exercise us — quantum physics gave them new life not so long ago. I think that they are at the bottom of the dispute between Galen's two doctors. (p. 578, a note omitted)

7. ———. 1986. "Peripatetic negations." *Oxford Studies in Ancient Philosophy* no. 4:201-214.

   Reprinted in J. Barnes, *Logical Matters: Essays in Ancient Philosophy II* , New York: Oxford University Press 2012, pp. 172-186.

   "Ancient logicians did not question the Aristotelian view that 'for every affirmation there is an opposite negation, and for every negation an opposite affirmation' (*int* 17a32–33); nor did they doubt that 'a single affirmation has a single negation' (17b37): every affirmation, P, has one and only one negation neg:P. Moreover, it was taken to be constitutive of the notion of negation that P and neg:P cannot both be true and cannot both be false. And it was supposed that a negation, neg:P, will normally be constructed from its affirmative twin, P, together with a negative operator.

   Those common notions form the background to a short essay on negation which Alexander of Aphrodisias inserted into his commentary on Aristotle's *Prior Analytics* . Alexander defends an Aristotelian account of negation and argues against a rival account.(3) The rival account is generally supposed to be Stoic or even Chrysippean; and it contains indisputably Stoic elements.

But Alexander does not name his opponents, nor does he offer any information about the history of the dispute." (pp. 172-173, notes omitted)

(3) *in APr* 402.1–405.16.

8. ———. 1990. "Logical Form and Logical Matter." In *Logica, mente e persona. Studi sulla filosofia antica* , edited by Alberti, Antonina, 7-119. Firenze: Olschki.

   Reprinted in J. Barnes, *Logical Matters. Essays in Ancient Philosophy II* , Oxford: Clarendon Press 2012, pp. 43-146.

   "The first theorem of the first Book of Euclid's Elements is this:

   On a given finite straight line, there can be constructed an equilateral triangle." (p. 43)

   (...)

   "At the heart of the proof lies an argument which I shall call the Euclidean Argument. It can be set out as follows:

   (1) Things equal to the same thing are equal to one another.

   (2) CA is equal to AB.

   (3) CB is equal to AB.

   Therefore: (4) CA is equal to CB.

   The argument is utterly clear and utterly simple. It might stand as a paradigm of deductive inference.

   The first premiss of the Euclidean Argument is the first of Euclid's 'common notions'; that is to say, it is one of the axioms of Euclid's geometry.

   If we omit the axiom, we are left with the following argument:

   (1) CA is equal to AB.

   (2) CB is equal to AB.

   Therefore: (3) CA is equal to CB.

   This argument, which I shall call the Truncated Argument, is also utterly simple and utterly clear. It too might be regarded as

a paradigm of deductive inference.

It is plain that both the Euclidean Argument and the Truncated Argument are deductively valid. Their conclusions follow from their premisses.

It is plain, moreover, that the Euclidean Argument is, so to speak, one member of a large family of arguments, each of which is valid." (p. 44, notes omitted)

(...)

"!If the Euclidean Argument and the Truncated Argument are valid, and yet are neither hypothetical nor categorical syllogisms, then it will be tempting to infer that there must be a third kind of syllogism in addition to the two kinds commonly recognized by the ancient logicians.

At least one ancient logician drew exactly that inference. My phrase ‘a third kind of syllogism’ is taken from Galen. In his *Institutio Logica* Galen presents elementary and unoriginal expositions both of categorical and of hypothetical syllogistic; and then he turns to the novelty— to his third kind of syllogism (xvi 1)." (p. 50, notes omitted)

9. ———. 2005. "What is a disjunction?" In *Language and Learning: Philosophy of Language in the Hellenistic Age: Proceedings of the Ninth Symposium Hellenisticum* , edited by Frede, Dorothea and Inwood, Brad, 274-298. Cambridge: Cambridge University Press.

   Reprinted in J. Barnes, *Logical Matters. Essays in Ancient Philosophy II* , Oxford: Clarendon Press 2012, pp. 512-537.

   "Stoic logicians attended to words rather than to things: so claimed Galen, a dozen times or more; and so claimed Alexander of Aphrodisias. Galen and Alexander meant the claim as an accusation and a criticism: it was because they thought not of things, but of words, that the Stoics made fundamental errors in their logic.

   Nineteenth-century historians of logic echoed the ancient claim, and they too thought that Stoic logic was ruined by its passion for words. Twentieth-century historians of logic also

echoed the ancient claim. But for them it was not a criticism. On the contrary, it was a sign that the Stoic logicians were ‘formalists’ — and it is good thing for a logician to be a formalist.

But whether it is bad or good to attend to words rather than to things can scarcely be decided until we know what it means to attend to words rather than to things. In the following pages I shall discuss one or two aspects of the ancient claim and one or two of the texts pertinent to it. The texts concern complex propositions — conditionals, conjunctions, disjunctions. Such items form the foundations of Stoic logic. According to Galen and Alexander, the Stoics made fundamental errors about those fundamental items: they did so because they attended to words rather than to things, because their misdirected gaze encouraged them to misclassify compound propositions." (p. 512)

10. ———. 2007. *Truth, etc.: Six Lectures on Ancient Logic* . Oxford: Clarendon Press.

    Contents: 1 Truth 1; 2 Predicates and Subjects 93; 3 What is a Connector? 168; 4 Forms of Argument 264; 5 The Science of Logic 360; 6 When is a Syllogism not a Syllogism? 448; Onomasticon 529: Index of Passages 533; General Index 543-551.

    "The book is about ancient logic. Antiquity is the antiquity of Greece and Rome—which here starts in the fourth century BC and continues, discontinuously, to the sixth century AD. As for logic, the table of Contents indicates what sort of thing is on or under the carpet.

    Ancient logic lacks sex appeal.

    Most contemporary logicians have little interest in the history—or at least in the ancient history—of their subject. No doubt they suppose that their long-dead colleagues have little or nothing to teach them, and perhaps they prefer the present and the future to the past. If that is so, then it must be confessed that their supposition is quite true: no logician has anything to learn from a study of Aristotle; and the pages of this book make

no contribution to logic or to philosophy. As for preferences, I myself rate the past way above the future. But *de gustibus* .

Most students of the ancient world have little interest in logic. Some indeed despise it, or affect to despise it; and some fear it, or affect to fear it. Such attitudes—which were sometimes assumed in antiquity—are lamentable, and they are vexing. But there is nothing much I or anyone else can do about them.

Nonetheless, on my own pink official form there is written: 'I like my work.' And I hope that a few discerning readers will find parts of the book engaging—and even entertaining." (Preface, pp. VII-VIII)

11. ———. 2007. "Peripatetic Logic: 100 BC - AD 200." In *Greek and Roman Philosophy 100 BC - 200 AD. Vol. II* , edited by Sharples, Robert W. and Sorabji, Richard, 531-546. London: Institute of Classical Studies.

    "Andronicus wrote commentaries; his successors wrote commentaries; the writing of commentaries was the philosophical activity of the imperial epoch. What was once philosophy had become philology. For although commentary is an honest activity and a useful activity, it is not an exciting activity and it is not an innovative activity. Commentators are essentially conservative beings: they are concerned to preserve and transmit the thought of the past, not to discover or invent the thought of the future. Such conservatism is likely to be even more marked in logic than in other areas of philosophy. After all, Aristotle had perfected - had he not? - the art of logic. That being so, we should not expect too much in the way of novelty from Andronicus and his Peripatetic successors." (p. 533)

13. ———. 2014. "Boethus and Finished Syllogisms." In *Strategies of Argument: Essays in Ancient Ethics, Epistemology, and Logic* , edited by Lee, Mi-Kyoung, 175-198. New York: Oxford University Press.

    "According to Aristotle, the four canonical syllogisms of the first figure—Barbara, Celarent, Darii, Ferio—are τέλειοι or finished (*APr* A 26b28–30). The four canonical syllogisms of the second figure, and the six of the third, are all ἀτελεῖς or unfinished (28a4–7, 15–16).(1) And "all the unfinished syllogisms are finished by way of the first figure" (29a30–31).(2)" (p. 175)

    (...)

    "And yet Ammonius took himself to be rehearsing a generally accepted view—a view which had been championed by Boethus, who "proved that all the syllogisms in the second and third figures are finished," and by Porphyry and Iamblichus and Maximus. Themistius defended Aristotle against Maximus, and the disputants asked the emperor Julian to arbitrate.

    Julian decided for Maximus; and Syrianus and Proclus and Hermias later took the same line. What is more, "it appears that Theophrastus, Aristotle's pupil, held the opinion contrary to his on the matter." (See Ammonius, *in APr* 31.11–15.)

It is a striking story.(5) And puzzling, for two reasons. First, it is hard to believe that Theophrastus and Boethus and all those later lights wasted their breath on such a silly business. Secondly, Alexander breathes no word of the “contrary opinion” in his commentary on the *Analytics* —neither does Philoponus, and neither does Boethius. The silence is strange.(6) As for Theophrastus, Porphyry, Iamblichus, Syrianus, Proclus, and

Hermias, no other text supports Ammonius—and in the case of Theophrastus, scholars have doubted his claim. But Ammonius did not invent the story." (p. 177, a note omitted)

(1) As for the non-canonical syllogisms of the first figure (Baralipton, Barbari, and the rest), Aristotle does not expressly say whether they are finished or unfinished; but he was taken, no doubt rightly, to have thought them to be unfinished (see e.g. Alexander, in *APr* 69.26–29; Boethius, *syll cat* 823A).

(2) On the finishing of syllogisms see Striker, “Perfection”; cf. Patzig, *Aristotle’s Theory,* pp.43–87; Barnes, *Truth, etc* ., pp.378–386.

(5) Parts of it are also told in an Aristotelian scholium, 156b43–47, and by David, in *APr* xi 1. According to the Suda, Julian wrote About the three figures (s.v. Ἰουλιανός): his written judgement on the dispute?

(6) Lee, *Syllogistik in der Spätantike* , p.132, suggests, implausibly, that it would have been out of place to discuss the question in a commentary on Aristotle.

    "Introduction. 1. A map of logic

    The Stoics were the innovative logicians of the Hellenistic period; and the leading logician of the school was its third scholarch, Chrysippus. Most of this section of the History will therefore describe Stoic ideas and Stoic theories.

    Its hero will be Chrysippus.

    Logic is the study of inference, and hence of the items upon which inference depends – of propositional structure (or 'grammar'), of meaning and reference. That part of their subject which the Hellenistic philosophers called λογικὴ (*logiké*) was a larger discipline;(1) for *logiké* –was the science which studies λὸγος in all its manifestations,(2) and logic is included in *logiké* as a part. Indeed as a part of a part. For the Stoics divided *logiké* into two subparts, rhetoric and dialectic; and logic is a part of dialectic.(3)

    "There has been considerable growth in the understanding and estimation of Stoic logic 'in the last thirty years, yet an important dimension of this Stoic achievement has not been grasped. Stoic logic was broadly conceived to include their theories of knowledge and perception, and the theory of perception provides the starting point and foundation of their logic. It is essential to the structure and unity of that logic that the Stoics take perception to be propositional. Starting from a new interpretation of the Stoic conception of *phantasia* as propositional perception, this study offers a view of Stoic logic that brings out the continuity linking perception, predication, inferential signs and proof." 17. Bobzien, Susanne. 2000. "Wholly Hypothetical Syllogisms." *Phronesis.A Journal for Ancient Philosophy* :87-137.

Abstract: "In antiquity we encounter a distinction of two types of hypothetical syllogisms. One type are the 'mixed hypothetical syllogisms'. The other type is the one to which the present paper is devoted. These arguments went by the name of 'wholly hypothetical syllogisms'. They were thought to make up a self-contained system of valid arguments. Their paradigm case consists of two conditionals as premisses, and a third as conclusion. Their presentation, either schematically or by example, varies in different authors. For instance, we find 'If (it is) A, (it is) B; if (it is) B, (it is) C; therefore, if (it is) A, (it is) C'. The main contentious point about these arguments is what the ancients thought their logical form was. Are A, B, C schematic letters for terms or propositions? Is 'is', where it occurs, predicative, existential, or veridical? That is, should '*A esti* ' be translated as 'it is an A', 'A exists', 'As exist' or 'It is true/the case that A'? If A, B, C are term letters, and 'is' is predicative, are the conditionals quanti ed propositions or do they contain designators? If one cannot answer these questions, one can hardly claim to know what sort of arguments the wholly

hypothetical syllogisms were. In fact, all the above-mentioned possibilities have been taken to describe them correctly. In this paper I argue that it would be mistaken to assume that in antiquity there was one prevalent understanding of the logical form of these arguments even if the ancients thought they were all talking about the same kind of argument. Rather, there was a complex development in their understanding, starting from a term-logical conception and leading to a propositional-logical one. I trace this development from Aristotle to Philoponus and set out the deductive system on which the logic of the wholly hypothetical syllogisms was grounded."

18. ———. 2000. "Why the Order of the Figures of the Hypothetical Syllogisms Was Changed." *Classical Quarterly* no. 50:247-251.

    "In chapter 6 of Alcinous' *Handbook of Platonism* we find a discussion of categorical, hypothetical, and mixed syllogisms. Alcinous distinguishes three figures of the hypothetical syllogism, and illustrates each figure with a syllogism based on an argument from Plato. Here he remarks in passing that most people called the second hypothetical figure the third and that some called the third figure the second.(1) We may assume that those who called the third figure the second and those who called the second the third were the same. In a parallel passage, Alexander of Aphrodisias advocates the same ordering of figures of hypothetical syllogisms as Alcinous, and reports that Theophrastus, in the first book of his *Analytics* , had the second and third figure in reverse order.(2) Combining these passages, we can infer that at the turn of the second century A.D. there existed two different views on the ordering of the figures of the hypothetical syllogisms, of which one goes back to Theophrastus, whereas the other presumably was the result of a later change. This curious fact has so far not received a satisfactory explanation. In the following pages I seek to show what prompted this reversal of the order of figures." (p. 247, notes omitted)

19. ———. 2000. "How to give someone Horns. Paradoxes of Presupposition in Antiquity." *Logical Analysis and History of Philosophy* no. 15:159-184.

    Abstract: "This paper discusses ancient versions of paradoxes today classified as paradoxes of presupposition and how their ancient solutions compare with contemporary ones. Sections 1-4 air ancient evidence for the Fallacy of Complex Question and suggested solutions, introduce the Horn Paradox, consider its authorship and contemporary solutions. Section 5 reconstructs the Stoic solution, suggesting the Stoics produced a Russellian-type solution based on a hidden scope ambiguity of negation.

    The difference to Russell's explanation of defmite descriptions is that in the Horn Paradox the Stoics uncovered a hidden conjunction rather than existential sentence. Sections 6 and 7 investigate hidden ambiguities in "to have" and "to lose" and ambiguities of quantification based on substitution of indefinite plural expressions for indefmite or anaphoric pronouns, and Stoic awareness of these. Section 8 considers metaphorical readings and allusions that add further spice to the paradox."

20. ———. 2002. "The Development of Modus Ponens in Antiquity: From Aristotle to 2nd Century AD." *Phronesis.A Journal for Ancient Philosophy* no. 47:359-394.

    Abstract: "*Aristotelian logic* , as it was taught from late antiquity until the 20th century, commonly included a short presentation of the argument forms *modus (ponendo) ponens* , *modus (tollendo) tollens* , *modus ponendo tollens* , and *modus tollendo ponens* . In late antiquity, arguments of these forms were generally classified as 'hypothetical syllogisms'. However, Aristotle did not discuss such arguments, nor did he call any arguments 'hypothetical syllogisms'. The Stoic indemonstrables resemble the *modus ponens/tollens* arguments. But the Stoics never called them 'hypothetical syllogisms'; nor did they describe them as *ponendo ponens* , etc. The tradition of the four argument forms and the classification of the arguments as hypothetical syllogisms hence need some explaining. In this paper, I offer some explanations by tracing the development of certain elements of Aristotle's logic via the early Peripatetics to

the logic of later antiquity. I consider the questions: How did the four argument forms arise? Why were there four of them? Why were arguments of these forms called 'hypothetical syllogisms'? On what grounds were they considered valid? I argue that such arguments were neither part of Aristotle's dialectic, nor simply the result of an adoption of elements of Stoic logic, but the outcome of a long, gradual development that begins with Aristotle's logic as preserved in his *Topics* and *Prior Analytics* ; and that, as a result, we have a Peripatetic logic of hypothetical inferences which is a far cry both from Stoic logic and from classical propositional logic, but which sports a number of interesting characteristics, some of which bear a cunning resemblance to some 20th century theories."

21. ———. 2002. "Some elements of propositional logic in Ammonius." In *Interpretation und Argument* , edited by Linneeweber-Lammerskitten, Helmut and Mohr, Georg, 103-119. Würzburg: Königshausen & Neumann.

    "In his recent research, Gerhard Seel has demonstrated that Ammonius' semantics of assertoric sentences and propositions deserves far more attention than it has hitherto received.(3) In acknowledging this fact,

    I shall in the present paper attempt to show that Ammonius' theory of compound assertoric sentences and of hypothetical propositions can provide us with some insight into the specifically Peripatetic-Platonist understanding of the .syntax, semantics, and function of molecular propositions in their logic; and in particular that it is mistaken to treat Ammonius where he remarks on issues of 'propositional logic'(4) as nothing but a muddled late witness of Stoic logic. The relevant main text passages are the Preface and Chapter 5 of Ammonius' *De lnterpretatione* commentary *(Int* .), some short, passages from Ammonius' *Prior Analytics* commentary (*APr* .) and the section on hypothetical syllogisms in [Ammonius] *On Aristotle's Prior Analytics* ([Amm.] *APr* .), which very closely follows what we know from Ammonius directly elsewhere.

    Following Aristotle's footsteps, Ammonius builds his logic on a distinction between two ontological levels: the level of things

(πράγματα) and the level of linguistic items. The latter comprises as sub-levels thoughts, the spoken word, and the written word (*Int*. 18.23-19.1). Only (compound) linguistic items are admitted as truth-bearers in a straightforward sense. (5)

Their truth-value depends on their relation to the things that make up the first level. I shall focus in the main on Ammonius' treatment of the spoken word, and its relation to the things. This is the sub-level of linguistic items Ammonius appears to be concerned with most of the time. The spoken word is caused by thought, whereas the written word serves to preserve the memory of the spoken word." (pp. 103-104)

22. Bochenski, Joseph. 1951. *Ancient Formal Logic* . Amsterdam: North-Holland.

Contents: I. Prolegomena 1; II. The Forerunners 14; III. Aristotle 19; IV. The Old Peripateticians 72; V. The Stoic-Megaric School 77; VI. The last period 103; Bibliography 110; Index of Greek terms 118; Index of names 121.

"The present book is intended to supply mathematical logicians with a synthetic outline of the main aspects of ancient formal logic which are known in the present state of research. In order to avoid misunderstandings, each of the above terms has to be explained.

The reader is supposed to be a *mathematical* logician, i.e., to know both the symbolisms and the (English) language of contemporary mathematical logic; those who are not

acquainted with it must be warned that several terms used in that language have a particular meaning, different from the meaning attributed to the terms of the same form in other contexts.

The subject of the book is *formal* Logic; by this we understand a science such as was developed by Aristotle in his *Prior Analytics* , i.e., essentially the theory of syllogisms as defined in *An. Pr. A* 1, 24b 18-20. Along with the syllogisms proper, the structure of the sentences and semiotics will be studied; contrariwise, not only all ontological, psychological and epistemological problems, but even methodological topics will be omitted in so far as possible. This is perhaps regrettable; but there are several good books on those subjects while there is *none* on ancient formal logic as a whole - and the limitation of space forced us to omit everything which was not strictly formal.

By ancient formal logic, Greek logic from the beginning of Greek Philosophy until the end of Antiquity is meant. We have, it is true, some Latin textbooks of formal logic - but they all seem based on, or even copied from, Greek sources. It is perhaps worthwhile mentioning that there is also an ancient *Indian* Logic; this lies, however, outside our present scope.

What is offered here is an *outline,* moreover a very fragmentary one. A complete account of ancient formal logic cannot be written at the present date because of the lack of scientific monographs on individual logicians and topics. The initial aim of the author was to limit himself to a reassumption of monographs already published; in the course of the work he was compelled, however, to use some of his own unpublished researches on Aristotle and had the exceptional fortune of reading the manuscript of Dr Benson Mates' book on Stoic logic. He also collected some new data on other topics. In spite of this, considerable parts of ancient logic have hardly been touched upon - e.g. the logic of the Commentators - while others, Aristotle included, have been treated in a way which is far from being complete. On the whole, what the book contains may be considered as a kind of starting point for future

research. Yet, it is hoped that even this will supply logicians with some information difficult to be found elsewhere and give a general idea of what the ancient logic was and how it developed." (pp. 1-2)

23. ———. 1961. *A History of Formal Logic* . Notre Dame: Indiana University Press.

    Translated from the German edition "*Formale Logik* " (1956) by Ivo Thomas; eeprinted New York, Chelsea Publishing Co., 1970.

    "§4. Method and Plan.

    A. Hisotry of Problems, and Documentation

    Conformably to the directions of the series *Orbis Academicus* this work will present a documented history of problems.

    We are not, therefore, presenting a material history of logic dealing with everything that has any historical importance, but a delineation of the history of the problematic together with the complex of essential ideas and methods that are closely connected with it. We only take into account those periods which have made an essential contribution to the problematic, and among logicians those who seem to us to rank as specially good representatives of their period. In this connection some thinkers of outstanding importance, Aristotle above all, Frege too, will receive much fuller treatment than would be permissible in a material history.

    The story will be told with the help of texts, and those originally written in a foreign language have been translated into English.

    This procedure, unusual in a scientific work, is justified by the consideration that only a few readers could understand all the texts if they were adduced in their original language. For even those readers with some competence in Greek are not automatically able to understand with ease a text of formal logic in that tongue. But the specialist logician will easiliy be able to find the original text by reference to the sources.

    The passages quoted will be fairly thoroughly commented where this seems useful, for without some commentary many of

them would not be readily intelligible." (p. 18)

24. Bonevac, Daniel. 2012. "A History of Quantification." In *Logic: A History of Its Central Concepts* , edited by Gabbay, Dov M., Pelletier, Francis Jeffrey and Woods, John, 63-126. Amsterdam: North-Holland.

    Volume 11 of the *Handbok of te History of Logic* .

    "Aristotle (384–322 BC), the founder of the discipline of logic, also founded the study of quantification. Normally, Aristotle begins a topic by reviewing the common opinions, including the opinions of his chief predecessors. In logic, however, he could not adopt the same strategy; before him, he reports, “there was nothing at all” (*Sophistical Refutations* 183b34–36). Aristotle’s theory dominated logical approaches to quantification until the nineteenth century.

    That is not to say that others did not make important contributions. Medieval logicians elaborated Aristotle’s theory, structuring it in the form familiar to us today. They also contemplated a series of problems the theory generated, devising increasingly complex theories of semantic relations to account for them. Textbook treatments of quantification in the seventeenth and nineteenth centuries made important contributions while also advancing some peculiar theories based on medieval contributions." (p. 63)

25. Bonevac, Daniel, and Dever, Josh. 2012. "A History of the Connectives." In *Logic: A History of Its Central Concepts* , edited by Gabbay, Dov M., Pelletier, Francis Jeffrey and Woods, John, 175-233. Amsterdam: North-Holland.

    Volume 11 of the *Handbok of te History of Logic* .

    "Contemporary students of logic tend to think of the logic of the connectives as the most basic area of the subject, which can then be extended with a logic of quantifiers. Historically, however, the logic of the quantifiers, in the form of the Aristotelian theory of the syllogism, came first. Truth conditions for negation, conjunction, and disjunction were well understood in ancient times, though not until Leibniz did anyone appreciate the algebraic features of these connectives.

Approaches to the conditional, meanwhile, depended on drawing an analogy between conditionals and universal affirmative propositions. That remained true throughout the ancient, medieval, and early modern periods, and extended well into the nineteenth century, when Boole constructed an algebraic theory designed to handle sentential and quantificational phenomena in one go. The strength of the analogy, moreover, undercuts a common and otherwise appealing picture of the history of logic, according to which sentential and quantificational threads developed largely independently and, sometimes, in opposition to each other, until Frege wove them together in what we now consider classical logic. Frege did contribute greatly to our understanding of the connectives as well as the quantifiers. But his contribution consists in something other than unifying them into a single theory" (p. 175)

26. Brunschwig, Jacques. 1994. "Remarks on the classification of simple propositions in Hellenistic logics." In *Papers in Hellenistic Philosophy* , 57-71. Cambridge: Cambridge University Press.

    "The first and chief difference among propositions (αξιώματα), the dialecticians say, is that between simple (απλα) and non-simple (οὐχ απλα)' These are the words of Sextus Empiricus (*M* VIII.93) and nobody would challenge the importance of that distinction. The declaration introduces a long passage (93-129) which sets out the subdivisions within this fundamental division. It is a passage which historians of logic tend to use as one of the sources that provide us with information on the Stoic classification of propositions, despite the fact that the Stoics are not specifically named, for it is generally accepted that Sextus does refer to them as 'the dialecticians'. The task that faces us, then, is to compare his text with the classification transmitted to us by Diogenes Laertius (VII. 68-76), who possibly bases his remarks on Diocles of Magnesia, - a classification which, for its part, is explicitly ascribed to Chrysippus and a number of his successors." (p. 57)

    (...)

"What I propose to do is study the formal characteristics of the classification of simple propositions, as it is set out by SE and by DL. My principal questionwill be whether or not this division is a true partition, that is to say whether it is of such a kind that every simple proposition necessarily belongs to one, and only one, of the classes that the division comprises. But in considering that question, I shall also be addressing myself to another: that of the criteria of the simplicity of a proposition. The two questions are clearly linked, insofar as they respectively concern the extension and the comprehension of the concept of propositional simplicity. That is why I think it a good idea to start off by saying a word or two about the division of propositions into sim le and nonsimple, before moving on to the subdivision of simple propositions." (p. 58)

27. Burnyeat, Myles. 2005. "The origins of non-deductive inference." In *Science and Speculation: Studies in Hellenistic Theory and Practice* , edited by Barnes, Jonathan, Brunschwig, Jacques, Burnyeat, Myles and Schofield, Malcolm, 193-238. Cambridge: Cambridge University Press.

    Reprinted in M. Burnyeat, *Explorations in Ancient and Modern philosophy, Volume 1* , Cambridge: Cambridge University Press 2012 pp. 112-151.

    "The notion of sign itself is of course virtually as old as the Greeks' habit of giving grounds or evidence for their assertions.

    The term 'sëmeion may be found in tragedy, in the orators, in the historians, in the medical writers, in the philosophers.

    (...)

    Given this background, we naturally assume, when first Aristotle and then later the Stoics propose an analysis of sign, that it will be a technical analysis of a notion in common use, not the stipulation of a technical concept. We expect no restriction on the range of things that can serve as a sign or evidence of something, for existing usage displays none. It is not even correct to say that a sign is what we would call empirical evidence for something.

Often this is so, but in the Elcatic tradition, when Parmenides' 'signposts' (*sëmata* , fr. 8,2) became Melissus' signs (*sëmeia* , fr. 8,1), they were intended to give demonstrative proof of an inescapable conclusion. Likewise in Sextus Empiricus it is regularly reported that demonstrative proof is one species of sign (*PH* II 96, I22, 131, 134; *M* VIII 140, 180, 278, 289, 299). If so, if 'sign' covers any kind of ground, evidence, or reason for believing something, including demonstrative evidence, we might expect that a rough, general first sketch of the notion as it functions in everyday discourse could take the following simple form: For X to be a sign or evidence of Y requires (i) that X should be evident or manifest to us in some appropriate way, (ii) that it should be evidence of something else in that Y can be inferred from it. The task of the technical analysis would then be to explain the relationship between X and Y which sustains and justifies the inferring of the second from the first.

Let us see how far Aristotle fulfils these expectations." (pp. 193-194)

28. Castagnoli, Luca. 2010. *Ancient Self-Refutation: The Logic and History of the Self-refutation Argument from Democritus to Augustine* . Cambridge: Cambridge University Press.

"I suggest that the various forms of self-contradiction and inconsistency which I have sketchily outlined should be carefully kept distinct from self-refutation, while recognising that the edges between all these notions are not always as sharp as we might desire. Independently of its theoretical merits, I hope that my rough via negativa to self-refutation will serve its contingent purpose of conveying some preliminary idea (and warning) of what the reader should not expect to find in the pages of this book. Standard r*eductio ad impossibile* arguments, which on my account are located in the sphere of self-contradiction, will not be on our menu (although some of my contentions concerning the logic of ancient self-refutation might have consequences for some forms of ancient *reductio* as well). The elenchus (Socratic, Aristotelian or otherwise) will also lie beyond the scope of my analysis, since its gist seems to remain, through all its varieties, intended aims and interpretations, that of unmasking hidden inconsistencies

between sets of beliefs, concessions, theses; for the same reason, Plutarch, with the material sedulously collected in his *De Stoicorum Repugnantiis* (*On the Contradictions of the Stoics*), will not be a hero of our story. The charge of pragmatic inconsistency was a favourite weapon in ancient philosophical controversy: while its history would certainly deserve a comprehensive investigation analogous to the one I am undertaking here for self-refutation, my tentative map of various types of refutation has banned it from the ground covered in this book. Also the notorious Liar Paradox, for reasons to be explained in chapter 1, will make only a cursory appearance on· the stage, to be quickly dismissed." (pp. 7-8, notes omitted)

29. ———. 2018. "Dialectic in the Hellenistic Academy." In *Dialectic after Plato and Aristotle* , edited by Bénatouil, Thomas and Ierodiakonou, Katerina, 168-217. Cambridge: Cambridge University Press.

    "To begin with, what do we mean, exactly, when we say, for example, that X's argument Y in passage Z is dialectical, or that X's defence Y against the charge W as reported in Z was dialectical? Did our source, the author of Z, clearly speak, or conceive, of that argument or defence as 'dialectical'? And is there any sign that X himself thought that, by proposing Y, he was engaging in some form of dialectic? If so, what form precisely?

    This chapter aims to show how a nuanced approach to these questions can provide firmer foundations for the debate concerning the 'dialectical nature' of the philosophy of Arcesilaus and Carneades. I will begin, in section 1, by reconstructing their attitudes towards what they, and their contemporaries, called 'διαλεκτικὴ'. In Section 2, I will examine some key ancient testimonies on their philosophical method and ask whether, and in what sense exactly, it can be characterised, on the basis of those testimonies, as 'dialectical'. In Section 3, I will examine the broad structure of Arcesilaus' and Carneades' 'core argument' for suspension of judgement (section 3.1) and then survey some other more specific types of

Academic arguments (section 3.2), asking in what sense, if any, all these arguments were ‘dialectical’.

Finally, in section 4, I will consider whether any exegetical and logical space is left to interpret the philosophy of Arcesilaus and Carneades as an exercise in ‘pure dialectic’, as proposed by Pierre Couissin in his influential article on ‘The Stoicism of the New Academy’ (Coussin 1929/1983)." (p. 169)

"Unlike contemporary logic, which is as well a mathematical discipline, ancient logic was squarely under the purview of philosophy. Not surprisingly, then, as historiographical disciplines developed during the first half of the nineteenth century, ancient logic was studied by general historians of philosophy and was not felt to require some special methodology. This rapidly changed near the end of the century, when the revolution that was radically transforming logic also changed the perception of its past, making a lasting impact on the way the history of the subject would be studied and written ever since. Several leading figures of the logical renaissance cast a curious eye on the history of their subject: Peirce, Couturat, Russell, perhaps even Frege, but the logician who more than anyone else cultivated historical studies, and the one who introduced a new way of reading ancient logical texts, was certainly Jan Lukasiewicz, the Polish logician best known as the father of multi-valued logics (Chapter 15 - Capozzi and Haaparanta). "Definition was a central topic in Greek philosophy. Socrates' most significant philosophical innovation, in Aristotle's view, was to focus on the search for definitions, raising and attempting to answer his famous 'What is it?' question (*Metaphysics* 1078b22ff.). In many of Plato's dialogues, Socrates asks such questions as 'What is virtue?', 'What is knowledge?', 'What is justice?' and hunts, often unsuccessfully, for an adequate answer. Aristotle, in the *Topics* , *Analytics* , and *Metaphysics* , devoted considerable time and effort to determining what counts as a good definition. Later philosophers pursued these issues further, developing their own accounts of the nature and role of definition. The topic remained, from Socrates onwards, an important concern in Greek philosophy." (p. 1)

32. Corcoran, John. 1972. "Conceptual Structure of Classical Logic." *Philosophy and Phenomenological Research* no. 33:25-47.

"Among other things logic is concerned with the correctness of arguments. An examination of the kinds of things pronounced correct and incorrect in logic reveals two distinct kinds of arguments, each with its own characteristic kind of correctness. Indeed, each kind of correctness is so distinctively related to its

corresponding kind of argument that nonsense generally results from predicating one kind of correctness (and/or incorrectness) of the other kind of argument.

Indeed, it appears that the set of arguments of one sort is the range of applicability of the corresponding kind of correctness. Similarly for the other."

(...)

"One purpose of this paper is to discuss the two kinds of argument(2) so that it will be clear how consideration of the kinds of "correctness" appropriate to each leads to distinct logical problems and to distinct philosophical problems. The problem, in logic, of determining the conditions under which the truth of a set of sentences "guarantees" the truth of another sentence contrasts with the problem of deter- mining "norms of correct reasoning." In philosophy, questions con- cerning the nature of the relationship which obtains between a set of sentences and each of its consequences are to be contrasted with questions concerning the nature of deductive reasoning." (pp. 25-26)

(2) This phrase is not intended to suggest one overarching genus "argument" subsuming two species.

Proceedings of the Buffalo Symposium on Modernist Interpretations of Ancient Logic, 21 and 22 April, 1972.

Contents: John Corcoran: Preface IX; Part One: Ancient semantics; Norman Kretzmann: Aristotle on spoken sound significant by convention 3; Ronald Zirin: Inarticulate noises 23; Newton Garver: Notes for a linguistic reading of the *Categories* 27; Part Two: Modern research in ancient logic; Ian Mueller: Greek mathematics and Greek logic 35; John Mulhern: Modern notations and ancient logic 71; Part Three: Aristotle's logic; John Corcoran: Aristotle's natural deduction system 85; Mary Mulhern: Corcoran on Aristotle's logical theory 133; Part Four: Stoic logic; Josiah Gould: Deduction in Stoic logic 151; John Corcoran: Remarks on Stoic deduction

169; Part Five: Final session of the Symposium; John Corcoran: Future research on ancient theories of communication and reasoning 185; A panel discussion on future research in ancient logical theory 189; Index of names 209-211.

"During the last half century there has been revolutionary progress in logic and in logic-related areas such as linguistics. Historical knowledge of the origins of these subjects has also increased significantly. Thus, it would seem that the problem of determining the extent to which ancient logical and linguistic theories admit of accurate interpretation in modern terms is now ripe for investigation.

The purpose of the symposium was to gather logicians, philosophers, linguists, mathematicians and philologists to present research results bearing on the above problem with emphasis on logic. Presentations and discussions at the symposium focused themselves into five areas : ancient semantics, modern research in ancient logic, Aristotle's logic, Stoic logic, and directions for future research in ancient logic and logic-related areas.

Seven of the papers which appear below were originally presented at the symposium. In every case, discussion at the symposium led to revisions, in some cases to extensive revisions. The editor suggested still further revisions, but in every case the author was the final judge of the work that appears under his name.

In addition to the seven presented papers, there are four other items included here. Two of them are papers which originated in discussions following presentations. Zirin's contribution is based on comments he made following Kretzmann's presentation. My 'Remarks on Stoic Deduction' is based on the discussion which followed Gould's paper. A third item contains remarks that I prepared in advance and read at the opening of the panel discussion which was held at the end of the symposium. The panel discussion was tape-recorded and the transcript proved of sufficient quality to merit inclusion in these proceedings with a minimum of editing." (From the *Preface*)

34. ———. 2006. "Schemata: The Concept of Schema in the History of Logic." *Bulletin of Symbolic Logic* no. 12:219-240.

Abstract: "Schemata have played important roles in logic since Aristotle's *Prior Analytics* . The syllogistic figures and moods can be taken to be argument schemata as can the rules of the Stoic propositional logic. Sentence schemata have been used in axiomatizations of logic only since the landmark 1927 von Neumann paper [31]. Modern philosophers know the role of schemata in explications of the semantic conception of truth through Tarski's 1933 Convention T [42]. Mathematical logicians recognize the role of schemata in first-order number theory where Peano's second-order Induction Axiom is approximated by Herbrand's Induction-Axiom Schema [23]. Similarly, in first-order set theory, Zermelo's second-order Separation Axiom is approximated by Fraenkel's first-order Separation Schema [17]. In some of several closely related senses, a schema is a complex system having multiple components one of which is a *template-text* or *scheme-template* , a syntactic string composed of one or more "blanks" and also possibly significant words and/or symbols. In accordance with a *side condition* the template-text of a schema is used as a "template" to specify a multitude, often infinite, of linguistic expressions such as phrases, sentences, or argument-texts, called *instances* of the schema. The side condition is a second component. The collection of instances may but need not be regarded as a third component. The instances are almost always considered to come from a previously identified language (whether formal or natural), which is often considered to be another component. This article reviews the often-conflicting uses of the expressions 'schema' and 'scheme' in the literature of logic. It discusses the different definitions presupposed by those uses. And it examines the ontological and epistemic presuppositions circumvented or mooted by the use of schemata, as well as the ontological and epistemic presuppositions engendered by their use. In short, this paper is an introduction to the history and philosophy of schemata."

"Before plunging into the examination of the early Peripatetics' views about dialectic, a methodological issue must be addressed. It concerns the noun 'dialectic'. This noun has been and is used differently by different authors, in antiquity as well as in modern times.

(...)

In consideration of these different uses, one wonders precisely what task one is setting up for oneself when one refers to the subject of one's inquiry as 'the early Peripatetics' views about dialectic'.

There are several reasonable answers to this question. According to the one adopted in this chapter, the subject

referred to as ‘the early Peripatetics’ views about dialectic’ is that of the early Peripatetics’ views about the discipline that they themselves called ‘dialectic’. This project, however, also faces a difficulty because there are regrettably few occurrences of the noun ‘dialectic’ or cognate expressions in the fragments of Aristotle’s immediate followers. A plausible solution to this further problem is to assume that the early Peripatetics’ use of ‘dialectic’ is roughly the same as Aristotle’s, namely that they employed ‘dialectic’ to denote an art of arguing on the basis of reputable views, an art codified mainly in the *Topics,* (1) the work to which Aristotle himself refers as ‘the treatise concerning dialectic’.(2) My own use of the noun ‘dialectic’ in this study will be in line with this assumption: I shall use ‘dialectic’ to denote the art of arguing on the basis of reputable views codified mainly in Aristotle’s *Topics* . My aim is to reconstruct and evaluate the early Peripatetics’ views about this discipline.

The available data enable us to reconstruct a substantial amount of the theses concerning dialectic put forward by Theophrastus and a small number of the views of Eudemus and Strato. Accordingly, the first of this chapter’s sections (section 1) will be concerned with Theophrastus, while the second and the third shorter ones (sections 2 and 3) will be dedicated, respectively, to Eudemus and Strato." (pp. 47-48)

"The potential author of a history of logic should not depend on any preconceived point of view. The formalistic option, for example, requires logic to be treated in a purely symbolic way, as a logical syntax of meaningless signs; obviously the historian who adopts such a view, hoping to achieve an absolute objectivity by eliminating any philosophical hypothesis, will be bound by it.

Such a logic is a logic without any philosophical content, and surely its history will have to adopt the same line. But is it possible to deal with logic without having any philosophical point of view? It is evident that such an intention is not realistic, and even in the formalistic point of view a certain philosophy is understood. Aristotle's statement "he who philosophizes, philosophizes, and he who does not philosophize, philosophizes too, so everybody philosophizes" is very significant.

A history of logic based on such a view would have to leave out of the list of logicians names like Thomas Aquinas, Kant, Hegel, Husserl, and many others. Is it possible to explain the development of logic without commenting on thinkers of great influence, who actually moulded the whole frame of human

thought in their time? Obviously such a point of view is inadmissible.

A history of logic without philosophical references leads to very important consequences, to wide mutations and alterations of the very concept of logic and philosophy. After two and a half millennia, logic is taken from philosophy, and belongs henceforth to another domain, that of mathematics. In this way, logic has escaped from the jurisdiction of philosophy, but philosophy has remained independent of logic. In the past logic was, on the contrary, closely connected to philosophy, whether it was conceived as a part of philosophy, or an introduction to it, or as an organon, or even as the philosophy itself." (*Foreword,* pp. IX-X)

37. Everson, Stephen, ed. 1994. *Language* . Cambridge: Cambridge University Press.

"Ancient philosophers, then, like their modern successors, were concerned to answer various sorts of question in their study of language. At the most basic level, they attempted to provide an analysis of the structure of language - to distinguish between subjects and predicates, nouns and sentences, and so on28 - and to clarify the meaning of individual expres¬ sions. Secondly, they set out to give accounts of how it is that sounds and marks can be meaningful. Thirdly, they dealt with the question of how a speaker can come to understand a language. In answering all of these, the study of language could not be

dissociated from questions to do with the nature of the mind and the world. Even if the ancients did not share the presuppositions of the contemporary analytical philosopher, neither their interests in the explanation of language nor their methods of general philosophical enquiry will prove alien to those brought up to take those presuppositions almost for granted." (*Introduction* , p. 9)

28 David Blank, in ch. 8, describes the relation between philosophy and grammar in the Hellenistic period.

"Concerning dialectic, Plato and Aristotle might be thought to stand on each side of a very wide gap. To Plato, dialectic is the best means available to philosophy for reaching truth, whereas Aristotle seems to grant dialectic little more than the function of testing propositions and thus denies a direct access to philosophical insight through dialectic. However, even if this were an adequate description of Platonic and Aristotelian dialectic (and it hardly is), one question would remain: what happened in between, or in other words, how did the concept of dialectic develop from Plato to Aristotle? The present volume aims at giving some answers to this question." (p. 1)

Bibliography of Ancient Logic in the Hellenistic Period

Selected bibliography on Hellenistic logic

Studies in English (G - Z)

1. Gabbay, Dov, and Woods, John, eds. 2004. *Greek, Indian and Arabic Logic* . Amsterdam: Elsevier.

   Handbook of the History of Logic : vol. 1.

   Contents: Dov Gabbay and John Woods: Preface VII; List of contributors IX; Julius Moravcsik: Logic Before Aristotle: Development or Birth? 1; John Woods and Andrew Irvine: Aristotle's Early Logic 27; George Boger: Aristotle's Underlying Logic 101; Fred Johnson: Aristotle's Modal Syllogism 247; Jonardon Ganeri: Indian Logic 309; Robert R. O'Toole and Raymond E. Jennings: The Megarians and the Stoics 397; Tony Street: Arabic Logic 523; Charles Burnett: The Translation of Arabic Works on Logic into Latin in the Middle Ages and Renaissance 597; Index 607-628.

   "With the present volume, the *Handbook of the History of Logic* makes its first appearance.

   Members of the research communities in logic, history of logic and philosophy of logic, as well as those in kindred areas such as computer science, artificial intelligence, cognitive psychology, argumentation theory and history of ideas, have long felt the lack of a large and comprehensive history of logic. They have been well-served since the early sixties by William

and Martha Kneale's single volume *The Development of Logic* , published by Oxford University Press. But what such a work cannot hope to do, and does not try to do, is provide the depth and detail, as well as the interpretive coverage, that a multi-volume approach makes possible. This is the driving impetus of the Handbook, currently projected to run to several large volumes, which the publisher will issue when ready, rather than in strict chronological order.

(,,,)

As with the present volume, the *Handbook* 's authors have been chosen for their capacity to write authoritative and very substantial chapters on their assigned topics; and they have been given the freedom to develop their own interpretations of things. In a number of cases, chapters are the equivalents of small monographs, and thus offer researchers and other interested readers advantages that only a multi-volume treatment can sustain." (*Preface,* , p. VII)

2. Graeser, Andreas. 1977. "On Language, Thought, and Reality in Ancient Greek Philosophy." *Dialectica* no. 31:359-388.

   Reprinted in A. Graeser, *Issues in the Philosophy of Language Past and Present: Selected Papers,* Bern: Peter Lang, 1999, pp. 9-41.

   Summary: "The common ground out of which the problem of "Language versus Reality" was to arise in ancient Greek philosophy may be characterized by the fact that words in general were thought of as names and thus considered to get their meaning accordingly.

   However, while Parmenides was actually committing himself to the position that language was altogether meaningless, Heraclitus seems to have believed that name and meaning are unrelated or even opposite to each other. Plato's *Forms* are clearly meant to serve as objects of linguistic meaning and reference. Aristotle retained the fundamentally realist theory of meaning which he inheritated from Plato and thus became liable to the criticism advanced by the Stoics, who insisted that

there is no isomorphic correlation between thought on the one hand and things-that-are on the other."

3. Hadgopoulos, Demetrius J. 1979. "The Principle of the Division into Four Figures in Traditional Logic." *Notre Dame Journal of Formal Logic* no. 20:92-94.

   "The purpose of this note is to show that the traditional account of the division of syllogisms into four figures confuses two different principles which can be used to that purpose, and which give different results. Thus, it is either mistaken or redundant. According to the traditional account of Aristotle's syllogistic, syllogisms are divided into four figures according to the position of the middle term in the premisses." (p. 92)

   (...)

   "But it is not really the position of the middle term that gives us four figures. For the above account makes reference to the major and minor premiss. Since the major premiss, according to the traditional account of the syllogism, is that which contains the major term, and the minor premiss is that which contains the minor term, the principle of the distinction of syllogism into four figures presupposes the distinction between major term and minor term.

   But if we already have this distinction, then it is not true to say that the distinction into four figures is due to the position of the middle term in the premisses, but we must say that the distinction is due to the position of the middle term in the premisses which have already been differentiated into major and minor. But if this (the differentiation) is taken into account, then reference to the position of the middle term is no longer necessary. For we can get four figures by distinguishing between major term and minor term only." (p. 93)

4. Hankinson, Robert James. 2007. " Self-refutation and the "sorites"." In *Maieusis. Essays on Ancient Philosophy in Honour of Myles Burnyeat* , edited by Scott, Dominic, 351-373. New York: Oxford University Press.

   "More than twenty years ago, Myles Burnyeat (1982) published an important article on the sorites;(3) a few years earlier he had

written two ground-breaking pieces on Protagorean self-refutation.(4) So, if nothing else, at least the title of this article is an appropriate one for something written in honour of and out of admiration for my former graduate supervisor.

My aim is relatively modest. I do not seek to discern a generalized ancient 'solution' to the 'paradox',(5) or to offer one in my own voice (although I will make one or two tentative suggestions). My main purpose is to take seriously a passing hint of Cicero's, one which has generally been either ignored or treated simply as a joke,(6) that the sorites may be applied to itself, or to the more general notion of coherent argument, with potentially devastating results. I say 'potentially devastating', since it is unclear whether the threatened disaster must occur, and if it does, which of the opposing sides in the dispute it is potentially disastrous for. As such, the debate as I shall reconstruct it mirrors that between Sceptics and Dogmatists as to the question of whether sceptical arguments against argument are self-refuting, and if so, what the appropriate upshot of that ought to be.(7)" (pp. 351-352)

(3) 'Gods and Heaps'.

(4) 'Protagoras and Self-Refutation in Later Greek Philosophy' (1976a); 'Protagoras and Self-Refutation in Plato' (1976b).

(5) 'Paradox' in scare-quotes since the puzzle does not have the logical form of a true paradox: viz. of a sentence that is true if and only if it is false (rather, it has the form of an apparently sound argument with an apparently false conclusion: of course that's bad enough); 'solution' similarly flagged because I am doubtful whether the puzzle—or puzzles—as such can yield to a single authoritative diagnosis. But these issues are largely irrelevant to the concerns of the present paper.

(6) A partial exception to this general neglect is Myles himself (Burnyeat 1982: 327 n. 33). It was thinking about this footnote (and that of Barnes (1982: 57 n. 60)) that first started me down the road followed by this paper more than twenty years ago.

5. Henle, Paul. 1949. "On the Fourth Figure of the Syllogism." *Philosophy of Science* no. 16:94-104.

"Perhaps the strangest controversy in the history of logic is that over the fourth figure of the syllogism. There was never any argument as to what syllogisms are valid, but merely as to how they should be arranged. Aristotle had divided syllogisms into figures according to whether the middle term was subject of one premiss and predicate of the other, or predicate of both premisses, or subject of both.(1) Theophrastus and Eudemus subdivided the first figure into those moods in which the middle term was subject of the major premiss (and predicate of the minor) and those moods in which the middle was predicate of the major premiss (and subject of the minor).(2) The latter moods were termed indirect. Galen said they constituted a separate figure;(3) and so the controversy started.

(...)

Galen received a somewhat different technical problem and his division represents the best solution to his problem. In neither case is there any interest in tracing the course of thought. The question as to what forms of reasoning are most natural is, to be sure, a genuine problem, but this is a psychological rather than a logical problem and one which-if I am right-did not concern the founder of logic in working out his theory of the syllogism." 6. Huby, Pamela M. 2004. "Elementary Logic in the Ancient World." *Bulletin of the Institute of Classical Studies* no. 47:119-128.

   Abstract: "In the ancient world most educated people, including medical men and lawyers, studied some elementary logic. The formal study began in Plato's Academy, and can be traced through to Boethius, and so into the Middle Ages. Many works seem to have been

   written to be memorized by students. Evidence comes, among others, from Aristotle, Apuleius, and Galen, and from a variety of anonymous sources, including some papyri. The views of the Peripatetics and the Stoics, originally different, coalesced, and later handbooks

   covered both at an elementary level. The origin of the concept of a syllogistic mood is obscure: it may have existed for some time before appearing first in Apuleius."

7. Hurst, Martha. 1935. "Implication in the Fourth Century B.C." *Mind* no. 44:484-495.

   "Modern analyses of the nature of necessary connection have given rise to more paradoxes than they have solved. A familiarity with the controversy between Diodorus and Philo which took place in the Fourth Century B.C. might perhaps

have made unnecessary the anguish which modern logicians have suffered. (1)

The dispute is mentioned in passing by Cicero (2) and is discussed in two places by Sextus Empiricus (3). The persons concerned in the dispute are named Diodorus and Philo, and are, I think, to be identified as the Megarians, Diodorus Cronus and his pupil Philo." (p. 484)

(1) My attention was first called to this dispute by a notice in C. S. Peirce, *Collected Papers* 3, 441. In being aware of this dispute Peirce is an exception among modern logicians. But he failed to grasp its full significance; so that his knowledge did not save him from the mistakes which they have made.

Contents: Preface V-VIII; I. The origin of logic as a science 5; II. Concepts, terms, definitions, ideas, categories 20; III. Judgments, subject and predicate 43; IV. Syllogisms 60; V. Induction: ancient and modern logic 75; Books cited 89; Index 91-95.

"We are concerned with the origin of the science of logic, and I think we have seen that the contents of the first systematic work on the subject have a claim to be considered first not merely for chronological reasons. Perhaps Aristotle was not so wrong in quoting a Greek saying equivalent to "the first start is the main part," although one may have one's doubts with regard to the amount of gratitude we owe him for this start. In any case the start itself demands a historical explanation, for the existence of such a game of mental gymnastics as we had to accept in order to understand the first textbook of logic, the *Topics* , seems even more puzzling than certain features of the developed Aristotelian logic in the *Analytics* .

There can be no doubt that in Aristotle's school such a mental game was taken rather seriously. Otherwise Aristotle would not have spent so much time and hard work in preparing the *Topics* as the book shows he must have spent and as according to his own testimony he did spend. We feel puzzled and perhaps a little embarrassed, for Aristotle's sake; but the explanation of the phenomenon is not so difficult as it might seem. The only thing needed is to recall a few well-known facts of the history of science and philosophy in Greece." (pp. 16-17)

9. Kneale, William, and Kneale, Martha. 1962. *The Development of Logic* . Oxford: Clarendon Press.

   Reprinted 1975 with corrections.

   "As its name indicates, this book is an account of the growth of logic, rather than an attempt to chronicle all that past scholars, good and bad, have said about the science. For the sake of continuity, and in order to give historical perspective to our story, my wife and I have included some references to work which does not deserve to be remembered for its own sake; and occasionally we have allowed ourselves to indulge an antiquarian curiosity, when we thought that the result might be of some interest to others. But our primary purpose has been to record the first appearances of those ideas which seem to us most important in

   the logic of our own day. Such a programme is based on judgements of value, and we rnlize that our selection of material and still more our comments, especially in the later chapters, may seem eccentric to some readers. In defence of our undertaking we can only say that we have followed the plan which our interests suggested, and that we could not have written in any other way." (*Preface,* , p. V)

10. ———. 1972. "Prosleptic propositions and arguments." In *Islamic Philosophy and the Classical Tradition. Essays Presented by His Friends and Pupils to Richard Walzer on His Seventieth Birthday* , edited by Stern, S.M., Hourani, Albert and Brown, Vivian, 189-207. London: Bruno Cassirer.

"In some ancient writers on logic we find mention of propositions and syllogisms κατὰ πρὸσληφιν. We shall attempt in this paper to determine the nature and logical relations of these propositions and arguments, which we call for brevity prosleptic. It will be convenient first to set out the evidence, which is rather tantalizingly exiguous. The quoted passages are numbered for ease of reference. In probable order of date and authoritythey are as follows."

(...)

"Although these sources are meagre, it is not difficult to discern the main outlines of the doctrine to which they refer. Either Aristotle or his pupil Theophrastus—and probably it was Theophrastus, since he gets the credit in passages 3 and 4 above—invented the description κατὰ πρὸσληφιν for arguments of such forms as “Whatever x-ness may be, if every x thing is α , then every x thing is β ; but every β ; thing is x ; therefore every y thing is B.” The description was intended to draw attention to the fact that these arguments proceed by specification of what was at first left indeterminate.

In modern terminology they are arguments by substitution and detachment, where the variable for which we make substitution is general rather than individual. Since, however, the pattern of each such argument is fully determined by the nature of its leading premiss, this also is called prosleptic by a very natural extension of usage and assigned to the same figure as its argument.

In working out their account of the various figures of prosleptic argument the Peripatetics seem to have been influenced by a misleading analogy with the theory of the categorical syllogism which was the pride of their school. Assuming wrongly that the indeterminate term of the leading premiss (i.e. What we now call the term-variable) was to be compared with the middle term of a categorical syllogism, they assigned to the first figure those prosleptic premisses in which the indeterminate term occurred as predicate of the antecedent clause and subject of the consequent clause (e.g. “Whatever x -ness may be, if every β thing is x , then every x thing is β "), to the second figure those

in which the indeterminate term occurred as predicate of both clauses, and to the third figure those in which it occurred as subject in both clauses. This classification is explained by the anonymous scholiast in quotation 4 above and again by members of the school of Ammonius in passages 6, 7, and 8. Some gratuitous puzzles into which it led them are indicated in passage 7. In the quotation 9 (i) there is to be found a prosleptic proposition which might be assigned on the same principles to a fourth figure in which the indeterminate term occurs as subject of the first clause and predicate of the second. But apparently the Peripatetics recognized no such figure, and on this point at least they were not misled by their analogy between prosleptic arguments and categorical syllogisms. For just as any fourth figure syllogism can be presented as an indirect mood of the first figure, so any fourth figure prosleptic argument can be reduced to the first figure by contraposition. From "Whatever *x* -ness may be, if every *x* thing is *α* , then every *β* thing is *x* ' we can easily derive Whatever *x* -ness may be, if some *β* thing is not *x* , then some *x* thing is not *β* , and *vice versa* . Such transformations involve use of categorical forms other than the universal affirmative in the two clauses of a prosleptic premiss, but it is clear from the various quotations listed above under 9 that this possibility was recognized

by the Peripatetics."

11. Knuuttila, Simo. 2012. "A History of Modalities." In *Logic: A History of Its Central Concepts* , edited by Gabbay, Dov M., Pelletier, Francis Jeffrey and Woods, John, 309-339. Amsterdam: North-Holland.

    Volume 11 of the *Handbok of te History of Logic* .

    "My aim is to shed light on long-lived assumptions in Western modal conceptions as well as some clashes between them. In the first section, I shall deal with those trends in ancient and medieval modal thought which were inclined to codify the meaning of modal notions in frequency terms. The second section concentrates on the emergence of a different paradigm in which the analysis of necessity and possibility is separated from a one world model, and which considerably modified late

medieval modal logic. The third section is about the interplay of these traditionsin the early modern period and their influence up to the nineteenth century." (p. 309)

12. Lloyd, Antony C. 1955. "Neoplatonic Logic and Aristotelian Logic: I." *Phronesis.A Journal for Ancient Philosophy* :58-72.

    "It is well known that *Ennead* VI contains an onslaught by Plotinus on Aristotle's *Categories* , but that his pupil, Porphyry, established both the Categories and Predicables as part of the Neoplatonic and eventually the Scholastic philosophical curriculum. So far as this situation has been studied, it has been for the most part from the standpoint of its extemal history. Philology has traced many of Plotinus's criticisms to the commentaries of the Middle Academy, and many of Porphyry's expressions to Stoic logicians; historical enquiry has found motives in the social position of the Schools for the Neoplatonic acceptance of Aristotle's logic. This valuable work, however, tends at best to ignore the philosophical understanding of both the criticism and the reinstatement of Aristotle, and at worst to give an erroneous account of the place of Neoplatonism in the history of logic. First, the criticism is of intrinsic philosophical interest, because it aims to shew that 'inseparable' universals, and the whole theory of genus and species, are unable to do the task required of them. Secondly, the logic which Porphyry and his successors reinstate resembles that of the Stoics in being stripped of certain metaphysical implications. The reason for this is not corruption of Platonism by the Stoa, but the inevitable effect of wanting Aristotle the elementary logician without Aristotle the metaphysician.

    And the result is that a good deal of credit has gone to the Stoics which was due to the Neoplatonists. Useful as it is, Prantl's work needs rewriting." (p. 58)

13. ———. 1955. "Neoplatonic Logic and Aristotelian Logic: II." *Phronesis.A Journal for Ancient Philosophy* :146-160.

    "Plotinus's criticism of definition by genus and differentia committed him to providing, by means of his new δύναμις-concept, an alternative version of the genus-species relation. In Ennead VI 2, 9 the aporia is raised, How do the five genera of

Being make species? Characteristically he answers it in terms of Nous. (This prevents us from having a direct description of the structure of the Ideas, which are the species of the genera severally, not of the totality of these, which is Nous.) Later he will have to qualify his answer by describing the genus and species as a prior and a posterior Nous and pointing out the dependence of both on a higher hypostasis. This addition is of great importance to Neoplatonic logic, because it includes the notion of a 'giver of form' that splits the generic cause into two, and because (contrary to common belief) it already displays substantially the schematism to be used in the Athenian School. I now proceed to summarise the logic of Enn. VI 2, 20, of which the Greek text, divided into sections, has been printed as an Appendix (infra, p. 160)." (pp. 147-148)

14. Lloyd, Anthony C. 2006. " Definite Propositions and the Concept of Reference." In *Les Stoïciens et leur logique* , edited by Brunschwig, Jacques, 223-234. Paris: Vrin.

"The Stoic position about the reference of tenses and names reflects their metaphysics. For it depends, as I have said, on the interpretation or pre-systematic assumptions of their logic. In this logic, if I am right about its interpretation, every expression which is read as a verb, including the existence sign, but barring of course an initial tense operator if there is one, is in the present tense. But did not grammarians say that the Stoics recognised only two tenses, past and future(27)? Yes, but so far from this being inconsistent with such a logic it is implied by it. Where everything is present, nothing is *present* , as the night in which all cats are grey, Columns C and D are both ways of translating column A. But their interpretation (or pre-systematic assumptions) is their metaphysics; and in Stoics metaphysics neither past nor future are real(28). Tenses belong to a logic, a *lekton* n, which is superimposed on the material reality. One might truthlully combine the grammarian’s with the metaphysician’s view of the logic by saying that the Stoics recognised only two tenses because they reognised only one time." (p. 231)

15. Longo, Angela. 2009. "The Principle of Contradiction: an Ancient Interpretation (Syrianus, AD Vth cent.) and a Modern Interpretation (J. Lukasiewicz, 1878-1956): a Comparison." In *Syrianus et la métaphysique de l'Antiquité tardive* , edited by Longo, Angela, 383-397. Napoli: Bibliopolis.

"Introduction

In this paper, I will draw a comparison between an ancient and a contemporary interpretation of the Principle of Contradiction, as formulated by Aristotle in his *Metaphysics* . My aim here is not to discuss the Aristotelian text(1), neither is it to criticize Lukasiewicz' interpretation. Rather, it is to do something new, namely, (a) to present Syrianus' interpretation of the Aristotelian Principle of Contradiction, and (b) to compare this original, but usually ignored, interpretation with that of Lukasiewicz. This is worth doing because, while Syrianus speaks of several principles of contradiction in his commentary on Aristotle's *Metaphysics* , the Polish scholar also seems to do the same; at the very least, the latter uses three formulations of such a principle(2)." (p. 383)

(1) I have previously produced a detailed analysis of the very varied way in which both Aristotle, in his *Metaphysics* Γ, and Syrianus, in his commentary on this work, express the Principle of Contradiction (cfr. A.

Longo, *Siriano e i principi delta scienza* . Prefazione di J. Barnes, Napoli 2005, cap. III, pp. 83-140).

(2) It is not always clear whether Lukasiewicz intended to speak of three substantially different Principles of Contradiction, or only of three different formulations of the same principle. Arianna Betti has been so kind as to verify for me that this ambiguity is indeed present in the original Polish. In any case, I will proceed on the minimal assumption that Lukasiewicz worked with three formulations of a single principle, since this,

at any rate is certain, and also because this position is much less exposed to criticism.

16. Lukasiewicz, Jan. 1967. "On the History of the Logic of Propositions." In *Polish Logic 1920-1939* , edited by McCall, Storrs, 66-87. Oxford: Oxford University Press.

    Originally published in Polish as *Z historii logiki zdan* , Przeglad Filozoficzny, 37, 1934; translated by the author in German as: *Zur Geschichte der Aussagenlogik* , Erkenntnis, 5, 1935, pp. 111-131.

    Translated in English in: Storrs McCall (ed.), *Polish Logic 1920-1939,* Oxford: Clarendon Press, 1967 pp. 66-87 and also in: J. Lukasiewicz, *Selected Works,* Ludwik Borowski (ed.), Amsterdam: North-Holland, 1970 pp. 197-217.

    "This fundamental difference between the logic of propositions and the logic of terms was unknown to any of the older historians of logic.

    It explains why there has been, up to the present day, no history of the logic of propositions, and, consequently, no correct picture of the history of formal logic as a whole. Indispensable as Prantl's(3) work is,

    even today, as a collection of sources and material, it has scarcely any value as an historical presentation of logical problems and theories.

    The history of logic must be written anew, and by an historian who has fully mastered mathematical logic. I shall in this short paper touch upon only three main points in the history of propositional logic.

    Firstly I wish to show that the Stoic dialectic, in contrast to the Aristotelian syllogistic, is the ancient form of propositional logic; and, accordingly, that the hitherto wholly misunderstood and wrongly judged accomplishments of the Stoics should be restored their due honour. Secondly I shall try to show, by means of several examples, that the Stoic propositional logic lived on and was further developed in medieval· times, particularly in the theory of "consequence". Thirdly I think it

important to establish something that does not seem to be commonly known even in Germany, namely that the founder of *modern* propositional logic is Gottlob Frege." (Lukasiewicz, *Selected Works,* , p. 198)

Appendix . On -the history of the law of bivalence.

In the communication "Untersuchungen Uber den Aussagenkalkül" (Investigations into the Sentential Calculus) which appeared in this issue under Tarski's and my name, Section 3 is devoted to the "many-valued" systems of propositional logic established by myself. Referring the reader to this communication as far as logical questions are concerned, I here propose to clarify the origin and significance of those

systems from a philosophical point of view." (Lukasiewicz, *Selected Works,* p. 153)

(...)

"I have compiled thus many quotations on purpose, for, although they illuminate one of the most important problems of logic, it nevertheless appears that many of them were either unknown to the historians of logic, or at least not sufficiently appreciated. The reason for this is in my opinion that the history of logic has thus far been treated by philosophers with insufficient training in logic. The older authors cannot be blamed for this, as· a scientific logic has existed only for a few decades. *The history of logic must be written anew* , and by an historian who has a thorough command of modern mathematical logic. Valuable as Prantl's work is as a compilation of sources and materials, from a logical point of view it is practically worthless. To give only one illustration of this, Prantl, as well as all the later authors who have written about the logic of the Stoa, such as Zeller and Brochard, have entirely misunderstood this logic. For anybody familiar with mathematical logic it is self-evident *that the Stoic dialectic is the ancient form of modern propositional logic.*

Propositional logic, which contains only propositional variables, is as distinct from the Aristotelian syllogistic, which operates only with name variables, as arithmetic is from geometry. The Stoic dialectic is not a development or supplementation of Aristotelian logic, but an achievement of equal rank with that of Aristotle. In view of this it seems only fair to demand of an historian of logic that he know something about logic. Nowadays it does· not suffice to be merely a philosopher in order to voice one's opinion on logic." (Lukasiewicz, *Selected Works,* p. 178, a note omitted)

18. Maconi, Henry. 1985. "Late Greek Syllogistic." *Phronesis.A Journal for Ancient Philosophy* no. 30:92-98.

    Critical review of Tae-Soo Lee: *Die griechische Tradition der aristotelischen Syllogistik in der Spatantike* (Hypomnemata 79). Gottingen, Vandenhoeck & Ruprecht, 1984.

The history of logic in late antiquity has not been a favourite subject of scholarly inquiry. The texts are imagined to be long, dull, and repetitive: they are perhaps quarries for information about earlier logicians, but their own content is unoriginal and unexciting. Anyone who holds that view should read Tae-Soo Lee's monograph on *Die griechische Tradition der aristotelischen Syllogistik in der Spdtantike* . Late Greek syllogistic emerges from Lee's study as a subject well worth examination. Admittedly, it is not original in any strong sense. But it does offer numerous clarifications, developments, and modifications in Aristotle's doctrines, many of which are intelligent and some of which are remarkably subtle. Lee takes as his primary texts the three surviving commentaries on the *Prior Analytics* - the commentaries of Alexander, of Ammonius, of Philoponus." (p. 92)

(...)

"In the course of his discussion Lee incidentally sheds light on a number of obscure parts of the Aristotelian tradition. For example, he has an excellent account of the Greek idea of "form" in logic; he gives a lucid explanation of what is involved in the idea that logic is (only) an instrument or tool of philosophy; he is illuminating on the dark topic of ἀντιστροφή. He also has wise words to say about the nature of his own enterprise: "I think that the main task of an historian is not simply to exclaim: "Look here - they already knew such and such" (usually adding: "but somewhat imperfectly and not with complete clarity"). On the contrary, if an ancient author is worth our attention, that is not only because he already knew something which we too now know, but also - and more importantly - because his mode of thinking was different from ours" (p. 22)." Proclus on the Logic of the Ineffable 65; 6. Proclus and the Neoplatonic Syllogistic 79; 7. Ammonius on the Canons of Proclus 125; 8. All Brutes are Subhuman: Aristotle and Ockham on Privative Negation 139; 9. Lukasiewicz's Many-valued Logic and Neoplatonic Scalar Modality 167; Bibliography 195; Index of Names 201; Index of Topics 203-204.

"he papers in this collection are presented in the historical order of the philosophers they discuss: Aristotle before Plotinus, Plotinus before Proclus, and so on. But that is not the order in which they were written. “A Tense Logic for Boethius” (Chapter 4) was my initial effort at applying the methods of modern logic and formal semantics to ancient logic. It gave me confidence to pursue Plotinus, the patriarch of the tradition. The result was “Existence, Negation, and Abstraction in the Neoplatonic Hierarchy” (Chapter 3). In this paper I argue that the mysticism in the *Enneads* is accompanied by some logically interesting theory. Plotinus exploits properties of scalar adjectives only recently studied in linguistics, and marshals them in structures of an algebraic character by means of negation operations characteristic of the Neoplatonic tradition. When formulated in this way, the views amount to serious positons in modern logic and the philosophy of language.

My excursion into the “logic” of Plotinus made it clear to me that I needed to work out in a satisfactory way Aristotle’s syllogistic, the theory that lies at the background of all ancient logic and that was bent to new purposes by Neoplatonists.

I found that the standard account of the syllogistic as developed in the 1960s by Smiley and Corcoran could be abstracted to a lattice theoretic semantics and given a more standard Henkin style completeness proof. These results are outlined in “Aristotle’s Natural Deduction Reconsidered” (Chapter 1) and “Ecthesis and Existence in the Syllogistic” (Chapter 2).

I was ready then for attempting to understand Proclus, who is without question the most logically sophisticated of Neoplatonic thinkers.

(...)

His logical ideas are explored in “Proclus on the Logic of the Ineffable” (Chapter 5), an introductory essay, and more fully in “Proclus and the Neoplatonic Syllogistic” (Chapter 6).

(...)

The collection concludes with two studies of Neoplatonic ideas in later logic. In “All Brutes are Subhuman: Aristotle and Ockham on Privative Negation” (Chapter 8) two closely related notions of privative negation are distinguished, one Neoplatonic and one more Aristotelian." (Preface, p. VIII)

20. McCall, Storrs. 1967. "Contrariety." *Notre Dame Journal of Formal Logic* no. 8:121-132.

"This paper is an attempt to make philosophical capital out of an important difference between the Aristotelian logic of terms and the Stoic, or 'modern', logic of propositions. This difference is, that although both logics include and give formal recognition to the relation of contradiction, only the former, and not the latter, takes account of the relation of contrariety.

Here I do not refer to the relation of contrariety as extending between terms (thus for example the terms 'pleasure' and 'pain', 'black' and 'white' denote contraries), but as extending between propositions.

The most common definition of contrariety is as follows: two propositions are contraries if they cannot both be true. For comparison, the definition of contradiction states that two propositions are contradictories if they can neither both be true nor both be false, and that of subcontrariety, that they cannot both be false.

(...)

The fact that there is not seems *prima facie* to be a consequence of Stoic logic's being a logic of unanalysed propositions, while Aristotelian logic is not.

Notwithstanding this seemingly irreconcilable difference between the two logics, there may still be ways of introducing the notion of contrariety into propositional logic. For example we might, analogously with Np, write Rp for the contrary of p.

This device is adopted by L. Goddard(2) in order to give a satisfactory analysis of exclusive disjunction: he points out that what makes disjunctions exclusive is not use of the exclusive 'or', but an internal opposition between the disjuncts which we can express by saying that they are contraries. The aim of this paper will be to investigate the formal properties of the notion of contrariety: that is, to provide means of introducing the operator *R* into the logic of propositions." (pp. 121-122)

21. ———. 2012. "A History of Connexivity." In *Logic: A History of Its Central Concepts* , edited by Gabbay, Dov M., Pelletier, Francis Jeffrey and Woods, John, 415-449. Amsterdam: North-Holland.

    Volume 11 of the *Handbok of te History of Logic* .

    "Connexive implication is a type of implication first defined in the 4th Century B.C., a time of active debate when it was said that the very crows on the rooftops were croaking about what conditionals were true. In Sextus Empiricus' Outlines of Pyrrhonism, which discusses four varieties of implication, including [1] material (Philonian) and [2] strict (Diodorean) implication, we read:

    "[3] And those who introduce the notion of connection say that a conditional is sound when the contradictory of its consequent is incompatible with its antecedent." [Kneale, 1962, 129]

    It follows from this definition that no conditional of the form "If p then not-p" can be true, since the contradictory of not-p, i.e. p, is never incompatible with p. Accepting this in turn requires that "compatibility" be essentially a relational concept, and that whether or not A is compatible with B cannot be determined by examining A and B separately.

    Thus even "p&~ p" is not incompatible with itself, and "If p&~ p, then not-(p&~ p)" is connexively false." (p. 415)

22. Mueller, Ian. 1974. "Greek Mathematics and Greek Logic." In *Ancient Logic and Its Modern Interpretations* , edited by Corcoran, John, 35-70. Dordrecht: Reidel.

    "By 'logic' I mean 'the analysis of argument or proof in terms of form'. The two main examples of Greek logic are, then, Aristotle's syllogistic developed in the first twenty-two chapters of the *Prior Analytics* and Stoic propositional logic as reconstructed in the twentieth century. The topic I shall consider in this paper is the relation between Greek logic in this sense and Greek mathematics. I have resolved the topic into two questions: (1) To what extent do the principles of Greek logic derive from the forms of proof characteristic of Greek mathematics? and (2) To what extent do the Greek mathematicians show an awareness of Greek logic?

    Before answering these questions it is necessary to clear up two preliminaries. The first is chronological. The *Prior Analytics* probably predates any surviving Greek mathematical text. There is, therefore, no possibility of checking Aristotle's syllogistic against the actual mathematics which he knew. On the other hand, there is no reason to suppose that the mathematics which he knew differs in any essential way, at least with respect to proof techniques, from the mathematics which has come down to us." (p. 35)

    "The paper which follows has three main sections. In the first I discuss the character of Euclidean reasoning and its relation to Aristotle's syllogistic. In the second I consider the passages in the *Prior Analytics* in which Aristotle refers to mathematics; my purpose here is to determine whether reflection on mathematics influenced his formulation of syllogistic. In both sections my conclusions are mainly negative. Euclid shows no awareness of syllogistic or even of the basic idea of logic, that validity of an argument depends on its form. And Aristotle's references to mathematics seem to be either supportive of general points about deductive reasoning or, when they relate specifically to syllogistic, false because based on syllogistic itself rather than on an independent analysis of mathematical proof.

In the third main section of the paper I consider the influence of mathematics on Stoic logic. As far as Chrysippean propositional logic is concerned, my conclusions are again negative. However, it is clear that at some time logicians, probably Stoic, began to consider mathematical proof on its own terms. Although they never developed what I would call a logic to cover mathematical proof, they at least realized the difference between it and the logical rules formulated in antiquity. Much of the third section is devoted to an attempt to reconstruct in outline the history of logical reflections on mathematics in the last two centuries B.C. In conclusion I recapitulate briefly my conclusions about the relation between Greek mathematics and logic." (p. 37)

23. Mulhern, John. 1974. "Modern notations and ancient logic." In *Ancient Logic and Its Modern Interpretations* , edited by Corcoran, John, 71-82. Dordrecht: Reidel.

    "To what extent does ancient logic admit of accurate interpretation in modern terms? Blanché [3] and Dürr [14] published general surveys of research on ancient logic in the mid-1950's. My aim in the present paper is to identify studies made available during the quarter-century 1945-1970 that illustrate the influence modern notations have had on our understanding of ancient logical texts. Accepting Bochenski's division of ancient logic into four temporally distinct stages, I mention research on the Prearistotelian, Aristotelian, Stoic and Commentatorial logics in Sections 1-4. In Section 5, I offer some generalizations on the utility of modern notations in writing the history of ancient logic." p. 71

    "At the beginning of this paper, I asked to what extent ancient logic admits of accurate interpretation in modern terms. While no final answer to this question will be available until research in the field has gone a good deal further than it has so far, still the progress since 1945 has been remarkable, and it is not too early to consider its causes. In his history of the history of logic, Bochenski wrote as follows:

    The rise of modern history of logic concerning all periods save the mathematical was made possible by the work of historians

of philosophy and philologists in the 19th century. These published for the first time a series of correct texts edited with reference to their context in the history of literature. But the majority of ancient philologists, medievalists and Sanskrit scholars had only slight understanding of and little interest in formal logic. History of logic could not be established on the sole basis of their great and laborious work.

For its appearance we have to thank the fact that formal logic took on a new lease of life and was reborn as mathematical. *Nearly all* the more recent researches in this history were carried out by mathematical logicians or by historians trained in mathematical logic. ([5e], pp. 9-10.)

The trained researchers who have worked on the ancient materials have had to do much more than merely transcribe into modern notations logical treatises originally written in ancient natural languages. Just finding suitable transcriptions has had to wait on considerable analysis of the ancient texts. Transcription into modern notations presupposes some community of understanding and purpose with the ancient logicians, and this community is something that needs to be argued for. In general, a department of ancient logic lends itself to being dealt with in notation if and only if its corresponding department of modern logic lends itself to being dealt with in notation. Logistic systems and their interpretations lend themselves to this to a great extent, theoretical syntax and especially semantics to a much lesser extent. Where a modern notation follows or reproduces or elucidates the logical form of a sentence or inference or schema that interests an ancient logician, then its use is in order. The studies discussed in Sections 1-4 of this paper point to the conclusion that the judicious use of modern notations has been one cause of progress -- over the last two decades and a half -- in our understanding of ancient logic." (pp. 81-82)

    Contents: Preface V; 1. Introduction 1; 2. Plato 13; 3. Aristotle 23; 4. The Stoic *lekton* 45; 5. The Stoic *axioma* 75; 6. Later developments in Greek antiquity 89; 7. The transition to the Latin West 105; 8. Boethius and the beginning of the Middle Ages 123; 9. Abelard 139; 10. The doctrine of the *dictum* in the century after Abelard 165; 11. Preliminaries to the fourteenth century debate 177; 12. The *complexum* theory of Ockham and Holkot 195; 13. Some reist opponents of Ockham and Holkot 209; 14. The theory of the *complexe significabile* 227; 15. The oppositions against the theory of the *complexe significabile* 243; 16. The significate of a true *propositio* 273; Selective bibliography 281; Indices 289-309.

    "This book is intended as the first part of a history of those problems and theories in the domain of philosophical semantics which nowadays are commonly referred to as problems and theories about the nature and the status of propositions. [*]

    Although the conceptual apparatus and the terminology by means of which questions concerning propositions were asked and answered have considerably varied from period to period, the main types of disputes and solutions have remained remarkably constant. One of the aims of this study is precisely to trace the vicissitudes of the vocabulary in which this refractory topic was treated in the remote past. As is evident from the Bibliography, many parts of the field have been explored by predecessors. Guided by their results, I have tried to fill in more details and to design a provisional map of the area as a whole." (from the Preface)

25. Plochmann, George Kimball. 1952. "Professor Henle on the four figures of syllogism." *Philosophy of Science* no. 19:333-341.

    "An able piece on the controversy over the fourth syllogistic figure, written by Paul Henle and published by this journal [*] deserves attention both for its clear argument and for details on which one might take issue. The essay, to renew old acquaintances, consists of two interlocking parts, and a very brief appendix. The two main theses relate, onie to the needlessness of the fourth figure both on Aristotelian grounds and in general, the other to the modal syllogism as being the real center of gravity in the *Prior Analytics*. The appendix pronounces a benediction upon the controversy because the syllogism is 'waning' in its importance for formal logic. Where it seems necessary, I should like to refine -or even correct points Dr. Henle has made." (p. 333)

    "The following study represents an attempt not only to explicate in some small way a mode of thought significantly different from much of our own, but also to suggest a new criterion of judgment for Classical Philology. These two purposes merge into one insofar as both come about from my own sharp disagreement with certain prevailing critical attitudes towards the so-called pre-Socratics. These essentially ungrounded attitudes are characterized, as I see them, by strong relativistic and materialistic premises which, although hidden for the most part, result in awkward misunderstandings of the pre-Platonic corpus in general and an uneven, if not castrating, criticism of specific authors in particular. These modern critical stances did not exist in the pre-Aristotelian Greek world in any predominant form, but Classical Philology in

the later half of the twentieth century maintains otherwise and has, consequently, severely limited itself and very probably its future by adopting a narrow and unnecessarily rigid criterion of judgment that largely misrepresents the literary evidence at hand. Beyond the by no means unanimous acknowledgment that Aristotle revealed little of the real worth of the pre-Socratics, modern Classical Philology has not even suggested the need of a method — let alone the method itself - that might grasp the period between Homer and the Platonic revolution. I offer this study as an attempt to supply this critical tool." (From the *Preface*)

27. Rescher, Nicholas. 1969. "Three Post-Aristotelian Concepts of Syllogistic Logic." In *Essays in Philosophical Analysis* , 61-71. Pittsburgh: University of Pittsburgh Press.

    "The aim of this chapter is to consider—primarily on the historical side— three important post-Aristotelian concepts of traditional syllogistic logic: the notions of the *quality* and *quantity* of categorical propositions and that of the *distribution* of terms therein. The history of all three of these key concepts of the traditional theory of the syllogism is still in significant measure obscure, and the remarks of recent scholars has tended (as will be shown) rather to darken than to clarify matters."

28. Smiley, Timothy. 1973. "What is a syllogism?" *Journal of Philosophical Logic* no. 2:136-154.

    "I shall offer my answer to my question in the shape of a formal system in which I shall put into practice the idea of treating syllogisms as deductions, and which is intended to match as closely as possible Aristotle's

    own axiomatisation of the syllogistic by means of conversion, reductio ad impossibile, and the two universal moods of the first figure. The definition of deducibility will ensure that in counting premisses attention is paid to whether and how often they are used in a deduction. This is in order to satisfy the constraints mentioned in the preceding paragraph, and also to harmonise with Aristotle's own remarks about the numbers of premisses (cf. *An. Pr* . 42b1, *An. Post* . 86b13); though it should

be stressed that the case for treating syllogisms as deductions is independent of the case for this particular treatment of deducibility. The principal result proved is that the system is complete with respect to the valid moods, where these are defined in the spirit of the Aristotelian figures but without his restriction to the special case of two premisses. I shall also show that the system possesses a simple decision procedure. Finally I shall test the system's harmony with Aristotle's ideas by considering it in relation to his well-known discussion of syllogisms with false premisses." (pp. 140-141)

29. Smith, Robin. 1983. "Completeness of an Echtetic Syllogistic." *Notre Dame Journal of Formal Logic* no. 24:224-232.

    Abstract: "In this paper I study a formal model for Aristotelian syllogistic which includes deductive procedures designed to model the "proof by ecthesis" that Aristotle sometimes uses and in which all deductions are direct. The resulting system is shown to be contained within another formal model for the syllogistic known to be both sound and complete, and in addition the system is proved to have a certain limited form of completeness."

30. ———. 2002. "Ancient Philosophical Logic." In *A Companion to Philosophical Logic* , edited by Jacquette, Dale, 11-23. Malden: Blackwell.

    "Ancient Greek logic was inseparable from ancient Greek philosophy. The formal theories developed by major logicians such as Aristotle, Diodorus Cronus, and Chrysippus were in large part influenced by metaphysical and epistemological concerns. In this brief essay, I will try to give some picture of this interrelationship. For reasons of space, I make no attempt to cover, or even to mention, every aspect of ancient Greek logic.

    I have preferred instead to concentrate on illustrating its philosophical aspects." (p. 11)

31. Speranza, J. L., and Horn, Laurence R. 2012. "History of Negation." In *Logic: A History of Its Central Concepts* , edited

by Gabbay, Dov M., Pelletier, Francis Jeffrey and Woods, John, 127-174. Amsterdam: North-Holland.

Volume 11 of the *Handbok of te History of Logic* .

"In choosing Grice as a catalyst and foundation stone, we open with a discussion of Formalism (or Modernism). This we present as giving a “System” for the logic of negation – notably with a syntactic and a semantic component. In the second part, we briefly discuss Neo-Traditionalism (or Informalism) which Grice saw as presenting a challenge to Formalism. We propose, with Grice, that most of the observations made by the Informalists pertain to the pragmatic component of the System, and characterise pragmatic rather than logical inference.

We will try to show that our choice of Grice as a catalyst is general enough to provide a basis for the History of Logic and the treatment of one of its central concepts. We center on the ideas of Grice as an example of a logical treatment of negation, but also as a memorial to a specific chapter in logical historiography.

Our focus will be one particular logical feature of negation as it has been conceived in the history of logic as a ‘unary’ truth-functor." (p. 127)

32. Tracy, Kevin. 2006. *The Development of Dialectic from Aristotle to Chrysippus* .

Dissertation presented to the University of Pennsylvania (available on ProQuest).

Abstract: "From Aristotle onward, formal logic was an element of ancient Greek dialectic (*dialektiké*). Aristotle's *Prior Analytics* (4th century BCE) is the earliest evidence of a formal logic in antiquity. The evidence for the formal logic of the Stoic philosopher Chrysippus (3rd century BCE) is fragmentary; nonetheless it makes clear that not more than a century or so after *Prior Analytics* , Chrysippus revolutionized formal logic. The scholarship on Stoic logic has not yet presented the history of dialectic from Aristotle to Chrysippus as an intelligible narrative. Without such a narrative, one cannot explain what, in general, motivated the innovations of Chrysippus, what

made Stoic logic coherent as a unified project, or what relationship that project had to earlier work in logic. This dissertation approaches the problem through the presentation and interpretation of the ancient source material. First it describes the logical doctrines of Aristotle, Theophrastus, and the 'Megarics' in such a way as to make clear what questions these predecessors left for Chrysippus. It then describes how Chrysippus addressed these questions. Finally, it uses the resulting narrative to give a detailed account of Stoic formal logic. The dissertation yields five principal conclusions. First, neither the Peripatetics or the 'Megarics' described logical forms of propositional logic; Chrysippus was the first to do so. Second, the guiding aim of Chrysippus' logic was to avoid adopting a semantic stance in describing logical forms and explaining logical relationships. Third, the Stoics distinguished 'valid' (*hugies*) from 'true' (*aléthes*), so that *sunartésis* is a standard for the validity rather than the truth of the Stoic conditional (*sunhémmenon*). Fourth, the Stoics produced derivations for categorical arguments in their deduction system. Fifth, the Stoic deduction system is roughly analogous to the first-order fragment of Frege's system, except on two points: it most likely was not designed to accommodate the use of polyadic predicates with multiple quantifiers, although the possibility for doing so inheres in its approach to the analysis of propositions, and it uses the 'natural' approach rather than the 'axiomatic' approach of Frege."

33. Waszkiewicz, Jan, and Wojciechowska, Agnieszka. 1990. "On the origin of reductio ad absurdum." In *Logic Counts* , edited by Zarnecka-Bialy, Ewa, 87-96. Dordrecht: Kluwer.

    "Our particular interest is in the origin of reductio ad absurdum method of theorem proving.(1) It is approached from both - the history of mathematics and history of logic side.(2) We proceed by analysing the cultural context of both sciences. Hence, it is necessary to regard some cultural phenomena much older than logic or even mathematics. The considered problem is well established. It has been widely discussed but no definite conclusions have been reached so far. Existing opinions are summed up by A. Szabó.(3)

An explanation of the origin (and priority in use) of reductio ad absurdum is crucial for the interpretation of the early history of the deductive method in mathematics and also of dialectics in philosophy. As A. Szabó stated (reformulating Proclus' opinion), "mathematics was at least in one respect a branch of dialectics'" and it is exactly this respect we are going to investigate." (p. 87)

34. Williamson, Timothy. 1994. "The early history of sorites paradoxes." In *Vagueness* , 8-35. New York: Routledge.

"The sorites puzzles can be traced conjecturally forward from Eubulides in the mid fourth century BCE through a chain of teacher–pupil links. One pupil of Eubulides was Apollonius Cronus; one of his pupils was Diodorus Cronus. David Sedley argues that it was Diodorus who gave Eubulides' puzzles wide

circulation and intellectual status. According to Sedley, Diodorus inherited from Eubulides ‘his sophistical leanings, his

flamboyancy and his love of showmanship’; he could present a puzzle so that it not only caught the imagination but emerged as a serious challenge to philosophical theory.(6) Diodorus taught dialectic, ‘the science of discoursing correctly on arguments in question and answer form’, the standard medium of philosophical argument and that in which the sorites puzzles were formulated." (p. 10)

35. Wolenski, Jan. 1998. "Scepticism and Logic." *Logical Analysis and History of Philosophy* no. 1:187-194.

    Abstract: "This paper offers a logical analysis of Scepticism. It is shown that Dogmatism, Academism and Scepticism as characterized by Sextus Empiricus in *Outlines of Pyrronism* form a variety of views which can be ordered by an interpretation of the classical logical square. In particular, Scepticism appears as a conjunction of the negations of Dogmatism and Academism. The next problem concerns the logic proper for Scepticism. Logic based on a dual of the consequence operation is proposed as satisfying intuitive requirements associated with doubting. Finally, the attitude of the sceptic toward logic is discussed. In particular, it is argued that the principle of isosteny trivializes scepticism if it is applied to logic."

36. Woods, John. 2012. "A History of Fallacies." In *Logic: A History of Its Central Concepts* , edited by Gabbay, Dov M., Pelletier, Francis Jeffrey and Woods, John, 513-609. Amsterdam: North-Holland.

    Volume 11 of the *Handbok of te History of Logic* .

    "Much of what I shall have to say in the chapter is centred around a concept and a list. The concept is the traditional

concept of fallacy, an idea that has come to us over the centuries from its early definition in antiquity. The list is the traditional list, or what I will for light relief call the “gang of eighteen”. The gang of eighteen is not a mathematically well-defined set. Its number varies somewhat from writer to writer, and some lists will contain items which other lists omit. But the gang of eighteen is a representative sample of the fallacies that we think of today as exemplars of the traditional concept of fallacy. The gang of eighteen is constituted as follows: *ad baculum, ad populum, ad verecundiam, ad hominem, ad ignorantiam, ad misericordiam* , affirming the consequent and denying the antecedent, *begging the question, many questions, hasty generalization, equivocation, biased statistics, gambler’s, post hoc, ergo, propter hoc, composition and division, faulty analogy, and ignoratio elenchi* (of which straw man is a special case).

The earliest predecessor list was Aristotle’s “gang of thirteen” in *On Sophistical Refutations*. It is made up of ambiguity (cf. the modern fallacy of equivocation), amphiboly (cf. equivocation), combination of words (cf. composition), division of words (cf. division), *secundum quid* (cf. hasty generalization), *ignoratio elenchi* (cf. straw man), begging the question (cf. begging the question), many questions (cf. many questions), consequent, non-cause as cause, accident, accent and form of expression. (3)" (p. 514)

(3) Not on Aristotle’s list are *ad hominem* argument, babbling and solecism. I will come back to these below.

   "Après avoir rappelé les principales concordances et divergences entre la terminologie logique latine avant et après Boèce, on examine deux choix propres soit à l'auteur du *Peri hermeneias* (PH) transmis sous le nom d'Apulée, soit à la première tradition logique de langue latine: celui de "pars" ("particula") et celui de "formula" ("forma" chez Martianus Capella), choix auquels Boèce substituera "terminus" et "figura", pour rendre le notion de "terme" (*horos* chez Aristote) et celle de "figure (du syllogisme)" (*skhema* chez Aristote). Dans chaque cas, on passe en revue la distribution des emplois dans le PH et chez Martianus, en signalant les attestations antérieures ou postérieures à ces traités. On s'interroge enfin sur les raisons possibles du choix effectué par l'auteur du PH et maintenu ou modifié par Martianus Capella."

Peripatetic Logic: Eudemus of Rhodes and Theophrastus of Eresus

Eudemus of Rhodes and Theophrastus of Eresus contributions to logic

This page use the font *Lucida Sans Unicode* for logical symbols.

“Aristotle's successor as director of the Lyceum was Theophrastus, his friend and disciple; Eudemus, another of the Stagirite's important disciples should also be mentioned. Other philosophers belonging to the Peripatetic school were: Aristoxenus, Dikaiarchos, Phanias, Straton, Duris, Chamaeleon, Lycon, Hieronymus, Ariston, Critolaus, Phormio, Sotion, Hermippus, Satyrus and others. Straton even succeeded Theophrastus as director of the Lyceum but his name and those of the other Peripatetics of Aristotle's old school should not be considered in a history of logic as they were mainly concerned with history and the natural sciences.

Theophrastus rejoiced in an enormous prestige at this time and for long afterwards. Diogenes Laertius attributes a tremendous number of works to him. Of them a significant proportion are writings on logic: *Analytica Priora* (3 books); *Analytica Posteriora* (7 books); *Analysis of Syllogisms* (1 book); *Summary of the Analytic*s (1 book); *Polemic on the Theory of Euristic Arguments. On Definition* (1 book); *The First Premises* (18 books); *The Sophisms* (2 books); *On the Solution of Syllogisms* (1 book); *Topics* (2 books); *On Artless Demonstrations* (1 book); *On Negation* (1 book); *On Intellect* (1 book); *Classifications* (2 books); *On Entymeme*s (1 book); *On the Appreciation of Syllogism* (1 book); *On Lies and Truth* (1 book);

Argumentations (2 books); *Theses* (3 books); *On Definitio*n (2 books); *On the Data of Problems* (1 book); *On the Liar* (3 books); *Preface to the Topics* (1 book); *On Arguments prope*r (1 book); *Specifications on The Texts of Syllogisms* (1 book).

Eudemus also wrote some treatises on logic, concerning which some information has come down to us; Ammonius, in his Commentary On Aristotle's Categories attributes to him a writing on The Analytics -- '*Analitika*', and another On Expressions -- *Peri lexeo*s, in which he deals with the grammatical and logical functions of the sentence. The commentator David in Prolegomena to Isagoge by Porphiry also mentions these works. The latter work is also known to us from the commentaries of Galen.

Theophrastus and Eudemus were concerned with the relationship between judgements in the mechanism of the syllogism, rather than the relationship of the concepts they are made of. In other words, as Prantl remarks (*Geschichte der Logik im Abendlande*, I, p. 351), the logical function of the proposition is gradually replaced by the grammatical function.

To Theophrastus we owe the distinction made between significant judgement -- apophansis -- and premise protasis. Aristotle had used the term protasis -- premise -- but by it he had meant apophantic judgement. Theophrastus retained the term apophantic for the true and false judgements; the same judgement becomes a premise if affirmative or negative. Theophrastus' interest turned, therefore, to the grammatical form and construction of the judgement whose function in the syllogism was, in his opinion, more important than the truth or falsity of a judgement.

This and many other examples illustrate that Aristotle's disciples were no longer in quest of truth but of the syllogistic mechanism independent of truth, and therefore independent of ontology.

These were also Eudemus' concerns. He made an interesting contribution to the theory of existential sentences. Aristotle had replaced all the verbs that could occur in judgements by the copula "is" -- *esti* -- or "is not" *ouk esti*. Eudemus studied the existential sentences and demonstrated that the copula 'is" is a real term that can itself have a predicative determination. This conception,

centered mainly, as we see from the examples above, on the structure of the grammatical form of judgements, explains why their logical investigations focused on another aspect of logic in which the expression of thinking was of prime importance." (pp. 207-208)

From: Anton Dumitriu, *History of Logic*, Tunbridge Wells: Abacus Press 1977, Vol. I.

Eudemus of Rhodes (c. 350 BC - 290 BC)

"Eudemus (2nd half of 4th cent. B.C.E.), of Rhodes. A student of Aristotle, often mentioned in conjunction with Theophrastus. In a charm story in Aulus Gellius (13.5), when Aristotle was dying, he chose Theophrastus over Eudemus as his successor in the Lyceum. Eudemus apparently returned to Rhodes on Aristotle's death and founded his own school; Simplicius (*In Phys* . 923.9-15) mentions an exchange of letters between him and Theophrastus on a textual question in Aristotle *Physics*. Simplicius also (924.13) mentions a biography of Eudemus by one Damas, of whom nothing else is known.

There are ascribed to Eudemus in various places (see Wehrli) two books of *Analytics*, a *Categories*, *On Expression* (*Peri Lexeôs*), *On the Angle, Physics*, and histories of geometry, arithmetic, and astronomy. Simplicius refers to Eudemus as "the most genuine of Aristotle's comrades" (*In Phys*. 411.15-16) and says that he "follows Aristotle in all things" (133.22). Though not entirely true, this appears not far off.

In logic, Eudemus and Theophrastus (who are always mentioned together in this connection) made various modifications to Aristotle's s logistic; Alexander, in his commentary on the *Prior Analytics*, cites the following (Alexander is echoed by the other commentators on most of these points): (i) Theophrastus and Eudemus devised a direct proof the convertibility of universal negative propositions (Alexander 31.4-10; contrast Ar. *APri*. 1.2, 25a14-17). (ii) They adopted the *peiorem* rule in modal logic: "that the conclusion is always assimilated to the lesser and weaker of the premises" (Alexander 124.13-14; by contrast Aristotle allowed certain combinations of necessary and assertoric premises to yield necessary conclusions, as in *APri*. 1.9). (iii) They defended the convertibility of

universal negative problematic propositions (Alexander 220.9-16, against Ar. *APri*. 1.17, 36b35-37a31). (iv) They also did extensive work on hypothetical syllogisms (Alexander 389.31-390.3; Philoponus *In APri*. 242.18-19, speaks of "treatises of many lines" on the subject).

Eudemus is said to have claimed in *On Expression* (Alexander *In APri*. 16.15-17, scholium in *APri*. ed. Brandis [in *Aristotelis Opera* 4] 146a24-27) that "is" in "Socrates is" is a predicate term; he may thus have been the first to have contradicted Kant's claim that existence is not a predicate. Alexander's notice of this is phrased in a way that make it appear to contradict Aristotle (at least under Alexander's interpretation of Aristotle: 15.14-22)." (p. 234)

From: *Eudemus of Rhodes* by Russell M. Dancy, in: Donald J. Zeyl (ed.), *Encyclopedia of Classical Philosophy*, London: Fitzroy Dearborn Publishers 1997.

"Those works of Eudemus of which we have any real knowledge fall into two groups: systematic and historical. The second group, containing the histories of arithmetic, geometry, astronomy and perhaps theology, is generally assumed to have been conceived as part of a greater project, initiated by Aristotle himself: a series of surveys covering all the philosophically interesting fields of knowledge, which included Theophrastus' *Physikai Doxai* and Menon's *Iatrika*, as well as those of Eudemus. They will have been compiled during Aristotle's lifetime at Athens, the only place where Eudemus could easily have got hold of the necessary research materials. This raises the question whether, or to what extent, his reading of his sources was affected by Aristotelian preconceptions, a question which has long bedevilled our understanding of Theophrastus' historical works. But it looms less large in connection with the history of mathematics, since in most respects Aristotle's teaching was in accord with the assumptions of mainstream mathematicians, e.g., in accepting the "Euclidean" notion of space, if you will allow the anachronism. The only point on which there was a fundamental disagreement between him and any major group of mathematicians was the existence of indivisible lines, and here Eudemus adopted the Peripatetic position. Thus he agreed with Aristotle in rejecting Antiphon's attempt to square the circle as

contravening a basic principle of geometry, the infinite divisibility of magnitudes.(8) In general, however, these works seem to have contained more straight reporting, and less criticism, than the *Physikai Doxai*. In particular, many of the extant fragments make a point of determining who first discovered a phenomenon or theorem, but then such observations are easier to make and more illuminating in connection with the special sciences than the history of philosophy. When we turn to Eudemus' systematic writings, the situation is more complicated. We have fairly extensive fragments of three: the A*nalytika* (frr. 9-24W), the *Peri lexeos* (frr. 25-9) and the *Physika* (frr. 31-123). Like the corresponding works of Aristotle and Theophrastus, they reflect Eudemus' lectures closely (see in particular fr. 88), even if they were more than lecture notes in the ordinary sense. Yet there are differences between them which are not only due to the differences of their subject-matter. The *Physika*, of which we have by far the fullest reports, was based on a course of lectures covering the same subjects as Aristotle's Physics in the same order (see especially fr. 98), except that it contained nothing corresponding to Book 7 of our version. The extant fragments contain no doctrinal innovations and Eudemus' contribution seems to have been limited to changes of presentation and emphasis (more on this later). Our reports of his *Analytika* are more sporadic, but this work brought some important modifications of Aristotle's doctrine: a new method of proving the convertibility of certain kinds of proposition; the recognition of five kinds of syllogism, which Aristotle treated as variants of other moods, as independent moods of the first figure; the Introduction of the in peiorem rule in modal syllogistic; and some advances in the theory of "hypothetical" syllogisms. If this were all we knew about the work, Eudemus would count as a considerable logician in his own right, but now comes the rub: all of these doctrines are attributed to him and Theophrastus jointly. The only major fragment ascribed to Eudemus alone (fr. 23W) contains a detailed discussion of the meanings of "hypothetical" which might have been useful for elementary students, but makes no advance in logical theory. (9)

The *Peri lexeos* shows rather more independence. Unlike the books with the same title written by Aristotle and Theophrastus (Diogenes Laertius 5.24 = Aristoteles *Rhet*. 3; 5.47), it was not concerned with

the stylistic, but the logical aspects of language. Of the four certain surviving fragments (frr. 25-8),(10) one asks in what circumstances questions count as "propositions" (*protasis*), two show Eudemus differing from Aristotle as to whether the "is," in sentences of the form "A is B," is part of the predicate or only a link between the subject-term and the predicate-term, while the fourth informs us that Eudemus gave an account of the "third man" argument similar in all essentials to the one found in Aristotle's *Peri ideon*.(11) One wonders how this came to be included in a treatise on language; perhaps the theory of Forms was brought into a discussion of meaning. While these fragments do not allow us to reconstruct the *Peri lexeos* even in outline, they are enough to indicate its subject matter. An almost pedantic concern with verbal expression and verbal distinctions can also be observed in some of the fragments of Eudemus' *Physika*, e,g., frr. 61, 83, 92, 94-6, 102.

Finally there is one series of fragments which is entirely different from all the others: half a dozen stories about animal behaviour preserved by Aelian (frr. 127-32)." (pp. 29-31, some notes omitted)

Notes

(8) Fr. 140W. But the sentence near the beginning of the extract printed by Wehrli (1969, 57.271.) which contains a verbal echo of Aristotle (Phys. 185a18), is the work of Simplicius; he only refers to Eudemus later, at 59.11.

(9) The last fragment printed under this head by Wehrli (fr. 24) is also attributed to Eudemus alone, but consists of a historical note about Speusippus' views on definition which may have come from a different work.

(10) 29W, from Galen's *De captionibus in dictione*, refers to a certain source of examples of fallacies; in the older editions, its name is given as (the book of) Eudemus, but the unique MS may read *eudumou* rather than *eudemou* and Ebbesen has printed *Euthudemou* in his edition [*Commentators and commentaries on Aristotle's Sophistici elenchi,*] (1981, 2:18; cf. 1:14-16). He cites Alcinoos *Didasc.* p. 159.39 H in support of his conjecture and further confirmation is offered by Simplicius *In Cat.* 22.11ff. This passage can no longer be safely attributed to Eudemus, and it is now doubtful

whether his *Peri lexeos* included a treatment of fallacies. See Fortenbaugh in this volume.

(11) Alexander of Aphrodisias I*n Metaph*. 83.34ff. = Aristotelis *Fragmenta* pp. 125-6 Ross; 380a36 - 381a32 Gigon. Wehrli (1969) only prints a very short extract as Eudemus fr. 28.

From: Hans B. Gottschalk, "Eudemus and the Peripatos", in: István Bodnár and William W. Fortenbaugh (eds.), *Eudemus of Rhodes*, New Brunswick: Transaction Publishers 2002, pp. 25-37.

Theophrastus of Eresus (371 BC - c. 287 BC)

"Theophrastus continued Aristotle's work on logic, making improvements, but also important modifications. Regarding statements, he distinguished between those that are singular and those that are particular, maintaining that the former are definite and the latter indefinite. Affirmations with a privative predicate he called *ek metatheseô*. In regard to the categorical syllogism, Theophrastus added five moods to the canonical four of the first figure. The five are those of the indirect first figure, which is equivalent to the later fourth figure. They are neither perfect nor undemonstrated and are mentioned by Aristotle only in passing. Theophrastus also held that the first mood of the third figure has two different forms. In the same figure he proposed another order of the moods based on the directness of their proofs. In modal logic, Theophrastus maintained against Aristotle that the universal negative problematic premise (that of one-sided possibility) converts just as do the assertoric universal negative and the necessary. In the case of syllogisms constructed from premises of different modalities, he held that the conclusion in every case follows the weaker premise (*peiorem*-rule), while according to Aristotle it follows the major premise. In connection with the Academic search for *eide*, Theophrastus developed a special logical form, the prosleptic syllogism, which cannot be reduced to a categorical syllogism. One proposition contains potentially a third term, which is made explicit in a second proposition; and the two propositions together yield a conclusion. Theophrastus also did more systematic research in hypothetical syllogistic than Aristotle, and almost certainly

influenced the Stoics. But he remained an Aristotelian, concerning himself mainly with the logic of terms and not that of propositions."

From: William W. Fortenbaugh and Josip Talanga, *Theophrastus*, in: Donald J. Zeyl (ed.), *Encyclopedia of Classical Philosophy*, London: Fitzroy Dearborn Publishers 1997, pp. 552-553.

Theophrastus on quantification

Boethius reports concerning Theophrastus (*floruit* 322-388 BC), student, friend, and first successor to Aristotle as Director of the Lyceum, that "those points which Aristotle expounded in this book on the proposition, he recapitulated lightly, but those items which him teacher failed to publish, he added as a supplement, and executed indeed with a rather sharp type of analysis."(29) And on other and independent grounds there is no doubt that Theophrastus prolonged the lines of Aristotle's own later development and thus stands forth as his most authentic interpreter. It is of crucial importance for the history of traditional logic to disengage the elements of this development from the fragments of Theophrastus. Many significant advances emerge. Of them the following three seem most relevant to our present purposes.

Among the disjointed references to Theophrastus one finds for example the very significant remark that:

On the other hand Theophrastus maintains that there are certain cases of statements in which, if there is no quantitative determination of the predicate also, their respective contradictories will be true. This is the example that he gives: if we say 'Phanias possesses knowledge'; Phanias does not possess knowledge,' it is possible for both statements to be true simultaneously. (30)

For Phanias could indeed be an expert in musical theory, but know nothing, for example, of astronomy. If one is to avoid the possibility of simultaneously valid contradictories that such unresolved ambiguity grounds, then it is necessary to add to the term: 'knowledge,' some quantitative specification. For one does quantify differently, for example, the following statements: (1) All men are mortal, and (2) Some men are married. In such quantification revision of the present case there would result : (1) Phanias possesses

all knowledge, and (2) Phanias does not possess all knowledge. Both of these latter formulations preclude the possibility of simultaneous truth.

The instance of Theophrastus is profoundly interesting. But its true significance is not cleanly and clearly disengaged from his vague but correct feeling for the problem. The focus would have been sharpened by two alterations in its formulation: (1) quantify the subject of the pertinent and illustrative sentences and (2) distinguish and divide the separate elements in the complex predicate: 'possess.' For in the present case 'knowledge' is not really the predicate. The true predicate is 'possesses' and 'knowledge' belongs in one of its two places, as one of its arguments or relata. For 'someone possesses something' comes far closer to the genuine analysis than 'someone is something-that-possesses-something'. Theophrastus is not clear. But his instinct is sound. Like most pioneers in theoretical advances, his grasp on the discovery is clumsy and heavy, even if sure and firm.

And the point is of paramount importance. For the main character of difference between the conventional logic of analysis of propositions and that of modern logic is precisely this: conventional logic arbitrarily restricts its analysis to functions involving a *single* generalization (of '*S'* in the '*S* is *P*' formula), whereas the modern analysis of statements concerns itself with the further analysis of functions involving many coordinate generalizations, wherever possible and wherever logically important or relevant. The conventional expression : 'All a's are b's', is no more nor less than a function constructed on the matrix pattern: 'if anything is an a, then it is a b,' by means of *the single generalization of the subject* to the level of 'anything.' And this level is the actual upper limit and maximum ceiling of conventional analysis. Consider however such a statement as: 'Every man has a father,' which even in its grammatical formulation is doubly generalized ('every' and 'a'). Such a sentence can undergo partial analysis and resolution by conventional procedures. One may let 'a' stand for the class of men, and 'b' represent the class of 'beings-that-have-fathers,' and write accordingly: Everything that is an a, is also a b.' But this technique achieves an analysis of the statement only with regard to its first generalization to the level of 'any man whatever.' If one is to secure an equally valid and necessary analysis of the *doubly* general

statement, there is no alternative but to proceed as follows: 'For every entity x there exists at least some one y or other, such that if x is a man, then y is the father of x' (31) This is in fact that technique of double generalization or quantification which Theophrastus glimpsed, but darkly.

Alexander (32) furthermore informs us that Theophrastus labeled 'propositions *kata prolepson*' statements which were formed by appropriate substitution in the generalized matrix formula: 'to that whatsoever to which B universally belongs, A belongs universally also.' And Alexander proceeds to explain that the label is etymologically derived from the fact that over and beyond the two determinate terms: 'A' and 'B,' one also employs [a third most generalized and indeterminate element, i. e. that object whatsoever it be to which both A and B jointly apply. The sense of the passage is clear and the meaning it suggests may be expressed in the following formulation of a universal affirmative statement: 'no matter what entity one may care to mention, if it is a B, then it is also an A.' Alexander further reports that in the opinion of Theophrastus himself such statements *kata prolepsin* and those which are called categorical and are formed by appropriate substitutions in the generalized schema : 'A is B,' are logically equivalent. It would thus appear that the primitive notions of a quantification theory and of resolution of categorical assertions into formal implications are not altogether foreign to the traditional development of Aristotle's logic." (pp. 19-20)

From: Joseph T. Clark, *Conventional Logic and Modern Logic: A Prelude to Transition*, Woodstock, Maryland: Woodstock College Press, 1952.

Theophrastus and hypothetical syllogisms

Boethius furthermore gives this reply to a persistent inquirer whose logical interests appear to have coincided with our own present ones:

... You frequently ask me about hypothetical syllogisms. Aristotle composed no treatise on them. Theophrastus, however, although gifted with a most versatile competence, only touches on their high points. Eudemus undertakes to impart a broader view of the subject, but goes about the execution of the project in such a way that to all

appearances he reaped no harvest from the germinal ideas that he scattered about. (33)

What then were these high points to which Boethius alludes? Alexander (34) reports for the record a set of rules which seem to pertain to the type of hypothetical syllogisms in question. These are the syllogisms *kata analoghian* also called 'completely hypothetical syllogisms', or again 'triply hypothetical syllogisms'. And we are instructed that Theophrastus reduced these formulae to three figures:

1. If the A proposition [to A], then the B; if the B, then the C; hence if the A, then the C.

2. If the A, then the B; if not the A, then the C; hence if not the B, then the C.

3. If the A, then the C; if the B, then not the C; hence if the A, then not the B.

Theme formulations are of profound logical interest. A1, first blush they may be hastily identified with comparable laws of the modern sentential calculus in which the alphabet symbols represent unanalyzed statements, regarded as unit block wholes. But it is more than likely that Theophrastus construes what ho Imparts in the familiar context of an Aristotelian logic of terms. The paradox is characteristic of pioneers. While laying the groundwork in point of fart for a primitive calculus of statements, Theophrastus apparently interprets his own advances as a prolongation into unexplored areas of the Aristotelian syllogism. But they are without doubt genuine advances."

(29) Migne, *Patrologiae Cursus Completus, Series Latina* 64; Boethius, *De Interpretatione* 12.16: ". . . quae Aristoteles Imo libro de enuntiatione tractavit, leviter ab co transcursa sunt; quae vero magister eius tacuit, ipse subtiliore modo considerationis adiecit." I take it that one does not 'keep silent' on matters of which one is completely ignorant.

Selected Bibliography on the Logic of Eudemus of Rhodes and Theophrastus of Eresus

Critical edition of the Fragments of Eudemus of Rhodes

1. Wehrli, Fritz, ed. 1955. *Eudemos von Rhodos*. Basel: B. Schwabe & C.

   The standard collection of Fragments, abbreviated W. in the citations; second edition 1969.

Selected bibliography on Eudemus' logic

1. Alexander, of Aphrodisias. 1999. *On Aristotle Prior Analytics 1.8-13 (with 1.1736b35 - 37a31)*, *Ancient Commentators on Aristotle*. London: Duckworth.

   Translated by Ian Mueller with Josiah Gould.

   On the modal logic of Eudemus of Rhodes see pp. 59ff. with notes on Alexander 124.11 ff.

2. Bodnár, István, and Fortenbaugh, William W., eds. 2002. *Eudemus of Rhodes*. New Brunswick: Transaction Publishers.

   Contents: Preface VII; Contributors IX; 1. Dimitri Gutas: Eudemus in the Arabic tradition 1; 2. Hans B. Gottschalk: Eudemus and the Peripatos 25; 3. Tiziano Dorandi: Qualche aspetto controverso della biografia di Eudemo di Rodi 39; 4. William W. Fortenbaugh: Eudemus' work *On Expression* 59; 5. Pamela M. Huby: Did Aristotle reply to Eudemus and

Theophrastus on some logical Issues? 85; 6. Robert W. Sharples: Eudemus' physics: change, place and time 107; 7. Han Baltussen: Wehrli's edition of Eudemus of Rhodes: the physical fragments from Simplicius' commentary *On Aristotle's Physics* 127; 8. Sylvia Berryman: Continuity and coherence in early Peripatetic texts 157; 9. István Bodnár: Eudemus' Unmoved Movers: fragments 121-123b Wehrli 171; 10.Deborah K. W. Modrak: *Phantasia*, thought and science in Eudemus 191; 11. Stephen A. White: Eudemus the naturalist 207; 12. Jørgen Mejer: Eudemus and the history of science 243; 13: Leonid Zhmud: Eudemus' history of mathematics 263; 14. Alan C. Bowen: Eudemus' history of early Greek astronomy: two hypotheses 307; 15. Dmitri Panchenko: Eudemus fr. 145 Wehrli and the ancient theories of lunar light 323; 16. Gábor Betegh: On Eudemus fr. 150 (Wehrli) 337; Index of ancients sources 359-383.

"This volume of Rutgers University Studies in Classical Humanities, no. XI in the series, is the third devoted to Theophrastus' colleagues, pupils and successors, i.e., those Peripatetic philosophers, whom Fritz Wehrli brought together under the label *die Schule des Aristoteles*. Volume IX focuses on Demetrius of Phalerum, who was Theophrastus' pupil and for ten years the ruler of Athens. Volume X has Dicaearchus of Messana, Theophrastus' fellow-pupil within the Aristotelian Peripatos, as its subject. The present Volume, no. XI, concentrates on Eudemus of Rhodes, who, like Dicaearchus, studied under Aristotle and alongside Theophrastus. This concern with *die Schule des Aristoteles* will continue with the next two volumes: Lyco of Troas and Ieronymus of Rhodes will be the subjects of Volume XII, and Aristo of Ceos will be featured in Volume XIII. All three belong to the post-Theophrastean Peripatos. Like Volumes IX and X, so Volumes XII and XIII will present the ancient sources with translation as well as discussion by various scholars. Volume XI is different in that it is entirely composed of articles which discuss Eudemus from differing points of view." (from the Preface by the Editors)

3. Fortenbaugh, William W. 2002. "Eudemus' work *On Expression*." In *Eudemus of Rhodes*, edited by Bodnár, István

and Fortenbaugh, William W., 59-83. New Brunswick: Transaction Publishers.

"Eudemus of Rhodes wrote a work entitled *On Expression, Peri lexeos*. It was at least two books or rolls long and was the subject of a lost treatise by Galen. Apparently the work was not only substantial but also full of interesting material. It is therefore regrettable that we have only a few fragments from which to judge the content of the work. Five fragments, nos. 25-9, are assigned to the work by Wehrli, but that may be too generous. In what follows, I intend first to consider Wehrli's five fragments and then to ask what we can conclude concerning the content of *On Expression*." (p. 59)

4. Gottschalk, Hans B. 2002. "Eudemus and the Peripatos." In *Eudemus of Rhodes*, edited by Bodnár, István and Fortenbaugh, William W., 25-37. New Brunswick: Transaction Publishers.

5. Gutas, Dimitri. 2002. "Eudemus in the Arabic Tradition." In *Eudemus of Rhodes*, edited by Bodnár, István and Fortenbaugh, William W., 1-23. New Brunswick: Transaction Publishers.

   Reprinted as Chapter VIII in D. Gutas, *Greek Philosophers in the Arabic Tradition,* Aldershot: Ashgate, 2000. see IV. *Logic* pp. 9-11.

   "The information on Eudemus of Rhodes that can be recovered in Arabic sources falls into three categories: there is a full collection of sayings (Section II below and Appendix), some incidental biographical notices that mainly state his relation to Aristotle and Theophrastus (Section III), and a number of references to his views on logic which lie held in common with Theophrastus (Section IV). No work of his is reported to have been translated into Arabic or is known to be extant. Apart from the sayings, therefore, Eudemus has no independent persona or presence in Arabic but rides on the coattails primarily of Theophrastus. This is hardly surprising, given the little information on Eudemus that was available even in Greek at the time of the rise of Islam." p. 1

6. Huby, Pamela M. 2002. "Did Aristotle reply to Eudemus and Theophrastus on some logical issues?" In *Eudemus of Rhodes*, edited by Bodnár, István and Fortenbaugh, William W., 85-106. New Brunswick: Transaction Publishers.
7. Steiger, Kornél. 2000. "Eudemos von Rhodos und der Peripatos." *Acta Antiqua. Academiae Scientiarum Hungaricae* no. 40:449-451.

   "Von Eudemos berichtet die Kommentarliteratur, vor allem im Zusammenhang mit Andronikos, dass er zu den bedeutendsten ἑταῖροι des Aristoteles gehört und wichtige und seiner Zeit weit vorauseilende philosophische Erkenntnisse gewonnen habe. Trotzdem gibt es von ihm keine Vita, Diogenes Laertios, Suda und Cicero kennen ihn nicht. Man darf wohl annehmen, dass der Rhodier Andronikos einen ganz und gar unauffälligen Aristotelesschüler aus Rhodos zum bedeutenden Philosophen hochstilisiert hat, um an eine alte peripatetische Tradition auf der Insel glauben zu machen."

Selected bibliography on Theophrastus' logic

1. Barnes, Jonathan. 1983. "Terms and Sentences: Theophrastus on Hypothetical Syllogisms." *Proceedings of the British Academy* no. 69:279-326.

   "One of the topics which Theophrastus certainly treated was that of ‘wholly hypothetical’ syllogisms. Our main source for that treatment is a long passage in Alexander’s commentary on Aristotle’s *Prior Analytics* in which he draws on the first book of Theophrastus’ Prior Analytics (1). The passage is not a quotation from Theophrastus, nor indeed does it purport simply to document Theophrastus’ views. None the less, we can extract his views from Alexander’s commentary with reasonable confidence." (p. 286)

   (...)

   "A generous, but not wholly implausible, reconstruction of Theophrastus’ account of hypothetical syllogisms would thus ascribe the following discoveries to him. He investigated inferences of the form (H**) (^). He arranged them into three

figures. Within each figure he discussed, systematically, the possible moods, singling out those which were valid. He asserted, if he did not prove, certain metatheorems about hypothetical syllogistic. He showed that the second- and third-figure moods could be derived from the first figure. He produced some derivations within the figures. He may perhaps have said something about compound syllogisms.

Modern logicians will not perhaps regard that achievement as particularly remarkable. Yet in its day it represented a definite extension of logical science beyond anything that is found in Aristotle's Organon.(2) At the same time, it is clear that Theophrastus was relying upon his master's work: Aristotle's treatment of categorical syllogistic gave him a model and a pattern for his own treatment of wholly hypothetical syllogisms." (p. 307)

(1) In *A.Pr*. 325. 31-328. 7: text and translation in the Appendix, below [for another translation see Alexander of Aphrodisias, *On Aristotle Prior Analytics 1.23-31*, London: Duckworth 2006, pp. 116-119]. Most of the passage appears as Theophrastus, F 30 G, frags. 34a and 34b R. See also Philoponus, *in A.Pr*. 302. 6-23, which is, however, a highly condensed and somewhat inaccurate version of Alexander's account.

(2) Wholly hypothetical syllogistic does not comprise the sum of Theophrastus' achievement in non-categorical logic: see Barnes, op. cit. (p. 285 n. 4), for further details (and for a brief argument against the tempting conclusion that Theophrastus the Peripatetic invented Stoic logic).

(^) Let us use 'M' to designate the middle hypothesis, 'E' and 'E*' to designate the extremes. And let 'IF [X, Y]' be ambiguous between 'If X, then Y' and 'If Y, then X'. Then Theophrastus' wholly hypothetical syllogisms are arguments of the specific form:

(H**) IF [±E, ±M]

IF [±E*, ±M]

———————

IF [±E, ±E*] (p. 296)

2. ———. 1985. "Theophrastus and Hypothetical Syllogistic." In *Aristoteles. Werk und Wirkung, Paul Moraux gewidmet, I: Aristoteles und seine Schule*, edited by Wiesner, Jürgen, 557-576. Berlin: de Gruyter.

   Reprinted in: W. W. Fortenbaugh, P.M. Huby, A. A. Long (eds.), *Theophrastus of Eresus. On His Life and Work,* New Brunswick, Transaction Books, 1985, pp. 125-141 and with the title *Theophrastus and Stoic Logic* in: J. Barnes, *Logical Matters: Essays in Ancient Philosophy II*, Oxford: Clarendon Press, 2012. pp. 413-432.

   "In *APr* 1.44 Aristotle considers "arguments on the basis of a hypothesis." He deals first with arguments that are "agreed to by way of a compact," and then with those that "reach their conclusion by way of the impossible." The chapter ends with a promise: "Many other arguments reach their conclusion on the basis of a hypothesis. We should consider them and mark them out clearly. We shall say later what varieties of them there are and in how many ways arguments can rest on a hypothesis" *(APr* 50 a 39-b2).

   Alexander of Aphrodisias *(In APr* 389, 31-390.9) (1) comments on that passage as follows:

   Having talked about arguments on the basis of an agreement and arguments by re*ductio ad impossible,* he says *that* "many others reach their conclusion on the basis of a hypothesis." He postpones discussion of them, as though intending to deal with them more carefully; but no book of his on the subject is in circulation. Theophrastus, however, refers to them in his own *Analytics* -- and so do Eudemus and some others of Aristotle's associates.

   Aristotle presumably has in mind those arguments which proceed by way of a continuous proposition (or a connected proposition, as it is also called) together with the additional assumption, and those which proceed by way of a separative or disjunctive proposition -- and perhaps also those which

proceed by way of a negated conjunction, if they are indeed different from the ones already mentioned. (2)

In addition to those we have mentioned, there will also be arguments on the basis of proportion and those which they call "qualitative" (i.e., arguments from what is more so or less so or equally so) and whatever other varieties of arguments based on a hypothesis (3) there are (they have been discussed elsewhere).

In addition to those we have mentioned, there will also be arguments on the basis of proportion and those which they call "qualitative" (i.e., arguments from what is more so or less so or equally so) and whatever other varieties of arguments basal on a hypothesis' there are (they have been discussed elsewhere).

Those paragraphs are of some importance for the history of logic: the present paper is a commentary on them."

1. The passage is F 29 in A. Graeser, *Die logischen Fragmente des Theophrast* (Berlin / New York 1973), and frag. 33c in L. Repici, *La logica di Teofrasto* (Bologna 1977).

2. Wallies, in the *CIAG* edition, punctuates so as to begin a new sentence with the clause "if they-already mentioned." The result is ungainly and obscure. In my translation I gratefully adopt a suggestion made by David Sedley: his punctuation gives perfect sense and makes better Greek. (It leaves an unpleasant asyndeton. Perhaps we should insert a particle and begin the new sentence at 390.6 with p*ara de tous*.)

3. I excise *protaseon* (390.9): the phrase "propositions based on a hypothesis" is strange, and even if it may be allowed as a variant on "hypothetical proposition," it is out of place; Alexander is enumerating types of hypothetical *arguments,* not types of hypothetical *propositions*.

3. Bobzien, Susanne. 2000. "Wholly hypothetical syllogisms." *Phronesis.A Journal for Ancient Philosophy*:87-137.

"Traces the history in Aristotelian commentators of the type of syllogisms called "wholly hypothetical" -- that is, those consisting in two conditionals as premisses, with a third as the

conclusion -- and sets forth the deductive system on which the logic of this syllogism was grounded. There was no unique prevalent understanding of the logical form of these arguments, but rather a complex development in their understanding, starting from a term-logical conception and leading to a propositional-logical one. The roles of Theophrastus, Alexander of Aphrodisias, and Porphyry (*via* Boethius) in the transmission and transformation of this problematic are investigated."

4. ———. 2000. "Why the order of the figures of the hypothetical syllogisms was changed." *Classical Quarterly* no. 50:247-251.

   "In chapter 6 of Alcinous' Handbook of Platonism we find a discussion of categorical, hypothetical, and mixed syllogisms. Alcinous distinguishes three figures of the hypothetical syllogism, and illustrates each figure with a syllogism based on an argument from Plato. Here he remarks in passing that most people called the second hypothetical figure the third and that some called the third figure the second. We may assume that those who called the third figure the second and those who called the second the third were the same. In a parallel passage, Alexander of Aphrodisias advocates the same ordering of figures of hypothetical syllogisms as Alcinous, and reports that Theophrastus, in the first book of his Analytics, had the second and third figure in reverse order. Combining these passages, we can infer that at the turn of the second century A.D. there existed two different views on the ordering of the figures of the hypothetical syllogisms, of which one goes back to Theophrastus, whereas the other presumably was the result of a later change."

5. ———. 2002. "Pre-Stoics hypothetical syllogistic in Galen's *Institutio logica*." In *The Unknown Galen*, edited by Nutton, Vivian. London: Institute of Classical Studies, University of London.

   ρὸλο"The text of the *Institutio Logica* (IL) or *Introduction to Logic* is not found in Kuhn (*) because its sole surviving manuscript was first published, not long after its discovery, in

1844, and thus too late for inclusion in Kuhn. Moreover, some have thought the work to be spurious.(1)

The reasons given for this assumption were on the whole unconvincing. I take it for granted that the *Institutio Logica* is by Galen.

In this paper I trace the evidence in the *Institutio* for a hypothetical syllogistic which predates Stoic propositional logic. It will emerge that Galen is one of our main witnesses for such a theory. In the *Institutio*, Galen draws from a number of different sources and theories.

There are the so-called ancient philosophers; there is the Stoic Chrysippus, whose logic Galen studied in his youth.(2) There are the 'more recent philosophers', post-Chrysippean Stoics or logicians of other schools who adopted Stoic terminology and theory.(3) There are from the 1st century BC the Stoic Posidonius and the Peripatetic Boethus, both of whom Galen may have counted among the 'more recent philosophers'. Again, in some passages Galen seems to draw from contemporary logical theories of non-Stoic make, presumably of Peripatetic or Platonist origin; and in others he explicitly introduces his own ideas.(4) But apart from Plato, who is generously credited by Galen with the use of the later so-called second hypothetical syllogism, the only promising candidates for pre-Stoic proponents of a hypothetical syllogistic are the above-mentioned 'ancient philosophers'." (p. 57)

(...)

"I now turn to the question who the ancient philosophers were. In the present section, I consider the passages in the *Institutio* and in other Galenic writings. In the *Institutio* the ancients are contrasted in ch. 14 with the Stoics and in ch. 3 with 'the more recent philo

sophers', who use Stoic terminology. We can infer that the ancient philosophers (i) were not Stoics, (ii) were older than those Stoics, (iii) were older than those more recent philosophers.

Furthermore, we have some good reasons for assuming that the ancient philosophers were Peripatetics: first, the terminology they use is Peripatetic: e.g. πρότασις, 'hypothetical premiss', 'hypothetical syllogism';(26) second, the account of the hypothetical premisses in terms of things (πράγματα) is Peripatetic;(27) third, the predicate of holding (ὑπάρχειν) is used not of the truth-bearers (as the Stoics would do), but of those things;(28) fourth, the two things that are related in a hypothetical premiss must differ from each other, whereas for the Stoics they could be the same;(29) fifth, at IL 7.7 the ancient philosophers are said to distinguish three figures of categorical syllogisms, and these syllogisms and their classification are without doubt Peripatetic.

In addition, everything suggests that the ancient philosophers were early Peripatetics, i.e. Aristotle, Theophrastus, Eudemus, and their contemporaries.(30) And in the case of hypothetical syllogistic, since as far as we know Aristotle did not have such a thing,(31) the ancients could only have been Theophrastus and Eudemus and their contemporaries." (p. 64)

(2) 2 Cf. Galen, *On my own books*, 43 (Kühn xix).

(3) Cf. L S. Kieffer, *Galen's Institutio Logica* (Baltimore 1964) 130-32; J. Bames, 'Form and Matter', in A. Alberti, ed., *Logica, Mente e Persona* (Florence 1990) 7-119, at 71-23.

(4) E.g. in chapters 16-17 of the *Institutio*.

(26) Cf. Philop. *APr*. 242.24-243.10, and my 'Stoic Hypotheses and Hypothetical Argument', *Phronesis* 1997, 299-312.

The expressions ἀπόφα[ν]σις at IL 3.1, and πρόβλημα, at IL 14.2 also suggest a Peripatetic origin.

(27) Cf. Philop. *APr*. 242.27-8 (= F (Fortenbaugh) 111B), where, after having mentioned Theophrastus and Eudemus in the previous paragraph, Philoponus states that the Peripatetics call the things (πράγματα) things (πράγματα); cf. also [Amm.] *APr* 68.4-5.

(28) Cf. Alex. *APr*. 156.29-157.2 (= F 100B) for the use of ὑπάρχειν by Theophrastus.

(29) See above, pp. 61-62.

(30) Theophrastus and Eudemus wrote books entitled Περι ερμηνέιας. and Αναλυτικά (Philop. *Cat*. 7.20-22), and in particular Theophrastus wrote many more books on logic (*Diog*. *Laert*. 5.42 and 50). Of their contemporaries, we know that Phaenias of Eresus and Strato of Lampsacus wrote on logic. The first seems to have written works entitled Κατηγοριαι, and Αναλυτικά (Philop. *Cat*. 7.20-22, Wehrli frg. 8), the second wrote, among other things, an introduction to the Topics and a treatise Περι του μαλλον και ηττον (*Diog*. *Laert*. 5.59-60).

"*Appréciation générale*. On voit donc que l'importance historique de la logique théophrastienne est vraiment grande: la préparation du Stoïcisme, la formation de la plupart des thèses « classiques », la découverte de quelques théories « modernes ». Au point de vue systématique, il en va autrement: il semble que les doctrines de Théophraste, viciées par un formalisme mal compris et par plusieurs thèses incompatibles, formaient un ensemble peu cohérent. Il serait naturellement déplacé de vouloir juger sa valeur en le comparant à nos systèmes modernes et il ne faut pas demander aux anciens ce que nous possédons aujourd'hui, grâce à l'effort de tant de siècles. Cependant, même comparé au système d'Aristote, celui de Théophraste reste inférieur. Théophraste n'est pas un logicien de premier ordre, tel que furent Aristote et Chrysippe chez nous, Dinnaga en logique indienne. Mais quand on le compare à la plupart des auteurs qui composèrent des logiques aux temps modernes — du XVIe au XIXe siècle — il semble leur être de beaucoup supérieur. Sans être un des génies de la logique formelle il peut être classé parmi les grands logiciens." (p. 138)

Essays Presented by His Friends and Pupils to Richard Walzer on His Seventieth Birthday*, edited by Stern, S.M., Hourani, Albert and Brown, Vivian, 189-207. London: Bruno Cassirer.

    "In some ancient writers on logic we find mention of propositions and syllogisms κατά πρόσληφιν. We shall attempt in this paper to determine I lie nature and logical relations of these propositions and arguments, which we call for brevity prosleptic." (p. 189)

23. Lejewski, Czeslaw. 1961. "On prosleptic syllogisms." *Notre Dame Journal of Formal Logic* no. 2:158-176.

    "As a rule modern textbooks of traditional logic distinguish only two kinds of syllogism: the categorical syllogism, which has originated with Aristotle, and the hypothetical syllogism, which goes back to the early Peripatetics and to the Stoics. Rarely, if ever, is mention made of the third kind of syllogism namely the *prosleptic* syllogism. Yet, the prosleptic syllogism, for which we seem to be indebted to Theophrastus, appears to have been regarded at least by some logicians in later ages of antiquity as a legitimate part of logical theory.

    Like the expressions 'categorical' and 'hypothetical' the expression 'prosleptic' is a technical term and its full significance can only emerge at a later stage of our enquiry. At this stage suffice it to say that 'prosleptic' is meant to render the Greek expression *kata proslepsin* in its adjectival use.

    Although the prosleptic syllogism has not played as important a role in the development of logic as the other two kinds of syllogism, it deserves our attention particularly for the following two reasons. First, the validity of prosleptic syllogisms is based, as we shall see, on certain logical notions which in modern logic find their expression in the use of the universal quantifier. Secondly, the theory of prosleptic syllogism bears witness to the resourcefulness of Theophrastus as a logician.

In what follows I propose to reconstruct the theory of prosleptic syllogisms to the extent to which the scarcity of textual evidence permits, and to examine it from the point of view of modern logic." (p. 158)

(...)

"Following our anonymous authority we can repeat that prosleptic premisses were called so because each of them contained an indefinite term, or a bound variable as we would say. Once this term has been made definite, i.e., once a constant noun expression has been substituted for the bound variable, the prosleptic premiss becomes an implication, which, granted its antecedent, yields its consequent as the conclusion in a valid inference of the *modus ponens* type.

Inferences which originated from prosleptic premisses in this way were called prosleptic syllogisms." (p. 170)

24. ———. 1976. "On prosleptic premisses." *Notre Dame Journal of Formal Logic* no. 17:1-18.

"Galen claimed that prosleptic premisses, used for the first time by Aristotle and treated systematically by Theophrastus, were equivalent to appropriate categorical premises. This claim can only be sustained with substantial qualifications. The paper carries out a detailed examination of equivalence relationship between the two kinds of premisses within the framework of axiomatized Aristotelian syllogistic, which had to be suitably extended for the purpose by additional assumptions. The results of the enquiry differ from those obtained by William and Martha Kneale in their paper on "Prosleptic propositions and arguments" in "Islamic philosophy and the Classical tradition", edited by S. M. Stern and others, Cassirer 1972."

(...)

"Within the limits of the present paper our analysis of prosleptic premisses with reference to traditional syllogistic must now be concluded. We have found, as the Kneales have done, that prosleptic premisses conveniently fall into four groups. The prosleptic premisses of the first two groups, which are the same as those distinguished by the Kneales, are each

equivalent to a categorical proposition. However, in order to prove this for the prosleptic premisses of the second group we have extended traditional syllogistic by including among its presuppositions the principle of ecthesis.

In this way we have avoided using inadmissible terms. We have had no recourse to inadmissible terms in connection with the analysis of the remaining prosleptic premisses. And this is why our results differ from those arrived at by the Kneales. Traditional syllogistic, which allows for the use of negated terms but does not admit terms that are empty or universal, appears to provide an appropriate framework for investigating the meaning of prosleptic premisses even though that framework has to be extended. This does not mean that it would be wrong to analyse the meaning of prosleptic premisses within the framework of a system whose language favours different restrictions as regards the range of substituends for the variables.

Thus, for instance, one could examine the logical import of prosleptic premisses within the framework of a system whose language allows for the use of universal terms but does not admit empty terms or negated terms.

Alternatively, one could relate one's enquiry to a system which, like that of Lesniewski's, has no inadmissible terms. Whichever strategy is adopted, the need for specifying one's presuppositions cannot be overemphasised." (p. 16)

26. Malink, Marko. 2012. "Figures of prosleptic syllogisms in *Prior Analytics* 2.7." *Classical Quarterly* no. 62:163-178.

    "In chaps. 2, 5-7 of his *Prior analytics*, Aristotle is concerned with circular proof. He gives an account of circular proofs within the framework of his syllogistic theory and discusses how they come about in the three figures of categorical syllogisms. The results of this discussion are summarized at the end of this section, at *APr*. 59 A 32-41. The summary contains

several statements to the effect that certain circular proofs come about in the third figure. Some of these statements are problematic because the circular proofs in question are actually not in the third figure of categorical syllogisms ; in fact, these proofs are not categorical syllogisms at all, but what Theophrastus called prosleptic syllogisms (Aristotle, *Sch. Σ* 190 A 1-4 Brandis). Hence, the statements are incorrect if they are understood to refer to the third figure of Aristotle's categorical syllogisms. The passage can, however, be shown not to be spurious: the problematic statements in it refer not to the third figure of categorical syllogisms, but to the third figure of prosleptic syllogisms. On this interpretation, the statements can be regarded as genuine. They show that Aristotle was aware of a classification of prosleptic syllogisms into three figures, even though such a classification does not occur elsewhere in his writings. Thus, the passage appears to be the earliest evidence we have of figures of prosleptic syllogisms."

John Locke's criticisms of Aristotle and the syllogism 137; Bibliography 144; Index 147-149.

    "Traditional "Aristotelian" logic recognizes four figures of the syllogism, including five "indirect" moods of the first figure.

    The usual account of the origin of these is that Aristotle himself developed the first, second, and third figures, that Theophrastus added the indirect moods of the first figure, (2) and that the fourth figure was added later on by someone else, probably Galen. (3)

    I shall attempt to show that the five argument forms added to the first figure by Theophrastus were in fact not the indirect moods of the first figure that became part of the traditional "Aristotelian" logic. They were, rather, argument forms corresponding both to the later indirect first and to the later fourth figure moods, but not recognizing any distinction between the two. From the modern (i.e., traditional) point of view, it is just as accurate, and just as wrong, to say that Theophrastus added the fourth figure as to say that he added the indirect first. In a sense he did both; in a sense he did neither. For in the later logic the indirect first moods are carefully distinguished from the fourth figure moods. But

Aristotle and Theophrastus had no formal basis for distinguishing the indirect first form the fourth. They attached no significance to premise order. (4)" (pp. 109-110)

(2) The main evidence for this is the statement of Alexander, *Alexandri in Aristotelis Analyticorum Priorum Librum I Commentarium*, CAG, edited by Maximilian Wallies. Berlin, 1883, vol. II, part I, pp. 69.26-70.21 and 109.29-110.21. See also *Boetii De Syllogismo categorico libri duo*. In *Patrologiae Cursus Completus*, Series Latina, edited by J.-P. Migne. Paris, Bibliothecae Cleri universae, 1891, vol. LXIV, 814C-816C.

(3) The best known source for this is Averroes. Two recent and full treatments of the history of the fourth figure and of reports about it are in A. I. Sabra: A twelfth-century defence of the fourth figure of the syllogism. *Journal of the Warburg and Courtauld Institutes*. XXVIII: 14-28, 1965, and Nicholas Rescher: *New light from Arabic sources on Galen and the fourth figure of the syllogism*. Journal of the History of Philosophy, III: 27-41, 1965.

(4) For Aristotle on premise order, see Chapter X above. We shall see in this Appendix that there seems to be no reason to suppose that Theophrastus had nay conventions regarding premise order either.

Selected Bibliography on the Megarians and the Dialectical School: First Part

Introduction

"MEGARIAN SCHOOL. Euclides founded a "school" in the town of Megara, just across the isthmus from Athens, c. 400 B.C.E. It was apparently short-lived, and its history is somewhat confusing. Diogenes Laertius (2.106) says of Euclides that "those after him were called Megarians, then eristics, and later dialecticians, because of their setting out their arguments in question and answer." But in 2.113 he quotes "Philippus the Megarian" to the effect that Stilpo of Megara "drew away" several of the dialecticians to the school of Megara, and elsewhere reports vari¬ ous attacks on "the dialecticians" (7.163, 10.8, 10.24), and he and other ancient authors use "dialectician" as a label for Diodorus Cronus and for Philo the Dialectician. Thus it looks as if the label "dialecticians" in 2.106 may refer to a separate school or sect. But it does not seem likely that anyone called himself an "eristic"; this label was probably attached to certain of the Megarians because of their argumentative tendencies." (From Donald J. Zeyl, *Encyclopedia of Classicl Philosophy*, New York: Routledge, 2013, p. 328)

"DIALECTICAL SCHOOL. A philosophical tradition closely associated with the "minor *Socratic" Megarian (Megaric) and Eristical traditions and believed by some to have flourished c. 320-250 B.C.E. Diogenes Laertius reports (2.106) that one ’"Euclides of Megara (or of Gela), who was "concerned with ’"Parmenidean matters," originated a tradition whose adherents "were called

Megarians (Megarikoi), then Eristikoi, and later Dialektikoi, Dionysius of Chalcedon having first named them thus because they formulated their arguments by question and answer." Scholarly tradition, then, takes philosophers referred to as "Megarikoi" (e.g., Euclides and Diodorus Cronus' contemporary, "Stilpo of Megara), those referred to as "Eristikoi" (e.g., Euclides' pupil and ""Aristotle's opponent, Eubulides of Miletus, and Alexinus of Elis), and those referred to as "Dialektikoi" (e.g., the supposed founder of the Dialectical tradition, Clinomachus of Thurii, Diodorus Cronus, and Diodorus' pupil Philo) as all belonging to the same tradition or school. With respect to philosophical method or style, most members of this group employed the "dialectical" (dialogue) approach of question-and-answer and attempted to bring philosophical opponents to their conclusions by carefully constructed puzzles and indirect (reductio) argumentation. With respect to philosophical doctrines, many seem to have combined a Socratic interest in moral issues with some form -in some cases much attenuated— of the Eleatic metaphysical doctrine of the unity and changelessness of "what is.""(From Donald J. Zeyl, *Encyclopedia of Classicl Philosophy*, New York: Routledge, 2013, p. 177)

"Döring has assembled the first complete collection of textual fragments concerning the Megarian philosophers of the fourth and third centuries B.C., together with a commentary.

The fragments are divided by the author into four groups, each centered around one of the better-known figures of the school: Euclid, Eubulides, Diodorus Cronus, Stilpo. Evidences concerning lesser-known personalities are included under the figure to whose "circle" they

belonged. A fifth group of texts appears in an Anhang devoted to the sophist Bryson (often mistakenly associated with the Megarians) and his student Polyxenus. Divisions in the commentary parallel those in the text. The author also adds a stemma summarizing his

conclusions about teacher-pupil relationships within the school, and there is a selective bibliography and a *Stellenregister* . An index, which in view of the work's organization would be helpful, is not included. Simply as a collection of texts, this is a major addition to the scholarship in

its field; with the author's commentary, it is the most important work on the Megarians since Kurt von Fritz's *Realencyclopädie* article. Döring presents convincing evidence that some widely disseminated opinions about the school have little or no foundation. Some of his alternative views have important consequences, and not only for the history of the Megarians." (Robin Smith, "Review of *Die Megariker: Kommentierte Sammlung der Testimonien* , by Klaus Döring", *Journal of the History of Philosophy* , 12, October 1974, pp. 521-522)

3. Muller, Robert, ed. 1982. *Les Mégariques. Fragments et témoignages* . Paris: Vrin.

   Traduction et commentaire.

   Table des matières: Introduction 7; Les fragments et témoignages (I. Euclide, II. Eubulide, III. Diodore, IV. Stilpon, V. Appendice: Bryson et son élève Polyxène) 19; Annexe I 75; Annexe II 91; Commentaire 95; Notes 183; Bibliographie 229; Index des sources 237; Index locorum 247-253.

   "Introduction. I. Les textes Mégariques.

   On s'accorde volontiers à reconnaître que les Mégariques sont parmi les plus mal connus des philosophes de l'Antiquité, assurément les plus insaisissables, alors même que les éléments de leur doctrine resurgissent régulièrement dans les travaux des interprètes de Platon et d'Aristote ou dans ceux des historiens de la logique, et après que plusieurs d'entre eux eurent joui auprès des Anciens d'une célébrité égale à celle des plus grands. A cela il y a d'abord une raison simple, la quasi-absence de textes: des originaux il ne subsiste en effet que quelques courts *fragments* difficiles à exploiter, et les *témoignages* des Anciens sont dans l'ensemble peu nombreux, souvent brefs, dispersés, et donc d'un accès malaisé. Cette situation défavorable n'est certes pas réservée aux seuls Mégariques, puisque bon nombre de Présocratiques, les Cyniques ou les Cyrénaïques, pour ne citer qu'eux, ne sont apparemment pas mieux lotis. Pour tous ceux-là, cependant, le lecteur moderne a à sa disposition, parfois depuis longtemps, des recueils regroupant l'essentiel ou la totalité des textes subsistants (1), alors que pour les Mégariques il lui aura fallu

attendre le dernier tiers du XXe siècle: ce n'est qu'en 1972, en effet, qu'est paru le livre de K. Döring qui réunit pour la première fois l'ensemble des fragments et témoignages qui les concernent (2). Les qualités de ce travail, jointes à la commodité que constitue le fait d'avoir enfin regroupés et ordonnés la quasi-totalité des textes intéressant les Mégariques font qu'il est en passe de devenir classique, les historiens de la philosophie et de la logique s'y référant de plus en plus volontiers. On ne pouvait donc mieux faire, quand il s'est agi de proposer au lecteur français la documentation la plus complète et la plus sûre sur la pensée mégarique, que de prendre le livre de Dôring comme base de travail, et de traduire la totalité des fragments et témoignages rassemblés par lui en respectant sa numérotation et la disposition générale de son ouvrage.

Il est bien connu cependant que les difficultés du genre empêchent presque fatalement un recueil de ce type d'être réellement exhaustif et de se suffire à lui-même. Il faut d'abord sélectionner et découper les textes pertinents, ce qui exige qu'on se donne des critères à la fois rigoureux et maniables, mais qui ne seront jamais totalement à l'abri de la contestation. Il faut ensuite tenir compte du fait qu'un extrait isolé de son contexte peut être inintelligible, ou interprété à contresens; de même la juxtaposition de fragments d'auteurs et de siècles différents, parfois très éloignés les uns des autres, peut avoir des conséquences malheureuses.

Il faut reconnaître que sur le premier point le travail de Döring ne suscite que peu de réserves: ayant adopté le principe de ne retenir que les textes où apparaît formellement le nom des Mégariques en général ou de l'un au moins des membres présumés du groupe, l'auteur ne fait donc pas figurer dans son recueil les divers passages où la critique moderne a cru déceler des allusions aux Mégariques. Si cette prudence peut sembler excessive à certains, elle a du moins le mérite de la clarté et de la rigueur en proposant un minimum de textes incontestables: dans la mesure où il est difficile de trancher sur la base de simples critères externes dans les querelles opposant à ce sujet les spécialistes, elle laisse aux interprètes la responsabilité de leurs choix. Tout au plus pourrait-on remarquer que Döring est

infidèle à son principe à une ou deux reprises -- en omettant telle phrase où figure pourtant le nom d'un Mégarique (3), ou en incluant un fragment dans lequel aucun nom n'est cité (4) -- et que parfois le mauvais découpage d'un extrait interdit d'en saisir clairement la signification.

La deuxième difficulté, quant à elle, ne peut guère être tournée qu'en joignant aux fragments et témoignages une introduction ou un commentaire, dont l'objet serait de restituer aussi souvent que nécessaire les divers contextes, et de mettre en lumière la cohérence conceptuelle des principaux éléments de la doctrine, ou, à défaut, de faire apparaître au moins l'unité d'inspiration de l'ensemble. Bien que l'auteur ait complété son travail par un commentaire assez fourni (une centaine de pages), il ne paraît pas que cette reconstruction de la pensée mégarique ait été pour lui un objectif prioritaire: tous ses soins sont allés à la réunion et à l'établissement des textes, les éclaircissements qui les accompagnent étant plutôt de nature historique et philologique.

C'est en tenant compte de ces difficultés et de cet état de fait que nous avons conçu notre propre travail. Les mérites du livre de Döring étant reconnus, on devait seulement chercher à le compléter pour pallier les inconvénients qu'on vient de relever. Pour combler les rares lacunes de sa collection, mais surtout pour éclairer par les sources anciennes elles-mêmes le contenu de quelques fragments elliptiques ou allusifs, un certain nombre de textes complémentaires ont été ajoutés en Annexe (5), ainsi qu'une brève liste des allusions probables ou possibles proposées par divers spécialistes; d'autre part, pour corriger dans la mesure du possible les effets négatifs de l'extrême dispersion de nos sources et de la brièveté de la majorité d'entre elles, on s'est efforcé d'éclairer par un Commentaire la signification littérale et la portée philosophique des divers fragments, la place occupée par ce commentaire se justifiant par la rareté, dans notre langue, des travaux consacrés aux Mégariques: hormis deux ou trois études déjà anciennes (6), on ne dispose en effet à ce jour que de quelques courts chapitres inclus dans les histoires générales do la philosophie et d'articles spécialisés sur telle ou telle question particulière de logique (7),

ce qui est manifestement insuffisant quand on cherche à acquérir une vue cohérente sur la nature exacte et l'étonnant destin de la doctrine mégarique.

Étrange destin, en effet, que celui des philosophes de Mégare. Les caractères particuliers de la documentation, que l'on vient de rappeler (sources indirectes, fragmentaires, longtemps difficiles à consulter), n'expliquent sans doute pas à eux seuls la méconnaissance dont ils sont encore partiellement victimes. Car il faut savoir qu'une certaine ambiguïté a marqué leur réputation dès l'origine: si on leur reconnaissait volontiers des talents hors pair, principalement dans le domaine de la dialectique, si on saluait la personnalité exceptionnelle à tous égards d'un Stilpon, on ne manquait pas de dénoncer d'autre part les dangers que présentait l'usage de ces mêmes talents, ou de souligner la vanité de leurs prétendus tours de force. Pour comprendre ces jugements contrastés -- auxquels font curieusement écho les appréciations contradictoires des historiens de la logique des XIXe et XXe siècles (8) -- et pour éviter les risques de méprise, il est indispensable de donner d'abord, à qui voudrait entreprendre la lecture des textes, une vue plus précise sur la situation historique de l'École de Mégare; on tentera ensuite, pour les mêmes raisons, de restituer quelque chose de l'unité d'une pensée souvent réduite à quelques thèses disparates et paradoxales." (pp. 7-9)

(1) En ce qui concerne les Petits Socratiques, on rappellera pour mémoire les *Antisthenis fragmenta* de Winckelmann (1842), ainsi que les recueils de J. Humble (1931) et de F. Decleva-Caizzi (1965) auxquels a fait suite récemment la traduction française de L. Paquet *(Les Cyniques grecs* , Ottawa, 1975) ; les fragments d'Aristippe et des Cyrénaïques ont été rassemblés en 1956 par G. Giannantoni (avec une traduction italienne) et en 1961 par E. Mannebach.

(2) K. Döring, *Die Megariker, Kommentierte Sammlung der Testimonien* , Amsterdam, B.R. Grüner, 1972.

(3) Voir les fr. 123 et 186. — On notera que, par commodité et pour nous conformer à l'usage, nous utilisons l'abréviation « fr. » pour désigner les textes mégariques bien qu'en toute rigueur

les fragments soient très peu nombreux et qu'il 'agisse en fait surtout de témoignages.

(4) Fr. 95.

(5) Pour éviter de briser la continuité de la numérotation originale, et parce que ces textes ne constituent pas à proprement parler des témoignages supplémentaires, on a préféré les regrouper à part et à la suite de l'ensemble constitué par Döring. Ces ajouts sont signalés après chacun des fragments concernés.

(6) Aux livres de D. Henne (*L'Ecole de Mégàre* , Paris, 1843) et de C. Mallet *Histoire de l'Ecole de Mégare et des Ecoles d'Ëlis et d'Ërétrie* , Paris, 1845), qui accusent leur âge, il faut cependant ajouter les belles analyses de Hegel (*Leçons sur l'histoire de la philosophie,* trad. fr. de P. Garniron, Paris, Vrin, tome 2, 1971, pp. 339-359) et de E. Zeller (*La philosophie des Grecs considérée dans son développement historique* , vol. 3, trad. franç. de M. Belot, Paris 1884 ; nous citons cependant une édition allemande postérieure, voir plus loin), toutes deux contenues dans des ensembles plus vastes et risquant de ce fait de passer inaperçues.

(7) La situation n'est pas très différente dans les autres langues. Une exception toutefois : l'article « Megariker» que K. von Fritz a signé dans la *Realenzyklopadie* de Pauly-Wissowa-Kroll (Suppl., vol. 5, Stuttgart, 1931, col. 707-724), et qui constitue l'étude la plus complète et la plus intéressante sur le sujet.

(8) Cf. par exemple C. Prantl, *Geschichte der Logik im Abendlande* , I, Leipzig, 1855, réimpr. Graz-Austria, 1955, p. 33 («l'Ecole de Mégare... n'a pas non plus et en aucune manière poussé plus loin l'édification d'une logique»), et R. Blanché, *La logique et son histoire* , Paris, A. Colin, 1970, p. 91 (Les Mégariques sont «les vrais fondateurs de la logique dite stoïcienne »).

4. Montoneri, Luciano, ed. 1984. *I Megarici. Studio storico-critico e traduzione delle testimonianze antiche* . Catania: Università di Catania.

Indice generale: Premessa 7; Parte prima I Megarici. Studio storico-critico 13; Introduzione: I discepoli di Socrate e le loro scuole 15; I. Euclide e la sua scuola 39; II. Eubulide e seguaci 93; III. Diodoro Crono e seguaci 123; IV. Stilpone e seguaci 207; Stemma della *diadoche* megarica 226; Parte Seconda: I Megarici. Le testimonianze 227; Indice dei nomi antichi 323; Indice degli autori moderni 329; Indice delle fonti 333-345.

La presente ricerca "vuole essere un primo tentativo unitario e globale di ricostruzione e interpretazione delle fondamentali problematiche speculative dei pensatori megarici, condotto sulla scorta di un'attenta ricognizione critica del lavoro storiografico degli ultimi due secoli." (p. 8)

"Veniamo ora a illustrare la struttura dell'opera, che è bipartita.

Abbiamo articolato la prima parte -- che ha carattere monografico -- in quattro capitoli, dedicati rispettivamente alle grandi figure dei "capiscuola" del Megarismo: Euclide, Eubulide, Diodoro Crono e Stilpone.

La seconda parte comprende invece la traduzione delle testimonianze sui Megarici, ed è anch'essa strutturata in quattro sezioni (I. Euclide e la sua scuola; II. Eubulide e seguaci; III. Diodoro Crono e seguaci; IV. Stilpone e seguaci), corrispondenti ai quattro capitoli della prima parte.

Diversamente da Döring che le raccoglie a parte (cf. *Anhang: Bryson und sein Schüler Polyxenos* , pp. 62-70), noi abbiamo incorporato nella sezione I le testimonianze su Brisone e Polisseno, conformemente al nostro punto di vista espresso nel capitolo I.

In ciascuna sezione abbiamo raggruppato le fonti -- secondo la partizione adottata da Döring -- in: Testimonianze sulla vita (A), sugli scritti e la dottrina (B) e (soltanto per Euclide) sulla scuola (C). Abbiamo inoltre inserito -- quando ci è parso utile a una maggiore perspicuità di lettura -- titoli supplementari (in corsivo), con intento classificatorio e, insieme, chiarificatore del contenuto delle testimonianze.

Per quanto riguarda la traduzione italiana, valgano le seguenti avvertenze:

1. Sono state tradotte tutte le testimonianze comprese nella raccolta di Döring, a eccezione di alcune poche (precisamente quelle corrispondenti ai frr. 21, 22, 23, 58, 69, 72, 200, 201), che sono state omesse o perché prive di senso compiuto (frr. 21, 22, 23), o perché non interpretabili, trattandosi di testi papiracei assai lacunosi dai quali si ricavano non più che nomi e termini isolati. In ogni caso, Si tratta -- a nostro avviso -- di testimonianze praticamente irrilevanti dal punto di vista del loro contenuto storico-filosofico.

Viceversa, abbiamo ritenuto utile inserire la traduzione di alcune testimonianze non comprese nella raccolta di Döring, e che sono quelle contrassegnate dai nn. 44, 48, 166, 174 del nostro ordinamento.

2. Nella traduzione abbiamo di norma seguito il testo critico riprodotto da Döring, esplicitamente dichiarando i pochi casi nei quali abbiamo preferito una diversa lezione.

Nella traduzione abbiamo disposto le testimonianze secondo un ordine di lettura che ci è parso coerente con le caratteristiche e le conclusioni della trattazione monografica. Per facilitare i riscontri col testo greco, abbiamo fatto seguire, al nostro numero d'ordine della testimonianza, quello corrispondente nella numerazione Döring, riportato in parentesi.

Al fine di renderne più perspicuo al lettore il senso complessivo, abbiamo tradotto alcune testimonianze in una citazione più ampia rispetto a quella riportata da Döring. Esse sono state contrassegnate da un asterisco (*) posto accanto al nostro numero d'ordine della testimonianza." (pp. 10-11)

5. Giannantoni, Gabriele, ed. 1990. *Socratis et Socraticorum Reliquiae* . Napoli: Bibliopolis.

Collegit, disposuit, apparatibus notisque instruxit Gabriele Giannantoni, (4 voll.).

Vol. I. 2. *Euclidis et Megaricorum philosophorum reliquiae* : Euclides Megareus, Eubulides Milesius, Alexinus Eleus,

Euphantus Olvnthius, Apollonius Cronus, Diodorus Cronus, Philon Megaricus, Ichthyas Megaricus, Clinomachus Thurius, Pasicles Thebanus, Thrasymachus Corinthius, I)ioclides Megareus. Stilpon Megareus, Dionysius Chalcedonius, Panthoides Megaricus, Philippus Megaricus, Bryson.

"Scopo della presente raccolta è quello di fornire, per la prima volta, l'intero corpus delle fonti antiche su Socrate e il movimento socratico.

Accanto perciò a una riedizione delle *Socraticorum reliquiae* , il lettore troverà qui la prima raccolta delle fonti antiche su Socrate, la raccolta aggiornata di quelle su Eschine e r indicazione di quelle su gli altri uditori e seguaci di Socrate."

"Le fonti relative a Euclide e alla scuola megarica sono state tradotte in italiano da L. Montoneri, *I Megarici* (1984) e in francese da R. Muller, *Les Mégariques* (1985). Entrambe queste traduzioni sono basate sulla raccolta di Döring: Montoneri (che dà alle fonti una diversa disposizione e una diversa numerazione), vi aggiunge solo il n. 44 (cfr. p. 246), che è un testo di al-Mubassir (« Zenone [di Elea] fu l'autore della dottrina che si chiama Megarica), Muller, invece, dopo aver notato qualche lieve incongruenza nella raccolta di Döring (omissione di due testi che pure citano il nome di un Megarico [cf Sext. Emp. a*dv. math* . X102 = F 13 e Plutarch. *de stoic. repugn* . 10 p. 1036 C- = F 18] e l'inclusione di un testo nel quale nessun Megarico è citato [cfr. Cicer. *de nat. deor* . 9,22-23 =Il C 4 aggiunge poi (pp. 75-93) una serie di testi, che pur non essendo testimonianze in senso stretto, aiutano tuttavia a comprendere determinate dottrìne attribuite ai Megarici: la maggior parte di questi testi (dr. pp. 65-86, ma a questi si possono congiungere anche i passi dal *De fato* ciceroniano tradotti a p. 88 circa il problema dei futuri contingenti) riguardano i cosiddetti « argomenti megarici » (il «mentitore» il «velato», il «sorite», ecc.); i rimanenti sono quelli già citati e passi di Seneca da me già inclusi (cfr. Il o 33 e II o 15) più l'indicazione di una serie di passi platonici e aristotelici, nei quali la critica moderna ha visto allusioni ai Megarici (cfr. *SR* 1

pp. 358-73 e la successiva nota 8)." (Dalla Nota 1. *Sui criteri della presente raccolta*)

"In 1983 Gabriele Giannantoni produced his *Socraticorum Reliquiae* [SR], in four handsome volumes produced by the firm of Bibliopolis in Naples. The new edition of the writings of and testimonia for the Socratics is again handsomely produced by Bibliopolis, in four bound volumes with a photograph of Socrates adorning the box that contains them."

(...)

Volume I of *SR* took us as far as Aristippus' pupil, Theodorus of Cyrene (IV H), in 315 pages; volume I of SSR takes us only to the school of Elis (II), in 521 pages. Volume II of SR took us to the last of the "Socratics" - the late descendant of Socrates in the line of Antisthenes (VA) and Diogenes of Sinope (VB), the Cynic Menedemus (VN), making a total of 778 pages; volume II of SSR takes us back to the first generation of the Socratics and Socrates' companions and associates who, for the most part, were Socratic only in their behavior and dress-Chaerephon, Apollodorus, and Aristodemus, in 778 pages, which brings the new collection of testimonia to a total of 1,173 pages.

Volume III of SSR contains a Bibliography of 85 pages and indices of sources and names. Volume IV contains a series of 56 essays modestly entitled "Note," which present economical and carefully considered accounts of some of the major Socratics, the last of these being Aeschines of Sphettos (who was excluded from SR). The most relevant of these notes is the first which sets out the criteria for inclusion in this collection." (Diskin Clay, "Review of *Socratis et Socraticorum Reliquiae* by Gabriele Giannantoni", *The Classical Journal* , 88, 1993, pp. 296-299)

Studies in English A - F

1. Allen, James. 2001. *Inference from Signs. Ancient Debates About the Nature of Evidence*. New York: Oxford University Press.

Study III: *The Stoics on Sign-Inference and Demonstration* pp. 147-193, Appendix: *The Evidence for a Dialectical Origin of the Stoic Theory of Signs* (pp. 188-193).

"The existence of a Dialectical school distinct from the Megarian school is controversial. The case in favour is made by D. Sedley,(33) doubts have been raised by K. Döring.(34) I am not concerned here with this wider controversy, but only with T. Ebert's contention that the Stoic theory of the sign had its origin in the Dialectical school.

The principal piece of evidence for this thesis is a passage in chapter 9 of the pseudo-Galenic *Historia philosopha*, where, as we have already had occasion to observe, a definition of the sign essentially the same as that in Sextus is preserved, but commemorative and indicative signs are represented as species of the genus sign determined by this definition." (pp. 188-189)

(...)

"But the burden of my argument in this study is that the distinction and the definition do not form a unity and that, if we must look for the origin of the distinction outside the Stoa, the most likely place is not the Dialectical school but in medicine. If this is right, it is possible to agree with Ebert that the distinction between commemorative and indicative signs is not Stoic without agreeing that it must be Dialectical or that its source and that of the definition of the sign must be sought in the same place." (p. 193)

2. ———. 2019. "Megara and Dialectic." In *Dialectic after Plato and Aristotle*, edited by Bénatouil, Thomas and Ierodiakonou, Katerina, 17-46. Cambridge: Cambridge University Press

"I spoke of the philosophers traditionally regarded as members of a Megaric school. In a 1977 article on Diodorus Cronus, David Sedley argued (among other things) that, instead of the single Megaric school of

tradition, there were at least two distinct schools, the Megaric and the Dialectical (and possibly a third, the Eristical).(10) After setting out this view, I shall rehearse some objections to it

and eventually sketch a position that can, I think, be viewed as one of tentative and qualified agreement.

This is the occasion for another caution, however. Suppose that a certain amount of cold water is thrown on the idea of a distinct Dialectical school.

It would be a mistake, I maintain, to think that that there ought to be a presumption in favour of the traditional one-school view. Questions about whether and in what way there was such a thing as a Megaric school can and have also been raised.(11) Doubts about the existence of a distinct Dialectical school should not necessarily be seen as confirming the traditional conception of a unitary Megaric school. In an effort to avoid prejudging the issue, I shall refer to a 'dialectical group'." (p. 21)

(10) Sedley 1977, summary and comments in Giannantoni 1990 *SSR* 4.46-8 (possibly anticipated by Schmid, whose view I know only from the summary in Giannantoni 4.43).

(11) Cambiano 1977; Giannantoni 1990 *SSR* 4.45-6. Cautions about the use of the term 'school': Döring 1972, 1989; Muller 1985: 9-10 (Muller 1988 is,, however, more sympathetic to the idea of a Megaric school).

3. Bailey, Dominic T. J. 2012. "Megaric Metaphysics." *Ancient Philosophy* no. 32:303-321.

"I examine two startling claims attributed to some philosophers associated with Megara on the Isthmus of Corinth, namely:

M1 . Something possesses a capacity at t if and only if it is exercising that capacity at t.

M2. One can speak of a thing only by using its own proper λὸγος.[*]

In what follows , I will call the conjunction of M1 and M2 'Megaricism'(1) The literature on ancient philosophy contains several valuable discussions of M1 and M2 taken individually. (2) But there is no discussion of them together, much less of their logical relations. I intend to remedy that lack, and to show why it is a lack worth remedying."

(1) I adopt the convention of using 'Megarian' for a citizen of Megara, 'Megaric ' for a follower ofthe philosophical trend. But in speaking of 'Megaricism' or 'the Megarics' , I do not intend to imply that there was anything coming from Megara so robustly unified or interconnected as to deserve the name of 'school' . I do not deny it either. See , most recently , Muller 1988. One of our main sources for M2 is a report from Aristotle' s *Metaphysics*, in which the position is attributed to the philosopher Antisthenes. Antisthenes was not from Megara (he was an Athenian contemporary of Plato). But some of his recorded claims are close enough to those attributed to bom and bred Megarians such as Euclides and Stilpo for me reasonably to include him, for my purposes, under the Megaric banner.

For arguments intimately connecting Antisthenes ' general views on language with those of actual Megarians, see Denyer 1991 , 27ff.

4. Barnes, Jonathan. 1993. "A big, big D?" *The Classical Review* no. 63:304-306.

   Reprinted with the title: *Logic and the dialecticians* as Chapter 16 of J. Barnes, *Logical Matters: Essays in Ancient Philosophy II*, edited by Maddalerna Bonelli, Oxford: Clarendon Press 2012, pp. 479-484.

   " 'As Aristotle invented predicate logic, so Chrysippus invented propositional Iogic. Unlike Aristotle, Chrysippus had precursors; but his debt to them was slight — and in any event we know little or nothing about them.(1)

   Thus, in caricature, an orthodoxy. Theo Ebert has urged heresy: Chrysippus, he suggests, owed a very great deal to his precursors — and we can itemize at least some parts of the debt. For substantial parts of Chrysippean logic were based, directly or indirectly, on the work of the Dialecticians (Diodorus Cronus, Philo, and their associates), and it is the Dialecticians whom we should honour as the inventors of propositional logic.

(1) In doing so we shall not merely pay just tribute to the eminent dead: we shall come to a better understanding of the course and career of logic itself.

Ebert's thesis is sustained by meticulous analyses of familiar texts, most of them in Sextus; and a thorough consideration of it would occupy a volume here — ολίγα από πολλών — I voice two general doubts and sketch two particular disagreements." (p. 479 of the reprint)

(...)

"In sum, Ebert has not yet converted me to his heresy.** Nonetheless, I give his book four hearty cheers. It is a rattling good read; it is lucid and open and honest; it essays sharp and subtle interpretations of texts which other scholar have merely blustered through; and in the course of discussing the theories of signs and of proof, the classification of types of proposition, the analyse of fallacies and sophisms, it often throws new and brilliant light on a portfolio of documents which are central to our understanding of Hellenistic logic." (p. 484 of the reprint)

Studi di filologia e storiografia filosofica in memoria di Gabriele Giannantoni*, Napoli: Bibliopolis 2008, pp. 275-293.]

5. Bobzien, Susanne. 1993. "Chrysippus' Modal Logic and its Relation to Philo and Diodorus." In *Dialektiker und Stoiker. Zur Logik der Stoa und ihrer Vorläufer*, edited by Döring, Klaus and Ebert, Theodor, 63-84. Stuttgart: Franz Steiner.

On Philo the Dialectician: "Philo's modal definitions are the least well reported and their exact meaning cannot be reconstructed with certainty. Only Boethius gives all four Philonian modal definitions (*in Int*. 234.10-22). The other three sources, all Aristotle commentators as well (Alex. Aphr. *in APr*. 183f; Phlp. *in APr*. 169; Simp. *in Cat*. 195f), confine themselves to Philo's notion of possibility, contrasting it with others; and it is not always clear what is part of the definition and what is part of the contrast. I will rely primarily on Boethius. According to his report, a proposition is Philonian possible, iff it is capable of truth according to the proposition's own nature or as far as the proposition itself is concerned; otherwise it is impossible. Thus, it seems, what is required for Philonian possibility is some sort of intrinsic consistency of the proposition. The propositions '(this) piece of wood bums' (Simp. *in Cat*. 196.1), 'Diodes is alive', 'it is night' would all be consistent in this sense.

The evidence is too sparse and heterogeneous to allow one to give a clear account of the type of consistency Philo had in mind. As it is also not essential for what follows, I leave the concept of consistency uninterpreted.

Consistency seems to be a common and reasonable criterion for possibility; still, due to the temporalized concept of truth, it works a little differently for Hellenistic propositions than for atemporal propositions." (p. 67, notes omitted)

On Diodorus Cronus: "As in the case of Philo, for Diodorus the full set of modal definitions is only reported by Boethius (*in Int*. 234.22-6). Yet, the definition of possibility is confirmed in some other sources (Alex. Aphr. *in APr*. 183f.; Phlp. *in APr*. 169; Simp, *in Cat*. 195; Boeth. *in Int*. 412), and we have further valuable information about Diodorus' modal theory in Epictetus, Cicero, and Plutarch (Epict. *Diss*. 2.19.1-5; Cic. *De fato* 12, 13, 17 and *Fam*. 9.4; Plu. *De Stoic,.rep*. 1055E-F).

For Diodorus, a proposition is possible iff it either is true or will be true."(p. 69, note omitted)

6. ———. 1998. *Determinism and Freedom in Stoic Philosophy*. Oxford: Clarendon Press.

Chapter 3.1.2 *Diodorus and necessitarianism*, pp. 102-108.

"We can hence conclude—fully in accord with the surviving passages —that Diodorus' modal notions were not criticized for leading to universal necessitarianism, i.e. to the theory that 'everything is necessary'—for that it is day, for instance, is not Diodorean necessary. Rather what was found unacceptable was that whatever in fact never happens is impossible (or alternatively that all false propositions about what happens in the future are impossible). This was the only straightforward way, within Hellenistic logic, to express the thought that Diodorus' modalities preclude counterfactual possibilities. But this is surely enough to worry not only a libertarian but also a 'soft determinist' such as Chrysippus. So Chrysippus, since he wanted to retain 'counterfactual possibilities', had to reject Diodorus' modal concepts. And he did this, as is well known, by attempting to refute the Master Argument, i.e. the argument with which Diodorus established his notion of possibility as the (only) right one.(26) Still, the question remains: what concept of possibility should Chrysippus adopt instead? One choice he had was Philo's." (p. 108)

(26) For Chrysippus' refutation of this argument see e.g. Bobzien 1986 [*Die stoische Modallogik* (Würzburg)], 105-13.

7. ———. 1999. "Logic. II. The 'Megarics'." In *The Cambridge History of Hellenistic Philosophy*, edited by Algra, Kempe, Barnes, Jonathan, Mansfeld, Jaap and Schofield, Malcolm, 83-91. Cambridge: Cambridge University Press.

"Apart from the various logical puzzles and sophisms, there are only two topics on which we can be sure of a positive contribution to logic(25) by the ‘Megarics’.(26) These are the positions of Diodorus Cronus and of Philo on the theory of conditionals and on modal logic. Why the discussion of these topics came down to us, we can only divine. Certainly both involve notorious difficulties. Again, they were topics which were extensively and intensely discussed in Hellenistic logic; so much so that the disputes became part of the general knowledge of the intelligentsia of the time (e.g. Sextus Empiricus *M* [*Adversus mathematicos*] 1.309–10). In addition,

the theory of modalities was believed to have far-reaching results for other areas of philosophy." (p. 83)

(25) Logic in the narrow sense, i.e. not including contributions to the study of ambiguity.

(26) On the extent to which it is legitimate to speak of a 'Megaric' (or Dialectical), 'school', see above, p. 47 n. 105.

P. 47, note 105: On the existence and name of this school, cf. Cambiano 1977 and Sedley 1977. Against this, see Döring 1989. Like Giannantoni 1990, iv 41–50, I am inclined to accept Sedley's hypothesis

regarding the 'Dialectical' school. For the chronology of these philosophers I follow Sedley 1977, 107 n. 23. Cf. also the useful chronological table ibid. 82.

8. Bochenski, Joseph. 1951. *Ancient Formal Logic*. Amsterdam: North-Holland.

Chapter V. *The Stoic-Megaric School,* pp. 77-102.

"The development of formal logic in Antiquity reached its peak in the works of the thinkers belonging to the Megaric and Stoic Schools. Unfortunately, none of those works are preserved and our information concerning them supplied by later sources is desperately scarce. It is sufficient, however, to show that among both Megaricians and Stoics there were very great logicians and that the general level of the formal rigour obtained by those

schools was remarkable - indeed, superior in some respects to that of our own today. Among the discoveries which may safely be attributed to them, are the following: invention and statement in form of an axiomatic system (which seems to have been both consistent and complete) of a logic of propositions; invention of truth-tables and thorough discussions of the meaning of implication;

subtle semiotical doctrines, including a sharp distinction between the logical laws and the metalogical rules of inference, and a clear distinction between intension and extension.

We shall expound here, after a historical survey (13), their logic in four chapters, dealing respectively with semiotics (14), the theory of propositional functors (15) the rules of inference or syllogisms (16) and the paradoxes, including the famous Liar (17)." (p. 77)

9. ———. 1961. *A History of Formal Logic*. Notre Dame: Indiana University Press.

   Translated from the German edition "*Formale Logik*" (1956) by Ivo Thomas.

   Reprinted New York, Chelsea Publishing Co., 1970.

   Chapter III. *The Megarian-Stoic School*, pp. 105-133.

   "In reading the Megarian-Stoic fragments one's first impression is that here is something different from Aristotelian logic: terminology, laws, the very range of problems, all are different. In addition we are confronted with a new technique of logic. The most striking differences are that the Megarian-Stoic logic is firstly not a logic of terms but of propositions, and secondly that it consists exclusively of rules, not of laws - as does the *Prior Analytics*. The question at once arises, what was the origin of this logic.

   The answer is complex. First of all one cannot doubt that the Megarians and Stoics, who as we have seen (cf. 18.03) found an only too frequent delight in refutation, had a tendency to do everything differently from Aristotle. Thus for example they

introduce quite new expressions even where Aristotle has developed an excellent terminology.

Yet it should not be said that their logical thought could have developed uninfluenced by Aristotle. On the contrary, they appear to have developed just those ideas which are last to appear in the *Organon*. We. find, for instance, a more exact formulation of the rules which Aristotle used in axiomatizing the syllogistic, and himself partially formulated. Nor can it be denied that they developed his theory of 'syllogisms from hypotheses', chiefly on the basis of the preparatory work of Theophrastus. And generally speaking they everywhere show traces of the same spirit as Aristotle's, only in a much sharper form, that spirit being the spirit of formalized logic." (p. 108)

10. Brancacci, Aldo. 2005. "The Double Daimon in Euclides the Socratic." *Apeiron* no. 38:143-154.

"According to Diogenes Laertius, Euclides of Megara wrote six dialogues: *Lamprias, Aeschines, Phoenix, Criton, Alcibiades, and Erotikos*.(1) That they were Socratic dialogues as can clearly be seen from the titles,(2) is confirmed by Panaetius, in a passage worth quoting at the outset: 'Panaetius thinks that of all the Socratic dialogues, those by Plato, Xenophon, Antisthenes and Aeschines, are genuine (*aletheis*); he is in doubt about those ascribed to Phaedo and Euclides; but he rejects the others one and all'.(3)

(...)

"Taking into account the existence of this dialogue [*Erotikos*] by Euclides, and the terms in which the association between the daimones Sleep and Death is developed, the conclusion of the *Apology of Socrates* can be better understood as can the way in which Plato constructed it. I am referring to the well-known section dealing with Socrates' two hypotheses on death. The first — which I believe is very close to the historical Socrates — is based on the assumption that dying 'is like being nothing anymore' (*Ap* 40c5-6), while the second — where Plato lets his own point of view creep in, which was to be further developed in the *Phaedo* — starts out from the assumption of Orphic-Pythagorean origin that dying is, 'as people say, a kind of

change and migration of the soul from this place down here to another place' (*Ap* 40c7-9).

11. ———. 2017. "Socratism and Eleaticism in Euclides of Megara." In *Socrates and the Socratic Dialogue*, edited by Stavru, Alexandru and Christopher, Moore, 161-178. Leiden: Brill.

"Foreword. The sources for Euclides of Megara are scarce, and it is extremely difficult, if not impossible, to reconstruct his philosophy fully. The aim of this paper is to reassess the main evidence about Euclides and answer a pair of questions.

These are indeed the two fundamental questions posed by his thought: the nature of Euclides' Socratism, and the problem of his adherence to Eleaticism.

Although these issues are largely independent, they are still to some extent linked. In fact, a survey of the sources related to the Socratism of Euclides is not of secondary importance for considering whether he was somehow also connected to the Eleatic tradition.

The difficulty of this survey is related to the imbalance between the complexity of these issues and the scarcity of the extant documentary framework.

In this chapter I will first determine the most reliable data emerging from the ancient texts and then reconstruct the

overall character of Euclides' thought. I will relate these data to a broader theoretical and historical-philosophical context.

I will thereby refrain from giving drastic or prejudicial answers to either question, in contrast to what has occasionally been done before. Although I will neither cite nor discuss in detail the wide bibliography on Euclides and the Megarian school, I will deal with the contributions that have most influenced the study of those two issues." (p. 161)

12. Byrd, Michael. 1978. "Megarian Necessity in Forward-Branching, Backward-Linear Time." *Noûs* no. 12:463-469.

"Studies by Mates [4], Hintikka [3], Prior [5], and Rescher [7] have drawn attention to the importance of temporally defined modalities in the writings of Aristotle, Aquinas, and other ancient and medieval philosophers. The most widely known concepts of this sort are the Diodorean and the Megarian-Aristotelian treatments of necessity. According to the former, a statement is necessary now just in case it is true now and will be true at all future times. According to the latter, a statement is necessary now in case it is true now and at all earlier and later times.

A major concern of the initiators of tense logic was the question of what modal structure these two conceptions of necessity possessed. Arthur Prior's interest centered on the Diodorean view." (p. 463)

(...)

"Investigation of Megarian necessity has been much less thorough; this is surprising in view of its centrality in the works of figures like Aristotle and Aquinas. Now, it is clear that if time is conceived as linear, then Megarian necessity is the system S5. However, it is not at all evident what the correct logic is if time is treated as branching toward the future but linear toward the past. To my knowledge, no serious attempt has yet been made to solve this problem.(1) Moreover, this failure is serious: important proponents of Megarian necessity-Aristotle, for instance-can be plausibly represented as having held the view that time is forward-branching and backward-linear."

(...)

"In what follows, I shall attempt to show that, while Aristotle is quite right to indicate the consequences which follow from the Megarian position, his response is inadequate as a refutation of that position, because it consists in little more than an affirmation of the reality of such processes as movement and becoming. As I shall seek to make clear, the Megarian position contends that these processes are logically impossible; and so it is no answer to it merely to affirm the realities which it denies, any more than it would be an adequate answer to Zeno merely to assert the reality of motion. In short, Aristotle's case fails because he does not try to uncover the logic of the Megarian argument, nor does he consider the possibility that the Megarians, like him, were perfectly aware of the absurdities, on a common sense level, that stemmed from their argument. .If their argument is to be countered, it has to be done so on a level different from that on which Aristotle operates.

In the remainder of this paper, what I shall do is to offer a reconstruction of the argument, and to suggest where its error lies. The reconstruction will certainly, in parts, be rather speculative—this mainly being due to the paucity of direct evidence. Nonetheless, my claim would be that even where my account does become speculative, it is not inconsistent with what evidence we do have, and, at the very least, it offers a new way of looking at the dispute." (p. 34)

14. Ciuni, Roberto. 2009. "The Search for the Diodorean Frame." *Humana Mente* no. 3:47-65.

    Abstract: "*Diodorean modalities* are logical notions that specify, in a precise way, how sentences may be true with respect to time: a sentence is diodoreanly necessary at a given instant iff it is true since that instant on.

    Arthur Prior has treated them as sentential operators and built up a logic for such modalities (DIOD) conjecturing that the frame for such a logic (the "diodorean frame") was the frame for S4. The Conjecture was soon proved false, through a number of counterexamples that played a role in the research on modal logics between S4 and S5. The present paper aims at showing that (i) the search for the diodorean frame benefited from such a research, and that (ii) there has been a mutual interaction between the search of the diodorean frame and some characterisation results. The paper is divided into five parts. In section 1, I will introduce diodorean modalities, while in Section 2 I will be focusing on Prior's reconstruction of the Master Argument and his characterisation of DIOD. In section 3, I present a conjecture Prior advanced about the characterisation of DIOD and some counterexamples to it. The notions of "frame" and "frame for" will be also introduced. In section 4 I summarise the connections between the search of the diodorean frame and some researches in modal logic. Section 5 presents a short conclusion."

15. Crivelli, Paolo. 1994. "The Stoic Analysis of Tense and of Plural Propositions in Sextus Empiricus, *Adversus Mathematicos* X 99." *Classical Quarterly* no. 44:490-499.

    "Adversus Mathematicos (*M*.) x is the second book dedicated by Sextus to the discussion of the physical doctrines put forward by dogmatic philosophers. An extensive section (*M*. X 85-120) deals with Diodorus Cronus' arguments concerning movement.

    M. X 99 occurs within the report of a debate on motion and time between Diodorus and some unnamed opponents. The passage is probably corrupt (as was already noticed by Heintz) and contains some observations on plural propositions and tense which have not yet been satisfactorily explained. In this paper I argue that Diodorus' critics are Stoics, propose a new emendation of the text, and attempt a plausible

    account of the remarks on plural propositions and tense. Thereby some light is shed on a hitherto unexplored region of Stoic logic." (p. 490)

    Euclides, pp. 132-134.

    "The so-called Megarian school was never a genuine institution nor did it consist in a unified philosophical position. Alongside the label “Megarians,” we find also “Dialecticians” and “Eristics.” It is difficult to say whether these terms are used to characterize distinct groups. Besides Euclides’ and Stilpo’s common origin from Megara, the aim of tracing the tradition of Pyrrhonist Skepticism back to Socrates probably also

played a determining role in the Hellenistic construction of the Megarian succession and “school” (cf. D.L. 9.61). In light of these data and of what we know of the orientations of Hellenistic historiography, the evaluation of possibly Eleatic themes ought to follow investigation of Euclides’ primary cultural relationship with Socrates, not be a point of departure for the reconstruction of Euclides’ philosophy in its entirety." (p. 132-133)

(...)

"Regarding his thought, the principal testimony is in Diogenes Laertius (2.106 = SSR II A 30 = 24 Döring): “He held the good to be one (*hen to agathon*), called by many names: sometimes wisdom, sometimes god, sometimes intelligence, and so on. All that is contradictory to the good he used to reject, maintaining that it has no existence.” To this we may add D.L. 2.161 (SSR II A 32 = 25 Döring), from which we learn that, for

the Megarians, virtue is one thing, called by many names. Cicero (*Acad*. II. [Lucullus] 42.129, cited above) writes that the Megarians said “the sole good is that which is always one and alike and the same. These authors also took much from Plato” (trans. Rackham)." (pp. 133-134)

Socraticorum Reliquiae (Naples, 1990). Both Doring, pp. 39-43, and Giannantoni, i.429-33,

reprint all the other passages here cited.

19. ———. 2002. "Neglected Evidence for Diodorus Cronus." *Classical Quarterly*:597-600.

"There are two standard compilations of the evidence relating to Diodorus Cronus and the Megaric school of philosophers.(1) Neither contains Eustathius, *Ad Hom. Od.* 28.46–29.2, part of his note on *Odyssey* 1.107." (p. 597)

(...)

"The second thing we learn about Diodorus Cronus from this neglected passage is that as early as c. A.D. 100 someone—Suetonius—actually called him a Megaric. This is without parallel in our other sources. When other sources apply to Diodorus what might be a label for his school, they uniformly call him διαλεκτικός, and the διαλεκτικοί (perhaps it should be printed with a capital delta) were rivals from whom Megarics are reported to have recruited pupils (D.L. 2.113). It has been proposed in consequence that we should abandon the recent practice of describing Diodorus as a Megaric, and call him a Dialectician instead(2) The proposal can still be adopted, even though we now have direct evidence of someone in antiquity calling Diodorus a Megaric. For supporters of the proposal can maintain that Suetonius too fell victim to the same confusion that has led more recent scholars to describe Diodorus as a Megaric rather than as the Dialectician that in fact he was. Nevertheless, in the light of the neglected passage of Eustathius, the proposal is perhaps less attractive than it originally looked." (p. 598)

(2) D. Sedley, 'Diodorus Cronus and Hellenistic philosophy', *PCPS* 203 (n.s. 23) (1977), 74–120, at 74–7. Sedley's proposal

was rejected by Giannantoni, who placed Diodorus testimonia in his section on Megarics. It was treated with some disdain by K. Döring, ‘Gab es eine Dialektische Schule?’, *Phronesis* 34 (1989) 293–310, and taken up enthusiastically by Theodor Ebert, *Dialektiker und frühe Stoiker bei Sextus Empiricus: Untersuchungen zur Entstehung der Aussagenlogik* (Göttingen, 1991) = Hypomnemata 95, and N. Denyer, ‘Diodorus Cronus’, in E. J. Craig (ed.), *The Routledge Encyclopedia of Philosophy* (London, 1998), 2.83–6. The most recent discussion is F. De Mattia, ‘*Diodoro Crono: testimonianze antiche ed esegesi moderna*’, unpublished dissertation (Bologna, 2000), 15–39.

20. Dorandi, Tiziano. 1999. "Chronology." In *The Cambridge History of Hellenistic Philosophy*, edited by Algra, Kempe, Barnes, Jonathan, Mansfeld, Jaap and Schofield, Malcolm, 31-54. Cambridge: Cambridge University Press.

    "The Dialectical (or ‘Megaric’) school(105) was given its name by Dionysius of Chalcedon, whose *floruit* can be placed at 320; he was more or less the contemporary of Euphantus, born before 348. More important are Diodorus Cronus, active in Athens and Alexandria between 315 and c. 284 (106) (his contemporary was Aristides the Dialectician), and Stilpo, who lived c. 360–280. Alexinus (c. 339–265), a younger figure, is well known for a debate on rhetorical questions with the Epicurean Hermarchus, dated – with certainty – to 267/6, and for his attacks on Zeno of Citium.

    Philo the Dialectician was a student of Diodorus Cronus between 310 and 300, and a contemporary of Zeno of Citium. Between 280 and 275 Panthoides, whose lectures were attended by the Peripatetic Lycon, was active; while the floruit of Aristotle and Artemidorus is put at around 250.

    The first is known for having contributed to the overthrow of the rule of Abantidas of Sicyon, the second for attacking the Stoic Chrysippus." (p. 47)

    (105) On the existence and name of this school, cf. Cambiano 1977 and Sedley 1977. Against this, see Döring 1989. Like Giannantoni 1990, iv 41–50, I am inclined to accept Sedley’s

hypothesis regarding the 'Dialectical' school. For the chronology of these philosophers I follow Sedley 1977, 107 n. 23. Cf. also the useful chronological table ibid. 82.

(106) This chronology is reconstructed in Sedley 1977, 78–80 and 107–9.

21. Drozdek, Adam. 2005. "Euclides of Megara: God = Phronesis = The Good." *Acta Antiqua* no. 45:27-34.

Summary: "The paper investigates reasons for which Euclides of Megara equates God, *phronesis*, and the good. The reasons include the importance of ethics in Socratic philosophy, the role of *phronesis* in Platonism, and absolutism of the Eleatic school."

"Euclides explicitly mentions God by making God one of the names of the good, of being. But what else, theologically, can that mean than pantheism? There is nothing beyond being and that being is called God, which is a pantheistic solution, pure and simple.(24) With his mention of God, Euclides' system becomes a theological commentary on the Parmenidean ontology. Parmenides never calls his being God although

attributes of that being are divine (eternity, perfection) and thus being is God.(25) Euclides just makes this theological aspect explicit. Mentioning God after *phronesis* as a possible name for the good may also mean that Euclides did not follow

Socrates in giving high – the highest – status to theology.(26) Theology seems to have been for him of secondary importance, turning ethics to ontology and intelligence – *phronesis* – of the resulting being was his primary concern. Theology fits rather well in that image, but, in a way, it is a happy accident that being can also be called God.(27) This signifies the devaluation of theological and religious issues by the Megarians, which is carried to the extreme by Cyrenaics and Cynics. Only Antisthenes and particularly Plato continue among the Socratics to give theology the prominent position in their works." (p. 34)

(24) Henne says in a roundabout fashion very much the same by stating that Euclides is a father of realism (Henne: *École de Mégare*. Paris 1843, 225) and that realism originates in timid pantheism which is transformed into

declared pantheism (p. 238).

(25) Drozfek, A.: Parmenides' theology. *Eranos* 99 (2001) 12–14.

(26) By itself, the order: phronesis – God – mind does not have to mean that phronesis is most important, God less important, mind even less. Cf. Paul's statement, "there remain these three: faith, hope and love, but the greatest of these is love" (*1 Cor*. 13.13) although love is listed at the end.

(27) It is thus justified to say that for the Megarians, God is a secondary form, just a name of a unity, as phrased by Henne: *op. cit*. 223.

22. Ebert, Theodor. 1987. "The Origin of the Stoic Theory of Signs in Sextus Empiricus." *Oxford Studies in Ancient Philosophy* no. 5:83-126.

"In his critical discussion of the dogmatic philosophers Sextus Empiricus expounds a Stoic doctrine which has conveniently been labelled 'the theory of signs'. This chapter of Stoic philosophy offers a blend of logic and epistemology, a mixture bound to attract the interest of present-day 'ancient philosophers'. Hence, with the growing discussion focusing on the philosophy of the Hellenistic period, this part of Stoicism

was to get a fair share of attention. Controversy has been flourishing over the merits and weaknesses of this theory; it has been compared with tenets about the topic of signs held by earlier and later philosophers, yet in these discussions it has almost universally been taken for granted that there is a single theory of signs and that it can be attributed unqualifiedly to the Stoics. (2)

Part of what I want to do in this paper is to challenge this assumption. I shall argue that the material relating to the theory of signs which is preserved in Sextus does not reflect Chrysippan teaching, but goes back to Stoics antedating Chrysippus. To have a convenient term, I shall refer to the pre-Chrysippan Stoics as 'early Stoics'. I shall further argue that the theory of signs of the early Stoics was a harvest not grown in the fields of Stoic philosophy, but that it originated from the 'Dialecticians', a group of philosophers confused for a long time with the Megarians and rediscovered as a group in its own right by David Sedley.(4) I shall further try to point out some modifications which this theory underwent as it was integrated into the epistemology of the early Stoics. I shall not discuss the doctrine of signs advocated by the opponents of the Epicureans in Philodemus' *de Signis* - almost certainly Stoic philosophers - a doctrine which has been ably discussed by David Sedley in a recent paper.(5)" (pp. 83-84, two notes omitted)

(2) The only exception known to me is D. Sedley who wants to 'put into abeyance the widespread belief that Stoic doctrine is under discussion by Sextus Empiricus throughout *M* VIII. 141-298 and *PH* II. 97-133 (Sedley, 'On Signs', in *Science and Speculation: Studies in Hellenistic Theory and Practice*, ed. Barnes et al. (Cambridge/Paris, 1982), 239-72.

(5) Cf. D. Sedley, 'On Signs', cit.

23. ———. 1993. "Dialecticians and Stoics on the classification of propositions." In *Dialektiker und Stoiker. Zur Logik der Stoa*

und ihrer Vorläufer, edited by Döring, Klaus and Ebert, Theodor, 111-127. Stuttgart: Franz Steiner.

"In his discussion and refutation of the logical theories of dogmatist philosophers in *Adversus Mathematicos* (M.) 8, Sextus Empiricus treats us, among other things, to an account of a classification of propositions (*M*. 8.93-129). The doctrine reported on here is usually taken to form part of Stoic logic.(1) Together with its apparent counterpart in Diogenes Laertius (D.L.) 7.68-76, this Sextian report is used to reconstruct a theory supposedly held by Stoic philosophers. In what follows I shall try to refute this view and I shall argue that Sextus' report encapsulates a doctrine worked out not by the Stoic, but by the Dialectical school whose most prominent members seem to have been Diodorus Cronus and Philo.(2)

First I shall try to show that the two reports by Sextus and by Diogenes resp. are quite different indeed as to their systematic content and that, therefore, both reports must be drawn from different sources. In a second step it is then argued that Sextus' account is based on Dialectical material. Finally, I shall compare the Dialectical classification to be found in Sextus to the Stoic one in Diogenes with an eye to exploring these two divisions as different phases within the development of propositional logic." 24. ———. 2008. "In Defence of the Dialectical School." In *Anthropine Sophia. Studi di Filologia e Storiografia Filosofica in Memoria di Gabriele Giannantoni*, edited by Alesse, Francesca, Aronadio, Francesco, Dalfino, Maria Cristina, Simeoni, Luca and Spinelli, Emidio, 275-293. Napoli: Bibliopolis.

"In 1977, David Sedley published a paper in which, among other things, he argued that the Dialectical and the Megarian school were not, as had hitherto been assumed, two names for the same sect, although at different periods, but that both were distinct groups of Hellenistic philosophers.(1) The received opinion, attacked by Sedley, based its claim on a passage in Diogenes Laertius (Diog. Laert.) concerning the disciples of Euclides of Megara, one of the minor Socratics:

His followers were called Megarians after him, then Eristics, and at a later date Dialecticians, that name having first been given to them by Dionysius of Chalcedon ... (Diog. Laert. II 106 = Giannantoni, SSR II A 22)(2)

The source of this text is probably Alexander Polyhistor, whose *Successions of Philosophers* is mentioned in the sentence preceding the one just quoted. Alexander lived around 100 B.C. Against this passage Sedley draws attention to a different piece

of evidence in Diog. Laert., namely a *verbatim* quotation from Philippus the Megarian, who gives a list of people whom Stilpo won over to his own school, i.e. the Megarians; after having mentioned two persons whom Stilpo had made to secede from Theophrastus and two more who came from Aristotle the Cyrenaic philosopher, Philippus continues:

From the Dialecticians he won over as devoted disciples Paeonius from Aristides, moreover Diphilus of Bosphorus, the former follower of Euphantes as well as Myrmex the son (or "follower") of Exaenetus, both of whom had come to refute him (Diog. Laert. II 113 = SSR II O 3).

Sedley concluded from this text that Megarians and Dialecticians could hardly be the same sect; the competition presupposed in this quotation from a contemporary of Stilpo clearly shows, thus Sedley, that Megarians and Dialecticians were seen as distinct schools by their contemporaries. As to the passage in Diog. Laert. II 106, this is, as Sedley argues, probably a doxographical construction of a διαδοχή, a succession of philosophers; it is not the description of a school, or αϊρεσις (4)." (pp. 275-276, note 3 omitted)

(...)

"The claim made by Sedley distinguishing the Dialecticians from the Megarians and the one made by me attributing source material in Sext. Emp. which had been used for the Stoics to the Dialectical school, in general met with a friendly reception(6). Yet neither claim has gone undisputed. Klaus Döring, to whom we owe our first comprehensive collection of the material relating to the Megarians(7), launched an attack on Sedley's contention(8); Döring sees no need to think of the Dialecticians as a separate school, distinct from the Megarians.(9) Even before Döring's 1989 paper, Robert Muller did not accept Sedley's separation of the Dialecticians from the Megarians (9). The attribution of the material in Sext. Emp. to the Dialecticians, for which I had argued, was flatly denied by Jonathan Barnes (10). Hence, it may be worthwhile to look at the available evidence again in order to see whether Sedley's

and my original contentions can survive the criticisms of Döring and Barnes." (p. 277)

25. Fine, Kit. 2011. "Aristotle's Megarian Manœuvres." *Mind* no. 120:993-1034.

"Towards the end of *Theta*, 4 of the *Metaphysics* (1047b14-b30), Aristotle attempts to establish two modal principles. The passage (with my paragraphing and square bracketing) goes as follows:

[Principle 1] At the same time it is clear that if, when A is B must be, then, when A is possible B also must be possible.

[Argument for Principle 1] For if B need not be possible, there is nothing to prevent its not being possible. Now let A be supposed possible. Then, when A is possible, nothing impossible would follow if A were supposed to be; and then B must of course be. But we supposed B to be impossible. Let it be impossible, then. If, then, B is impossible, A also must be. But A was supposed possible; therefore B is also possible. If then A is possible, B also will be possible, if they were so related that if A is B must be. If, then, A and B being thus related, B is not possible on this condition, A and B will not be related as supposed.

[Principle 2] And if when A is possible B must be possible, then if A is B must also be.

[Argument for Principle 2] For to say that B must be possible if A is possible means that if A is both at the same time when and in the way in which it was supposed capable of being, B also must then and in that way be.

This passage raises severe exegetical problems. One of these problems is that the second principle seems obviously to be incorrect; and so it is not clear why Aristotle would have wanted to endorse it. For suppose that a fair coin is tossed and turns up heads. It is then plausible to maintain that when it is possible that the coin is fair and turns up heads it must be possible that it turn up tails and hence not turn up heads. By the principle it follows that when the coin is fair and turns up heads then it must not turn up heads; and from it follows that it is not true that it is both fair and turns up heads, contrary to our original supposition. (1)" (pp. 993-994)

(1) As a referee pointed out, the premiss of this inference already appears to be in conflict with Aristotle's denial that not-A can necessarily follow from A (*Prior Analytics* 57b13–14) and so the supposition that a fair coin is tossed and turns up heads is not even required. Let me also note that we can give a highly abstract counter-example to the principle, based simply on the assumption that there is a description of how things are (theorem 5 of the appendix)

26. Furley, David J. 1967. *Two Studies in the Greek Atomists*. Princeton: Princeton University Press.

    Study I: Indivisible Magnitudes; Study II: Aristotle and Epicurus on Voluntary Action.

    Study I, Chapter 9: *Epicurus and Diodorus Cronus,* pp. 131-135.

    "Some sort of theory of indivisibles was advanced by the Megarian philosopher Diodorus Cronus."

    (...)

    "Diodorus held a theory of" minimum, partless bodies." According to Dionysius of Alexandria (quoted by Eusebius *Praeparatio Evangelica* 14.23) it was a common opinion that Diodorus was responsible for substituting the name "partless bodies" for "atoms."

    Whether or not there is any truth in the implication that Diodorus was a conscious innovator in this matter, it seems to be agreed among the doxographers that the use of the term "partless bodies" distinguished Diodorus from Democritus and Epicurus. The same is said by Sextus Empiricus (*Against the Mathematicians* 9.363 and *Outlines of Pyrrhonism* 3.32) and by Stobaeus (*Eclogae* 1 p. 128.10); "partless bodies" are attributed to Diodorus, without any explicit contrast with the Atomists, by Alexander (*De Sensu* 122.23 and 172.29) and Simplicius (*Physics* 926.20).

    The most interesting point about Diodorus is that he apparently held a theory of motion remarkably like the Epicurean theory. It is reported at length by Sextus Empiricus (*Against the Mathematicians* 10.37-154). Sextus distinguishes three views which may be held about motion: that it exists, that it does not exist, and that "it exists no more than it does not exist." Those who hold the second view he says, are Parmenides and Melissus - and Diodorus Cronus, "unless it ought to be said that according to him a thing has moved though nothing is moving." Selected Bibliography on the Megarians and the Dialectical School: Second Part

Studies in English G- Z

1. Gillespie, Charles Melville. 1911. "On the Megarians." *Archiv für Geschichte der Philosophie* no. 24:218-241.

   "The object of this paper is to investigate the view entertained by Zeller(1) with the support of many other critics and historians, that the Megarians held a theory of εἴδη closely resembling that of Plato. The evidence for this view is entirely indirect. Nowhere in the ancient authorities is such a doctrine attributed to them by name.

   Stilpo is said to have attacked the εἰδη of the Academy (Diog. Laert. ii. 119); even though he seems to have incorporated much of the Cynic doctrine in his teaching, so great a change from the supposed earlier attitude of the school is difficult to believe; the suggestion of Zeller(2) that our authority interprets as an argument against the Ideas one that was intended to support them only weakens his case. In fact, Zeller has no evidence at all except the passage in the *Sophist* which gives an account of the εἴδων φιλοι (246B ff.), whom Zeller identifies with the Megarians. The "friends of the Ideas" must stand for some contemporary school or allied schools; in many details their doctrines agree with what is elsewhere known of Megarian theory; the complete opposition between unchangeable noetic reality and the changing corporeal world, treated as an illusion; the Eleatic doctrine of the complete mutual exclusion of Being

and Not-being; the denial of δνναμις — all these points, as Zeller urges with force, bear out what is known from other sources of the Megarian doctrines. In one point, however, the theory of the εἴδων φιλοι seems to disagree with Megarianism as otherwise known; it apparently allows a plurality of reals, whereas we have some authority for the fact that the Megarians taught the absolute unity of ultimate Being. (Aristocles ap. Euseb. *Pr. Ev.* XIV. 17, p. 756; DL II. 106). Zeller meets this difficulty by the hypothesis that in the *Sophist* we have an earlier form of the Megarian doctrine, in which a partial plurality of reals was recognised. He supposes that the Megarians were led to posit the reality of "intelligible species" by considerations similar to those which influenced Plato, but that afterwards Eleatic influence made them deny reality to all but the supreme εἰδος. As Apelt points out (*Beiträge zur Gesch. der Gr. Phil.* 96), this implies a view as to the relations between the Socratic

and the Eleatic elements in Megarianism which requires examination.

(...)

The points which require investigation are easily stated. We must first of all examine the internal evidence of the passage in the *Sophist*. We must then inquire whether the metaphysic and logic of the Megarians, as known to us from independent sources, are so closely akin to the Platonic as demanded by Zeller' s theory.

We shall find their spirit, their aims, their presuppositions so opposed to the Platonic in fundamental respects, that we cannot seriously entertain the view that Megarianism and Platonism travelled on the same road for a time, and subsequently diverged in opposite directions." (pp. 218-219)

2. Goldblatt, Robert. 1980. "Diodorean Modality in Minkowski Spacetime." *Studia Logica* no. 39:219-236.

   Abstract: "The Diodorean interpretation of modality reads the operator □ as “it is now and always will be the case that”. In this paper time is modelled by the four-dimensional Minkowskian

geometry that forms the basis of Einstein's special theory of relativity, with “event” y coming after event x just in case a signal can be sent from x to y at a speed at most that of the speed of light (so that y is in the causal future of x).

It is shown that the modal sentences valid in this structure are precisely the theorems of the well-known logic S4.2, and that this system axiomatises the logics of two and three dimensional spacetimes as well.

Requiring signals to travel slower than light makes no difference to what is valid under the Diodorean interpretation. However if the “is now” part is deleted, so that the temporal ordering becomes irreflexive, then there are sentences that distinguish two and three dimensions, and sentences that can be falsified by approaching the future at the speed of light, but not otherwise."

3. Gomperz, Theodor. 1905. *Greek Thinkers. A History of Ancient Philosophy. Vol. II*. London: John Murray.

   Chapter VIII. *The Megarians and kindred Movements*, pp. 170-208.

   "The founder of the Megarian school was Euclides.

   He appears to have belonged to the older generation of the pupils of Socrates. But it was not by Socrates alone that he was influenced. Among the scanty records of his teaching we find no statement more full of significance than the one which ascribes to him a blending of Socratic doctrine with Eleatic. Socrates had taught the unity of virtue, and its absolute identity with Good. The Eleatics had asserted the unity of Being. In the mind of Euclides the two doctrines were fused together. He held that the unity of Being was identical with the Good. According to trustworthy accounts, he " designated the One Good by many names, sometimes speaking of it as Wisdom, sometimes as Deity." And the Good con3tituted for him the whole of Being; to its opposite, the Not-Good, he denied all existence. These curt notices require some explanation, and supply abundant food for reflexion. First of all, we have here the earliest instance of a tendency which left its impress on several successive periods of

philosophy - the tendency to retain the teaching of Socrates, but not to rest satisfied with it. Socratism was haunted by a sense of its own incompleteness. Socrates himself had brushed aside the physical and metaphysical speculations of his predecessors.

But his disciples, both of the first and of the second generation, resumed the discarded studies, and endeavoured to combine them with their master's ethical teaching." (pp. 173-174)

4. Grote, George. 1885. *Plato and the Other Companions of Sokrates*. London: John Murray.

   Vol. 1, Chapter III. *Other companions of Sokrates*: *Diodorus Kronus*, pp. 140-146.

   From the pains which Aristotle takes (in the "treatise 'De Interpretatione' and elsewhere) to explain and vindicate his own doctrine about the Potential and the Actual, we may see that it was a theme much debated among the dialecticians of the day. And we read of another Megaric, Diodorus Kronus, perhaps contemporary (yet probably a little later than Aristotle), as advancing a position substantially the same as that of Eubulides. That alone is possible (Diodorus affirmed) which either is happening now, or will happen at some future time. As in speaking about facts of an unrecorded past, we know well that a given fact either occurred or did not occur, yet without knowing which of the two is true - and therefore we affirm only that the fact may have occurred: so also about the future, either the assertion that a given fact will at some time occur, is positively true, or the assertion that it will never occur, is positively true: the assertion that it may or may not occur some time or other, represents only our ignorance, which of the two is true. That which will never at any time occur, is impossible." (pp. 140-141)

   (...)

   "In what manner Diodorus stated and defended his opinion upon this point, we have no information. We know conclusion only that he placed affirmations respecting the future on the same footing as affirmations respecting the past: maintaining that our potential affirmation - *May or May not be* - respecting

some future event, meant no more than it means respecting some past event, viz.: no inherent indeterminateness in the future sequence, but our ignorance of the determining conditions, and our inability to calculate their combined working." (pp. 143-144)

5. Guthrie, W. K. C. 1971. *A History of Greek Philoshy, Vol. 2: Socrates*. Cambridge: Cambridge University Press.

   Chapter III. *Philosophical significance*, § 12: The immediate followers of Socrates: (Aristippus and Euclides); *Euclides*, pp. 179-187.

   "Only one positive doctrine can be safely credited to Euclides, namely the unity of the good. The testimonies are:

   (i) Cicero, *Ac. pr*. 2.42. 129. Cicero begins somewhat oddly by saying that, 'as I have read', the *princeps* of the Megaricorum *nobilis discip!ina* was Xenophanes, followed by Parmenides and Zeno. 'Then',

   he continues, 'came Euclides, a disciple of Socrates from Megara, after whom they were called Megarians. He said that that alone was good which was one, all alike, and always the same.'

   (ii) D.L. 2. 106: 'He declared that the good was one, though called by many names, sometimes wisdom, sometimes God, and again mind (*nous*) and so on. Things opposed to the good he rejected, saying that

   they did not exist.'

   (iii) With these one may compare a passage from the history of philosophy of Aristocles quoted by Eusebius (*P.E*. 14. 17), which speaks only of the Megarians without mentioning Euclides by name.

   He ranks them with those who condemned the senses and claimed that only reason was to be trusted. ' So said, in earlier times, Xenophanes, Parmenides, Zeno and Melissus, and later the followers of Stilpo and

the Megarians. For this reason the last-named said that what is is one and anything else does not exist,3 and that nothing comes into being or is destroyed or undergoes any movement whatever'." (p. 180, a note omitted)

6. Haake, Matthias. 2018. "Megara and 'the Megarians': a City and its Philosophical School." In *Megarian Moments. The Local World of an Ancient Greek City-State*, edited by Beck, Hans and Smith, Philip J., 237-256. Montreal: McGill University.

   Teiresias Supplements Online, Vol. 1.

   "..., this contribution elaborates on the idea that a philosophical school existed in Megara that was identified through association with its place – a school of thinkers who took their name from the city and thus were known as Megarians.(6) It is also not my intention to outline a history of the Megarian school. Rather, I seek to locate it in the local (discourse) environment of the city; to ask for interactions between the city of Megara, its citizens and inhabitants respectively, and the school and its members;(8) and, as far as possible, to embed the Megarian school in the Megarian localscape.(9) To achieve this goal, I will examine the presence of Megarian philosophers in Megara as well as their visibility, and engagement, in the local cosmos of the city. The first step, however, will be to address some general problems in respect to the Megarian school that make things even more difficult than the outlined approach would suggest. In the concluding observations, a remarkable piece of evidence, dating to the second century CE, will be introduced in order to demonstrate that, at a time when the Megarian school was long gone, its founder continued to be remembered as an icon of local pride." (pp. 238-239, anote omitted)

   (6) In a largely unnoticed passage of the prologue to his *Lives and Opinions of Eminent Philosophers*, Diogenes Laertius mentions the various possibilities to name a philosophical school, among them the designation ἀπο` πόλεων (1.17). Even if it is, in general, possible to explain the origins of a name of a philosophical school, it is an unsolved question as to how and

by whom philosophical schools were named and for which reason(s) a specific name was chosen. The remarks by Gigon (1960: 60) on Diog. Laert. 1.17 are anything but exhaustive; cf. also Cambiano 1977: 27-35.

(8) It is worth noting that, in order to avoid misconceptions, in Ancient Greek the ethnicity of the inhabitants of Megara is Μεγαρεύς, pl. Μεγαρεῖς (Legon 2004: 463), whereas the name of the members of the school is Μεγαρικός, pl. Μεγαρικοί, a term rarely attest ed; see Döring 1989: 296. In English the form "Megarician(s)" is uncommon (a rare exception is Bocheński 1951: 77-102); both the inhabitants of the city and the members of the school are therefore mostly called Megarians.

(9) The term '-scape' is in part borrowed from the title of a workshop organized by Anja Slawisch and Michael Loy in Cambridge, March 22-23, 2018: *Shedding Light on the Matter: Ideascapes and Material Worlds in the Land of Thales*.

7. Hartmann, Nicolai. 2017. "The Megarian and the Aristotelian Concept of Possibility: A Contribution to the History of the Ontological Problem of Modality." *Axiomathes*.

Translated by Frédéric Tremblay and Keith Peterson.

Abstract: "This is a translation of Nicolai Hartmann's article "Der Megarische und der Aristotelische Möglichkeitsbegriff: ein

Beitrag zur Geschichte des ontologischen Modalitätsproblems," first published in 1937. In this article, Hartmann defends an interpretation of the Megarian conception of possibility, which found its clearest form in Diodorus Cronus' expression of it and according to which "only what is actual is possible" or "something is possible only if it is actual." Hartmann defends this interpretation against the then dominant Aristotelian conception of possibility, based on the opposition between *dynamis* and *energeia*, and according to which there is always an open multiplicity of simultaneous "possibilities," the outcome of which remains undetermined. Since, according to Hartmann, reality suffers no indetermination, the Megarian conception of possibility is an account of *real possibility,* whereas the Aristotelian one is merely an account of *epistemic possibility* (Frédéric Tremblay)."

8. Hurst, Martha. 1935. "Implication in the Fourth Century." *Mind* no. 44:484-495.

   "Modern analyses of the nature of necessary connection have given rise to more paradoxes than they have solved. A familiarity with the controversy between Diodorus and Philo which took place in the Fourth Century B.C. might perhaps have made unnecessary the anguish which modern logicians have suffered." (p. 484)

   (...)

   "The problem with which Diodorus and Philo were concerned was the definition of the " if . . . then " relation, or the discovery, as Sextus puts it, of the " criterion of following " (τής ακολουθίας εκτίθενται κριτήρια).(1) Philo's(2) definition is this: "there is a case of true fastening together when we have not a true antecedent and a false consequent ".(3) This corresponds to the symbolic form - (p. - q), and is equivalent to the definition of material implication.(4) The definition of Diodorus is: "that is a case of true fastening together which did not and does not admit the possibility of the antecedent being true and the consequent false ".(6) This is practically equivalent to Lewis's definition of strict implication.(6)

   (1) *Adv. Math.*, VIII, 113.

(2) Sextus gives Philo's views first and this is the natural order of exposition, as Diodorus succeeded in refuting Philo, while, as far as we know, Philo did not refute Diodorus. It may also be the chronological order of development, in spite of what was said above as to the relation of the two men; for Diodorus may have made his views explicit only in answer to the criticisms of his pupil.

(3) Sextus, Adv. Math., VIII, 113: οϊον 6 μεν Φίλων ελεγεν αληθές γίνεσθαι τό συνημμένου όταν μη αρχηται άπ' αληθούς καί λήγη επί ψεύδος [Thus Philo declared that " the hypothetical is true whenever it does not begin with what is true and end with what is false" (tr. Bury, vol. II, p. 297)]

11. Kurzovà, Helena. 2009. "What worried the crows in Callimachus' epigram." *Studia minora Facultatis Philosophicae Universitatis Brunensis. Series archaeologica et classica* no. 14:125-129.

Abstract: WThis paper deals with the Callimachus' epigram devoted to Diodorus Cronus and attesting his great popularity as dialectician. New interpretation of the second croak of crows is proposed, according

to which the crows worry about their future: "what will be with us further?". Thus both croaks of the crows are connected with the most important part of Diodorus' teaching, i. e. his theory of modality expressed in the so called "Master Argument"."

"The following fragment of Callimachus′ epigram Fr. 393 Pfeiffer relates to Diodorus Cronus, the prominent representative of the Megarian School, whose main centre of interest was dialectics, the discipline corresponding to the contemporary logic and philosophy of language. The epigram was probably written during Diodorus᾽ stay in Alexandria, which is supposed to have occurred during the 80s of the 3rd century B.C.:

αὐτο ̀ς ὁ Μῶμος

ἔγραφεν ἐν τοίχοις 'ὁ Κρόνος ἐστι ̀ σοφός'. [Blame (*Momus*) himself wrote on the walls "Cronus is wise]

ἠνίδε κοἰ κόρακες τεγέων ἔπι "κοῖα συνῆπται"

κρώζουσιν και ̀ "κῶς αὖθι γενησόμεθα'. [And here the crows are, squawking from the rooftops "what conclusions follow?" or "how will we become again?]

Surely, the epigram is one of the testimonies of Diodorus' popularity. The fragment 393 consists in fact of two fragments, which were connected together by Bentley. The first two lines are quoted by Diog. Laert. II, 10, 7. The sense and interpretation of this part is quite obvious. "Momus himself used to write on the walls 'Cronus is wise.'" *Kronos* is the nickname of Diodoros, inherited probably from his teacher Apollonius Cronus." (p. 125, English translation added)

(...)

"The third and fourth lines come from Sextus Empiricus' book for Grammarians (*Adversus Mathematicos* I, 309–312)." (p. 126)

(...)

"Sextus admits that even the grammarians are able to understand the first part of what the crows are croaking on the rooftops: 'κοῖα συνῆπται;' "what follows from what?" This is an allusion to the ability of the great dialectician to judge the validity of implication." (p. 126)

(...)

"I argue that the second croak of the worrying crows, like the first one, relates to the most prominent activity of Diodorus in dialectics. It is his view on the possible and the necessary which is in play here and which was formulated in his "Master Argument"." (p. 127)

12. Leith, David. 2014. "Causing doubts: Diodorus Cronus and Herophilus of Chalcedon on causality." *The Classical Quarterly* no. 64:592-608.

"My aim in this paper is to move this discussion on by filling out some of the historical and philosophical background to Herophilus' doubts about the existence of causes, and to re-

evaluate the significance of these doubts in the context of his scientific project.

I shall try to show that the arguments which Galen records in connection with Herophilus' doubts were in fact propounded by the philosopher Diodorus Cronus, and that Herophilus must have encountered them through personal contact with Diodorus in Alexandria before the latter's death c. 284 B.C. Hence Herophilus' sceptical views on the existence of causes are very much tied to these particular arguments and to

the personality of Diodorus. This allows us to reassess Herophilus' attitude to causes to an extent, and I shall offer some observations on the nature of his reaction, maintaining that it need not be indicative of a more wide-ranging sceptical attitude. It is hoped that this analysis will help first to locate Herophilus' medicine more firmly within the context of early Alexandrian intellectual currents, and secondly to expand our knowledge of Diodorus' dialectical challenges and their influence in particular upon contemporary science." (p. 593)

13. López-Astorga, Miguel. 2015. "Diodorus Cronus and Philo of Megara: Two Accounts of the Conditional." *Rupkatha. Journal On Interdisciplinary Studies in Humanities* no. 7:9-16.

Abstract: "Diodorus Cronus and Philo of Megara presented criteria for identifying true conditionals. Diodorus' criterion has been said to be a version of that of Philo requiring that the conditional is always true.

However, in this paper, based on the mental models theory and its analysis of possibilities, I try to show that those two interpretations are very different and that they do not refer to the same combinations of

possibilities. In my view, Philo's account can be linked to the material interpretation of the conditional.

Nevertheless, Diodorus' explanation can be related to that very interpretation and, in addition, to three different combinations of possibilities, none of them being that corresponding to the material interpretation."

14. ———. 2019. "The semantic method of extension and intension and the four criteria of the conditional described by Sextus Empiricus." *Revista de Filosofía* no. 44:253-261.

Abstract: "In this paper an analysis is conducted of the debate about the most suitable way to understand the conditional, which took place in the 4th century B.C. This is done using the extension and intension

method provided by Rudolf Carnap to study the meaning of expressions. The results seem to show that, according to Sextus Empiricus, although the debate was about four different criteria to understand the

conditional, three of those criteria actually appear to be the same and have a very clear common logical form under Carnap's framework."

15. Makin, Stephen. 1996. "Megarian Possibilities." *Philosophical Studies* no. 83:253-276.

"There are some - such as the Megarians - who say that something is only capable when it is acting, and whenever it is not acting it is not capable; for example, someone not building is not capable of building, but someone who is building is, when he is building; it is the same too in other cases." Aristotle, *Metaphysics* 9.3, 1046b29-32

"The Megarian position which Aristotle describes has had a bad press.

Aristotle himself says that it is not difficult to see the absurdities to which it gives rise. He does not, however spend any time considering why someone might have adopted such an apparently absurd view.

The same brisk treatment is found in a contemporary discussion, in which Elizabeth Prior disposes of Megarianism (or radical actualism) in two pages, as a preliminary to an analysis of dispositions.(1) Specialists

in ancient thought typically spend more time on exegesis of the Megarian view, but the tendency is for the Megarian account to

come out as either true but trivial, or false but ludicrous.(2) My intention is

to rehabilitate the Megarians. The claim Aristotle reports is indeed false. But there is underlying it a striking and extremely plausible basic intuition about capacities (and, by extension, possibilities more

generally). Much that is of substance remains even when the Megarians' error in arguing from that intuition is excised. In particular there is a valid argument from that intuition to a remarkable thesis about

capacities, on the basis of which a novel and revisionary account of capacities could be constructed - although full development of that account would raise questions which are beyond the range of this

paper." (p. 253)

16. Marko, Vladimir. 1995. "Callimachus' puzzle about Diodorus." *Organon F* no. 2:342-367.

    Abstract: "The author tends to emphasize that there are almost the three reasons to analyse Callimachus' epigram about Diodorus (Pfeiffer fr.393, 14): *First of all, the date of this epigram* shows us that it represents the earliest information about Diodorus doctrine. *Second*, another support of its authenticity could be found in fact that this epigram *expressing part of the atmosphere* following, and also remaining after, discussing the Diodorian topics. *Third*, its *philosophical relevance*, usually minimised in classical literature, could be found in those facts that it could show the way out in many today dilemmas about his philosophical

    claims and support some of our contemporary assumptions about its logical conception, as well as that of space, time, and meaning of statements. The author defends a position that it is necessary to develop *well-grounded* and *methodologically relevant base* covering the historical reconstruction and the interpretation of ancient logical theories."

"In fact, this is not a story about M.A. [Master Argument] Possibly, just partly. We would like to introduce one Callimachus' epigram that could have a reference to Diodorus' logical and temporal conception, and to form its adequate interpretation. It follows:(3)

(Even) Momos (himself) used to write on the walls: "Cronos is wise."

Look, even the ravens on the rooftops are craving: "What follows (from what)?"

and "How shall we come to be hereafter?" (p. 344)

(3) Dôring [(1972): *Die Megariker Kommentierte Sammlung der Testimonien. Amsterdam*], frs. 96, 128; D.L., ii 111; S.E. *M* i 309, p. 672 Bekk.; Pfeiffer [(1949): Callimachus. Oxford]: fr. 393, 1-4, Epigrammatum fragmenta, i.

17. Marko, Vladimír. 2011. "Looking for the Lazy Argument Candidates (1)." *Organon F* no. 18:363-383.

Abstract: "The Lazy Argument, as it is preserved in historical testimonies, is not logically conclusive. In this form, it appears to have been proposed in favor of part-time fatalism (including past time fatalism). The

argument assumes that free will assumption is unacceptable from the standpoint of the logical fatalists but plausible for some of the nonuniversal or part-time fatalists. There are indications that the layout of

argument is not genuine, but taken over from a Megarian source and later transformed. The genuine form of the argument seems to be given in different form and far closer to logical fatalism and whose purpose

is not to defend laziness. If the historical argument has to lead to the logically satisfactory solution, some additional assumptions and its additional tuning are needed."

[The oldest form of the Lazy Argument]: "These and others like them are the absurdities that follow if it is necessary for every affirmation and negation (either about universals spoken of

universally or about particulars) that one of the opposites be true and the other false, and that nothing of what happens is as chance has it, but everything is and happens of necessity. So there would be no need to deliberate or to take trouble, thinking that if we do this, this will happen, but if we do not, it will not." (Aristotle, *de interpretatione* 18b26-33)"

18. Máralém, Claudia. 2011. "Megaric Philosophy Between Socrates' Influence and Parmenides' Ghost." In *Parmenides, Venerable and Awesome (Plato, Theaetetus 183e). Proceedings of the international symposium (Buenos Aires, October 29-November 2, 2007)*, edited by Cordero, Nestor-Luis. Las Vegas: Parmenides Publications.

    Summary: "The theoretical origins of Megaric philosophy have been discussed at length. The ancient sources refer to the influence of Socratism and Eleatism on Euclid, but some more recent studies deny that his last current of thought had any importance in the formation of the Megaric theses.

    This article studies the disadvantages of this proposal and sets out to show that it is necessary to consider the Eleatic influence. In order to support this point, it examines some aspects of Euclid's position and their connections with Parmenidean philosophy. Then, three doctrines of later authors associated with the Megaric line (Eubulides, Diodorus Cronus, and Stilpo) are examined in order to show the presence of Eleatic approaches and its persistence and relevance for the theoretical identity of the group."

19. Mates, Benson. 1949. "Diodorean Implication." *The Philosophical Review* no. 58:234-242.

    "Diodorus Cronus a Megarian logician greatly renowned in antiquity, is known to students of the history of logic chiefly for his part in the ancient controversy over the truth-conditions for hypothetical propositions." (p. 234)

    (...)

"The present paper(5) attempts to give as clear and correct an account as possible of Diodorean implication(6) and of its relation to the other types of implication which were advocated by the several participants

in the ancient controversy. Perhaps this account will not be uninteresting to students of modern logic, for Diodorus managed to define a plausible sense of "implication" that is stronger than Material implication and weaker than Strict implication-a feat requiring no little skill."

(5) This paper is based on a portion of the author's doctoral dissertation, *The Logic of the Old Stoa* (1948, typescript, University of California Library). [published as *Stoic Logic*, Berkeley: University of California Press, 1953 (second revised edition 1961).]

(6) The term "Diodoran" was coined by C. S. Peirce; I prefer "Diodorean."

20. ———. 1961. *Stoic Logic*. Berkeley: University of California Press.

Second revised edition; first edition 1953.

"In this section we shall investigate what remains of the ancient treatment of the problem just mentioned [*the problem of implication*]. We know that the controversy was begun by Diodorus and Philo in the Megarian school and was taken up and enlarged by the Stoics. Most of the latter seem to have adopted the position of Philo,(4) although at least three other views were represented.

In modem times, C. S. Peirce was the first competent logician to comment on the ancient dispute.(5) He was struck by the fact that Philo's notion of implication was exactly the same as the modem so-called "material implication," which also has provoked much debate. Other authors have mentioned this same point of similarity,(6) and today it is probably the best-known fact about Stoic logic." (p. 43)

21. Moline, Jon. 1969. "Aristotle, Eubulides and the Sorites." *Mind* no. 78:393-407.

"In this paper I should like to inquire about the probable historical origin, target and solution to perhaps the most perplexing of the ancient paradoxes, the Sorites.(1) The

evidence which remains on these points is neither copious nor quite conclusive, but it does support reasonably compelling hypotheses which serve to illuminate further our picture of the period. And such hypotheses should be formulated, for, as W. and M. Kneale noted, it is incredible that the ancient paradoxes were produced in the entirely pointless way the tradition appears to suggest.(2)"

(1) 'That this argument is still perplexing is indicated by Max Black's article, " Reasoning With Loose Concepts ", *Dialogue*, II (1963), no. 1, pp. 1-12. An additional indication of the perplexity it generates is provided

by Evert Beth, who saw the argument as leading to paradoxical results in set theory. *Foundations of Mathematics* (Amsterdam, 1959), p. 22.

(2) W. and M. Kneale, *The Development of Logic* (Oxford, 1962), p. 114.

This point has also been recognized by Beth (see n. 1). The traditional view is found in Kurt von Fritz's article, " Megariker ", in Pauly-Wissowa's Realencyclopaedia der Classischen Altertumswissenschaft (Stuttgart, 1931), Supplement V, p. 710. It also appears in E. Zeller's *Outlines of the History of Greek Philosophy,* 13th edition, transl. by L. R. Palmer (London, 1931), p. 107. Zeller viewed Eubulides' paradoxes as " clever but worthless fallacies ". This view dates back at least to Cicero, who considered the Sorites to be a " very vicious and captious style of arguing ", and the other Megarian paradoxes to be " far-fetched and pointed sophisms ". *Academic Questions,* transl. by C. D. Yonge (London, 1853), pp. 46, 58.

22. O'Toole, Robert R., and Jennings, Raymond E. 2004. "The Megarians and the Stoics." In *Handbook of the History of Logic, Vol. 1: Greek, Indian and Arabic Logic*, edited by Gabbay, Dov and Woods, John, 397-522. Amsterdam: Elsevier.

"The Megarian School was founded by Euclides, a pupil of Socrates (DL 2.47) and a native of Megara on the Isthmus (DL 2.106). He was succeeded as head of the school first by Ichthyas and later by Stilpo, also a native of Megara in Greece (DL

2.113). Evidently, since Diodorus can trace his philosophical lineage back to Euclides through Apollonius Cronus and Eubulides (DL 2.110-11), it has been generally thought that he also was a member of the Megarian school; hence, the Megarian connection with respect to the source of Zeno's logical doctrines would seem assured. Sedley, however, has presented what seems to us a convincing argument to the effect that Diodorus belonged rather to a rival school which was called the Dialectical School (Sedley, [1977, pp. 74-75]; cf. Sandbach, [1985, p. 18]).

At 2.106 Diogenes reports that the followers of Euclides were called Megarians after his birthplace. Later they were called Eristics, and later still, Dialecticians.

Sedley argues for the possibility that these remarks should not be interpreted, as they usually are, to mean that this was one and the same school known at different times by different names, but rather that these names designated splinter groups whose *raisons d'être* were different enough from that of the Megarian School to warrant viewing them as distinct schools [Sedley, 1977, p. 75]. According to Sedley, several sources inform us that the Dialecticians recognised Clinomachus of Thurii, a pupil of Euclides, as the founder of their school [Sedley, 1977, p. 76].

However, since the name 'Dialectician' was first coined for the school by Dionysius of Chalcedon (DL 2.106), an "approximate" contemporary of Diodorus (Sedley [1977, p. 76]), it seems more likely not that Clinomachus actually founded the school, but rather that he was recognised by its members as the source of the ideas foremost in their teachings [Sedley, 1977, p. 76]." (p. 406)

23. Opsomer, Jan. 2013. "The lives and opinions of Socrates and Stilpo as defended by Plutarch against the insidious yet ignorant attacks of Colotes." *Aitia*:1-23.

Abstract: "In chapters 17 to 23 of the *Adversus Colotem* Plutarch defends Socrates and Stilpo against Colotes' criticism. I examine the embedding of this section in the larger context of the work, the links between the sections on Socrates and Stilpo, Colotes' criticisms and Plutarch's counter-arguments and polemical strategies. In doing so, I attempt to disentangle the different layers of this complex text. Socrates is portrayed as an imposter and a sceptic by Colotes.

Plutarch argues that Socrates' philosophy indeed implies a radical distrust of the senses, but that this does not make it impossible for him and his followers to live their daily lives. Socratic philosophy is much to be preferred to Epicureanism. Stilpo, a Megarian, also belongs to the Socratic tradition. Plutarch upholds the high moral reputation of this sharp-witted philosopher against the abuse that he had to suffer from Colotes. The latter also attacked Stilpo's rejection of all predication except identity predication. Plutarch claims that Stilpo's argument is a mere dialectical exercise and poses no threat to our daily lives. Plutarch moreover engages in a counter-attack on the Epicurean philosophy of language, more particularly their abolishment of the intermediate level – that of meanings. As Plutarch presents Stilpo's famous argument,

it amounts to a denial of the ontological relation to which ordinary predication corresponds.

Plutarch's conclusion – that Stilpo merely urges us to abandon the use of the verb "to be" as a copula – does not fit the argument as it is presented by him. This mismatch is best explained by the hypothesis that Plutarch copied the argument quite faithfully without analysing it in detail. That would also explain the fact that the argument makes no use of Plato's account of predication in the *Sophist*."

24. Prior, Arthur Norman. 1955. "Diodoran Modalities." *The Philosophical Quarterly* no. 5:205-213.

    "The Megaric logician Diodorus defined the possible as that which either is or at some time will be true, the impossible as that which neither is nor ever will be true, and the necessary as that which both is and always will be true. These definitions assume-as ancient and medieval logic generally assumes-that the same proposition may be true at one time and false at another; Dr. Benson Mates has accordingly remarked, in his recent study of Stoic logic, that Diodoran 'propositions' are not 'propositions' in the modern sense, but something more like propositional functions, and he represents them as such in his symbolic treatment of the Diodoran definitions of the modal operators.(1)

    I propose here to do something a little different, namely to employ the ordinary propositional variables 'p ', 'q', 'r ', etc., for 'propositions' in the Diodoran sense, and to use certain operators which take such propositions as arguments, and which form functions taking such propositions as values." (p. 205)

    (1) B. Mates, *Stoic Logic,* University of California Press, 1953, pp. 36-37. It has been pointed out to me by Mr. W. W. Sawyer that the Diodoran view that whatever is possible either is or will be true is very like the ergodic hypothesis in the kinetic theory of gases.

25. ———. 1958. "Diodorus and Modal Logic: A Correction." *The Philosophical Quarterly* no. 8:226-230.

    "In the course of a sketch, published in the *Philosophical Quarterly* for July 1955, of a modal system based on the Diodorean definition of the possible as 'what is or will be true ', I showed that this system contains

    all the laws of the Lewis system S4. Whether it contains further modal theses beside those of S4, I went on to say in the same paper, " is a question which remains to be investigated "; it being clear, nevertheless, that the Diodorean system " does not contain the characteristic theses of the main modal system

known to be stronger than S4, namely S5 ". In my *Time and Modality* this question is again referred to, but unhappily with less caution. The Diodorean definition being translated into a 'matrix ', I state on p. 23 that this matrix is ' characteristic ' for S4, i.e. verifies all those and only those formulae which are theorems of S4. And this is a mistake. I should like, therefore, to set out such facts as are now clear to me about the actual relation of the Diodorean modal system, which I shall call D, to S4." (p. 226)

27. Rankin, H. D. 1983. *Sophists, Socratics and Cynics*. Totowa (NJ): Barnes & Noble Books.

    Chapter 11: *The Socratics*; on the Megarics pp. 191-198.

    "Euclides and other ‘Megarian’ pupils of Socrates (and some other non-Megarian Socratics) were influenced by the view that being is one, which originally comes from Parmenides of Elea. A consequence of this

    view is that it becomes impossible to apply predicates to being apart from ‘it is’. You can hardly even say of it that it is one for in doing so you are saying that it is something other than itself, and are denying

    its pure unity even at the very moment of asserting that unity!

    Euclides seems to have taken this ‘oneness’ and applied it to the ‘good’. Like Socrates, he was as much, if not more, interested in questions of goodness and moral value as he was in the question of ‘being’.

    Just as the Eleatics maintained that you could not say that the opposite of ‘being’, that is ‘not being’, exists — such a statement is in their assumptions self-contradicting — so Euclides states that the opposite

    of ‘good’ cannot exist.

As we have seen, the influence of Eleatic ‘logic’ of this kind was strong in many viewpoints and arguments of the Sophistic movement.

Statements involving the verb ‘to be’ invariably involved the notion of ‘being’ in the sense of real, genuine existence, not the mere linking of a predicate to a subject to express what that subject is in part, as in,

for instance, the statements the apple is round, or, the apple is green.

This exhaustive ‘existential’ meaning of the verb ‘to be’ allowed no such variations or dilutions of ‘being’. Consequently two examples of the kind I mention would be held to be contradictory of each other.

This information about Euclides probably comes from a source book written by a doxographer. Cicero’s statements and those of Diogenes Laertius have much in common. Diogenes also tells us how Euclides

took over and adapted Parmenides’ teachings." (pp. 193-194)

Reprinted as Chapter Seven in S. Rosen, *Essays in Philosophy: Ancient*, edited by Martin Black, South Bend, St. Augustine Press, 2013.

"In this paper, I shall summarize a series of arguments taken from a more extensive analysis of Aristotle's treatment or non-being. That analysis is itself intended to serve as a foundation for studying the

ostensible resolution of the problem of non-being in contemporary analytical philosophy. My paper will be divided into three parts. l begin with a sketch of a critical aporia in Aristotle's doctrine of predication.

If my sketch is sound, the implications for contemporary philosophy will be easy to see. In the second part I shall offer

some general observations on the senses of *dunamis* and *energeia* in everyday discourse.

These observations begin from a consideration of the Aristotelian text and the pre-theoretical situation as it was accessible to Aristotle and is still accessible to us. The doctrine of predication is itself based

upon an analysis of everyday discourse and, despite the logical revolution of the present century, continues to play a central role in contemporary philosophy. In the third part of my paper I shall discuss Aristotle's

criticisms of the Megarian thesis and attempt to formulate in such a way as to show that Aristotle has not refuted it." (p. 105)

29. Santos, Ricardo. 2019. "The Pre-Analytic History of the Sorites Paradox." In *The Sorites Paradox*, edited by Oms, Sergi and Zardini, Elia, 289-306. Cambridge: Cambridge University Press.

"Most probably, we owe the discovery of the Sorites Paradox to Eubulides of Miletus.

Eubulides was a philosopher of the Megarian school and a contemporary of Aristotle, who distinguished himself by his outstanding argumentative capacities. Unfortunately, we know very little about him. But Diogenes Laertius(2) attributes to him the formulation of seven arguments ‘with interrogative form’, among which we find the Liar (*pseudomenon*), the Heaper (*sôritês*) and the Bald Man (*phalakron*). Sextus Empiricus(3) says that logic was the only part of philosophy to which Eubulides dedicated himself and, according to Philodemus, he despised every argument that did not contain syllogisms,(4) thus reinforcing his

image of a ‘rigorous dialectician’. But Eubulides was also a polemist, frequently accused of using eristic arguments.(5) He was notorious for his great animosity against Aristotle, against whom he wrote a whole book." (p. 289)

(5) An eristic argument, as Plato and Aristotle characterised it, is a bad argument, based upon some tricky fallacy, used for purely competitive purposes, i.e. aiming at victory rather than knowledge.

30. Sedley, David. 1977. "Diodorus Cronus and Hellenistic Philosophy." *Proceedings of the Cambridge Philological Society* no. 23:74-120.

    Reprinted in: Terence Irwin (ed.), *Hellenistic Philosophy* (Classical Philosophy Collected Papers vol. 8), New York: Routledge, 1995, pp. 270-315.

    "During the last four decades historians of ancient logic have become increasingly aware of the importance of Diodorus Cronus and his pupil Philo as pioneers of the propositional logic which came to flourish in the Stoa. Their direct influence has so far been recognised in two main areas of Hellenistic controversy -- the validity-criteria for conditional propositions, and the definition of the modal terms 'possible' and 'necessary'. But some broader questions have not been satisfactorily answered. What wee Diodorus' own philosophical allegiances and antecedents? What is his place in the history of Greek philosophy? How far-reaching was his influence on the post-Aristotelian philosophers?

    There was little chance of tackling these questions confidently until 1972, when Klaus Döring published for the first time the collected fragments of Diodorus, in his important volume *Die Megariker*. Meagre though they are, these fragments confirm my suspicion that Diodorus' philosophical background has not been fully explored, and also that his influence on the three emerging Hellenistic schools -- the Stoics, Epicureans, and Sceptics -- was far wider than has hitherto been recognised. There has been much discussion as to which earlier philosophers played the most decisive part in shaping Hellenistic philosophy, and the respective claims of the

Platonists and of Aristotle have never lacked expert advocacy. In all this, the claims of so obscure a figure as Diodorus have been underrated." (p. 74)

31. Sentesy, Mark. 2018. "Are Potency and Actuality Compatible in Aristotle?" *Epoché A Journal for the History of Philosophy*:239-270.

    Abstract: "The belief that Aristotle opposes potency (*dunamis*) to actuality (*energeia* or *entelecheia*) has gone untested. This essay defines and distinguishes forms of the Opposition Hypothesis—the Actualization, Privation, and Modal—examining the texts and arguments adduced to support them. Using Aristotle's own account of opposition, the texts appear instead to show that potency and actuality are compatible, while arguments for their opposition produce intractable problems. Notably, Aristotle's refutation of the Megarian Identity Hypothesis applies with equal or greater force to the Opposition Hypothesis. For Aristotle, then, potency and actuality are compatible."

32. Seuren, Pieter A. M. 2005. "Eubulides as a 20th-century semanticist." *Language Sciences* no. 27:75-95.

    Abstract: "It is the purpose of the present paper to highlight the figure of Eubulides, a relatively unknown Greek philosopher who lived ±405–330 BC and taught at Megara, not far from Athens. He is mainly known for his four paradoxes (the Liar, the Sorites, the Electra, and the Horns), and for the mutual animosity between him and his younger contemporary Aristotle.

    The Megarian school of philosophy was one of the main sources of the great Stoic tradition in ancient philosophy. What has never been made explicit in the literature is the importance of the four paradoxes for the study of meaning in natural language: they summarize the whole research programme of 20th century formal or formally oriented semantics, including the problems of vague predicates (Sorites), intensional contexts (Electra), and presuppositions (Horns). One might say that modern formal or formally oriented semantics is essentially an attempt at finding linguistically tenable answers to problems

arising in the context of Aristotelian thought. It is a surprising and highly significant fact that a contemporary of Aristotle already spotted the main weaknesses of the Aristotelian paradigm."

33. Sorabji, Richard. 1983. *Time, Creation and the Continuum: Theories in Antiquity and the Early Middle Ages*. London: Duckworth.

    Chapter 2: *Solutions from Diodorus to Augustine*, pp. 17-32.

    "Diodorus delighted in paradoxes, many of which he took from Aristotle.

    Several will be discussed in later chapters, and it will be seen that he sometimes used atomist theory in order to deal with them. It is not certain whether he tried to solve Aristotle 's paradoxes of time. But there is a certain likelihood that he did, since many of the paradoxes he is known to have tackled are related to Aristotle's. For example, there is a connexion between Aristotle's paradox of the ceasing instant and Diodorus ' question when a wall ceases to exist - while it is intact, or after it has disintegrated.(2) I shall only claim, however, that Diodorus' atomism gave him the *materials* for solving the paradoxes of time. And in this chapter I shall discuss his atomism only so far as is necessary for showing that it supplied these materials.

    Diodorus ideas on atomism are recorded by Sextus Empiricus. An atom, in Greek thought, differs from a geometrical point in that, although it is indivisible is supposed to have a positive size. (We shall see eventually that some Islamic and fourteenth-century Western thought differed in this regard)." (p. 17)

    (2) ap. Sextum, *M* 10.347-9.

34. Temple, George. 1977. "Inference without Axiom of Paradoxes." In *Logic Colloquium 76*, edited by Gandy, Rob Oliver and Hyland, John Martin Elliott, 221-233. Amsterdam: North-Holland.

    "The study of formal, propositional logic has known three great periods - the Greek, the Mediaeval Scholastic and the Modern,

which are, respectively, commonly associated with the names of their reputed

founders: Philo of Megara, Abelard and Frege.

In each period a number of different theories of implication have been advanced of which the most important are

(1) the theory of material implication;

(2) the theory of incompatibility, and

(3) the theory of inclusion.

All three of these theories are attributed to the logicians of the Greek school of Megara in the treatise by Sextus Empiricus ("Outlines of Pyrrhonism", Book ii, 110-112, ca. A.D. 200). Philo is credited with the

theory of material implication, according to which, a proposition p always implies a proposition q unless p is true and q is false. An unnamed Stoic, perhaps Chrysippus, is said to have introduced the notion that p

implies q if p is incompatible with the negation of q. And some who have not been identified are said to define the implication $p \rightarrow q$ to mean that q is virtually included in p." (p. 221)

(...)

"The purpose of this note is to show that a careful analysis of these three theories shows that they are not merely mutually compatible, but essentially the same, the superficial differences exhibiting only a shift of emphasis.

Philonian Implication

We do not possess any of the original works of the Megarian logicians and therefore do not know for certain how they formulated the theory of material implication, but it seems indubitable that they initiated the study of unanalyzed propositions, which were classified as either "True" or "False" accordingly as they corresponded or did not correspond with reality.

This unique scheme of valuation was fatal to their theory of inference.

Philo of Megara (ca. 300 B.C.) recognised three varieties of valid inference, *viz*. from a true antecedent to a true consequent, from a false antecedent to a false consequent, and from a false antecedent to a true

consequent. This is undoubtedly a complete classification, but it is difficult to believe that it was accepted as a definition of inference.

I cannot believe that any Greek politician, barrister or tradesman can ever have sought to persuade his adversary, his judge or his client that a false proposition implies any proposition (true or false), and that a true

proposition is implied by any proposition (true or false).

In fact what is called "Philonian" implication is completely ineffective as a definition, and the Megarian logicians used in its place various schemes of inference. Which we should undoubtedly recognise today as completely satisfactory and sometimes of surprising subtlety.

They also used the unique valuation of propositions as true or false to characterise disjunction and conjunction, but there is no evidence that they were under the illusion that they had provided formal definitions of these connectives." (p. 222)

35. Uckelman, Sara, and Uckelman, Joel. 2007. "Modal and temporal logics for abstract space–time structures." *Studies in History and Philosophy of Science Part B: Studies in History and Philosophy of Modern Physics* no. 38:673-681.

Abstract: "In the 4th century BC, the Greek philosopher Diodoros Chronos gave a temporal definition of necessity. Because it connects modality and temporality, this definition is of interest to philosophers working within branching time or branching spacetime models. This definition of necessity can be formalized and treated within a logical framework. We give a survey of the several known modal and temporal logics of abstract space-time structures based on the real numbers and

the integers, considering three different accessibility relations between spatio-temporal points."

36. Unlu, Hikmet. 2020. "Aristotle, Heidegger, and the Megarians." *Revue Roumaine de Philosophie* no. 64:125-139.

    Abstract: "This paper examines Aristotle's analysis of unenacted capacities to show the role they play in his discovery of the concept of actuality. I first argue that Aristotle begins Metaphysics IX by focusing on active and passive capacities, after which I discuss Aristotle's confrontation with the Megarians, the philosophers who maintain that a capacity is present only insofar as it is being enacted. Using Heidegger's interpretation as a guide, I show that Aristotle's rejection of the Megarian position leads him to propose that presence cannot be confined to activity. I also argue that this provides the context for Aristotle to realize that the relation between capacity and activity can be generalized as the relation between two ways of being."

37. Verde, Francesco. 2013. *Elachista. La dottrina dei minimi nell'Epicureismo*. Leuven: Leuven University Press.

    "The three chapters of this work provide a philological analysis of the primary sources (Epicurus, *Epistle to Herodotus*, 56-59 / Lucretius, *De rerum natura* I 599-634; II 481-499) concerning thetheory of minima (Ch. 1); an analysis of the likely historical background to this theory (Xenocrates, Aristotle and Diodorus Cronus – Ch. 2); and a study of the development of this doctrine within the Garden, based on an examination of the question whether it is legitimate to speak of an "Epicurean geometry" (Ch. 3). The research thus seeks to provide a broad, detailed and comprehensive overview of the Epicurean theory of minima." (English summaries, p. 329)

    "Al di là del dibattito sulla sua appartenenza filosofica, a Diodoro Crono vengono attribuite alcune argomentazioni nella forma di veri e propri "paradossi" concernenti *stricto sensu* non tanto l'esistenza del movimento (tema specifico, invece, dei paradossi di Zenone), quanto la sua "attualità". La fonte privilegiata per la ricostruzione di questi argomenti è il II libro del *Contro i fisici* di Sesto Empirico (*M* X 85-118)441. La

comprensione di due di tali argomentazioni si fonda necessariamente su una dottrina che alcune fonti attribuiscono a Diodoro, ossia l'esistenza di "enti" minimi e indivisibili che, in quanto principi, costituirebbero la materia, lo spazio e (forse) il tempo. La questione se Diodoro abbia teorizzato questi minimi come una propria dottrina oppure solo a fini dialettici (considerata anche la sua affiliazione filosofica, dialettica o megarica che sia) è stata al centro del dibattito moderno(442). La maggior parte della critica ha ritenuto che l'ammissione di minimi privi di parti sia essenzialmente a scopo dialettico, disserendi causa, dunque: Diodoro avrebbe concesso l'esistenza di minimi per confutare dottrine (fisiche) avversarie che evidentemente si basavano su quell'attualità del movimento che le argomentazioni diodoree andavano, per l'appunto, a negare." (p. 214)

"The main textual evidence illustrating Diodorus' interest in perceptible minima is constituted by two passages from Alexander of Aphrodisias' commentary on Aristotle's *On Sense and Sensibilia*." (p. 134)

"Although they have not, to my knowledge, been the subject of any specific scholarly treatment, Diodorus' perceptible minima have been variously interpreted. As Alan Towey(19) suggests, the range of interpretations may usefully be divided into two. On the one hand, some interpreters (Mau, Denyer, Sedley) have thought of perceptible minima as an idea used by Diodorus in order to "draw an analogy between perceiving something and conceiving of it." On this view, Diodorus will have accepted that something that can be perceived as lacking parts, although actually divisible, cannot be conceived of as having parts. On the alternative view (Sorabji's), Diodorus used the idea in connection with the problem "that a smallest visible size and a largest invisible size differ from each other by an atomic magnitude."(20)" (p. 140)

39. Weidemann, Hermann. 2008. "Aristotle, the Megarics, and Diodorus Cronus on the Notion of Possibility." *American Philosophical Quarterly* no. 45:131-148.

"One of the most remarkable traits of the fragmentary picture which our sources allow us to draw of the philosophy of the Megarics is the conception of possibility ascribed to them by Aristotle. The well-known passage in Aristotle's Metaphysics in which this ascription is made, namely the beginning of the third chapter of book IX (Θ), is, if we leave aside the commentary on this passage which has falsely been attributed to Alexander of Aphrodisias, our only evidence for the Megaric doctrine in

question. Aristotle does not content himself with giving an account of this doctrine, but subjects it to a severe criticism, which he underpins by an exact definition of what, in his opinion, it is for something to have a certain possibility. This definition is fundamental not only to his criticism of the Megaric position, but also to his rejection of a view which is opposed to it in the extreme. He criticizes this extreme anti-Megaric conception of possibility in the first half of chapter 4 of Met. Θ. In my essay I shall first concentrate on this chapter and the chapter preceding it, in order to show that by means of his definition of the notion of possibility Aristotle is able to strike a happy medium between the Megaric position which he attacks in chapter 3 and the extreme anti-Megaric position which the target of his criticism in chapter 4. Then I shall try to show that even in chapter 5, in which at first sight he seems to adopt the view of his Megaric opponents himself, Aristotle firmly sticks to his own conception of possibility. Since this conception is seriously challenged by the famous Master Argument of Diodorus Cronus, who modified the Megaric conception of possibility, I shall finally try to show that this argument is not damaging to Aristotle's position at all, because it fails to be sound." (p. 131)

40. Wheeler, Samuel C. III. 1983. "Megarian Paradoxes as Eleatic Arguments." *American Philosophical Quarterly* no. 20:287-295.

    "The main result reached in the paper is that the Megarians were serious and brilliant philosophers, who in the course of defending views of Parmenides, raised powerful objections via the paradoxes attributed to Eubulides to standard views of the world. In the case of at least twoparadoxes, the Electra and the Sorites, I think the Megarian solutions can teach us a lot. I will briefly defend the Megarian's solution to the Electra and will refer the reader to recent papers by Peter Unger(9) and the author(10) for a defense of the Megarian solution to the Sorites.

    (...)

    "That even Euclid, let alone Eubulides, was an advocate of Parmenides' ideas at all is not conclusively supported by

Diogenes' claim that he read Parmenides' works. Ancient sources besides Diogenes do regard the Megarians as successors of the Eleatics, but are divided as to what Parmenidean doctrines they might be committed to.(14) The main argument I have that the paradoxes are designed to support Parmenidean conclusions is that such a hypothesis gives them a coherent focus and makes them into serious problems with metaphysical consequences. If the ascription of Parmenidean views to the Megarians turns what

the tradition treats as a melange of verbal tricks into a unified and serious program, that is strong evidence in favor of the ascription." (pp. 287-288)

41. White, Michael J. 1979. "An S5 Diodorean Modal System." *Logique et Analyse* no. 88:477-487.

"As is now well known, the alethic modalities were normally conceived in temporal terms by the ancients (1). In particular the Megarian logician Diodorus Cronos defined a possible proposition as one that either is now or will be true, an impossible proposition as one that is now false and will always be false, a necessary proposition as one that is now true and will always be true, and a nonnecessary proposition as one that either is now false or will be false (2).

The research — both historical and logical — of Arthur Prior has proven especially fruitful in the contemporary analytical study of «Diodorean modalities.»" (p. 477)

42. ———. 1980. "Facets of Megarian Fatalism: Aristotelian Criticisms and the Stoic Doctrine of Eternal Recurrence." *Canadian Journal of Philosophy* no. 10:189-206.

"The Megarians, as well as their Stoic heirs, are known to have been fatalists or logical determinists in the following, very broad sense of these terms: with respect to at least certain classes or kinds of nontautologous propositions, they held that the mere truth of a proposition entails its necessity.(1) This paper explores, in a very tentative fashion, the relation between several versions of logical determinism and two passages in the Aristotelian corpus [*], one of which is specifically directed against Megarian doctrine and the other of which is an argument purporting to establish a thesis concerning the necessity of future events which Aristotle wished to reject but which the Megarian logician Diodorus Cronus apparently accepted."

(1) This characterization of logical determinism is broad enough to include even Aristotle: he apparently held that all propositions 'about' the past and present are necessary. *Rhet.* Ill, 17, 1418a3-5; *De Int*. 9, 19a23-25; *Eth. Nic.* 2, 1 139b7-9; and *De Caelo* I, 12, 283b13 are cited by Jaakko Hintikka, "Aristotle and the 'Master Argument' of Diodorus," *American Philosophical Quarterly*, I (April 1964), pp. 101-2. However, Aristotle apparently wished to deny that 'future contingent' propositions are necessary. In order to do so, he at least toyed with the idea of withholding a truth value from such propositions. Vid. *De Int*. 9.

[*] *Metaphysics*, Θ, 3, *De interpretatione* 9.

43. ———. 1985. *Agency and Integrality: Philosophical Themes in the Ancient Discussions of Determinism and Responsibility*. Dordrecht: Reidel.

Chapter Three: *Diodorean Fatalism*, pp. 69-96.

"The basic elements of Diodorus' view are not difficult to ascertain. He retains a "positivistic" or "extensional" conception of the modalities but modifies slightly the conception attributed to the "Megarians" by Aristotle. According to Aristotle's account, the Megarian doctrine apparently is that "what is possible," from the present temporal perspective, is equivalent to "what is *now* actually the case." There is, however, what I believe is a natural tendency to interpret "what is, at present,

possible" in such a way that "present" has "widest scope": and, as a consequence, we tend to apply the phrase "what is, at present, possible" not only to what might be happening at the *present moment*, but also to what might happen in the future relative to the present time. There is, in other words, a temporally *prospective* aspect to the modality of possibility, or at least to some ordinary conceptions of possibility. (27) It is this temporal prospectivity that lends credibility to the premise Aristotle invokes against the Megarians in *Metaphysics* 9.3. Note that without the implicit assumption of the temporal prospectivity of possibility, the fact that the occurrence of an event is impossible now, at the present moment, is apparently irrelevant to the question of whether that event shall occur or fail to occur at some *future time*." (p. 73)

(2/) Hintikka makes essentially the same point in his discussion of the passage (*Time and Necessity*. pp. 197-199). However. far from being a "rather peculiar concept of possibility" (ibid. p. 197), the concept being exploited in the passage by Aristotle strikes me as a very commonly encountered concept."

44. ———. 1986. "What Worried the Crows?" *The Classical Quarterly* no. 36:534-537.

"A well-known epigram by Callimachus on the philosopher Diodorus Cronus (fr. 393 Pfeiffer) reads as follows:

αὐτο`ς ὁ Μῶμος

ἔγραφεν ἐν τοίχοις ‘ὁ Κρόνος ἐστι` σοφός’. [Blame (*Momus*) himself wrote on the walls "Cronus is wise]

ἠνίδε κοἰ κόρακες τεγέων ἔπι “κοῖα συνῆπται”

κρώζουσιν και` “κῶς αὖθι γενησόμεθα’. [And here the crows are, squawking from the rooftops "what conclusions follow?" or "how will we become again?]

The question of the third line, while perhaps recondite from a contemporary perspective, was clear in antiquity. The crows are asking' What follows (from what)?', in allusion to the Hellenistic disputes concerning the truth conditions of

conditional propositions (συνημμένα), disputes in which the views of Diodorus figured prominently.(1)

I agree with Sedley that the question of the last line is 'much more problematic'.(2)

The common interpretation has been to read the αὖθι as a form of αὖθις and to interpret it temporally. The result, in Pfeiffer's estimation, is 'quomodo posthac erimus?'.(3)" (p. 534)

(...)

"The crows' how-question is particularly apposite, then. Because of Diodorus' doctrine of temporal and spatial minima, the 'natural' answer cannot be given to their question how they will come to be at that very place they will later occupy. That is, Diodorus cannot admit that the crows get from one place to an adjacent minimal place by means of a continuous process or κῑ̆νησι ̆ς moving (κινεἰσθαι) that results

in the crows' gradually occupying less and less of the first place while occupying more and more of an adjacent minimal place. Rather, the crows simply are at rest in the first place during one time atom and, during the next time atom, they find themselves at rest at the adjacent minimal place. The crows' question, natural though it may be, is a question that Diodorus cannot answer." (p. 537)

45. Witt, Charlotte. 1995. "Powers and Possibilities: Aristotle vs. the Megarians." *Proceedings of the Boston Area Colloquium in Ancient Philosophy* no. 11:249-266.

"Book IX of the *Metaphysics* explores Aristotle's complex notion of *dunamis,* a term that its translators have rendered as

power, capacity,and potentiality.(1)I Book IX Aristotle uses words in the same family

to express the notion of possibility (δυνατός) and impossibility (ἀδύνατος) as well. These concepts—powers, potentialities and possibilities—differ markedly from one another. Powers and capacities

are abilities that an object has at present (given certain conditions) to enact or to suffer a change." (p. 249)

(...)

"My paper examines this difficult, but crucial, text in order to tease out the systematic connections, and differences, that Aristotle saw among the powers, potentialities and possibilities of substances." (p. 250)

(...)

"We find Aristotle's only direct argument concerning what is at stake philosophically in the notion of *dunamis* in his criticisms of the Megarians. As Aristotle introduces their position in the first few lines of Book IX, chapter three, the Megarians espoused the doctrine that the only capacities or powers that objects have are those that are manifest or actual. "There are some who say, as the Megaric school does, that a thing can act only when it is acting, and when it is not acting it cannot act" (1046b29-30). A person can build a house, only when she is actually building it; when she has ceased working, she can no longer build. A color can be seen only when it is actually being seen; when no longer being seen the color is no longer visible. Capacities exist only while and as long as they are being actualized. Although we will need to reconsider this point below, Aristotle's initial statement of the Megarian position holds that there exists no *dunamis* that is not being actualized, which is compatible with the idea that what an entity actually is doing, it is capable of doing. That is, capacities exist, but not independently of their being actualized." (p. 252)

(1) For example, Ross uses all three translations of *dunamis* in his translation of Book IX of the *Metaphysics* (Barnes (ed.)

1984).
46. Zeller, Eduard. 1877. *Socrates and the Socratic Schools*. London: Longmans, Green & Co.

Translation of the third edition of E. Zeller (1889).

Chapter XII. *The Megarian and the Elean-Eretrian Schools*, pp. 250-283.

"The starting-point of the Megarian philosophy must be looked for in Socrates' demand for a knowledge of conceptions. With this demand Euclid combined the Eleatic doctrine of a contrast between

sensational and rational knowledge. Distinguishing these two kinds of knowledge by their objects far more than by their form, he arrived at the conviction that the senses show us what is capable of change

and becoming, and that thought only can supply us with the knowledge of what is unchangeable and really existing. He stood, therefore, in general, on the same footing as Plato, and it is possible that this

view was simultaneously arrived at by both philosophers in their intellectual intercourse, and that owing to Plato Euclid was influenced by Heraclitus' view of the world of sense. Socrates had indeed

made the immediate business of thought to be the acquisition of a knowledge of conceptions. Conceptions, accordingly, represent that part of a thing which never changes. Not material things, butt

only incorporeal species, taught Euclid, admit of true being. The same view Stilpo expressed, when he refused to allow the general conception to apply to individual things, on the ground that a general

conception implies something quite different from every individual thing, and not like these having its origin in time. In this respect the Megarians again agree with Plato. Whilst Plato, however, regarded species as living spiritual forces, Euclid,

following in the steps of Parmenides, denied every kind of motion to being. He, therefore, reduced action and passion to the sphere of the becoming.

Of being, he asserted, you can neither predicate action, nor passion, nor yet motion." (pp. 261-262, notes omitted)

Selected Bibliography on the Megarians and the Dialectical School: Non-English studies

Études en Français

1. Boutot, Alain. 2001. "Heidegger et les Mégariques." In *Socrate et les Socratiques*, edited by Romeyer Dherbey, Gilbert and Gournat, Jean-Baptiste, 431-456. Paris: Vrin.

   "Le dialogue de Heidegger avec les Mégariques n'a pas eu lieu, et, à moins de forcer les textes ou de se contenter de vagues généralités, il est impossible de savoir ce que Heidegger aurait pu nous en dire.

   Cela est vrai, ou plutôt cela était vrai mais ne l'est plus tout à fait aujourd'hui, à savoir depuis la parution, en 1981, d'un cours donné à rÙniversité de Fribourg pendant le semestre de l'été 1931. Ce cours forme le tome 33 de la *Gesamtausgabe* et a été traduit sous le titre *Aristote. Métaphysique Θ 1-3, De 1'essence et de la réalité de la force*(9). Dans ce texte, Heidegger commente, de manière très détaillée, presque ligne à ligne, les trois premiers chapitres du livre 6 de la *Métaphysique* d'Aristote qui traite de la δὐναμις et de l'ενέργεια de la puissance et de l'acte. Or il se trouve que dans l'un de ces chapitres, le troisième, le Stagirite expose puis réfute une thèse des Mégariques dirigée contre sa doctrine de la puissance. Ce passage(10) est d' autant plus remarquable que c'est le seul endroit du corpus aristotélicien où les Mégariques sont nommément désignés, mis à part les mentions de Bryson(11) dans la *Rhétorique*(12), les *Seconds analytiques*(13) et les

Réfutations sophistiques(14). Heidegger évoque alors dans son commentaire ces penseurs en des termes extrêmement flatteurs: «Qui sont-ils?, demande-t-il. C'est ce que nous devons repérer par exemple à partir de ce passage d'Aristote. Car aucun de leurs 6crits ne nous est parvenu." (pp. 432-433)

(...)

"Avant d'être des dialecticiens, des théoriciens du logos, les Mégariques étaient des métaphysiciens, des théoriciens de l'être. Ils étaient associés à des débats ontologiques tout à fait fondamentaux, comme on peut le voir non seulement dans notre passage de la Métaphysique, mais encore dans le *Sophiste* de Platon(26). En bref, ils faisaient partie de ces penseurs de l' Antiquité pour qui l'être était encore un problème." (p. 434)

3. Hartmann, Nicolai. 1993. "Le concept mégarique et aristotélicien de possibilité. Contribution à l'histoire du problème ontologique de la modalité." *Laval Théologique et Philosophique* no. 49:131-146.

   Traduction de Hartmann (1937) par Jean-Pierre Narbonne.

   "La métaphysique de l'Antiquité tardive, et non moins celle du Moyen Age, sont dominées par le concept aristotélicien de possibilité, qui s'érige à partir de l'opposition de la dynamis et de l'energeia. L'ambiguïté interne de ce concept a tôt fait d'être remarquée, étant de fait déjà rendue sensible chez Aristote lui-même. On s'est pourtant attaché à ce concept, car on n'en trouvait aucun autre, qu'on aurait pu mettre à sa

   place." (p. 131)

   (...)

   "Compte tenu de ces circonstances, il est du plus haut intérêt, d'un point de vue historique, de constater que le concept aristotélicien de possibilité, dans la philosophie antique, n'a été ni le seul ni le premier. Avant lui en advint un tout autre, qui était tout à fait connu d'Aristote, qui a été par lui le plus énergiquement combattu et qui fut enfin presque supprimé. Celui-là est le concept de possibilité de l'École de Mégare,

   fondée par l'élève de Socrate, Euclide. Ce concept se situe à plusieurs égards beaucoup plus près de la relation réelle {*Realverhältnis*) de l'être-possible que la dynamis aristotélicienne, et il est contrairement à elle un véritable concept modal ontologique. Il n'a cependant — sauf dans la polémique du Stoïcisme — presque plus reçu d'attention chez les philosophes plus tardifs; sans doute pour aucune autre raison que, dans la

   perspective aristotélicienne toujours plus dominante, il ne pouvait que paraître absurde.

   Ce concept mégarique de possible énonce: «Seul est possible, cela qui est réel»; ou encore «une chose est seulement possible, quand elle est réelle». C'est sous cette forme que ce concept

nous est transmis, de manière apparemment fidèle, par Aristote(3)." (p. 134)

(3) Métaph. G. 1046 b, 29 f: («Il y en a certains qui prétendent, comme par exemple les Mégariques, qu'il y a seulement puissance lorsqu'il y a acte, et que lorsqu'il n'y a pas acte, il n'y a pas puissance»).

4. Henne, Désiré. 1843. *École de Mégare*. Paris: Cez Joubert, libraire-éditeur.

"Ce qu'on va lire n'est pas le panégyrique d'Euclide; moins encore celui de son école. La place de l'école mégarique nous semble à jamais marquée parmi les écoles de second ordre, et il y aurait abus à inscrire

le nom d'Euclide sur la liste des vrais grands hommes.

Toutefois, en considérant l'histoire générale des doctrines et le progrès continu de la pensée philosophique, on trouve que l'école d'Euclide a une très-grande importance. Si l'on demandait quelle est celle des écoles antiques qui s'est jetée avec le plus d'ardeur dans le mouvement de la philosophie contemporaine; celle qui se lie le plus étroitement aux écoles qui l'ont précédée, qui a le plus influé sur celles qui l'ont suivie, ce serait peut-être l'école de Mégare qu'il faudrait nommer. C'est qu'en effet elle touche à tout. Les plus grands noms de la philosophie grecque sont ceux de ses précurseurs, de ses alliés, de ses adversaires. Héritière de Parménide, fille de Socrate, elle a eu Platon pour élève, les écoles d'Elis et d'Erétrie pour appendices; elle a lutté contre les successeurs d'Héraclite et de Démocrite, contre Aristote et contre Platon

lui-même. Enfin, elle s'est perpétuée en deux de ses disciples dont l'esprit vit encore dans ce monde, Pyrrhon d'Elis, Zénon de Cittium." (pp. 9-10)

(...)

Or, c'est un fait avoué d'Aristote lui-même, qu'avant lui les Mégariques avaiént logiquement distingué l'acte et la puissance, et résolu d'après leurs idées systématiques la question des rapports qu'ils ont entre eux. Un autre titre de

gloire d'Aristote, c'est d'avoir tiré de l'analyse des divers procédés de l'intelligence les lois de l'intelligence elle-même. Or, avant l'auteur de l' *Organum*, Euclide et les dialecticiens de son école

s'étaient exercés sur ces matières, et c'est une remarque de Diogène de Laërte que Clinomaque de Thurium, l'un d'eux, est le premier qui ait écrit *sur les propositions, les prédicats et autres sujets de cette nature* (1). Le stoïcisme a les mêmes origines. D'abord, sa dialectique fut purement mégarienne." (pp. 10-11)

5. Humbert, Jean. 1967. *Socrate et le petits socratiques*. Paris: Presses universitaires de France.

Sommaire: Première partie: Socrate; Deuxième partie: Les petits socratiques: I. Eschine; II. Antisthène; III. Aristippe; IV. Euclide; V. Phédon; VI. Autres socratiques.

"Nous voyons bien que l'originalité d'Euclide consiste principalement dans la synthèse d'une logique de type éléatique et d'une éthique de type socratique : mais la grande difficulté pour nous est de nous représenter comment fonctionnait un système de l'un constitué d'une métaphysique de la connaissance et d'une éthique qui, du moins chez Socrate, écartait toute métaphysique. Assurément il n'y avait pas incompatibilité rédhibitoire entre certaines formes de l' éléatisme et le mouvement socratique : dans le *Parménide* Platon exalte le fondateur de cette école aux dépens de son disciple Zénon ; mais il faut dire que Platon, entraînant lui aussi l'enseignement de Socrate vers une métaphysique, voyait dans les positions propres de Parménide comme une garantie pour sa théorie des Formes, fort étrangère à la pensée même de Socrate. Si Euclide n'a pas été qu'un éristique essentiellement négatif comme l'ont été après lui les Mégariques ou s'il ne s'est pas immobilisé dans la contemplation de l'un qui est le Bien, si cet esprit si pugnace

ne s'est pas contenté de s'enivrer d'unité, il semble que cela n'a pu se produire que suivant l'hypothèse que propose L. Robin dans sa *Pensée grecque*(803) : le Bien unique est l'être de chaque essence qui garde son immuable unité et exclut l'Autre comme un non-être. Comme on suppose que la pensée est susceptible d'atteindre chaque essence, l'unité du Bien n'empêche point de passer d'une essence à l'autre. Suivant

l'heureuse formule de L. Robin « l'unité du bien n'est pas plus incompatible avec la pluralité des essences que l'unité de l'être avec la pluralité des atomes ». Euclide aurait abouti à une sorte d' « atomisme logique », à une dialectique « morcelante », que peut-être Platon a en vue dans le *Sophiste* quand il défend la réalité de l'Autre et du Non-Être. Il semble qu'il n'y a pas d'autre moyen d'expliquer le fonctionnement

de cette éthique socratique à base éléatique."

6. Mallet, Charles Auguste. 1845. *Histoire de l'école de Mégare et des écoles d'Élis et d'Éretrie*. Paris: Maire-Nyon, Libraire.

"La méthode que j'ai suivie déjà dans mon *Histoire de la Philosophie Ionienne*, m'a paru également applicable à cette nouvelle publication.

Ici encore j'ai adopté pour plan une série de monographies., précédées d'une introduction générale, cherchant ainsi à concilier l'aperçu synthétique de l'ensemble avec l'exposé analytique des détails.

Indépendamment des documents qui nous sont fournis par l'antiquité, et qu'on rencontre épars dans Platon, dans Aristote, dans Diogène de Laërte, dans Sextus, dans Plutarque, dans Eusèbe, dans Athénée, dans Cicéron, dans Aulu-Gelle, j'ai dû m'entourer des principaux travaux publiés plus récemment, et surtout en Allemagne, sur la philosophie mégarique. L'excellent travail de M. Deycks [*] m'a été surtout d'un très-utile et puissant secours. Toutefois, je me suis imposé la loi de ne faire de mon livre ni un commentaire, ni surtout une reproduction de la dissertation de ce savant critique. J'ai voulu exposer les

doctrines des Mégariques d'après mes propres recherches, et apprécier ces doctrines d'après mes propres impressions.

Aussi, ai-je proposé, sur plusieurs points importants de cette philosophie, des solutions tout à fait différentes de celles que les travaux de Schleiermacher et de Deycks ont accréditées en Allemagne, et que l'autorité attachée au nom de ces grands critiques ont fait adopter chez nous.

L'histoire d'une école philosophique dont tous les travaux ont péri, offre toujours de graves difficultés. Mais peut-être ces difficultés augmentent - elles encore quand il s'agit d'une philosophie contentieuse et subtile, comme fut celle de Mégare. Ce serait mon excuse, j'espère, auprès de ceux qui jugeraient qu'il reste en ce travail, des points à compléter ou à éclaircir." (pp. III-IV)

7. Muller, Robert. 1988. *Introduction à la pensée des Mégariques*. Paris: Vrin.

Table des matières: Première partie: Préliminaires méthodologiques et historiques. 1. Problèmes généraux de la connaissance et de l'interprétation de l'École de Mègare 11; I. Historique 33; Deuxième partie: La philosophie mégarique: essai d'Interprétation. I. La visée éthique 71; II. Un rationalisme abstrait 83; III. La dialectique 111; Troisième partie et Conclusion. I. Le rôle de Dodore et de Stilpon 185; II. Le Destin de l'École de Mègare 198; Appendice: L'édition de Döring et l'édition de Giannantoni 205; Index des fragments 221; Note bibliographique 223; Index nominum 227-232.

"Avant-propos. Longtemps délaissés, les Mégariques sont depuis peu l'objet d'études de plus en plus nombreuses. Venant après quelques articles remarquables mais trop discrets, le travail le plus décisif de ces dernières années a sans doute été la publication par K. Döring de la quasi-totalité des fragments et témoignages concernant cette école, dans une édition fiable et commode: *Die Megariker. Kommentierte Sammlung der*

Testimonien, Amsterdam, Grüner, 1972. L'importance de cet ouvrage nous a incité à proposer une traduction française, assortie d'un commentaire, des textes de Döring: *Les Mégariques. Fragments et témoignages,* Paris, Vrin, 1985. A peu près en même temps paraissaient deux autres publications comparables, l'une de L. Montoneri *(I Megarici. Studio storico-critico e traduzione delle testimonianze antiche*, Università di Catania, 1984), et l'autre de G. Giannantoni *(Socraticorum reliquiae,* Roma, Ed. dell'Ateneo, 4 vol., 1983-85 - mais disponibles en 1985 seulement) (1). On ne peut que se féliciter de cette soudaine richesse, en dépit des inconvénients qui résulteront des numérotations différentes dont les textes mégariques sont désormais affectés.

Il nous a semblé qu'il convenait de contribuer à cette renaissance en offrant au lecteur non-spécialiste un aperçu systématique -- quoique moins ambitieux -- de l' état de nos connaissances sur le sujet. Tel est donc l'objet du présent ouvrage, qui s'efforce de ne pas faire double emploi avec notre publication précédente. Ce livre se distingue du précédent sur deux points: 1. le commentaire fragment par fragment ne permettant guère les vues d'ensemble, nous avons au contraire cherché ici à présenter une vision plus synthétique de la philosophie mégarique, voire -- pour autant que la documentation l'autorise, et justement parce que cette documentation fragmentaire a trop souvent servi de prétexte à des recherches ponctuelles -- une tentative de reconstruction de la doctrine, dans son unité et sa cohérence; 2. les mêmes raisons font que certains développements particuliers intéressant des fragments éloignés les uns des autres (le problème des Amis des Idées du *Sophiste,* le contexte et la nature exacte de la dialectique mégarique), ou impliquant une mise en perspective des auteurs les uns par rapport aux autres (l'évolution de l'école), ne pouvaient trouver leur place et leur portée que dans ce cadre-ci.

Enfin, nous avons jugé utile d'ajouter en appendice une courte comparaison des deux éditions de fragments disponibles et auxquelles on devra désormais se référer, suivie de deux tables de concordance destinées à faciliter la confrontation."

(1) Comme l'indique son titre, ce dernier recueil est beaucoup plus large puisqu'il concerne tous les (Petits) Socratiques. Le vol. I contient les textes relatifs aux Socratiques en général (section I), aux Mégariques (sect. II); aux philosophes d'Elis et d'Erétrie (sect. III), et aux Cyrénaïques (sect. IV); le vol. II est entièrement consacré à Antisthène et aux Cyniques. Le vol. III comprend les "notes" (en fait, une série de chapitres sur les principaux auteurs et les problèmes concernant leurs écoles, dont l'ensemble constitue un commentaire très substantiel des deux premiers vol.); le vol. IV enfin, la bibliographie et deux index (les sources; les noms propres).

8. ———. 2008. "A propos du possible mégarique." In *Dunamis. Autour de la Puissance chez Aristote*, edited by Crubellier, Michel, Jaulin, Annick, Lefebvre, David and Morel, Pierre-Marie, 303-325. Louvain-la-Neuve: Peeters.

   "Comme intepréter la nègation mégarique de la puissance?

   (...)

   "Sur le fond, la problématique de la puissance ou du possible engage la réflexion dans des directions multiples et des aventures périlleuses qu'on ne saurait examiner ici. A cela s'ajoute que pour les Mégariques la documentation est disparate, ce qui rend malaisé le «retour au texte»; il faudrait en effect se pencher sur un grand nombre de passages difficiles à réunir en un temps limité, parfois assez longs (le livre Θ de la *Métaphysique*, par exemple), et parfois empruntés à des problématiques de prime abord étrangères à la question (la doctrine du mouvement). Je vous propose en conséquence un projet plus modeste: voir si l'on ne pourrait pas éclairer la position mégarique en l'interprétant comme une réaction critique à un usage lui-même ambigu, voire contradictoire, des notions de puissance et de possible. Toutefois, dans la mesure où les formules controversées sont le plus souvent citées allusivement et hors contexte, il me paraît nécessaire de faire d'abord une revue rapide de la documentation et de la façon dont elle est ordinairement comprise. Ce n'est qu'ensuite que j'essaierai de comprendre ce qui est exactement refusé par la définition mégarique du possible, et de montrer que ce refus

s’accompagne d’une avancée de la position de l’école sur la question des événements, et partant de la liberté." (pp 303-304)

(…)

"Les sources sur lesquelles reposent les discussions autour du possible mégarique sont peu nombreuses, mais disparates et difficiles à interpréter : d’abord parce qu’on a affaire à des citations ou commentaires d'auteurs très différents (Aristote et ses commentateurs, Cicéron, Epictète, Plutarque), et ensuite parce que les préoccupations et les intentions de ces auteurs ne sont pas immédiatement claires (il s’agit généralement de critiques de la position mégarique, mais pas toujours; en outre la position mégarique ne constitue pas l’objet direct ou premier du texte, elle n’apparaît qu’incidemment dans le cours du débat). La part de reconstruction et d’interprétation est donc particulièrement forte, ne serait-ce que parce que nous réunissons dans une même discussion des sources qui ne parlent pas tout à fait de la même chose. Cela dit, voyons rapidement quels sont les textes qui d’une façon ou d’une autre nous informent sur la doctrine du possible:

1. Aristote, *Métaphysique* Θ 3 (fr. 130 A), qui affirme que selon les Mégariques «il n’y a puissance que quand il y a acte» (ὁταν ἐνεργη μόνον δὐνασθαι); formule lapidaire qu’il convient de compléter par la discussion des chapitres 3 et 4 en entier;

2. Diodore, cité par divers auteurs:

a) la définition du possible seule: «est possible ce qui est ou sera |vrai]» (fr. 133, 134, 136, 137, 138, et 139);

b) en rapport avec l’argument Souverain (κυριεὐων λὀγος), dont on dit qu’il sert à établir la définition diodoréenne du possible: fr. 131, 135, et probablement 132 (le Souverain n’est pas explicitement nommé);

c) la définition du possible utilisée dans la doctrine de la proposition ou du raisonnement conditionnel (συνημμένον) (fr. 140 143)." (p. 305)

[Les réfèrences sont à R. Muller (éd.), *Les Mégariques. Fragments et témoignages*, Paris : Vrin, 1985.]

9. Rosen, Stanley. 1982. "La critique aristotélicienne des Mégariques." *Les Etudes Philosophiques*:309-330.

   "Pour conclure j'ai suggéré que le problème sous-jacent à la controverse entre Aristote et les Mégariques n'est autre que celui de la nature du néant (et par limitation du non-être). On pourrait aussi exprimer

   ce problème de la façon suivante : pour Aristote comme pour Platon, être, c'est être quelque chose de défini, c'est, comme nous dirions aujourd'hui, être comptable ou nommable(47). Un *genus* ne peut être que

   cette espèce-ci ou cette espèce-là en acte; une *ousia* ne peut admettre que l'un des deux contraires à la fois; et, pour ne faire que mentionner ce que je regarde comme une difficulté sérieuse en soi, de la même

   façon exactement que la perception du sensible ne peut saisir que l'une de deux perceptions contraires à la fois (e.g. le froid ou le chaud), de même l'intellect ne peut comprendre qu'un *eidos* à la fois, quoiqu'il

   doive être les autres en puissance. Pour un Mégarique pourtant, puisque l'être est un, l'exigence de choisir« ceci» ou« cela» est rejetée ou classée comme apparence ou illusion. La puissance, dans la *technè*, de construire, n'est pas distincte ontologiquement de l'activité de construire. Dans sa formulation la meilleure possible, la thèse mégarique mène à ou tend vers Hegel. Pourtant, la version éléatique elle-même est une alternative honorable à Aristote, pourvu qu'elle soit exposée d'une façon honorable."

10. Slama, Paul. 2016. *Elementa logicae heideggerianae. Heidegger interprète d'Aristote : logos, être et temporalité*. Bruxelles: Éditions Ousia.

    Quatrième partie: *Logos* et temporalité : Heidegger, Aristote, et les Mègariques: Chapitre 1 : Heidegger et les Mégariques : la

réalisation comme horizon de la *dunamis*, 349; Chapitre 2 : Interpretation phénoménologique de *De Int*. 9 : *logos* et finitude, 395-478.

"En effet : il y a des lieux essentiels où Heidegger évoque les Mégariques. Il les évoque dans le grand cours sur le *Sophiste* de 1924/25, mais sans manifester de réelle connaissance sur la secte, ni sans montrer sa pertinence philosophique - elle ne sert qu'à mettre en scène Antisthène et sa thèse sur le discours faux. En revanche, dans le cours de 1931 sur *Mét*. Θ 1-3, les développement sur l'école de Mégare sont nombreux et d'une grande profondeur, certes orientés vers Θ 3 et la discussion qu'on y trouve avec les Mégariques." (p. 354, notes omises)

2. Cambiano, Giuseppe. 1971. "La Scuola megarica nelle interpretazioni moderne." *Rivista di Filosofia* no. 62:227-253.

   "Rassegna delle interpretazioni della Scuola Megarica a partire dagli inizi dell'Ottocento: dalle ricostruzioni tendenziose di Tennemann e Hegel alle ricerche di Schleiermacher, Deycks, Henne e altri, dalla presentazione negativa della logica megarica dovuta a Prantl e Zeller e combattuta da Grote e Gomperz sino alla storiografia del Novecento, che ha insistito soprattutto negli ultimi decenni sull'importanza della logica Megarica (Lukasiewicz, Mates, Kneale). ma la filosofia Megarica, benchè sia un campo ampiamente esplorato, sembra costituire ancor oggi uno dei problemi piu difficili per la ricerca storica, filologica e filosofica."

3. ———. 1977. "Il problema dell'esistenza di una scuola Megarica." In *Scuole socratiche minori e filosofia ellenistica*, edited by Giannantoni, Gabriele, 25-53. Bologna: Il Mulino.

   "Se esiste, dunque, un filo documentato che lega tra loro tutti gli appartenenti alla scuola megarica, questo è per noi costituito soltanto da questi esigui appellativi di 'eristico' e 'dialettico' . Certo non erano appellativi che andavano ad essi soltanto, ma questa tendenza abbastanza generale delle fonti nell'usarli non

può essere del tutto casuale. All'ipotesi dell'esistenza di una scuola megarica vorrei sostituire un'altra

ipotesi: le denominazioni 'eristico' e 'dialettico' dipendevano dalla costruzione degli schemi di successione e riflettevano il contributo fornito all'elaborazione di questi stessi schemi dall'interesse per la problematica e il metodo dialettico, comune a tutti questi pensatori - anche se non solo ad essi (ma negli altri casi si trattava di pensatori, ad esempio stoici, che potevano ricevere una collocazione meno controversa in una scuola). Gli storici della filosofia di età tardo-ellenistica avevano di fronte a loro ben documentata l'esistenza di scuole istituzionali, con successioni al loro interno: si pensi agli elenchi degli Accademici e degli Stoici, che sono stati conservati. Non poteva non essere tentante l'utilizzazione della categoria di scuola per sistemare tutte le informazioni concernenti i filosofi antichi, generalizzando all'indietro una realtà del loro tempo e, comunque, risalente almeno sino all' Accademia platonica.

(...)

"Le tre denominazioni della scuola, ricordate da Diogene Laerzio, Megarica, Eristica e Dialettica possono essere contemporanee all'attività dei filosofi che la storiografia posteriore classificò sotto di esse. Sappiamo che Megarici era un'espressione già usata da Aristotele e dialettici e eristici erano termini all'ordine del giorno nel linguaggio dell'Accademia.

Ma il progetto di costruire classi abbastanza rigorose di filosofi megarici, eristici e dialettici dovette essere proprio della storiografia filosofica ellenistica. Partendo da Stilpone la denominazione Megarici era pienamente giustificata, ma non lo era più partendo da Diodoro, dal momento che non è nota un'attività di apprendimento e/o di insegnamento di Diodoro a Megara. Non solo, ma l'appellativo Megarico

non poteva adattarsi neppure a molti altri, antecedenti sia a Stilpone sia a Diodoro. Ciò può spiegare il ricorso alla denominazione più generale, e necessariamente più vaga, di Dialettica, che sottolineava una proprietà comune a quella

catena di filosofi che doveva ricondurre da Stilpone e Diodoro a Socrate. Il fatto che nell'elenco di 10 *airéseis* fornito da Diogene Laerzio I, 18 - 19 possano essere istituite le connessioni

Megarica-Dialettica e Cinica-Stoica potrebbe anche suggerire l'ipotesi che la denominazione Dialettica fosse un corollario della tesi storiografica che ricollegava lo stoicismo al cinismo e non al megarismo, nel senso che il megarismo sarebbe confluito nella Dialettica e non nello stoicismo." (pp. 50-51)

4. Casari, Ettore. 1958. "Sulla disgiunzione nella logica megarico-stoica." In *Actes du VIIIe Congres international d'histoire des sciences : Florence-Milan, 3-9 septembre 1956*, 1217-1224. Paris: Hermann.

5. Celluprica, Vincenza. 1982. "Necessità megarica e fatalità stoica." *Elenchos* no. 3:361-385.

6. Donini, Pierluigi. 1977. "Stoici e Megarici nel *de fato* di Alessandro di Afrodisia?" In *Scuole socratiche minori e filosofia ellenistica*, edited by Giannantoni, Gabriele, 173-194. Bologna: Il Mulino.

   "Al trattato di Alessandro gli studiosi moderni hanno costantemente rivolto l'accusa di professare, nella sua parte costruttiva, una dottrina non genuinamente aristotelica, ma influenzata dallo Stoicismo, e di non riuscire nelle pagine polemiche ad argomentare in modo sempre pertinente contro gli Stoici : tutto questo, benché non una sola volta Alessandro nomini esplicitamente gli Stoici, o un qualsiasi stoico,

   nemmeno come bersaglio della sua polemica. È forse tempo, allora, di suggerire che la parte dello Stoicismo possa essere, nel *de fato*, minore di quella che comunemente si assume, soprattutto nella funzione di ispiratore di Alessandro, ma anche in quella di suo obiettivo polemico. Ed è poi importante domandarsi chi siano gli avversari di Alessandro, là dove sia dimostrato che non sono gli Stoici ." (p. 173)

   (...)

   "In ogni caso, non si potrà più ragionevolmente sostenere che il trattato di Alessandro sia uno scritto di polemica antistoica, e

non si potrà indiscriminatamente indicare come stoIca ogni tesi combattuta da Alessandro. Non si potrà però nemmeno dare una paternità assolutamente precisa alle tesi non stoiche combattute da Alessandro. Se infine è vero che il grande commentatore, vissuto fra il II e il III secolo si sente già cosè insicuro a proposito delle dottrine dei Megarici, sembrerà giusto domandarsi quanto di valido resti nelle testimonianze sui Megarici fornite da autori di età ancor più recente, o di acume, dottrina e scrupolo minori di quelli di cui era fornito Alessandro. Ma questo è un discorso che non poteva più essere sviluppato qui." (p. 194)

7. Ettari, Dario. 2002. "La polemica sul possibile nel IV secolo a.C. [Aristotele, Filone, Diodoro Crono, Crisippo] in una interpretazione moderna." *Metalogicon* no. 15:27-32.

   "Il passo aristotelico sopra riportato [Aristotele,. Metaphysica, 1046b – 1047a] polemicamente indirizzato contro una tesi "megarica" non meglio precisata, mentre da un lato conferma il convincimento del suo autore circa il sussistere di uno stadio particolare dell'essere – vale a dire quello dell'essere-in-potenza come divenire, movimento – dall'altro lato offre un importante "aggancio" teorico per una comprensione della concezione aristotelica – ed indirettamente di quella megarica – del possibile, intorno al quale sorse nel IV secolo a. C. un fervido dibattito i cui protagonisti possono individuarsi appunto in Aristotele, nei Megarici (in particolare Diodoro Crono e Filone di Megara) e nel grande stoico Crisippo, ma la cui eco giunse fino a personaggi molto posteriori quali Alessandro di Afrodisia, Cicerone, Boezio, che ce ne lasciano

   importanti testimonianze."

   (...)

   "È comunque prassi storiografica comune attribuire appunto a Diodoro la tesi confutata da Aristotele, tesi che è formulabile all'incirca nei termini seguenti: *possibile è soltanto ciò che è o sarà* (3) laddove viceversa ciò di cui non si dà mai il caso avrebbe la caratteristica della impossibilità." (p. 28)

    Libro Quarto: Socrate e i socratici; Capitolo VIII: I Megarici e le tendenze affini, pp. 607-660.

    "Nuovi Elea ti: così potrebbero essere indicati i Megarici. E la novità consiste in ciò, che gli antichi motivi speculativi trovano una nuova materia cui applicarsi nella filosofia socratica del concetto. Ciò si mostra chiaro non appena si prendano in considerazione i due problemi capitali dei quali si occuparono. In linguaggio dotto essi vengono indicati come *problema della inerenza* e *problema della predicazione*.

    (...)

    "Come si vede, le due questioni si riducono in fondo ad una sola, a quella concernente il *rapporto dell'unità con la pluralità*. Gli Eleati avevano negato ogni e qualsiasi possibilità di un tale rapporto. Precisamente lo stesso fanno i loro prosecutori, i Megarici. Solo che gli Eleati avevano specialmente fatto oggetto di considerazione la pluralità nella· successione, *il problema del mutamento*, e ciò in quanto le loro menti erano dominate dai due postulati della materia che si erano lentamente venuti costituendo attraverso le ricerche dei fisiologi." (pp. 614-615)

12. Kneale, William Calvert, and Kneale, Martha. 1972. *Storia della logica*. Torino: Einaudi.

    A cura e con una premessa di Amedeo G. Conte.

Capitolo III: *I megarici e gli stoici*, pp. 131-207.

"Mentre la teoria logica d'Aristotele sembra sia stata promossa soprattutto dalla riflessione sopra la dimostrazione quale ricorre, ad esempio, in geometria, sembra invece che i megarici abbiano concentrato

l'attenzione sulla dialettica di Zenone e su quelle dispute di ogni giorno onde nacque ciò che Platone ed Aristotele chiamano eristica. O almeno, è facile vedere come le caratteristiche delle argomentazioni dei megarici possano essere nate dall'aver essi concentrato l'attenzione su ciò, ed è attestaita un'ascendenza eleatica. Euclide, fondatore della scuola megarica, sembra abbia studiato le opere di Parmenide,(1) e Diodoro Crono, uno dei membri piu eminenti della scuola, sembra abbia costruito argomenti contra la possibilità del movimento.(2) Ed è significativo che la logica stoica fosse chiamata dialettica.(3)" (p. 131)

(...)

"I megarici apportarono tre contributi importanti allo sviluppo della logica: l'invenzione di numerosi interessanti paradossi, il riesame delle nozioni modali, l'inizio d'un importante dibattito sulla natura degli asserti condizionali." (p. 138)

Ristampa: Roma, Libreria Editrice Aseq, 2010.

"In breve, si può dire che l'opera di Euclide consiste nello sforzo di conciliare e fondere i due insegnamenti che aveva ricevuto; infatti egli ritiene che il solo pensiero arreca la conoscenza vera la quale ha per oggetto un'unica realtà, che da una parte assume l'aspetto della rielaborazione ontologica dell'eticismo socratico compiuta nel senso del monismo parmenideo, dall'altra appare interpretazione etico-religiosa (derivante dal

Socratismo) della metafisica eleatica. Nella confutazione delle opinioni degli avversari, Euclide, e molto più di lui i suoi discepoli, si vale di un ἔλεγχος che fa predominare il momento eristico sul socratico, ma riceve significato e valore etico dal fine cui è rivolto." (p. 466)

17. Mondini, Ugo Carlo Luigi. 2017. "La preoccupazione filosofica dei corvi nel fr. 393 Pf. di Callimaco." *Acme. Annali della Facoltà di studi Umanistici dell'Università degli Studi di Milano* no. 1:61-72.

    Abstract: "Riguardo alle due domande poste dai corvi nel fr. 393 Pf. di Callimaco la critica moderna ha proposto varie interpretazioni, suscitate in parte dal commento di Sesto Empirico al passo. Corroborando la tesi già sostenuta da H. Kurzová [*], questo contributo cerca di spiegare le due domande come allusione al più conosciuto argomento dialettico di Diodoro Crono, il κυριεύων λόγος. Inoltre si tenterà di capire la fonte da cui Sesto ha tratto il distico, per valutare il suo strano commento."

    [*] *What worried the crows in Callimachus' epigram* (2009).

    Callimaco fr. 393 Pfeiffer:

    αὐτο῀ς ὁ Μῶμος

    ἔγραφεν ἐν τοίχοις ‘ὁ Κρόνος ἐστι῀ σοφός’.

    ἠνίδε κοὶ κόρακες τεγέων ἔπι ‘κοῖα συνῆπται’

    κρώζουσιν και῀ ‘κῶς αὖθι/αὖθις1 γενησόμεθα’.

“Momo stesso scriveva sui muri: «Crono è sapiente»” (Diogene Laerzio, libro II, 111, tr. Reale, p. 261)

“Senti come anche dai tetti i corvi gracchiano: « Quante Cose si sono congiunte? » e « Come di nuovo vivremo? »” (tr. Russo, p. 102)

18. Pelucchi, Marco. 2016. "Callimaco, il Fedone e la scuola filosofica cirenaica nell'epigramma per Cleombroto (Call. 23 Wil.)." *Acme. Annali della Facoltà di studi Umanistici dell'Università degli Studi di Milano* no. 69:93-109.

    Abstract: "Muovendo dall’epigramma per Cleombroto (*AP* 7,471 = 23 *Wil.* = 53 G.-P.), l’articolo si propone di rivalutare la posizione di Callimaco rispetto a un autentico interesse per la filosofia. Contro le interpretazioni più recenti, che hanno letto l’epigramma alla luce di una polemica innanzitutto “metacomunicativa”, si cerca di mostrare come l’intento ironico dei versi possa essere compreso pienamente solo ammettendo una simpatia di Callimaco per la scuola cirenaica. L’epigramma sembra dunque presupporre una critica alle tesi sostenute nel *Fedone*, in effetti incompatibili con le dottrine dei Cirenaici, che non dovevano condividere la lettura platonica dell’insegnamento di Socrate, almeno per come questa emerge nel dialogo. È così possibile riconoscere la *pointe* dell’epigramma nell’intenzione di mostrare le tensioni interne al *Fedone*, specificamente in merito alla questione del suicidio."

Deutsche Studien

1. Döring, Klaus. 1989. "Gab es eine Dialektische Schule?" *Phronesis* no. 34:293-310.

    English abstract: "Until recently, students of ancient philosophy have generally believed that Diodorus Cronus was a member of the Megarian school founded by Socrates' pupil Euclides of Megara. In 1977, however, David Sedley claimed that Diodorus should be associated with the so-called Dialectical school. The article argues against this view. The main results are (1) There are no testimonies which suggest that we should distinguish between Megarians and Dialecticians. (2) The so-called Dialectical school never existed; it is a construct of ancient historians of philosophy."

"Ich fasse zusammen.

Die Sichtung der Zeugnisse hat vor allem zu den folgenden beiden Ergebnissen geführt: 1. Weder aus der Zeit um 300 noch aus späterer Zeit gibt es Zeugnisse, die dazu zwängen oder es auch nur nahelegten, in Zukunft anders, als es bisher üblich war, zwischen Megarikern und Dialektikern zu unterscheiden und Stilpon den Megarikem und Diodor den Dialektikern zuzuordnen. 2. Versteht man unter einer philosophischen Schule, wie wir dies bewußt oder unbewußt üblicherweise tun, eine über mehrere Generationen hin durch bestimmte institutionelle Bindungen, vor allem aber durch einen Fundus gemeinsamer Gundüberzeugungen zusammengehaltene Gemeinschaft philosophisch interessierter und gebildeter Personen, dann hat es eine Megarische Schule nie gegeben." (p. 309)

(...)

"Liegen die Dinge so, wie ich sie gerade skizziert habe, dann können wir Diodoros Kronos und seinen Schüler Philon in unseren Philosophiegeschichten und die sie betreffenden Testimonien in unseren Textsammlungen guten Gewissens an dem Ort belassen, an dem sie bis jetzt gestanden haben, bei den Megarikern. Wir müssen nur darauf achten, daß wir mit der Bezeichnung "Megariker" keine falschen Vorstellungen verbinden." (p. 310)

6. Giannantoni, Gabriele. 1993. "Die Philosophenschule der Megariker und Aristoteles." In *Dialektiker und Stoiker. Zur Logik der Stoa und ihrer Vorläufer*, edited by Döring, Klaus and Ebert, Theodor, 155-165. Stuttgart: Franz Steiner Verlag.

   "Das Thema meines Vortrages ist die Polemik des Aristoteles gegen die Megariker.

   Diese Polemik ist in doppelter Hinsicht bedeutsam: Einmal wegen des ihr innewohnenden philosophischen Gehalts, zum anderen wegen der möglichen Konsequenzen, die sich aus ihr für eine historische Rekonstruktion der sogenannten megarischen Schule ergeben. Nicht umsonst hat dieser Gegenstand immer wieder das Interesse der Historiker der antiken Philosophie und der Logik auf sich gezogen, und vor einiger Zeit wurde die antimegarische Polemik des Aristoteles erneut einer systematischen Prüfung unterzogen. Es handelt

sich um die Arbeit eines italienischen Kollegen, Aldo Magris,(1) in der gegen K. von Fritz und gegen Döring die Meinung vertreten wird, die eleatische Komponente im Megarismus sei seit Euklid von zentralem Gewicht gewesen. Dies erkläre die Polemik des Aristoteles, die noch an einer ganzen Reihe anderer Stellen in seinem Werk spürbar sei, auch wo die Megariker nicht ausdrücklich genannt werden.

Aus meinen Ausführungen wird hervorgehen, daß ich die These nicht für richtig halte. Zunächst möchte ich mich jedoch darauf beschränken, die in diesem Zusammenhang bekannteste Stelle bei Aristoteles näher zu untersuchen, aus der eine antimegarische Polemik mit Sicherheit hervorgeht, da hier die Megariker ausdrücklich genannt und kritisiert werden." (p. 155)

7. Göbel, Christian. 2002. "Megarisches Denken und seine ethische Relevanz." *Classica et Mediaevalia* no. 53:123-140.

   English abstract: "The most famous concept of possibility and necessity in Antiquity is the Aristotelian one. However, there was a totally different understanding in ancient Greek philosophy: in the Megarian school, possibility was seen as only a modal moment within the real. The present paper suggests a re-reading of this concept in order to explore its implications, its possibilities and challenges. Here, ‘Megarian thinking’ is understood in the larger sense of a philosophical ‘facticism’. Thus, Parmenides of Elea and Aristippus of Cyrene can be seen as ‘Megarian thinkers’ and the onto-theological and ethical relevance of this kind of thinking becomes obvious. "

8. Hartmann, Nicolai. 1937. "Der Megarische und der Aristotelische Möglichkeitsbegriff. Ein Beitrag zur Geschichte des ontologischen Modalitätsproblems." *Sitzungsberichte der Preußischen Akademie der Wissenschaften* no. 10:85-100.

   Nachdruck in N. Hartmann, *Kleinere Schriften*, Band II: *Abhandlungen zur Philosophie-Geschichte*, Berlin: Walter de

Gruyter 1955, ss. 85-99.

Traduction française: "Le concept mégarique et aristotélicien de possibilité. Contribution à l'histoire du problème ontologique de la modalité", *Laval Théologique et Philosophique*, 49, pp. 131-146.

"Die Metaphysik des späteren Altertums, und nicht weniger die des Mittelalters, ist beherrscht vom Aristotelischen Möglichkeitsbegriff, der sich auf dem Gegensatz von Dynamis und Energeia aufbaut. Die innere

Zweideutigkeit dieses Begriffs ist früh bemerkt worden, ja sie machte sich schon bei Aristoteles selbst fühlbar. Dennoch hielt man an ihm fest, denn man fand keinen anderen, den man an seine Stelle hätte setzen

können." (s. 85)

(...)

"Angesichts dieser Sachlage ist es von hohem geschichtlichem Interesse, daß der Aristotelische Möglichkeitsbegriff in der antiken Philosophie weder der einzige noch der erste war. Ihm voraus ging ein ganz anderer, der dem Aristoteles wohlbekannt war, von ihm aufs nachdrücklichste bekämpft und schließlich fast verdrängt wurde. Es ist dieses der Möglichkeitsbegriff der von dem Sokratesschüler Eukleides gestifteten Megarischen Schule. Er stand in mancher Hinsicht dem Realverhältnis des Möglichseins weit näher als die Aristotelische Dynamis und ist im Gegensatz zu ihr ein echt ontologischer Modalbegriff. Er hat aber —

außer in der Polemik der Stoa — bei den Späteren kaum mehr Berücksichtigung gefunden; wahrscheinlich aus keinem anderen Grunde, als Der Megarische und der Aristotelische Möglichkeitsbegriff weil er von der sich, immer mehr durchsetzenden Aristotelischen Sehweise aus unsinnig erscheinen mußßte.

Dieser Megarische M glichkeitsbegriff besagte: „M glich ist nur das, was wirklich ist"; oder „möglich ist etwas nur, wenn es wirklich ist".

In dieser Form ist er uns glaubw rdig von Aristoteles berliefert(1)." (s. 88)

Estudos en Español

1. Chame, Santiago. 2017. "La ontología negativa en las filosofías socráticas y sus proyecciones interepocales." *Eidos* no. 27:39-69.

Resumen "En este trabajo nos proponemos analizar la ontología de distintas corrientes socráticas con un enfoque por Zonas de tensión dialógica. Antístenes y los megáricos Euclides y Estilpón despliegan modelos de negatividad que rechazan la afirmación de principios ontológicos capaces de sustentar lo real y su expresión en el lenguaje. Estas propuestas teóricas no solo ofrecen una perspectiva alternativa a la platónico-aristotélica, sino que influyen de manera decisiva, por medio de la interacción e influencia recíproca, en la construcción de las variantes afirmativas de la época clásica. De este modo, la inclusión de las líneas socráticas permite poner en cuestión el diagnóstico heideggeriano que ve en la filosofía griega la sede del paradigma de la "metafísica de la presencia". La recuperación de las filosofías socráticas, habitualmente invisibilizadas bajo las figuras de Platón y Jenofonte, ofrece una oportunidad para redimensionar la Antigüedad clásica en función de propuestas ontológicas divergentes."

2. Gardella, Mariana. 2013. "Conflictos socráticos en el *Eutidemo*: la crítica platónica a la dialéctica megárica." *Argos* no. 36:45-64.

   Resumen: "En el presente artículo intentaremos mostrar que en el *Eutidemo* Platón desarrolla una crítica contra la dialéctica de los filósofos megáricos que tiene por objetivo señalar los aspectos problemáticos de la teoría del lenguaje que fundamenta el procedimiento erístico. Específicamente, Platón muestra que la falta de un criterio de verdad los lleva a comprometerse con enunciados que socavan los fundamentos de la dialéctica."

3. ———. 2014. "La metafísica megárica: unidad, identidad y monismo predicativo." *Diánoia* no. 49:3-26.

   Resumen: "Este trabajo pretende elucidar los rasgos generales de la metafísica de los megáricos en contra de las interpretaciones tradicionales que les atribuyen la defensa de un monismo numérico o una teoría de las Formas.

   Con base en los testimonios sobre Euclides y Estilpón de Mégara, intentaré mostrar que la metafísica megárica se caracteriza principalmente por el desarrollo de los conceptos de

unidad e identidad de cada cosa consigo misma, lo que conlleva el rechazo de la diferencia y, en consecuencia, de cualquier tipo de cambio. Esta perspectiva no excluye la existencia de múltiples entidades que, sin embargo, no son Formas. Por esta razón, los megáricos no desarrollan un monismo de tipo numérico, sino que su visión es coherente con un monismo de tipo predicativo que impugna la posibilidad de adjudicar atributos múltiples a una misma entidad."

4. ———. 2014. "Euclides de Mégara, filósofo socrático." *Agora. Papeles de Filosofía* no. 33:19-37.

   Resumen: "El objetivo de este trabajo es mostrar la influencia socrática sobre la filosofía de Euclides de Mégara, en contra de la interpretación que señala la influencia de los eleáticos sobre su teoría. Para ello indicaré que la doctrina de Euclides exhibe una fuerte impronta socrática, al menos en lo que concierne a: su labor como escritor de diálogos socráticos, el uso de la dialéctica erística, el desarrollo de algunos postulados éticos sobre la conducta frente a la muerte, el auto-dominio y la unidad de la virtud, y la presentación de una metafísica que coloca al bien en un lugar privilegiado. Aunque esta metafísica excede el socratismo, no puede ser identificada con los postulados de la filosofía eleática."

5. ———. 2014. "El argumento 'Velado' y las críticas megáricas a la predicación atributiva." In *Pensar, desear y actuar en el pensamiento grecolatino. Actas del primer simposio de la Asociación Argentina de Filosofía Antigua*, edited by Fierro, María Angélica and Bieda, Esteban, 169-177. Santa Fr: Asociación Argentina de Filosofía Antigua.

   Resumen: "En este trabajo analizo el razonamiento megárico conocido como "Velado" o "Electra", atendiendo particularmente a la interpretación que aporta Aristóteles en las *Refutaciones sofísticas*. Intentaré mostrar que este razonamiento mantiene una estrecha relación con las críticas de Estilpón de Mégara a la predicación atributiva, pues ambos manifiestan la importancia que adquieren los conceptos

   de "unidad" e "identidad" en el marco de la metafísica megárica."

6. ———. 2016. "Ανθρωπος περιπατεῖ. Los argumentos del tercer hombre megáricos." *Elenchos. Rivista di studi sul pensiero antico* no. 37:69-94.

   Abstract: "The Platonic Theory of Forms has received many critiques from many critics, among which stands out the well-known “Third man argument”. Although traditionally the studies about this subject only have considered the versions of the argument introduced by Plato and Aristotle, the Megarian philosophers also developed other versions of the same reasoning. In this paper I would like to analyze the argument which is attributed by Alexander of Aphrodisias to “the sophists” and to Polyxenus in his commentary on Aristotle’s *Metaphysics*. I will try to show that the main point of these objections is to criticize the homonymy of the universal terms, a problem that Plato evokes in his Parmenides, where he also points out some difficulties in relation to the semantics of his own theory."

7. ———. 2019. "Sobre la influencia de Zenón de Elea en el grupo megárico." *Axioma. Revista Portuguesa de Filosofia* no. 75:697-734.

   Abstract: "The aim of this paper is to revisit the problem about the influence of preceding philosophical theories on the Megaric group. Against the traditional view which defend either the influence of Parmenides or that of Socrates, I will try to show the impact of the philosophical position of Zeno of Elea. I will aim to defend that the Megarics use Zenonian antilogy as a part of eristic refutation. In the first section of this paper, I will present and discuss the aforementioned interpretations that privilege either the Parmenidean or the Socratic influence on the Megarics. Then I will analyze the grounds and scope of Zenonian antilogy taking into account all the testimonies which present it as a tool to dicuss theories, rather than to defend them. Finally, I will show how the Megarics use Zenonian antilogy to construct paradoxes based on the numerous ambiguities concerning the signifier and meaning of words, predication, and reasoning, in order to reveal the limits of lógos and refute those who use it as a tool to grasp reality."

8. Mársico, Claudia. 2012. "Ni el hombre es blanco ni el caballo corre.Argumentos antiplatónicos en Estilpón de Mégara." *Méthexis* no. 25:9-33.

   Abstract: "The testimonies of Stilpo of Megara show an anti-Platonic position within the megaric program against fundationists attempts. This paper studies a particular point of this deployment. We will review the origin of the views that locate thruth on the onomastic or on the predicative level. This initial survey will provide the basis for the study of the paradoxes of the nomination, an element Stilpo used as a tool to challenge the theory of Forms, and the analysis of the aporias of predication, through which he rejects the combination of parts of the sentence in order to represent reality. The figure of Stilpo reveals the dialogical context in whichancient philosophies developed and, at the same time, displays ways of thinking the relationship between language and reality often forgotten."

9. Villar, FRancisco. 2016. "Los megáricos como sofistas erísticos. La respuesta platónica al ataque de isócrates contra los socráticos." *Eidos*:185-213.

   Resumen: "Durante el siglo IV a. C. los intelectuales griegos discutieron sobre los alcances y características de la labor filosófica, en un intento por delimitar esta práctica distinguiéndola de otras. En este artículo me centraré en el retrato del sofista como contracara del filósofo. Analizaré específicamente la respuesta platónica al ataque que Isócrates dirige contra todos los discípulos de Sócrates en *Contra los sofistas* y *Encomio de Helena*.

   Defenderé que la estrategia de Platón para eludir dicha crítica consistió en construir en el *Eutidemo* y la quinta definición del *Sofista* un personaje que reúne los rasgos más censurados por Isócrates: el sofista erístico. Argumentaré que esta figura no remite a los sofistas del siglo V a. C., sino que tras ella se encuentran ocultos los representantes del grupo megárico, a quienes Platón habría colocado como los principales merecedores de la embestida isocrática."

Selected Bibliography on the *Master Argument* of Diodorus Cronus

Bibliography

1. Akama, Seiki, Murai, Tetsuya, and Miyamoto, Sadaaki. 2011. "A three-valued modal tense logic for the Master Argument." *Logique et Analyse* no. 213:19-30.

   Abstract: "The Master Argument was shown by Diodorus Cronos to conclude that nothing is possible that neither is true nor will be true and that therefore every (present) possibility must be realized at a present or future time. It leads to logical determinism. Prior tried to reconstruct the argument by means of modal tense logic. As a consequence, Prior proposed several branching time tense logics to resolve the fallacy of the Master Argument. In this paper, we propose a three-valued modal tense logic with a Kripke semantics to defend Prior's original argument."

    "I shall consider two Diodorean models: what I call the **D**-model, constructed on the set of non-negative reals, and the D-model - in effect the usual one - on that of positive integers. I show that these characterise S4.3 and D, respectively. All the Diodorean models verify S4.3. It is easy to adapt the completeness proof for S4.3 given here to Diodorean models on the non-negative rationals and various other linearly-ordered sets. (The proof depends, in fact, on the linearly-ordered set having a suitable sub-set of ordinal $W2^{\cdot}$) There are other Diodorean systems, but they do not seem to be of any interest." (p. 59)

21. Ciuni, Roberto. 2009. "The Search for the Diodorean Frame." *Humana Mente: Journal of Philosophical Studies* no. 8:47-65.

    Abstract: *"Diodorean modalities* are logical notions that specify, in a precise way, how sentences may be true with respect to time: a sentence is diodoreanly necessary at a given instant iff it is true since that instant on. Arthur Prior has treated them as sentential operators and built up a logic for such modalities (DIOD) conjecturing that the frame for such a logic (the "diodorean frame") was the frame for S4. The Conjecture was soon proved false, through a number of counterexamples that played a role in the research on modal logics between S4 and S5. The present paper aims at showing that (i) the search for the diodorean frame benefited from such a research, and that (ii) there has been a mutual interaction between the search of the diodorean frame and some characterisation results. The paper is divided into five parts. In section 1, I will introduce diodorean modalities, while in Section 2 I will be focusing on Prior's reconstruction of the Master Argument and his characterisation of DIOD. In section 3, I present a conjecture Prior advanced about the characterisation of DIOD and some counterexamples to it. The notions of "frame" and "frame for" will be also introduced. In section 4 I summarise the connections between the search of the diodorean frame and some researches in modal logic. Section 5 presents a short conclusion.

22. Corpina, Fabio. 2016. " The Ancient Master Argument and Some Examples of Tense Logic." *Argumenta* no. 1:245-258.

    Abstract: "The Master Argument of Diodorus Cronus has been long debated by logicians and philosophers. During the Hellenistic period it was so famous that doxographers and commentators took for granted its notoriety and none of them gave us a detailed report. The first section presents a philosophical account of the ancient Master Argument, by trying to retrace its meaning, originated from the Megarian context, and so halfway between ancient logic and metaphysics.

The second section introduces a logical analysis of the Master Argument against the backdrop of the Jarmużek-Pietruszczak semantics for the tense logic K_t4P; but the main aim of the section is to deal with one of the most fascinating attempts to peruse the Master Argument, i.e. A. Prior's reconstruction. Prior stays true to the Diodorean philosophical stance even if he uses modern logical tools. The significance of the work by Prior marks the beginning of tense logic. The third section expounds an argument by Øhrstrøm-Hasle. Danish logicians do not consider additional premises for the Master Argument. They give, in primis, a sentential example for the third premise, proving its inconsistency with the first two. The deterministic conclusion is the implicit result of this stratagem. Finally, in the fourth section, we compare the strategies by Prior and Øhrstrøm-Hasle."

Abstract: "Diodorus Cronus (ca. 340–280 B.C.) was an important philosopher and logician of the Megaric School. His principal contribution consists in a strong, logically oriented, characterisation of metaphysics, focused on the temporal aspects of important logical notions, in particular the understanding of conditionals and modality. Furthermore, he is well known for his so-called Master Argument which was designed to demonstrate that if something is possible then either it is the case already or it will be the case later. In this way Diodorus suggested a close connection between time and

modality. According to Diodorus time can be seen as a series of temporal atoms. At any such atomic moment a proposition may be true or false.

Since we do not have the details of Diodorus' original argument, several scholars have tried to reconstruct the Master Argument as it might have been. In this paper, we consider two attempted reconstructions of the argument: one based on a certain interpretation of Diodorus' notion of implication, and one suggested by A.N. Prior and based on a tense-logical approach to time and reasoning. We argue that both reconstructions are possible from a historical point of view, but that the latter is more interesting than the former if the argument should be conceived as an argument in favour of determinism."

24. de los Ríos Gutiérrez, Iván. 2018. "Kyrieuon Logos. Diodoro Crono y el problema del determinismo a la luz de *Metaphysica* IX, 9, 3." *Trans/Form/Ação* no. 41:9-30.

    Resumen: "El presente artículo tiene por objetivo la reconstrucción del argumento dominador (*kyrieuon logos*) atribuido a Diodoro Crono y su revisión filosófica a la luz de la crítica aristotélica al actualismo extremo de la Escuela de Mégara en *Metafísica* IX, 3. Desde esta perspectiva, el trabajo aspira a situar el proyecto teórico de Diodoro en el marco de su disputa filosófica con la metafísica aristotélica y su concepto de δὐναμις, con el fin de traducir esta querella dialéctica en lo que, a nuestro juicio, constituye una disputa teórica de importantes consecuencias prácticas: la disyunción excluyente entre el azar y el destino como paradigmas de interpretación conceptual y de acción moral."

    "Richard Gaskin's *The Sea Battle and the Master Argument* (1995) falls into two roughly equal sections each corresponding to one half of its title. The first explores Aristotle's treatment in

De Interpretatione 9 of his puzzle about tomorrow's sea-battle; the second puts some of these results to work in developing a novel account of the Master Argument of Diodorus Cronus. Moreover, throughout the book, Gaskin pays detailed attention to rival interpretations from the mass of commentary that has accumulated around these topics since ancient times, and that continues to accumulate ever faster in our own. On this aspect of Gaskin's book, I will have little more to say than that he discusses all the rival interpretations with a general good sense, and with a patience that I for one could not so long sustain. Moreover, I propose merely to summarise the salient points in Gaskin's own understanding of Aristotle. In the bulk of this critical notice, I will examine at much greater length what I myself take to be Gaskin's most interesting achievement: a reconstruction of the Master Argument that, whatever its faults, is both more plausible historically and more interesting philosophically than all but a handful of the umpteen reconstructions that are now on offer."     Abstract: "Diodorus' Master Argument was intended to show that whatever is possible either is or will be true. The intended conclusion does not follow from the extant premisses of the Master Argument. The Near Miss argues however, from those premisses alone, that nothing can be more than momentarily an exception to the Master Argument's intended conclusion. Strong arguments support even the most contentious of those premisses ("every past truth is necessary"). We therefore cannot easily ignore the Near Miss. Moreover, there are various supplementary premisses that would turn the Near Miss into an argument with the full force of the Master Argument itself. Each of Diodorus' ancient rivals, since they accepted such doctrines as eternal recurrence, temporal atomism, and the "extended" present, would grant him at least one of these supplementary premisses. So too would any modern who holds that time is not circular, has no beginning, and does not branch."

    "My purpose in this chapter is to examine the modalities of Diodorus and the logic of his argument in their behalf, the so-called Master4 Argument." (p. 19)

    (...)

    "What Diodorus seems to me to be saying is that if there is a state of affairs that will never occur, then (for example) it was always true that it would never occur (and always true to say so, as in the version of the argument that Aristotle considers). So the event cannot occur without falsifying that truth or claim, thus, without making over the past, which Aristotle concedes is impossible. Diodorus seems to me to generalize this approach, by assuming that there is always some truth about the past that any falsehood about the future will contradict. The inference is that all falsehoods about the future are impossible and all truths about the future necessary.

    We need not speculate that this line of argument was in fact taken by Diodorus, for we have the testimony of Cicero's *De Fato* to confirm our reconstruction. The core of the argument that Cicero links to the name of Diodorus is this: If p ('Fabius was born at the rising of the Dogstar') entails q ('Fabius will not die at sea'), then the entailment of q by p (a necessary proposition, since it deals with the past) renders q necessary as well, and it becomes impossible for Fabius to die at sea. (27)

The strength of the Diodorean position lay in its capacity to refute the conception of possibility put forward by Aristotle, and that by arguing from his own premises.(28) If real possibility is indeed an incoherent notion and there are no possibilities that are not at some time to be realized, then all truths become necessary and the time dimension itself is called into question. For necessity is timeless. Even though Diodorean necessity was achieved through quantification over time, it has the effect of bracketing or erasing time." (pp. 21-22)

(...)

"With the elimination of real possibility, modality as an independent category is effectively suppressed. A system of modality which does not allow for possibilities that may never be realized cannot distinguish possibility from actuality except in point of temporal placement. Modality as such becomes vacuous; and the distinction of, say, natural from logical necessity, otiose. The Aristotelian, then, and indeed anyone who would retain modal concepts in describing change, causality, or nature has an interest in refuting the Master Argument." (p.22)

39. Gundersen, Lars. 1997. "The Master Argument and Branching Time." *Logic and Logical Philosophy* no. 5:49-60.

Abstract: "It is argued that reconstructions of the so-called ‘Master Argument’ of Diodorus Cronos to the effect that possibility should be understood as present or future truth,

essentially relies on two axioms: i) that every true proposition concerning the past is necessary, and ii) that it follows necessarily from a proposition being true that it always has been the case that it would be true. It is furthermore argued that these two axioms are inconsistent in the sense that any tense/modal semantics which incorporates both collapses either modally (fails to distinguish between truth simpliciter and modalised truth) or temporally (fails to offer a plausible semantical account for propositions about the future). This finding is, furthermore, taken as indicator for the more generel claim that there are principled difficulties involved in construing semantics for combined tense/modal logical systems."

    Akzidenzien allgemeiner Gegenstände und graduelle Wahrheit in Aristoteles'

    De Interpretatione 7 und 9." *Philosophiegeschichte und logische Analyse / Logical Analysis and History of Philosophy* no. 2.

    Abstract: "Die von Aristoteles in *De Int*. 7 eingeführte „indefinite Aussage" verweist nach meiner Deutung auf ein Universale, welches anteilig an widersprüchlichen akzidentellen Prädikaten teilhat. Dem korrespondiert auf semantischer Ebene die graduelle Wahrheit beider Widerspruchsglieder. In gleicher Weise ist für Aristoteles auch die Aussage, daß ein Individuum zu einem Zeitpunkt seiner kontingenten

    Zukunft so-und-so bestimmt sein wird, nach *De Int*. 9 offenbar als graduell-wahr einzustufen. Das Einzelne kann hinsichtlich seiner kontingenten Zukunft nämlich noch nicht betrachtet werden, sofern es faktisch wäre, sondern nur, sofern es zeitübergreifend ein Universale exemplifiziert. In diesem Zusammenhang werden zugleich fundamentale Bezüge zwischen indefiniter Aussage einerseits und Aristotelischer Modallogik, Statistik und Wissenschaftstheorie andererseits deutlich."

    Translated by Frédéric Tremblay and Keith Peterson.

    Abstract: "This is a translation of Nicolai Hartmann's article "Der Megarische und der Aristotelische Möglichkeitsbegriff: ein Beitrag zur Geschichte des ontologischen Modalitätsproblems," first published in 1937. In this article, Hartmann defends an interpretation of the Megarian conception of possibility, which found its clearest form in Diodorus Cronus' expression of it and according to which "only what is actual is possible" or "something is possible only if it is actual." Hartmann defends this interpretation against the then dominant Aristotelian conception of possibility, based on the opposition between *dynamis* and *energeia*, and according to which there is always an open multiplicity of simultaneous "possibilities," the outcome of which remains undetermined. Since, according to Hartmann, reality suffers no indetermination, the Megarian conception of possibility is an account of *real possibility,* whereas the Aristotelian one is merely an account of *epistemic possibility* (Frédéric Tremblay)."

45. Ide, Harry A. 1992. "Chrysippus's Response to Diodorus's Master Argument." *History and Philosophy* no. 13:133-148.

Abstract: "Chrysippus claims that some propositions perish. including some true conditionals whose consequent is impossible and antecedent is possible, to which he appeals against Diodorus's Master Argument. On the standard interpretation. perished propositions lack truth values, and these conditionals are true at the same time as their antecedents are possible and consequents impossible. But perished propositions are false. and Chrysippus's conditionals are true when their antecedent and consequent are possible, and false when their antecedent is possible and consequent impossible. The claim of the Master Argument that Chrysippus rejects, then, is stronger that usually supposed."

47. Jarmużek, Tomasz. 2009. "Master Argument vs. Sea-Fight Tomorrow." *Bulletin of the Section of Logic* no. 38:205-214.

Abstract: "This paper deals with the Aristotelian problem of Sea-fight tomorrow, but it is analyzed from a Diodorean point of view. Precisely, we examine whether the lost argument of Diodor Cronus, called Master Argument, could be conducted within a frame of future open time. Since we do not know the argument itself, we follow the known reconstructions of Master Argument. Each of them requires special logical assumptions, but also semantic constraints concerning a frame of time. The last detail interests us the most. Showing shortly, step by step, all constraints, we come to the conclusion that the strictly treated reconstructions of Master Argument must prefer a linear model of future."

    Abstract: "Come risulta chiaro già dal titolo, il libro di Gaskin è diviso in due parti: la prima, che comprende i capitoli 1-14, tratta del famoso e famigerato argomento fatalista di *De Interpretatione* 9, mentre la seconda, che comprende i capitoli 15-25, è dedicata al quasi altrettanto famoso e dibattuto "Argomento Dominatore" di Diodoro Crono, nonché alle sue possibili relazioni con la "Battaglia navale" aristotelica. Seguono poi tre appendici, la prima dedicata ad alcune interpretazioni arabe e medievali di *De Interpretatione* 9, le altre due al tema della prescienza e della contingenza in Alessandro di Afrodisia. Si tratta – è già chiaro da questo sommario – di un libro ricco e stimolante, la cui disamina approfondita richiederebbe molto più spazio di quanto ne ho a disposizione. Mi limiterò dunque a discutere innanzitutto la sua interpretazione della "Battaglia navale", e in secondo luogo il rapporto che la sua ricostruzione dell'"Argomento Dominatore" stabilisce tra Diodoro e Aristotele."

    Chapitre 2: L'argument de Diodore Kronos 7; 2.1 L'argument rapporté par Epictète 8; 2.2 L'argument du pseudo-Diodore (1965) 8; 2.2.1 Exposé de l'argument 8; 2.2.2 Analyse de l'argument 10; 2.3 Retour à l'argument de Diodore (350 av. J.-C.) 14-16.

    "L'« argument dominateur » de Diodore est plus souvent qualifié d'« aporie(1) » que de « paradoxe ». Cela peut s'expliquer par le fait que la prétendue contradiction produite par la conjonction des trois énoncés n'est en rien intuitive. En effet, Vuillemin, après d'autres, s'est efforcé de donner une démonstration formelle de la contradiction, démonstration qu'il corrigée par la suite(2). Pour des raisons de simplicité, je ne reprendrai pas ici les arguments que Vuillemin donne en faveur de sa reconstruction formelle qu'il veut à la fois fidèle à l'histoire et à la philosophie de Diodore. Les reconstructions formelles de l'argument qui ont été données n'entrent pas dans le cadre de cet ouvrage et je ne ferai donc que les mentionner à l'attention du lecteur qui souhaiterait approfondir la question.

    Mon intention est de donner une explication rigoureuse mais intuitive de l'argument de Diodore (appelé « argument dominateur ».) La section qui suit est un « détour » qui devrait permettre de rendre plus transparent et plus aisé le sens réel de l'argument, présenté d'une façon plus simple. On reviendra à la présentation axiomatique dans la section suivante." (p. 8)

(1) On nomme « aporie » (en grec *aporia*, absence de passage, difficulté, embarras) une difficulté à résoudre un problème. Les premiers dialogues de Platon sont dits « aporétiques » parce qu'ils s'achèvent sur une absence de réponse au problème dont il est question dans le dialogue. Ce n'est que par extension de la signification originelle de ce terme que l'on désigne souvent aujourd'hui par « aporie » une problème insoluble et inévitable.

    "This third section responds to a version of Wiggin's article which has been slightly altered. But since the causes of our disagreements have not changed, I did not think it necessary to change my response.

    The first of these disagreements concerns the economy of Diodorus' axioms; it results in part from a misunderstanding, my critique not having taken account of my *retractio* (see note 2). The second disagreement concerns the original axiom E, for which Wiggins substitutes the forms E' and E", without having reflected on the clauses of external hindrance assumed by the Ancients in the notion of the possible. The third, fundamental disagreement is of a philosophical kind: in order to found the analysis, one of us reverts to the suggestions of natural language, the other of us criticizes them in the name of scientific language."

Abstract: "Diodorus' Master Argument was intended to show that whatever is possible either is or will be true. The intended conclusion does not follow from the extant premisses of the Master Argument. The Near Miss argues however, from those premisses alone, that nothing can be more than momentarily an exception to the Master Argument's intended conclusion. Strong arguments support even the most contentious of those premisses ("every past truth is necessary"). We therefore cannot easily ignore the Near Miss. Moreover, there are various supplementary premisses that would turn the Near Miss into an argument with the full force of the Master Argument itself. Each of Diodorus' ancient rivals, since they accepted such doctrines as eternal recurrence, temporal atomism, and the "extended" present, would grant him at least one of these supplementary premisses. So too would any modern who holds that time is not circular, has no beginning, and does not branch."

Studies in English

1. Barnes, Jonathan. 1968. "Peripatetic Negations." *Oxford Studies in Ancient Philosophy* no. 4:201–215.

   "Ancient logicians did not question the Aristotelian view that 'for every affirmation there is an opposite negation, and for every negation an opposite affirmation' (*de lnterpretatione* 17a32-3); nor did they doubt that 'a single affirmation has a single negation' (17b37): every affirmation, *P*, has one and only one negation *neg:P*. Moreover, it was taken to be constitutive of the notion of negation that *P* and *neg:P* cannot both be true and cannot both be false.(1) And it was supposed that a negation, *neg:P*, will normally be constructed from its affirmative twin, *P*, together with a negative operator.(2)

   Those common notions form the background to a short essay on negation which Alexander of Aphrodisias inserted into his commentary on Aristotle's *Prior Analytics*. Alexander defends an Aristotelian account of negation and argues against a rival account.(3) The rival account is generally supposed to be Stoic or even Chrysippean; and it contains indisputably Stoic elements. But Alexander does not name his opponents, nor does he offer any information about the history of the dispute. (4)" (pp. 201-202)

   (1) It does not follow, nor was it generally accepted, that the Law of Bivalence has unrestricted validity.

   (2) See e.g. Galen, *Inst. Log*. vi. 2 (where exceptions to the normal rule are noted).

   (3) *In Aristotelis Analytica Priora* 402. 1-405. 16. Scholarly attention was first drawn to this passage b.y A. C. Lloyd, 'Definite Propositions and the Concept of Reference', in *Les Stoiciens et leur logique,* ed J. Brunschwig (Paris, 1978). I have recently had the advantage of reading an unpublished paper by Paul Moraux on the passage. [Only after finishing this paper did I receive a copy of Walter Cavini's long paper on 'La Negazione di Frase nella Logica Greca', in *Studi su Papiri Greci*

di Logica e Medicina, Accademia Toscana di scienze e lettere 'la Colombaria', Studi LXXIV, by W. Cavini, M. C. Donnini Maccio, M. S. Funghi, D. Manetti (Florence, 1985). Cavini discusses the passage from Alexander on pp 67-80; on pp 122-6 there is a thorough bibliography on Greek negation.]

(4) Alexander is not normally reluctant to name his opponents or to refer to the Stoics.

He frequently speaks of Στοικοι οι απο τής Στοας or οι νεώτεροι, and he more than once cites Chrysippus by name. In the essay on negation, however, the opponents remain anonymous (they are introduced impersonally at 402. εἰοι... οἰς δοκεῖ-and never later identified); and that is perhaps an indication that the men in question were not simply identifiable as Stoics or Chrysippeans.

2. Bobzien, Susanne. 2000. "Wholly Hypothetical Syllogisms." *Phronesis.A Journal for Ancient Philosophy* no. 45:87–137.

Abstract: "In antiquity we encounter a distinction of two types of hypothetical syllogisms.

One type are the 'mixed hypothetical syllogisms'. The other type is the one to which the present paper is devoted. These arguments went by the name of 'wholly hypothetical syllogisms'. They were thought to make up a self-contained system of valid arguments. Their paradigm case consists of two conditionals as premisses, and a third as conclusion. Their presentation, either schematically or by example, varies in different authors. For instance, we find 'If (it is) A, (it is) B; if (it is) B, (it is) C; therefore, if (it is) A, (it is) C'. The main contentious point about these arguments is what the ancients thought their logical form was.

Are A, B, C schematic letters for terms or propositions? Is 'is', where it occurs, predicative, existential, or veridical? That is, should 'ἐστι' be translated as 'it is an A', 'A exists', 'As exist' or 'It is true/the case that A'? If A, B, C are term letters, and 'is' is predicative, are the conditionals quantified propositions or do they contain designators? If one cannot answer these questions,

one can hardly claim to know what sort of arguments the wholly hypothetical syllogisms were.

In fact, all the above-mentioned possibilities have been taken to describe them correctly. In this paper I argue that it would be mistaken to assume that in antiquity there was one prevalent understanding of the logical form of these arguments - even if the ancients thought they were all talking about the same kind of argument. Rather, there was a complex development in their understanding, starting from a term-logical conception and leading to a propositional-logical one.

I trace this development from Aristotle to Philoponus and set out the deductive system on which the logic of the wholly hypothetical syllogisms was grounded."

3. ———. 2014. "Alexander of Aphrodisias on Aristotle's Theory of the Stoic Indemonstrables." In *Strategies of Argument: Essays in Ancient Ethics, Epistemology, and Logic*, edited by Lee, Mi-Kyoung, 199–227. New York: Oxford University Press.

   "In her important 1979 paper “Aristoteles über Syllogismen ‘aufgrund einer Hypothese,’(1) Gisela Striker provided an in-depth analysis of these vexing and perplexing Aristotelian arguments. She showed that they were Aristotle’s way of providing a logical vehicle for inferences based on other than term-logical relations; that the “hypothesis” that gives them their name is best understood as a rule that is not based on a relation of terms,(2) rather than as a premise; and that in those arguments “the thing taken instead” (το ̀ μεταλαμβανόμενον) is an assertion that is used instead of the demonstrandum.(3) It was upon reading this paper that I realized that the (then) prevalent interpretation of later ancient texts on hypothetical syllogisms as presenting the Stoic theory of indemonstrables needed a thorough revision. For it is possible to show that, starting from Aristotle’s “syllogisms based on a hypothesis,” a specifically Peripatetic (and from the third century CE also partly Platonist) development can be traced through the centuries up to the late ancient passages on hypothetical syllogistic in Philoponus and Boethius. Although the Stoic indemonstrables undoubtedly played a role in this

development, the various theories of hypothetical syllogisms over the centuries are all Peripatetic (and sometimes a little Platonist) in form, function, and terminology.(4) The present paper looks at Alexander of Aphrodisias' role in this development." (p. 199)

(1) Striker [1979]. See now also Striker [2009], 174–8, 201, 237–238.

(2) Striker [1979], 46.

(3) Ibid., 43.

(4) Here I am in agreement with Maroth [1989]. The arguments the Stoics called hypothetical syllogisms were completely different from those the Peripatetics called hypothetical syllogisms: see my [1997].

4. Castelli, Laura M. 2015. "Alexander on Aristotle, *An. Pr.*, I, 31, Division and Syllogistic." *Documenti e studi sulla tradizione filosofica medievale* no. 26:33–54.

Abstract: "*An. Pr.*, I, 31 is one of the several passages Aristotle devotes to the method of division.

From other texts we know that he is not unwilling to make room for a constructive use of division within the search for and the formulation of definitions. However, in *An. Pr.*, I, 31 the basic issue seems to be whether division understood as a procedure typically embedded in a standardized argumentative practice can be regarded as a part of a general deductive

method. Although the results of Aristotle's discussion in this chapter are mainly negative, I shall argue that Alexander takes seriously the idea that division might actually play some role in the formulation of some deductive arguments. In spelling out this proposal, Alexander relies on a theory of deductive arguments much richer than Aristotle's syllogistic in the *Analytics* and provides a systematic theoretical framework to interpret Aristotle's claim that division is only a 'small part' of syllogistic."

6. Flannery, Kevin. 1993. "Alexander of Aphrodisias and Others on a Controversial Demonstration in Aristotle's Modal Syllogistic." *History and Philosophy of Logic* no. 14:201–214.

   Abstract: "Aristotle's treatment of mixed, first-figure, problematic-assertoric syllogisms has generated a good deal of controversy among modern commentators. I argue that W. D. Ross's criticism of A. Becker's criticism of Aristotle's treatment is unsuccessful. I then attempt to justify Aristotle's treatment, employing some ideas found in Alexander of Aphrodisias."

7. ———. 1995. *Ways into the Logic of Alexander of Aphrodisias*. Leiden: Brill.

   "The present work is intended to be an introduction to Alexander's logic. A point-by-point treatment of Alexander's logical writings (besides being an enormous task) would not produce this. First of all, much of what might be called Alexander's logic is simply Aristotelian logic-and that falls beyond the scope of the intention I have just enunciated. Secondly, much of what is distinctive in Alexander's logical writings has to do with his dialogue with (or, perhaps more precisely, opposition to) the Stoic logical tradition. It is not my intention to go into this material either, except to the extent that it helps to explain Alexander's own ideas. (This occurs in chapter 3, for instance, where Alexander's dismissal of the Stoics' duplicating and non-differently concluding arguments

sheds a good deal of light on his positive conception of Aristotelian syllogistic deduction.) I take up, rather, three themes, one from each of the main areas of traditional logic: the assertoric syllogistic,(12) the modal syllogistic, and the area of metalogical concerns. There will be aspects of Alexander's thought which, on account of this way of proceeding, I skip over; but this is inevitable in any introduction. The other possible concern-that the resulting account of Alexander's logic might be very disjointed-will be dispelled, I am quite sure, as the reader proceeds through it." (*General Introduction,* pp. XXI-XXII)

(12) Actually, my discussion of ecthesis also involves to a small extent the modal syllogistic but not in any essential way. The method of ecthesis itself belongs basically to the asseItoric syllogistic.

8. Flannery, Kevin. 2003. "Logic and Ontology in Alexannder of Aphrodisias's Commentary on *Metaphysics* IV." In *Alessandro di Afrodisia e la «Metafisica» di Aristotele*, edited by Movia, Giancarlo, 117–134. Milano: Vita e Pensiero.

"What, therefore, can we say after this fairly detailed analysis of some passages in Alexander’s commentary on the *Metaphysics*? Three things. I affirm the first two with some confidence; the third is an hypothesis. I believe that I have demonstrated that, when he wrote *in Metaph*., Alexander was under the influence of a certain model of the proper method of doing philosophy, including first philosophy - that is, he was much attached to the demonstrative method found in the *Posterior Analytics*. On account of this attachment, he had an antipathy for going below the logical and linguistic level of analysis, to the level of signification. I believe that I have also demonstrated that, being so inclined, Alexander *in in Metaph*. also occasionally forces the reading a text. Often he offers us a series of possible interpretations of a text, thereby giving the appearance of objectivity; but, in fact, as we have seen in one such passage, even while doing so, he is capable of succumbing to this most common of academic temptations.

This brings me to the hypothesis. Of course, we cannot assume that mature scholars are never tempted to force a text, but there are also other factors that suggest that *in Metaph*. (or, at least, *in Metaph*. IV) is less mature than some other works of Alexander's. We have seen that, in *in APr*., Alexander seems to adopt a more balanced approach: i.e., he seems to have a more exact understanding of the relationship between the logical and the non-logical. We have also seen that in *in Metaph*. he demonstrates a certain ignorance regarding the way in which the game of dialectics is played - an ignorance (I might add) that he does not demonstrate in his comment on the Topics. (57) Since there are references in *in Top*. to *in APr*. but not in *in APr*. to *in Top*.,(58) the order of composition that I would suggest is the following: *in Metaph*., *in APr*., *in Top*. This is, however, only an hypothesis; such issues demand a more thorough study than I can perform here." (p. 134)

(57) See, e.g., *in Top*. 577.5-15. It is noteworthy also that at *in Metaph*. 204.13-14, Alexander says that something in fact found in *Top*. is found in *APo*., suggesting with this that, at the time he was writing this section of *in Metaph*., he did not know *Top*. especially well.

(58) *in Top*. 7.11, 166.21.

9. Garin, Sergei. 2019. "Alexander of Aphrodisias on syllogistic reasoning." *ΣΧΟΛΗ. Ancient Philosophy and the Classical Tradition* no. 13:32–47.

Abstract: "The article deals with ancient ideas on the nature of syllogistics on the example of Empire's official Peripatetic philosopher, Alexander of Aphrodisias. We interpret Alexander's position on the syllogistic form as a theory of constant function. Alexander offers a conjunctive and purely formal understanding of the nature of syllogistic necessity.

This approach to the modal properties of assertoric judgments differs from Theophrastus' ontological position, who believed that modal characteristics of assertoric premises are determined by looking to the state-of-affairs to which they refer. Also the paper examines Theophrastus' legacy of hypothetical syllogisms related to Alexander.

Stoic and Peripatetic versions are also compared against the background of Alexander's logical amalgamation. The article elucidates late “Peripatetic conservatism” regarding the hypothetical syllogistics. We discuss the syntax of propositional / term relations (ei to A, to B), tackling the problem of grammatical ellipsis."

10. Gaskin, Richard. 1993. "Alexander's Sea Battle: a discussion of Alexander of Aphrodisias *De Fato* 10." *Phronesis.A Journal for Ancient Philosophy* no. 38:75–94.

    "The tenth chapter of Alexander of Aphrodisias' *De Fato*(1) contains a treatment of fatalism and future truth which clearly harks back to Aristotle's famous 'Sea Battle' discussion in *De Interpretatione* (DI) 9.(2) Alexander's discussion has not yet been satisfatorily interpreted: this paper is intended to help remedy this lack." (p. 75)

    (1) The text of the *De Fato* is available in *Supplementum Aristotelicum* II.ii. 164-212, ed. I. Bruns, Berlin, 1892. Bruns' text is reproduced in the commentary of R. Sharples: *Alexander of Aphrodisias on Fate* (London, Duckworth, 1983).

    (2) The literature on DI 9 is vast: the references in the following footnotes are no more than highly selective samples: I am myself preparing a study of the chapter.

11. Gili, Luca. 2012. "Alexander of Aphrodisias’ Solution to the Puzzle of the Two Modal Barbaras: a Semantic Approach." *Documenti e studi sulla tradizione filosofica medievale* no. 23:35–64.

    Abstract: "In this paper I dwell on Alexander of Aphrodisias’ reconstruction of a famous puzzle of Aristotle’s modal logic. Aristotle’s claim that a LX-L Barbara is a valid syllogism, whilst a XL-L Barbara is an invalid formula within the syllogistic system has been contested not only in recent times, but by ancient Peripatetics too. I show that Alexander accepted Aristotle’s claim, and criticized Theophrastus, who firstly contested the above thesis. My claim is that Alexander introduced a ‘dictum de omni et de nullo’ for modal propositions, and that, on the basis of it, he proved the validity

of the LX-L Barbara syllogism. However, this proof is problematic, because it seems to be inconsistent with Alexander's proof for the validity of the rules of conversions for modal propositions. I suggest that Alexander had good arguments for avoiding the above difficulty, by making appeal to his semantics for modal propositions. This semantics is at the same time a temporal semantics and is rooted in Alexander's theory of predication. The second part of the paper offers a brief account of this semantics and presents its theoretical advantages."

12. ———. 2015. "Categorical μη` κατα` χρόνον Propositions in Alexander of Aphrodisias' Modal Syllogistic." *Apeiron* no. 48:466–482.

    Abstract: "In this paper I deal with Alexander of Aphrodisias' theory of categorical μη` κατα` χρόνον propositions, namely of propositions which are neither necessity nor contingency propositions, but which are true not only at a certain instant in time. I argue that these propositions are true at least at two instants in time, but their presentation does not commit Alexander to a revision of his general semantic scheme for modal propositions, in which he showed that categorical propositions are not necessity propositions, and thus cannot be true at every instant in time. In the last section, I shall argue that Alexander's presentation of categorical μη` κατα` χρόνον propositions is linked to his theory of predication and that such a semantic framework may explain the apparently difficult classification of this set of propositions."

13. ———. 2015. "Alexander of Aphrodisias and the heterodox *dictum de omni et de nullo*." *History and Philosophy of Logic* no. 36:114–128.

    Abstract: "Aristotle's explanation of what is said 'of every' and 'of none' has been interpreted either as involving individuals (of which something is said 'of every', or of which something is said 'of none'), or as regarding exclusively universal terms. I claim that Alexander of Aphrodisias endorsed this latter interpretation of the *dictum de omni et de nullo*. This interpretation affects our understanding of Alexander's

syllogistic: as a matter of fact, Alexander maintained that the *dictum de omni et de nullo* is one of the core principles of syllogistic."

14. ———. 2015. "A neglected source of Boethius's « De syllogismo categorico." *Mnemosyne*:304–307.

    Abstract: "This paper shows that Boethius's *De syllogismo categorico* had among its sources Alexander of Aphrodisias's commentaries on the *Topics* and on the *Prior Analytics*. The first of these sources has been neglected by scholars until now. Boethius's usage of these sources shows the originality of his logical treatise."

15. ———. 2020. "Erotetic Logic, Uncertainty and Therapy: Galen and Alexander on Logic and Medicine." In *Ancient Greek Medicine in Questions and Answers: Diagnostics, Didactics, Dialectics*, edited by Meeusen, Michiel, 108–132. Leiden: Brill.

    Abstract: "Syllogistic is grounded upon dialectics. Dialectics is a version of erotetic logic, because it deals with questions and answers. This paper intends to explore the erotetic logics of Galen and of Alexander of Aphrodisias in order to establish whether the differences in their logical systems correspond to differences in their understanding of medicine.

    Galen and Alexander of Aphrodisias were almost contemporaries. Both of them shared the idea that doctors should know logic to practice medicine. The radical difference between Alexander and Galen consists in the fact that Alexander has a modal logic,

    whereas Galen does not. In other words, the premises—the answers in a dialogical exchange—include a modal operator for Alexander, but not for Galen. This absence is not without consequences. This will become clearer if one pays attention to the role of

    contingency syllogistic within Alexander's own account of medicine."

16. ———. 2020. "Categories in Alexander of Aphrodisias." *Ancient Philosophy* no. 40:453–468.

"There is no reason to doubt that Alexander wrote a commentary on Aristotle's *Categories*. Both Simplicius (Simpl. *In Cat*. 1,16) and Olympiodorus refer to it (Olymp. *In Cat*. 13,24-35).(1) Alexander's notion of 'category', however, has not received much attention after Prantl's sketchy reconstruction (see Prantl 1955, 623-624). The loss of Alexander's commentary on Aristotle's *Categories* might explain this relative neglect." (p. 453)

(...)

"I intend to show what categories are for Alexander.5 No scholar has ever attempted (to my knowledge) to reconstruct Alexander's concept of 'category' and this gap in the scholarly literature should probably be filled before any other undertaking concerning the lost commentary on the *Categories*. In my interpretation, Alexander maintains that a κατηγορία is, first and foremost, a 'predication', i.e., a linguistic structure of this form: 'S-is-P', where 'S' represents the grammatical subject, 'is' is the copula, and 'P' is the grammatical predicate. According to Alexander, there are as many κατηγορίαι as there are meanings of the copula 'is'.

Different predications allow us to single out different types of predicates. If there are n predications ('S-is_1-P', 'S-is_2-P', 'S-is3-P'... 'S-is_n-P'), there will be *n* types of predicates (P_1, P_2, P_3, ... P_n) such that 'S-is_1-P_1', 'S-is_2-P_2' ... 'S-isn-P_n' are grammatical phrases, whereas 'S-is_1-P_2', 'S-is_2-P_1', 'S-is_3-P_1... 'S-is_n-$_{Pk(k=/=n)}$)' are not grammatical phrases.6 From the κατηγορία-predication is possible to deduce the κατηγορία qua class of predicates, but the former κατηγορία has an explanatory priority." (pp. 454-455)

(1) Barnes 2005, 23 casts doubts on the veracity of Olympiodorus' account.

(5) There is an important debate on the status of the categories in Aristotle's writings. The debate echoes the ancient discussions that are summarized by Boethius (*PL* 64, *In Cat*. 161ff.) and Simplicius (*in Cat*. 9,4-10,19). According to Simplicius, the *Categories* is a treatise about ten γένη (*in Cat*.

9,7), but commentators disagree about the nature of these γένη. According to some commentators, these γένη are mere words, for others they are beings, others maintain that they are concepts. Alexander, in turn, claims that these γένη are words that signify the concepts that represent the most simple beings (Simpl. *In Cat*. 10, 9-19). Simplicius' account of Alexander's opinion on the 'goal' (σκοπός) of the Categories is, however, not entirely reliable because it is suspiciously similar to Simplicius' own opinion about the σκοπός of the treatise. Luna 2001, 79-84 has written enlightening pages on the different opinions held by the commentators on the σκοπός of the *Categories*, and she concludes that Alexander is likely to have maintained something different from what Simplicius attributes to him.

The modern debate on the status of Aristotle's categories was inaugurated by Trendelenburg 1846 that argued that the distinction among the several categories relied on grammatical considerations.

Despite its early criticism by Bonitz 1853, 591-645, Trendelenburg's opinion was highly influential.

For a detailed and dense summary of the interpretation of the status of the Aristotelian categories after Trendelenburg, see Oehler 1983, 67-96.

newly discovered fragment of Alexander of Aphrodisias' « Commentary » on Aristotle's « Posterior analytics »." *Documenti e Studi sulla Tradizione Filosofica Medievale* no. 29:137–184.

Abstract: "Hugh Eterianus (ca. 1110/1120-1182), an Italian theologian who worked in Byzantium as an advisor to Manuel I Comnenos, is the author of the treatise *De sancto et immortali deo*, where he argues against the Orthodox denial of the *filioque*. In this treatise, Hugh quotes from the works of Plato, Aristotle and other Greek philosophers. In chapter I, 4, Hugh includes a short passage from a certain 'Alexander' who commented on Aristotle's *Posterior Analytics*. We show that this passage is a fragment from Alexander of Aphrodisias' lost commentary on the *Posterior Analytics*. This article includes a new edition of the fragment with an English translation and a philosophical commentary."

"It is commonplace to think that ancient commentators aimed to systematize Aristotle.

(…)

Alexander of Aphrodisias' attempt to make metaphysics into a demonstrative science would be a prime example of such tendency.(4) More generally, his exegetical method is held to rest on a "systematic presupposition" and to aim for a "unified" or even "dogmatic Aristotelianism".(5)

To put it plainly—I think this is painting too unilateral and simple a picture, and I would like to contribute, here, following others,(6) to enrich and detail it. To do so, I will look into Alexander's usage of dialectical method in metaphysics, with particular interest for his exegesis of book Beta of the M*etaphysics* and his use of the aporetic method. Alexander's aporetic method in the *Quaestiones*(7) as well as the one he puts to use in his commentary on *Metaphysics* Beta has led to

the same diagnosis. In both cases, no “honest perplexity”(8) is displayed, and the Beta aporiae are not treated like genuine puzzles but rather as simple exposition devices.(9) In contrast to this view, I would like to show two things: first, that aporia retains an authentically exploratory function for Alexander; and, second, that Alexander’s use of aporia in metaphysics does not originate in systematization, but rather in the fulfillment of dialectic’s status as an organon within Aristotelian tradition." 22. Todd, Robert B. 1976. "Alexander of Aphrodisias on *De interpretastione* 16a 26-29." *Hermes* no. 104:140–146.

"At *de interpretatione* i6a 26-29 Aristotle makes the brief assertion that names (ὄνοματα) exist by convention and not by nature. In his note on this text Ammonius, the fifth century Alexandrian commentator, reports that Alexander of Aphrodisias had proposed the following syllogism, presumably in his own commentary on this work which is no longer extant: ὄνοματα and ρἐματα are sounds' (φοναι), sounds exist by nature, therefore so do ὄνοματα and ρἐματα. Ammonius then proceeds to offer a refutation of this argument. Although he does not explicitly attribute this subsequent reasoning to Alexander I shall try to show in this note that he must be offering an account of the earlier exegete's thought, for all the essentials and some of the details of Ammonius' report can be paralleled in some philosophically interesting ways from texts in other Alexandrian works." (pp. 140-141, some notes omitted)

3. Bonelli, Maddalena. 2022. "Alessandro di Afrodisia et il *De interpretatione*: il caso della proposizione." *Rivista di storia della filosofia* no. 77:195–207.

   Abstract: "This article considers a passage in Alexander of Aphrodisias' commentary on the *Prior Analytics* (*in APr*., 10, 13-28) concerning the definition of proposal (premiss or proposition). Its interest lies in the fact that Alexander

establishes a very articulated relationship between the definition of proposal that we find in Aristotle's *Prior Analytics* (24a16-17) and that of Apophantic reason (position) in *De interpretatione* (4, 17a2-3). Nonetheless, the author aims to demonstrate that this relationship is problematic and unnecessary because the definition of proposal in Prior Analytics is in fact independent from the definition of Apophantic reason. However, it is also the author's intention to show why Alexander does this."

4. Dal Forno, Davide. 2019. "Alessandro di Afrodisia e Proclo sulla dialettica." *Elenchos* no. 40:165–197.

   Abstract: "In this paper I compare Alexander of Aphrodisias' and Proclus' conceptions of dialectic by discussing a passage from Alexander's commentary on Aristotle's *Topics* and texts from Proclus' *Platonic Theology* and commentary on Plato's *Parmenides*. I show how Alexander takes up Aristotle's view of dialectic as an argumentative technique that has no specific object but can be put in the service of philosophy e. g. to establish first principles. In a key passage, Alexander quotes some lines from the *Parmenides* to emphasize that this was also Plato's view on dialectic. By contrast, Proclus uses the *Parmenides* as a crucial source for his conception of dialectic as the crowning glory of philosophy, and fiercely criticizes such interpretations of the *Parmenides* as that of Alexander, which reduce it to the illustration of a logical method. I argue that the difference in their conceptions of dialectic lies in Alexander's positive and Proclus' negative view on *doxa* and on its role in knowledge."

5. Gili, Luca. 2011. *La sillogistica di Alessandro di Afrodisia*. Hildesheim: Georg Olms.

   "Questo lavoro ha come oggetto una esposizione dei principali temi della sillogistica di Alessandro di Afrodisia, delineati a partire dal suo commento agli *Analitici Primi* di Aristotele.

   Il tema finora è stato poco studiato, sebbene negli ultimi anni siano fioriti gli studi dedicati alla filosofia tardoantica. In questa generale riscoperta di un periodo ingiustamente trascurato dalla storiografia precedente, anche Alessandro di

Afrodisia è tornato al centro dell'attenzione. Fino ad ora tuttavia la sua sillogistica non è stata oggetto di una indagine complessiva. Dopo la fondamentale edizione critica del commento di Alessandro agli *Analitici Primi* curata da Maximilien Wallies (cfr. Wallies [1883]), l'unico testo che ha affrontato la logica di Alessandro di Afrodisia nel suo complesso è Volait [1907]. Questa monografia raramente si eleva dall'essere una parafrasi, peraltro utile, di alcune sezioni del commento di Alessandro agli *Analitici Primi*." (p. 5)

(...)

"Una ricerca che abbia per proprio oggetto la sillogistica di Alessandro di Afrodisia nel suo complesso e che affronti sia la parte categorica che la parte modale potrebbe apparire troppo ampia ed ambiziosa per una trattazione esaustiva.

Ho cercato tuttavia di portare a termine questa impresa, operando evidentemente delle scelte: i capitoli del commento di Alessandro esaminati analiticamente nella mia ricerca sono solo una parte di quelli pervenutici del suo commento. Ho scelto infatti i capitoli o i blocchi di capitoli che credo costituiscano il nocciolo più significativo per la ricostruzione della sillogistica categorica (*in Anal. Pr*. A, 1-2, 4-7) e modale (*in Anal. P*r. A, 3, 8-9, 13-15) del commentatore di Afrodisia." (p. 7)

6. ———. 2011. "Boeto di Sidone e Alessandro di Afrodisia intorno alla sillogistica aristotelica." *Rheinisches Museum für Philologie* no. 154:375–397.

"Boeto di Sidone fu un aristotelico. La tradizione filosofica nella quale egli volle inserirsi è perciò la stessa alla quale appartenne

poi Alessandro di Afrodisia, che tuttavia non cita mai espressamente il peripatetico di Sidone nel suo commento agli *Analitici Primi* di Aristotele.(1)

"La tesi di questo lavoro è che la presentazione della sillogistica di Alessandro sia radicalmente alternativa a quella di Boeto e che ciò possa essere spiegato con un differente approccio dei due autori alla tradizione peripatetica a loro precedente. Questo confronto dottrinale con Boeto, che nel testo di Alessandro rimane implicito, costituisce a mio parere una delle chiavi interpretative che consentono di apprezzare l'originalità della presentazione della sillogistica fornita dall'esegeta di Afrodisia e di fornire una spiegazione di alcune prese di distanza, da parte del commentatore, rispetto a molte tesi di un'autorevole tradizione peripatetica risalente a Teofrasto.(2)" (p. 376)

(1) Alessandro tuttavia doveva conoscere l'opera di Boeto, che sicuramente citava nel suo commento alla *Fisica,* da cui Simplicio molto probabilmente trasse i frammenti dell'opera di Boeto che ci ha trasmesso con il proprio commento (cfr. P. Golitsis, *Les Commentaires de Simplicius et de Jean Philopon à la Physique d'Aristote*, Berlin 2008, 70–71).

(2) Il presente studio non intende stabilire che Alessandro di Afrodisia abbia deliberatamente espresso posizioni alternative a quelle di Boeto di Sidone, perché allo stato attuale delle nostre conoscenze non ci sono evidenze testuali che mostrino la conoscenza e la critica da parte dell'esegeta di Afrodisia della logica di Boeto.

Questo saggio vuole piuttosto stabilire un confronto dottrinale fra le posizioni dei due autori, che occupano un posto di primo rilievo nella storia dell'aristotelismo, per mostrare come sia stata possibile la elaborazione di teorie logiche fra loro così diverse.

[Su Boeto di Sidone si veda: Riccardo Chiaradonna et Marwan Rashed (éds.), *Boéthos de Sidon – Exégète d'Aristote et philosophe*, Berlin de Gruyter 2020.]

7. ———. 2015. "Il confronto di Giovanni Filopono con Alessandro di Afrodisia intorno al problema della conversione delle

proposizioni." *Elenchos* no. 36:317–338.

Abstract: "In this paper I compare Philoponus's account of the laws of conversion for categorical and modal propositions with Alexander's exposition of the same topic. I argue that Philoponus's main source was Alexander's commentary on Aristotle's *Prior Analytics* and that Philoponus had no access to independent sources to reconstruct Theophrastus's proof for the conversion of universal negative propositions.

I suggest that the different solutions that Alexander and Philoponus offer to the puzzles of the doctrine of the laws of conversion depend on the two commentators' different exegetical strategies. Alexander tries to solve the puzzles by means of doctrines, which Aristotle expounded elsewhere. Philoponus instead interprets Aristotle's passage as implying a hierarchy among propositions – a doctrine which is not explicitly present in Aristotle's text."

8. Mignucci, Mario. 1983. "Alessandro di Afrodisia e la logica modale di Crisippo." In *Atti del Convegno internazionale di storia della logica organizzato dalla Società italiana di logica e filosofia delle scienze (SILFS), San Gimignano, 4-8 dicembre 1982*, edited by Abrusci, Michele , Casari, Ettore and Mugnai, Massimo, 47–58. Bologna: CLUEB.

   "La logica peripatetica è stata studiata finora comparativamente meno di quella stoica e di quella aristotelica. Per giustificare quest'asserzione dovrei naturalmente chiarire che cosa intendo per 'logica peripatetica'. Non è tuttavia mia intenzione affrontare qui questo complesso problema. Al mio scopo è sufficiente dire che sotto l'etichetta di 'logici peripatetici' raccolgo tutti i commentatori greci delle opere logiche di Aristotele, anche se essi appartengono a scuole filosofiche diverse. Non mi propongo nemmeno di spiegare i motivi per i quali gli storici hanno trascurato questa parte della logica. Mi limito a far presente che fra le ragioni di questo abbandono non c'è quella che i non addetti ai lavori potrebbero sospettare che ci fosse, e cioè che la logica peripatetica è una logica non interessante o, addirittura, una piatta ripetizione dei punti di vista di Aristotele. A prova del fatto che essa merita di

essere ripresa in considerazione illustrerò qui alcune delle obiezioni che Alessandro di Afrodisia rivolge contro una tesi di logica modale sostenuta da Crisippo." (p. 47)

9. ———. 2001. "Alessandro di Afrodisia e la logica modale di Aristotele." In *Antichi e moderni nella filosofia di età imperiale: atti del II colloquio internazionale: Roma, 21-23 settembre 2000*, edited by Brancacci, Aldo, 239–263. Napoli: Bibliopolis.

   "È ad Albrecht Becker, in un saggio del 1933, che dobbiamo una chiara messa a punto dei problemi interpretativi e di consistenza che le tesi aristoteliche [sulla logica modale] sollevano(2). Da allora la sillogistica modale di Aristotele è stata variamente analizzata e discussa, senza però che si giungesse mai a un'interpretazione capace di dar conto unitariamente delle molte contrastanti affermazioni in essa contenute. Anche gli studi più recenti, sebbene numerosi e molto sofisticati, più che pervenire a un modello interpretativo coerente, hanno soprattutto mostrato che non c'è unanimità fra gli specialisti sulla diagnosi delle ragioni degli errori di Aristotele(3).

   Non è senza significato quindi cercare di saggiare 1'approccio di Alessandro a questa parte della dottrina aristotelica, perché il suo compito di commentatore è messo alla prova in una misura che eccede la norma." (p. 240)

   (...)

   "Naturalmente nel breve arco di questo saggio non potremo esaminare tutto il commento di Alessandro alla sillogistica modale. Ci limiteremo a prendere in considerazione le sue definizioni di possibilità e di attualità e alcune applicazioni di queste definizioni nel contesto della discussione di tesi controverse della sillogistica." (p. 242)

1. Bonelli, Maddalena. 2009. "Alexandre d'Aphrodise et le « De interpretatione »." In *Interpréter le De Interpretatione*, edited by Husson, Suzanne, 51–67. Paris: Vrin.

    "Le commentaire d'Alexandre d'Aphrodise sur le *De interpretatione* d'Aristote est perdu, mais on en retrouve plusieurs fragments, ou plutôt des paraphrases, principalement dans le commentaire de Boèce(1). Dans cet article, je considérerai deux de ces « fragments », portant tous deux sur le premier chapitre de l'oeuvre d'Aristote ; mais, auparavant, je présenterai l'arrière-plan, à savoir la tradition dans laquelle le commentaire d'Alexandre s'insère, en commençant brièvement par les autres commentaires anciens sur le De interpretatione." (p, 51)

    (1) C. Meiser (ed.), *Anicii Manlii Severini Boeti Commentarii in librum Aristotelis PERI ERMENEIAS*, editio secunda, Leipzig, Teubner, 1880 (désormais cité In *De int. II*).

2. Ferroni, Lorenzo, and Gili, Luca. 2014. "Syllogistique et méréologie chez Alexandre d'Aphrodise: remarques textuelles sur deux passages difficiles du commentaire aux "Premiers analytiques"." *Revue de Philologie, de Littérature et d'Histoire Anciennes* no. 88:91–110.

   Résumé : "Examen du texte d'Alex. Aphr., *In APr*. 60, 21-25 et 129, 33-130, 13. Le premier passage discute le syllogisme catégorique dit « Darii » : il ne faut pas éditer le texte admis, τὶ δε᾽ τοῦ Β ἐστι᾽ το᾽ Γ (c'est-à-dire que tout Γ est une partie de B, soit que B est dit de tout Γ), car on ne peut le déduire de la prémisse mineure qui précède. Il faut donc éditer τι᾽ δε᾽ τοῦ Β ἐστὶ <τι> τοῦ Γ (« quelque chose de B est quelque chose de Γ ») pour que l'argumentation soit valide. Cette tournure trouve des parallèles en Alex. Aphr., *In APr*. 34, 9-10 ; 121, 33-122, 1 ; 174, 23-24, etc. Dans le second passage, il faut placer les guillemets fermants en 130, 1, après ἐξ ἀνάγκης : il s'agit d'une version modale du « dici de omni et de nullo » employée par Alexandre pour résoudre le problème de la validité de « Barbara LX-L ». En 130, 4-5, l'expression impliquant ἐν τῇ οὐσίᾳ ne se laisse pas comprendre comme une affirmation de la position d'Alexandre lui-même mais comme une objection fictive qui est fautive. En 130, 11, la reconstruction du raisonnement d'Alexandre indique qu'il faut restituer une virgule après ὄντων, rejeter l'ajouter de δὲ au profit du οὕτως des manuscrits et ajouter un point-en-haut après αὐτῶν."

4. Guyomarc'h, Gweltaz. 2013. "Les sources post-hellénistiques du questionnaire de Porphyre." *Methodos. Savoirs et textes* no. 13:1–23.

   Résumé : Le début de l'*Isagogè* de Porphyre énonce une série de trois questions à propos des genres et des espèces, que l'on

tient pour l'origine de la médiévale « Querelle des universaux ». Mais la question s'est posée aux interprètes de savoir si, dans ce texte, Porphyre se référait à certaines thèses historiquement déterminées ou bien s'il construisait ces alternatives de façon théorique, dans une *lingua franca* non connotée d'un point de vue doctrinal. Cet article, en se concentrant sur la première alternative du questionnaire, tente de montrer que le texte porphyrien prend davantage sens si l'on s'avise que l'époque post-hellénistique (IIe s. av. J.-C. – début du IIIe s. ap.J.-C.) donne déjà à voir une polémique scolaire sur le statut des universaux. Ce n'est ainsi pas seulement le vocabulaire employé par Porphyre qui est doctrinalement connoté, mais l'alternative elle-même, qui fait très probablement référence à un débat entre les thèses platoniciennes, stoïciennes et péripatéticiennes. Alexandre d'Aphrodise constitue une aide précieuse pour reconstruire ce débat, dont l'article esquisse une cartographie."

Abstract: "At the beginning of his *Isagoge*, Porphyry establishes a famous set of questions concerning genera and species, which is the origin of the medieval “Quarrel of universals”. But this text gave rise to difficulty for interpreters: does Porphyry, when elaborating this set of questions, refer to historical positions or does he offer these alternatives in a *lingua franca*, which would be neutral from a doctrinal point of view? This article focusing on the first of the three alternatives raised by Porphyry aims to show that replacing Porphyry's text in its historical and philosophical background can shed light on the meaning of this alternative. During the Post-Hellenistic period (100 B.C.–200 A.D.), the different schools discussed the ontological status of universals. Therefore, not only does Porphyry use the terminology shaped by former philosophers, but he also alludes to the debate between Stoics, Middle Platonists and Peripatetics. Alexander of Aphrodisias constitutes a precious help to reconstruct this dispute, which this article tries to depict."

5. Guyomarc’h, Gweltaz. 2017. "« Métaphysique » et « Organon » selon Alexandre d’Aphrodise : l’utilité de la logique pour la philosophie première." In *Alexandre d’Aphrodise et la*

métaphysique aristotélicienne, edited by Balansard, Anne and Jaulin, Annick, 83–117. Leuven: Peeters.

"si, comme on le dit, Alexandre d'Aphrodise travaille à «systématiser» l'oeuvre d'Aristote (en un sens qui reste pour partie à déterminer), il est légitime de s'interroger sur la façon dont il conçoit les frontières entre

les différentes disciplines dans la cartographie aristotélicienne des savoirs.

Dans le cas de la métaphysique, ce sont les relations avec deux types de discours qui méritent en priorité un examen: d'une part, la physique, pour d'évidentes raisons internes à l'aristotélisme; d'autre part, la logique, pour des raisons qui tiennent aussi au contexte d'Alexandre. C'est à cette dernière que l'on souhaite s'intéresser ci-dessous. On voudrait plus précisément essayer d'éclairer le sens et la portée de trois passages du *Commentaire à la Métaphysique*, trois textes qui font explicitement se croiser logique et métaphysique." (p. 83)

6. Hugonnard-Roche, Henri. 2015. "Les épîtres syriaques de Sévère Sebokht et leurs sources grecques." *Studia greco-arabica* no. 5:53–104.

   "Abstract: "The aim of this paper is to provide the edition, with translation and commentary, of a short Syriac epistle by Severus Sebokht, bishop of Qenneshre (7th century), in which the author discusses some issues related to Aristotle's *Peri Hermeneias* and *Analytics*. The commentary examines in detail Severus' Syriac text by comparison with the Greek sources, namely the commentaries by Alexander of Aphrodisias, Ammonius, and Philoponus. In addition, in an appendix a study is included of a part of another epistle by Severus, concerning the existence of the possible, which shows a remarkable similarity with Alexander's *Question* II 4."

7. Lafleur, Claude. 2012. "Alexandre d'Aphrodise et l'abstraction selon l'exposé sur les universaux chez Boèce dans son Second commentaire sur l'« Isagoge » de Porphyre »." *Laval théologique et philosophique* no. 68:35–89.

   Avec la collaboration de Joanne Carrier.

Résumé : "Cette première traduction française d'une portion significative de l'*In « Isagogen » Porphyrii Commentorum Editio secunda*, en regard d'un texte latin reponctué en conséquence et accompagné d'annotations critiques, est précédée d'une présentation historico-doctrinale mettant en relief le rôle — à la fois central et problématique — de l'abstraction dans la solution boécienne, ouvertement rattachée à Alexandre d'Aphrodise (dont le traité *De l'âme* est ici examiné), du statut des genres et des espèces dans ce texte qui, à travers l'exégèse du célèbre questionnaire porphyrien, a fait connaître le problème des universaux à l'Occident latin et en est demeuré l'expression la plus achevée jusqu'au XIIe siècle, où Abélard en a donné un métacommentaire particulièrement brillant dans sa Lo*gica « Ingredientibus » : Super Porphyrium*, éditée, traduite et étudiée ci-après dans ce numéro thématique."

Abstract: "This first French translation of a relevant portion of the I*n "Isagogen" Porphyrii Commentorum Editio secunda*, in parallel with a consequently reponctuated and critically annotated Latin text, is preceded by a historico-doctrinal presentation highlighting the role — both central and problematic — of abstraction in the Boethian solution, openly linked to Alexander of Aphrodisias (whose treatise *On soul* is here examined), of the status of genera and species in this text which, through the exegesis of the well-known porphyrian questionary, has revealed the problem of universals to the Latin West and remained its most achieved expression until the 12th century, where Abelard wrote on those pages a particularly brilliant metacommentary in his *Logica Ingredientibus" : Super Porphyrium*, edited, translated and studied hereafter in this thematic issue."

8. Moraux, Paul. 1979. *Le Commentaire d'Alexandre d'Aphrodise aux «Seconds Analytiques» d'Aristote*. Berlin: Walter de Gruyter.

   "Les fragments du commentaire perdu d'Alexandre d'Aphrodise aux *Seconde Analytiques* d'Aristote devaient, en principe, être présentés dans le troisième volume de mon *Aristotelismus bei den Griechen,* qui sera consacré tout entier â l'oeuvre

d'Alexandre. Sans doute n'en aurais-je abordé l'examen que dans quelques années, si le thème proposé pour le huitième *Symposium Aristotelicum* (Padoue, 7-15 septembre 1978), â savoir l'étude des *Seconde Analytiques* eux-mêmes, ne m'avait incité â modifier mon plan de travail pour rassembler plus tôt que je ne l'aurais fait autrement les restes du commentaire d'Alexandre â ce traité.

Dans les pages qui suivent, on trouvera, groupés dans l'ordre même du texte commenté, les témoignages anciens qui peuvent être rapportés, avec certitude ou avec une assez grande probabilité, au commentaire perdu. J'y ai joint les principaux passages parallèles, ceux-ci nous montrant que les commentateurs grecs ont souvent puisé à l'ouvrage d'Alexandre sans mentionner leur source. Aux textes grecs eux-mêmes font suite quelques brèves explications; elles n'ont pas la prétention de résoudre tous les problèmes soulevés par le texte d'Aristote ou par le commentaire d'Alexandre; elles sont avant tout destinées à aider le lecteur, soit en lui rappelant quelles déclarations d'Aristote ont provoqué les remarques du commentateur, soit en éclairant d'une courte paraphrase le texte, parfois difficile, des interprétations de l'Exégète. Mon étude est donc avant tout philologique. J'espère pourtant que les philosophes qui étudieront les *Seconds Analytiques* trouveront matière à réflexion dans les vestiges, trop maigres, hélas! d'un commentaire qui, tant par son contenu que par l'influence qu'il a exercée, fait date dans l'histoire de l'aristotélisme." (Avant-Propos, pp. VII-VIII)

Estudios en Español

1. Correria, Manuel. 2024. "El silogismo como combinación en Alejandro de Afrodisias." *Daimon. Revista Internacional de Filosofía* no. 92:177–190.

   Resumen: "En el antiguo comentario a la lógica aristotélica, el vocablo griego συζυγία (*syzygía*) se refiere a un par de proposiciones que tienen uno o ambos términos en común. Esta voz griega se presenta como el género desde donde se especifican las tres reglas deductivas de la lógica aristotélica: conversión (si ambos términos son comunes, pero cambian su posición), oposición (si ambos términos son comunes, pero no cambian su posición) y silogismo (si un solo término es común y cambia su posición). Esta enseñanza no es explícita en Aristóteles, pero ya es conocida por su principal comentarista Alejandro de Afrodisias.

   En este artículo se muestra que la presencia de esta enseñanza, que mira al silogismo como una combinación (syzygía), conduce a describir la silogística como la actividad que busca las premisas que justifican una conclusión, que es la tarea de la dialéctica de los *Tópicos* de Aristóteles y lo que explica por qué el comentario de Alejandro propone un contexto dialéctico para

discutir la silogística en *APr*. Finalmente, sobre la base de que el uso del término *syzygía* está atestiguado en autores contemporáneos y anteriores a Alejandro, como Cicerón, Galeno y Apuleyo, el artículo sugiere que la elaboración y transmisión de esta enseñanza está relacionada con una fuente anterior, quien podría ser el discípulo de Aristóteles, Teofrasto de Ereso."

Abstract: "In the ancient commentary on Aristotelian logic, the Greek word συζυγία (*syzygía*) refers to a pair of propositions that have one or both terms in common. This Greek voice is presented as the genus from which the three deductive rules of Aristotelian logic are specified: conversion (if both terms are common, but change their position), opposition (if both terms are common, but do not change their position) and syllogism (if a single term is common and changes its position). This teaching is not explicit

in Aristotle, but it is already known by his main commentator Alexander of Aphrodisias. This article shows that the presence of this teaching leads to describe syllogistic as the activity that seeks the premises that justify a conclusion, which is the task of the dialectic of Aristotle's *Topics* and explains why Alexander's commentary proposes a dialectical context to discuss syllogistic in Prior Analytics. Finally, on the basis that the use of the term syzygía is attested in authors contemporary and prior to Alexander, such as Cicero, Apuleius and Galen, the article suggests that the elaboration and transmission of this teaching is related to an earlier source, who could be Aristotle's disciple, Theophrastus of Eresus."

2. Salles, Ricardo. 2009. "Alejandro de Afrodisia y el problema de la instrumentalidad de la lógica. Notas sobre *in A. Pr.* 2, 22-33." *Estudios de Filosofía* no. 40:223–243.

   Resumen: La contribución de Ricardo Salles se centra en la interpretación peripatética de Alejandro en contra de la tesis estoica de que la lógica no es "instrumento", sino "parte" de la filosofía. Según Alejandro, si la lógica fuera parte de la filosofía, como pretenden los estoicos, la filosofía no podría ocupar el lugar más elevado en la jerarquía del conocimiento; pero esto

sería, en cierto modo, paradójico, argumenta Salles, pues todos –tanto estoicos como peripatéticos– consideran, por diversas razones, que la filosofía es, por su objeto, la disciplina más elevada. De acuerdo con Salles, sin embargo, esta aguda crítica no es lo suficientemente penetrante para poner de manifiesto una verdadera inconsistencia en el estoicismo.

Salles cree que esto sería paradójico, pues todos –tanto estoicos como peripatéticos– consideran, por diversas razones, que la filosofía es, por su objeto, la disciplina más elevada. De acuerdo con Salles, sin embargo, la aguda crítica de Alejandro no es lo suficientemente penetrante para poner de manifiesto una verdadera inconsistencia en el estoicismo. Su principal debilidad, en su opinión, radica en el hecho de que el razonamiento sobre el cual descansa depende de supuestos aristotélicos que los estoicos rechazan."

Abstract: "Ricardo Salles' contribution is focused on Alexander's Peripatetic interpretation against the Stoic thesis that logic is not an "instrument", but a "part" of philosophy. According to Alexander, if logic were part of philosophy, as the Stoics maintain, philosophy could not occupy the highest place in the hierarchy of knowledge. Salles takes this to be paradoxical since both the Stoics and the Peripatetics consider that philosophy is, due to its object, the highest discipline. According to Salles, Alexander's acute criticism is not penetrating enough to make obvious a real inconsistency in Stoicism. In his view, Alexander's main weakness is that the reasoning on which such criticism is based depends upon some Aristotelian assumptions that the Stoics reject."

3. Brunschwig, Jacques. 2008. "Le chapitre 1 du *De Interpretatione*. Aristote, Ammonius et nous." *Laval Théologique et Philosophique* no. 64:35–87.

   "La treizième réunion du *Symposium Aristotelicum*, en 1993, a eu une très étrange et très triste destinée. Certes, elle s'est tenue dans le cadre enchanteur de la Chartreuse de Pontignano, près de Sienne; elle a donné lieu, comme ses devancières, à des communications et à des discussions d'un vif intérêt. Mais l'édition de ses Actes, pour une fois, s'est heurtée à d'insurmontables obstacles. La charge en avait été initialement confiée à Mario Mignucci et à Michael Frede, deux des plus fidèles et stimulants participants du Symposium. Ils ont été tragiquement enlevés à notre admiration et à notre affection, le

premier en 2004, sous les coups d'une longue et impitoyable maladie, le second en 2007, en conséquence d'un accident imprévisible et brutal. Le retard causé à la publication du XIIIe Symposium par cette double et douloureuse disparition n'a pu être comblé jusqu'à présent; les membres du comité organisateur m'ont assuré qu'à leur avis, il risquait de ne l'être jamais.

Par une coïncidence émouvante (en tout cas pour moi), trois semaines seulement avant la mort de Michael Frede, mon collègue et ami Thomas De Koninck me demanda si j'accepterais de publier dans le *Laval théologique et philosophique* l'étude que j'avais présentée, plus de dix ans auparavant, au XIIIe Symposium. Je passe sur les divers scrupules qui me firent hésiter quelque temps. L'insistance du Professeur De Koninck et celle de ses collaborateurs, Paul Asselin et Martin Achard, en eurent finalement raison, ce dont je leur suis très profondément reconnaissant.

Quant à ce texte, le lecteur voudra bien se souvenir de la longue histoire dont il est l'ultime fruit. Il serait bien difficile de le résumer: il est, il tente d'être cela même pour quoi il se donne, à savoir pour une lecture détaillée du commentaire par Ammonius du célèbre premier chapitre du *De Interpretatione*, lecture focalisée non pas tellement sur la lumière que le commentaire ancien peut (ou peut ne pas) jeter sur la lettre et sur l'interprétation du texte aristotélicien que sur ce que ce commentaire peut nous apprendre sur les méthodes, les choix, les comportements intellectuels de son auteur lui-même, et sur ses propres motivations philosophiques et pédagogiques face à un texte comme celui qu'il entreprend de commenter."

5. De Rijk, Lambertus Marie. 2003. "Boethius on *De interpretatione* (ch. 3): is he a reliable guide?" In *Boèce ou la chaîne des savoirs. Actes du Colloque International de la*

fondation Singer Polignac (Paris, 8-12 juin 1999), edited by Galonnier, Alain, 207–227. Paris: Peeters Publishers.

"There can be no doubt whatsoever about Boethius's exceptional merits for transmitting Aristotle's logic to us. But while 'Aristotelian' logic is in many respects synonymous with 'Aristotelico-Boethian' logic, the question can be raised whether Aristotle himself was an 'Aristotelian'. To give just one example: from Lukasiewicz onwards there has been much debate among scholars about the telling differences between traditional syllogistic and that of the *Prior Analytics*. (1)

In this paper I intend to deal with two specimens of Boethius's way of commenting upon Aristotle's text. They are found in his discussion of *De interpretatione*, chapters 2 and 3, which present Aristotle's views of *ónoma* and *rhema*. (2) One concerns the semantics of indefinite names, the other that of isolated names and verbs." p. 227

(1) Jan Lukasiewicz, *Aristotle's Syllogistic from the Standpoint of Modern Formal Logic*, Oxford, 1951. G. Patzig, *Aristotle's Theory of the Syllogism. A logico-philological study of Book A of the Prior Analytics*, Dordrecht, 1969.

(2) *Rhema* properly stands for 'what is said of', including not only our 'verb' but also adjectives, when used in attributive position. One should realise, however, that 'verb' refers to a word class, rather than a semantic or syntactical category, as *rhema* does.

"Conclusion. Returning now to Boethius' manner of commenting upon Aristotle's texts, the following points can be made:

[1] In the wake of Ammonius, (3) Boethius explains [*De int.*] 16b22-25 on the apophantic level, i.e. in terms of statement-making, instead of framing significative concepts, i.e. on the onomastic level.

[2] Whereas in Ammonius' report of the predecessors, Alexander and Porphyry, as well as his own exposition of the issue, there are many clues to the previous alternative reading

and interpretation on the onomastic level, Boethius does not even refrain from cleansing the text (including his 'quotations'), by changing, at any occurrence, '*ens*' into '*est*'.

[3] In doing so, Boethius decisively influenced the commentary tradition on account of the purport of *De int*. 3, 16b19-25. He effectively contributed to the common verdict on this paragraph in terms of 'a curious medley'.

[4] As far as the semantics of the indefinite verb (3, 16b14-15) is concerned, Boethius' apparently adhering to the so-called 'Ammonii recensio' was far less desastrous for the common understanding of Aristotle on this score, and, in effect, merely provided us with some stimulating Medieval discussions of the semantics of term infinitation.

[5] Finally by way of speculative surmise, it might be suggested that both the fact that Boethius dealt with the 'Ammonii recognise' without reading it in his lemma of 16b14-15, as well as his rather ruthlessly interfering in the quotations of the pre-Ammonian sources, should make it more plausible that Boethius had extensive, but incomplete marginal notes to his Greek text of Aristotle at his disposal, rather than a full copy of Ammonius' commentary (or those of other Greek commentators).

To comment upon Aristotle's work naturally includes developing his lore. But nothing can ever guarantee that this will happen *ad metem auctoris*. (4)"

(3) It is unmistakably plain that in *De int*. ch. 3, Boethius is strongly influenced by what he read in Ammonius (or in marginal notes on Ammonius' view).

6. Diebler, Stéphane. 2002. "Les canons de Proclus: problèmes et conséquences de l'interprétation syriano-proclienne du *De interpretatione*." *Dionysius* no. 20:71–94.

"Ammonius' commentary on the third section of Aristotle's *De interpretatione* offers insight into the hermeneutical and logical debates of the 5th-cent. Neoplatonic school in Athens. These debates reveal one of the rare cases of a theory that was developed by Proclus in contradiction to that of his teacher Syrianus, and in the course of which the authoritative status of *De interpretatione* as a carefully composed, syntagmatic work was itself put into question. Ammonius was concerned to establish the coherence of Int. 19 B 19-20 B 12. According to his interpretation, this section falls into two further sections, arranged around two types of logical sequences : the first section (19 B 19-20 A 6) is explained according to an interpretation that derives from Syrianus ; the second (20 A 20-20 B 13) recalls the canons of Proclus."

16. Ierodiakonou, Katerina. 2019. "The Byzantine Reception of Aristotle's Theory of Meaning." *Methodos* no. 19:1–17.

    Abstract: "Byzantine scholars composed, primarily for educational purposes, paraphrases and commentaries on Aristotelian logic and, in particular, on Aristotle's *De interpretatione*. Some of these works clearly betray their ancient provenance and others are testimony either to lost ancient traditions or to the Byzantines' own attempts to make sense of Aristotle's puzzling text.

    My aim is to present the Byzantine comments on the first chapters of the *De interpretatione*, in which we find traces of Aristotle's theory of meaning. I begin by collecting the relevant textual material from the eleventh to the fifteenth century and, then, I discuss the Byzantine views on four topics that seem to be of some philosophical and historical interest: Are the same thoughts shared by all people? In what way do likenesses, symbols and signs differ? Are names by nature or by convention? Do parts of composite names have meaning?"

    Contents: Acknowledgements IX; Sigla X; Abbreviations and Editions XI; Introduction 1; I. Aristotle: *Peri Hermeneias* I, 16a3-9; 7; II. Boethius' Translation 49; III. Orandi Ordo 64; IV. Cogitabilis Oratio 93; Afterword 142; Bibliography 150; Index Locorum 155; Index Nominum et Rerum 162-165.

    "The present work is divided into four chapters, taking as its starting point the lines of Aristotle's *Peri Hermeneias* around which Boethius' theory of signification turns. The first chapter of the study plunges in *medias res*, and for that the reader's patience is requested. The Greek text is both difficult and compressed, and necessarily brings into consideration questions of the history of transmission and commentary, as well as numerous aspects of Aristotle's thought both in this and in other works. But since Boethius translated either all or part of the *Peri Hermeneias* before commenting upon it, and then revised the translation for the second commentary; and since in his translation, as in all translations, there is an element of "commentary" upon the meaning of the original, it has been thought necessary to come to a clear understanding of what Aristotle wrote before proceeding to the translation and commentaries. After careful examination of the Greek passage and of the questions it poses, there follows in the second

chapter an analysis of Boethius' Latin translation of the same, and of the interpretation implicitly contained therein." (pp. 1-2)

21. ———. 2010. "On the Composition and Sources of Boethius' Second *Peri hermeneias* Commentary." *Vivarium* no. 48:7–54.

    Abstract: "The paper is in three parts, prefaced by general remarks concerning Boethius' logical translations and commentaries: the text of the *Peri Hermeneias* as known to and commented on by Boethius (and Ammonius); the organizational principles behind Boethius' second commentary on the *Peri Hermeneias*; its source(s). One of the main purposes of the last section is to demonstrate that the *Peri Hermeneias* commentaries of Boethius and Ammonius are, although part of a common tradition, quite independent of one another, and special consideration is given to the question of how Boethius interpreted and shaped the doxographical material concerning Aspasius, Herminus, and Alexander that had been handed down to him by Porphyry."

    "Sifting through the interpretations of earlier commentators was painstaking and laborious, Porphyry's interpretation of 19b22-24 alone requiring, as we have seen, seventeen pages of commentary. By about the year 515 Boethius' attention must have been turning toward other projects, to new translations and commentaries, the theological tractates, logico-rhetorical monographs, and so on. If the Peri Hermeneias were allowed to consume so much time and energy, what would become of the rest of the *Organon* and Aristotle, not to mention Plato? Even for a treatise as rich and complex as the *Peri Hermeneias* Boethius may have had finally to calculate his "point of diminishing returns." He may have grown impatient with the project, his copy of Porphyry may have failed, or both. Had he known of the premature end that awaited him, he might have thought differently about how to weight the commentary, might have sought compensation in other projects for problems left unsolved in connection with the *Peri Hermeneias*; but as it is, he left a work which, despite its imperfections, has proved to be one of his most fascinating and influential." (p. 54)

22. ———. 2011. "Preliminary Observations on the Textual Tradition of Boethius' First *Peri Hermeneias* Commentary." In *Logic and Language in the Middle Ages: A Volume in Honour of Sten Ebbesen*, edited by Fink, Jakob Leth, Hansen, Heine and Mora-Márquez, Ana María 13–26. Leiden: Brill.

"In editing the first of Boethius' two commentaries on Aristotle's *Peri Hermeneias* Carl Meiser essentially worked from a single witness, F (below), which he ranked both *antiquissimus* and *optimus*. (1) Readings from three other munich manuscripts, e (MS Bayer. Staatsbibl. clm 14401, s. XI), M (below), and T (MS Bayer. Staatsbibl. clm 18479, s.XI), he reported *perpetuo more* but with varying degrees of accuracy. (2) He further consulted two st. Gall manuscripts, G (below) and S (MS Stiftsbibl. 817, s. XI-XII) *omnibus locis paulo difficilioribus* — citing them only infrequently, however, in his critical apparatus. from *Peri Hermeneias* 17b20 on, F preserves excerpted lemmata, and Meiser correctly recognized that the supplemented versions found in other witnesses violate Boethius' intention. (3)

But F is in fact neither *antiquissimus* nor *optimus*, and Meiser's edition suffers from a particular failure to distinguish between the three versions of Boethius' *Peri Hermeneias* translation, two of which form his commentary lemmata. Hence a full assessment of the evidence seems called for. In what follows, I hope to shed some light on certain salient characteristics of the textual tradition." (p. 13)

Chapter 2.3.

"In a series of articles during the 1920's and 30's the famous Polish logician Jan Lukasiewicz advocated a particular interpretation of Aristotle's discussion of the status of sentences about the contingent future, as developed in his 'sea-fight'

example (from *De Interpretatione* chapter IX). Lukasiewicz' interpretation crucially rests on a rejection of the principle of bivalence. In fact, this kind of interpretation was not new, but had been formulated as early as by the Epicureans. However, Lukasiewicz presented this position more clearly than had ever

been done before, and developed it with the aid of modern symbolic logic." (p. 149)

(...)

"Lukasiewicz' interpretation was disputed by Prior [1962, p. 240 ff.], who pointed out a significant difference between Lukasiewicz's trivalent logic and Aristotle's text: according to Aristotle it is true already today, that there either there will or there will not be a sea-fight tomorrow, even though the truth value of the two constituents of the disjunction are separately unknown, or possibly 'undetermined'. " (p. 152)

"This work aims to be a study of his commentaries on Aristotle’s *Peri hermeneias* (*De interpretatione*). For my discussion of these commentaries, I use Carl Meiser’s edition, which is the only critical edition currently available. Deviations from the critical edition are recorded in the footnotes of the quotations.

Boethius wrote two commentaries on *Peri hermeneias*. In Meiser’s edition, the first commentary is only 195 pages while the second commentary is 502 pages, more than double the length of the first. Writing two commentaries on the same work was not unusual for him. He also wrote two commentaries on Porphyry’s *Isagoge*, but the first commentary is three-fifths the length of the second commentary.(3) The striking difference in length between the two commentaries on *Peri hermeneias* reflects his careful planning of the role of each commentary: the first one to present basic lines of Aristotle’s thought, the second one to provide much more detailed explanations.(4) In the second commentary, he often introduces past discussions of Greek commentators and notions that he does not mention in the first commentary. The fact that he purposely wrote two commentaries should be seriously taken into account in considering the apparent inconsistencies and contradictions between them.

This work is primarily devoted to the second commentary. I include the first commentary principally in the following two cases: First, I point out where his explanation significantly differs from that of the second commentary. His account in the second commentary can be mostly regarded as a development

of the first, but the first commentary sometimes has explanations incompatible with those in the second commentary.(5) Boethius seems to make contradictory statements rather deliberately, intending to present simple interpretations in the first commentary, knowing that they are not the best.(6) Second, I refer to the first commentary when it illuminates or enhances his explanations in the latter.

I sometimes look at Boethius' other works, mainly logical ones, in relation to the main questions surrounding the second commentary.

Where the texts contribute to our understanding, I discuss them in the relevant sections. Otherwise, I refer to them in the footnotes. For my interpretations of the commentaries, I have relied very little on his treatises on theology, liberal arts, and his renowned masterpiece, The *Consolation of Philosophy*. It is important to consider why the same individual wrote all these works in different disciplines. I would not deny that these independent treatises could illuminate his logical works. In fact, I believe they do, and I will argue so in the concluding chapter.

I find, however, that these independent treatises have many differences from his logical works. For an accurate interpretation of his logical works we should be very careful in relying on these treatises.(7)" (pp. 1-2)

(3) In Brandt's edition of Boethius' commentaries on Isagoge, the second commentary is 214 pages while the first commentary is 130 pages. Boethius does not allude to a second commentary in the first.

(4) In *PH1* 31.6-32.3; In *PH2* 186.2-9; 250.20-251.4; 294.5-8. For the dates of composition of these commentaries, see Chart 2, p. XIX.

(5) His distinction between simple and composite propositions, which I discuss in Chapter 5, is an example of this.

(6) Sten Ebbesen (*The Aristotelian Commentator* (2009): 49) points this out with textual evidence: In PH1 132.3 sqq. and In

PH2 276.8 sqq.

(7) Scholars have pointed out this danger. Antony Lloyd (*The Anatomy of Neoplatonism* (1990): 2, n.2) cautions against cross-referencing Boethius' different works. Ebbesen says, "one should be cautious in assuming consistency between the doctrines of the Aristotle commentaries and that of *Consolation of Philosophy*" ("Review of J. Magee's *Boethius on Signification and Mind*." *Vivarium* 29, 1991, p. 153). Vincent Spade (*Boethius against Universals: Arguments in the Second Commentary on Porphyry*, 1996) criticizes Peter King's use of Boethius' *De trinitate* for understanding his second commentary on *Isagoge*.

    "A la lumière des analyses qui précèdent, qu'en est-il maintenant du titre *peri hermeneias*? Ce titre correspond-il au contenu de l'ouvrage?

    La question posée ne vise pas directement l'authenticité Aristotélicienne de la formule: il est vrai cependant, qu'un titre qui ne traduirait pas bien le contenu du traité, aurait peu de chances d'avoir été rédigé par le Stagirite. Par contre, il est probable que l'ouvrage ait reçu un certain titre de la part de son auteur et si le titre traditionnel correspond au contenu de l'écrit, il peut très bien remonter à l'auteur lui-même. Quoi qu'il

en soit de la question d'authenticité, nous croyons pouvoir conclure que le titre donné recouvre bien le contenu du traité, dont le sujet principal est l'énonciation catégorique et ses composants. En se basant sur les analyses de Boèce et d'Ammonius, on peut dire que tous ces éléments correspondent à l'idée d'interprétation telle qu'elle est expliquée dans le traité:

1. L'énonciation y est conçue comme l'interprétation d'un contenu de pensée. Toutefois si le langage se rapporte directement à un objet pensé, il se réfère indirectement au réel: il en résulte que le discours énonciatif est aussi une interprétation de la réalité. Il l'est à un double niveau: le contenu particulier de chaque énonciation se rapporte à un sujet déterminé du monde et en exprime certaines caractéristiques; on peut donc le considérer comme un acte d'interprétation. Par ailleurs, il y a la structure même du jugement, qui, elle aussi, est une interprétation à un niveau plus fondamental de la physionomie du réel.

2. Les noms et les verbes constituent à leur tour un acte d'interprétation. Selon Aristote, la signification des mots est conventionnelle: elle est le résultat de la vie en communauté, où les hommes sont amenés à se mettre d'accord sur des notions fondamentales de la vie morale et sociale. Ammonius croit que le sens des mots n'est pas purement artificiel, mais qu'il est adapté à la nature des choses. Quoi qu'il en soit, le fait d'appliquer au réel des noms et des verbes est un acte d'interprétation. Exprimer le réel dans les catégories du langage implique toujours un acte interprétatif.

La doctrine aristotélicienne sur la nature du langage justifie donc le titre de *peri hermeneias.".*

History of Medieval Logic: A General Overview

Introduction

"The role of logic in the Middle Ages.

Regarding the role of logic within the framework of arts and sciences during the Middle Ages, we have to distinguish two related aspects, one institutional and the other scientific. As to the first aspect, we have to remember that the medieval educational system was based on the seven liberal arts, which were divided into the *trivium*, i.e., three arts of language, and the *quadrivium*, i.e., four mathematical arts. The so-called trivial arts were grammar, rhetoric, and logic, and during a period of several centuries virtually every educated person, at least every university graduate, received a training in these matters, especially in logic. Students in the medieval faculty of arts probably spent more time studying logic than any other discipline. This first -- institutional -- aspect concerning the role of logic is explained by the second -- scientific -- aspect. The trivial disciplines provided techniques of analysis and a technical vocabulary that permeate philosophical, scientific and theological writings. Logic, as mentioned before, was referred to and was generally regarded as the art of arts and the science of sciences. The increasing cultural dominance of the universities with their obligatory *disputationes* and their hierarchy of examinations on the one hand and the outstanding status of logic on the other were corresponding features of the educational world of the 13th century.

The core of the logic curriculum from the 12th century onwards was provided by the logical works of Aristotle. These represented the

material for the study of types of predication, the analysis of simple propositions or statements (2) and their relations of inference and equivalence, the analysis of modal propositions, of the structure and the types of the syllogism, dialectical topics, fallacies and scientific reasoning as based on the demonstrative syllogism. Medieval logicians, however, realized that there were other, non-Aristotelian, approaches to logical subjects, questions and methods that could be investigated. The new approaches primarily included works on the signification and the supposition of terms -- a distinction showing some similarity to the modern distinction between meaning and reference. The theory of signification deals with the capability of descriptive terms to function as signs, i.e., their property of being meaningful. The theory of supposition was concerned with the types of reference that terms in their function as subject and predicate obtain in the context of different propositions. Another emphasis was put on consequences or valid inference forms. These innovations were by no means regarded as an alternative to tradition, but supplemented the Aristotelian *logica antiqua* under the heading of *logica moderna* or *logica modernorum*.

The medieval logicians themselves did not classify their discipline as a *scientia formalis* -- to my knowledge the expression was not used in the Middle Ages -- but as a *scientia sermocinali*s, i.e., a science of argumentative speech, which was the overarching framework of the trivial arts. The *scientia sermocinalis* itself is one of three types into which science was divided, e.g., by Peter of Spain in his well-known [Lambertus Marie de Rijk (ed.), Petrus Hispanus: *Tractatus* called afterwards *Summule logicales*, Van Gorcum 1972, p. 29, 14-16]. The differences (*differentiae*) of science, as Peter states, are *naturale, morale*, and *sermocinale*, a division which resembles the Stoic division into natural philosophy, ethics, and logic.(3) William of Sherwood, another important logician of the 13th century, offers the same scientific differences, but -- in contrast to Peter of Spain -- as the result of a twofold division:(4) Since there are two sources (*principia*) of things, nature and the soul, there will accordingly also be two kinds (*genera*) of things. The things whose source or principle is nature are the concern of natural science. The others, whose source or principle is the soul, are again divided into two types. Since according to Sherwood the soul is created without virtues or

knowledge, it performs certain operations by means of which it attains to the virtues, and these are the concern of ethics or *scientia moralis*. The soul performs different operations by means of which it attains to knowledge, and these are the concern of the science of argumentative speech or *scientia sermocinali*s. At this point we meet the same threefold division of science that occurs in Peter of Spain. It is worth mentioning that the first division regarding the nature of things is metaphysical while the second division regarding the different sorts of things whose source is the soul is epistemological. The sciences whose principle is the human soul are understood as concerning basic human activities or operations, and the specific differences among them are obtained from the goals of these activities, namely virtues on the one hand and science on the other.

The term "scientia sermocinalis" which stands for the subtle analysis of ordinary language came into use in the late 12th or early 13th century. The designation of logic as a *scientia sermocinalis* was commonly accepted during the 13th century, but it was not the only one. The term "logica" as derived from the Greek "logos" can mean both "sermo" and "ratio". Accordingly, logic was regarded either as a *scientia sermocinalis* or as a *scientia rationalis*. The medieval authors offer considerations supporting both titles. While logicians like William of Sherwood and Peter of Spain stressed the feature of logic as a linguistic science as mentioned above, other authors in the 13th century like Robert Kilwardy and St. Bonaventure called it linguistic and rational alike. In the 14th century the notion of logic as a rational science became predominant. An important reason lies in the fact that logic was about second intentions, which were higher-level concepts like "genus", "species", "predicate", etc. We make use of second intentions to classify our concepts or first intentions of things in the world. Second intentions reveal both universals and logical structures and were regarded as mental constructs or rational objects reached through abstraction, which means reflection on general features and relations of things and on actual pieces of discourse."

Notes

(2) In medieval logic "propositio" and "enuntiatio" both stand for a sentence signifying something true or false and are mostly used as

interchangeable terms. However, using the term "propositio" we have to avoid the modern understanding of proposition, or content, as what is asserted or what is expressed by a sentence.

(3) The *scientiae morale*s and *naturales* as the counterpart to the *scientiae sermocinales* were sometimes brought together under the integrating concept of *scientiae reales*; cf. [Jakob Hans Josef Schneider, *Scientia sermocinalis / realis,* in: Joachim Ritter and Karlfried Gründer (eds.) Historische Wörterbuch der Philosophie 8, Wissenschaftliche Buchgesellaschaft Darmstadt 1992, col. 1508].

(4) Cf. [William of Sherwood, *Introductiones in logicam,* in: J. Reginald O'Donnell, The *Syncategoremata* of William of Sherwood, Medieval Studies 3 (1941), p. 46-93, p. 2, 1-12].

From: Christoph Kann, "Medieval Logic as a Formal Science", in: Benedikt Löwe, Volker Peckhaus, and Thomas Räsch (eds.), *Foundations of the Formal Sciences IV. The History of the Concept of the Formal Sciences*, London: College Publications 2006, pp. 103-123.

"The specific contribution of mediaeval logicians.

The new elements which the mediaeval logicians have added to the logical theories which had been handed down to them via Boethius, are found embodied in a number of treatises which mainly discourse upon the field of semantics.(5) To define the exact place of these new elements in mediaeval logic from the twelfth to the fifteenth century, we must recall to mind the mediaeval terminology: *logica vetus*, *logica nova*, *logica antiqua*, and *logica moderna*.

(a) *Logica vetus*. It is a matter of common knowledge, that up to and including the first few decades of the twelfth century the Latin West knew from Aristotle's *Organon* only the*Categories* and *De Interpretatione*. These two works formed, together with the I*sagoge* of Porphyrius, Boethius' commentaries on these three writings as well as his logical monographs, the works of the *ars vetus* or l*ogica vetus*. From c. 1200 the work *De Sex Principiis*, attributed to Gilbert de la Porrée, also belonged to this group.

(b) *Logica nova*. This comprised Aristotle's two *Analytics*, *Topic*s and *Sophistici Elenchi*.

(c) *Logica antiqua* (or *antiquorum*). This name is the generic term for the a*rs vetus* and *ars nova* together.

(d) *Logica moderna* (or *modernorum*). This term is the pendant of the preceding and comprises those elements in mediaeval logic which cannot be simply traced back to the writings of the *logica antiquorum*." (pp. 14-15)

Notes

(5) The treatise *De Consequentiis* can be said to be nearer to the logic of propositions.

From: L. M. de Rjik, *Logica Modernorum. A Contribution to the History of Early Terminist Logic*, Assen: Van Gorcum 1962, Vol. I *On the Twelfth Century Theories of Fallacy*.

"It was argued in Trentman [5] that, in spite of the important and obvious differences of opinion that divided them, the medieval logicians were in general agreement on the nature of their task and the way to carry it out. For them logic was analytic and, one might say, reconstructionistic. This character of their discipline was well expressed by St. Anselm in a passage Henry has used to good advantage: *Non tantum debemus inhaerere improprietati verborum veritatem tegenti quantum inhiare proprietati veritatis sub multimodo genere locutionum latenti* (*). (*De casu diaboli*; cf. Henry [4, 6].) Truth lies hidden under the surface structure of everyday speech. The job of the logician is to bring out in a systematic way what lies thus hidden. What is hidden is logical form; we might say that it is the form of thought, and Ockham identifies it with the structure of mental language (Trentman [7]). But we could also say that it is the form of the world; hence, describing it means stating the most general truths about reality. Ockham's mental language is also intended to satisfy this requirement in that it is supposed to be a kind of ideal language directly picturing the world. But logicians sceptical of "Mental" also held firmly to this point of view (Trentman [8]) ; thus a study of logic taught men to speak truly (*vere loqui*). Nor did the dispute about whether logic is *scientia sermocinalis* or a *scientia rationalis* (cf. Kretzmann [9, 10]) really touch this point of fundamental agreement. Medieval logic, therefore, was not formalistic in the sense of a study of uninterpreted calculi. It studied

very general truths about reality, reflected in the form of thought and expressed in language. It proceeded by systematic reconstruction, but the "system" that emerged thereby must be viewed as an interpreted system. Of course, contrary to what people sometimes seem to believe, by no means all twentieth-century logicians have been formalists. Indeed, the points of view of Frege and Russell were not unlike that of the medievals, and such otherwise disparate recent logicians as Lesniewski and Bergmann have maintained essentially the same view of logic as an interpreted system.

To say that medieval logic was systematic is not, of course, to say that it was constructed like a modern quasi-axiomatic system. There are no axioms and theorems, no formation rules and the like. Medieval logics were generally presented in the form of lists of rules of inference, often with little or no apparent heed for economy. This does not mean, however, that the logicians were unaware of logical relations between rules. Indeed, in some cases they showed a very perceptive appreciation of the ways in which proofs are constructed and the ways in which some rules may be derived from others (Boh [11]). The medieval logicians, unfortunately, lacked a good notation; indeed, they lacked any notation. Even quotation marks would have helped, as some of the complications with material supposition show. But, although they experimented a bit with something like indicators of quotation, and they commonly used letters for abbreviation, on the whole, they had to make do with ordinary or (as Henry has often reminded us) rather extraordinary Latin. None of them, however, was an "ordinary language" philosopher. Contrary to what John of Salisbury had urged, they did not take the idioms of any ordinary language as an arbiter of logical rectitude. No problems are solved simply by citing ordinary usage. Yet, as Boh [11] points out, it was the "formal aspects of ordinary discourse", that is, the syntax of ordinary language, that provided the material for logical analysis. To this material they brought the tools of their trade. They aimed at reconstructions of puzzling syntactical constructions that would perspicuously reveal the logical forms they concealed. The logicians' business, then, was with the perplexities of ordinary language syntax; on them he used his tools of reconstruction; and the arbiter of his success was an ideal syntax, a syntax reflecting the general form of reality.

The theory of supposition was one of the great preoccupations of the later medieval logicians. It was, in fact, at the heart of the studies of *proprietates terminorum* which so characterized their work and led to their being called "terminists". Owing to the important work of de Rijk [12], its origins are no longer veiled in impenetrable obscurity; but, whatever its origins, it has for some time been a subject of much fascination for modern scholars and logicians, although, like so many medieval theories, it seems to aim one stone at too many birds; it has to do equally with matters that we should prefer to distinguish as semantic and syntactic. In any case, there has been considerable recent discussion about whether or not a part of it, in particular the theory of personal supposition, constitutes a kind of analogue to modern quantification theory. This debate is interesting, not only in its own right, but also in exemplifying some of the problems involved in attempted comparisons between modern and medieval logical theories."

Notes

(*) [We should not let ourselves be hindered by the improprieties of words which cover up the truth; rather we should seek after the propriety of the truth which is hidden under diverse manners of speaking.]

Selected Bibliography on Medieval Logic: General Studies. (First Part: A - J)

Bibliography

1. "Aristotelian Logic East and West, 500-1500: "On Interpretation" and "Prior Analytics" in Two Traditions." 2010. *Vivarium* no. 48.

   Special issue edited by Margaret Cameron and John Marenbon.

   Contents: Margaret Cameron and John Marenbon: Introduction 1; John Magee: On the Composition and Sources of Boethius' Second *Peri Hermeneias* Commentary 7; Taneli Kukkonen: Al-Ghazālī on the Signification of Names 55; Simo Knuuttila: Medieval Commentators on Future Contingents in *De Interpretatione* 9 75; Sten Ebbesen: The "Prior Analytics" in the Latin West: 12th-13th Centuries 96; Uwe Vagelpohl: The "Prior Analytics" in the Syriac and Arabic tradition 134; Christopher J. Martin: 'They had added not a single tiny proposition': The Reception of the "Prior Analytics" in the First Half of the Twelfth Century 159; Henrik Lagerlund: Al-Ghazālī on the Form and Matter of the Syllogisms 193; Simo Knuutila: Generality and Identity in Late Medieval Discussions of the "Prior Analytics" 228; Paul Thom: Three Conceptions of Formal Logic 228-242.

2. "Ontological Commitment in Medieval Logics." 2019. *Medioevo.Rivista di Storia della Filosofia Medievale* no. 44.

Edited by Laurent Cesalli, Parwana Emamzadah, Frédéric Goubier.

Contents: Laurent Cesalli, Parwana Emamzadah, Frédéric Goubier: Presentation 7; Laurent Cesalli: Mentalism without Psychologism: Abelard's *Dicta* as Objective, Mental Entities 17; Ana MarÍa Mora-Márquez: The Dialectical Construction of a Notion of Truth in Some 13th-Century Masters of Arts 39; Danya Maslov: Francis of Meyronnes on the Ontological Status of the «First Complex Principle» 57; Claude Panaccio: Ockham's Commitment to Merely Possible Beings 81; Ernesto Perini-Santos: Wodeham against Chatton: The Second Part of the Way towards *Complexe significabilia* 99; Joël Biard: John Buridan and Natural Supposition: From the Semantics of Names to Atemporal Propositions 123; Graziana Ciola: The Void and the Chimera: Marsilius of Inghen on *Imaginabilia* 141; Magali Roques: Vincent Ferrer on Natural Supposition 161-177.

3. Aho, Tuomo, and Yrjönsuuri, Mikko. 2009. "Late Medieval Logic." In *The Development of Modern Logic*, edited by Haapranta, Leila, 11-77. New York: Oxford University Press.

   "1. The Intellectual Role and Context of Logic

   Our aim is to deal with medieval logic from the time when it first had full resources for systematic creative contributions onward. Even before that stage there had been logical research and important logicians. The most original of them, Abelard, achieved highly significant results despite having only a very fragmentary knowledge of ancient logic. However, we shall concentrate on the era when the ancient heritage was available and medieval logic was able to add something substantial to it, even to surpass it in some respects.

   A characterization such as this cannot be adequately expressed with years or by conventional period denominations; we hope though that the grounds for drawing boundaries will become clearer during the course of our story." (p. 11)

    "Semantics in the Middle Ages is not precisely defined discipline, but it seems to be rather the complex of the reflections on the concept of the lingustic sign, its functions and classifications. Semantic reflection mainly emerged out from the ancient ideas concerning the problems of language and grammar.

    Let us make a suggestion, that the theory of properties of terms was the basis of the medieval semantics. Among the various properties, signification (*significatio*) was the most important property of terms, which were distinguished by the medievals. Thus, in this article, I would like to examine the basic semantic problems considered by the medieval authors, but mainly, I shall focus on the concept of signification. It seems, that solutions of semantic problems, which were offered by scholars, lead to the division of the medieval semantics tradition into the

two traditions, namely *via antiqua* and *via moderna* semantics. So, I would like to point out these main directions of the development of the semantic in the Middle Ages." (pp. 55-56)

    Supplementary Volume 17: *Aristotle And His Medieval Interpreters*.

    "In many fields within the history of medieval philosophy, the comparison of the Latin and Arabic Aristotelian commentary traditions must be concerned in large measure with the influence of Arabic authors, especially Avicenna and Averroes, upon their Latin successors. In the case of the commentary tradition on the Peri hermeneias, however, the question of influence plays little or no part in such comparative considerations. Yet the absence of a direct influence of Arabic philosophers upon their Latin counterparts does have its own peculiar advantages, since it provides an opportunity to explore the effects upon Aristotelian exegesis of the different linguistic backgrounds of Arabic and Latin authors. This is especially evident in the discussions in *Peri hermeneias* commentaries devoted to the relationship between logic and language, and to

the question of the differences between a logical and a grammatical analysis of linguistic phenomena. While both Arabic and Latin exegetes inherited, directly or indirectly, some of the same materials of the late Greek commentary tradition, and of course, some of the same issues inherent in Aristotle"s own text, Arabic and Latin authors filtered that same philosophical material through very different linguistic traditions, each with its own indigenous grammatical and linguistic theories. Given these circumstances, the very linguistic gulf separating the Latin and Arabic authors, which in many areas of philosophy remains merely incidental, becomes essential to the philosophical issues posed by certain parts of Aristotle"s *Peri hermeneias*." (p. 25, a note omitted)

18. Boehner, Philotheus. 1952. *Medieval Logic: An Outline of Its Development from 1250 to c.1400*. Manchester: Manchester University Press.

    "For those who have more than a passing acquaintance with modern logic, it is an accepted fact that this logic has made tremendous strides forward. It is likewise a fact-and one which current research continues to confirm-that these new developments have deviated far less from the logic of the 13th and 14th centuries than from that of our neoscholastic textbooks. This present study in the elements and systems of scholastic logic should make this evident.

    And while, in the space of this relatively short work, it is impossible to do full justice to the subject of scholastic logic, the several samples and selections we have made should make it clear that it is far easier to compare modern logic with that of the scholastics than with that of the neoscholastics.

For, in the latter case, there is often no basis for comparison.

Among the elements shared in varying degrees by genuinely scholastic logic and modern logic, there is one in particular that brings them in close proximity and facilitates a comparison. It is the character of formality, conserved in a much purer form in scholastic logic than in its neo-scholastic counterpart. The real reason why certain neo-scholastics are averse to the "formalism" of modern logic is to be found precisely in the non-scholastic elements of their neo-scholastic logic." (*Introduction,* pp. XIII-XIV, a note omitted)

(...)

"By *scholastic logic* we refer to the logic taught during the 13th, 14th and 15th centuries in the Latin Occident, which has come down to us in various compendia, commentaries and other writings. Only a small fraction of this logic is accessible in modern editions. The bulk still remains hidden in old editions, incunabula and manuscripts. For the sake of convenience, we have begun with the 13th century, though this does not imply that the logic of the 12th-century scholastics was of no importance. We have also excluded the work of Ramond Lull, since we have to confess we are not sufficiently familiar with his peculiar logic to

deal with it adequately, though we suspect that it is much better than the usual evaluation by historians would lead us to believe." (*Introduction,* pp. XIV_XV)

19. Boh, Ivan. 1977. "The "conditionatim"-clause: one of the problems of existential import in the history of logic." *Notre Dame Journal of Formal Logic* no. 18:459-466.

"An attempt is made to provide a "missing link" in the history of the problem of existential import of standard categorical propositions by examining the late-medieval compilation "Parvulus logice" and finding there a promising direction toward modern interpretation. The anonymous author realizes that an existential assumption must be made for affirmative propositions to secure the validity of A I, but curiously he adds the assumption conditionally rather than conjunctively and this

not only for "A" but also for "I" propositions. he latter insistence leads to unacceptable consequences, even if one accepts the medieval maxim that negative propositions have no existential import; but dropping the "conditionatim"-clause requirement for "I" propositions and insisting on it for "A" propositions only would yield precisely the "modern" Square."

21. ———. 1993. *Epistemic Logic in the Later Middle Ages*. New York: Routledge.

"Epilogue: A summary and an assessment of medieval achievements in epistemic logic

Given the data presented in the ten chapters, there should be no doubt that the medievals discerned accurately the special character of problems of a epistemic/doxastic nature. We have encountered very

early in our investigation: (i) an open admission of non-standard modes by Anselm, and later on by Burley and Ockham; (ii) two distinctly diverse characterizations of consequence-relation, one in terms of

alethic modal conditions, the other in terms of understandings, signification, conceptual involution, and *illatio* - beginning with Garland and Abelard, continuing through the ages, and ending (?) with the predominance of the epistemic as opposed to alethic characterization; (iii) a search for firm, demonstrative knowledge of necessary propositions by Grosseteste, but leading to a distinction of various senses of scire and eventually leading to a search of necessary and sufficient conditions for knowing contingent propositions by the authors of de scire et dubitare literature, such as Kilvington and Heytesbury; (iv) a search - especially among the early theologians such as Anselm, Albert the Great, Thomas Aquinas, etc. - for the proper conceptual relationship of knowing, believing, having conviction, having faith, and truth; (v) a discovery of de dicto and de re constructions (e.g. necessity of consequence and necessity of the consequent), eventually including those

constructions caused by verbs signifying acts of mind and will; (vi) discovery of special, Gettier-like problems and epistemic paradoxes; (vii) a growing awareness of the pragmatic dimension of language involving a reference to an epistemic subject; (viii) a growing recognition that some inferences depend for their validity or acceptability on epistemic/doxastic functors, even though propositional and quantificational or syllogistic principles are, of course, in full force; (ix) an attempt in the later fourteenth century (e.g. Strode, Peter of Mantua) to systematize the most general principles of epistemic logic and to co-ordinate them with alethic and obligational principles, and of course with the principles of propositional logic; (x) a practice quite common in Burley, based on the distinction between the principal and the derived rules of consequence, to prove certain rules by appealing to other, more basic rules, and now extended (e.g. by Strode and Frachantian) to rules ofa epistemic/doxastic sort (...)" 24. Bonfiglioli, Stefania, and Marmo, Costantino. 2007. "Symbolism and Linguistic Semantics. Some Questions (and Confusions) from Late Antique Neoplatonism up to Eriugena." In *The Many Roots of Medieval Logic: The Aristotelian and the Non-Aristotelian Traditions*, edited by Marenbon, John, 238-252. Leiden: Brill.

Abstract: "The notion of 'symbol' in Eriugena's writing is far from clear. It has an ambiguous semantic connection with other terms such as 'signification', 'figure', 'allegory', 'veil', 'agalma', 'form', 'shadow', 'mystery' and so on. This paper aims to explore into the origins of such a semantic ambiguity, already present in the texts of the pseudo-Dionysian corpus which Eriugena translated and commented upon. In the probable Neoplatonic sources of this corpus, the Greek term *symbolon* shares some aspects of its meaning with other words inherited from the ancient tradition, such as *synthēma*, *eikōn, homoiotēs*. Some of them, such as *eikōn* and *homoiotē*s, belong to the field of images and are associated with linguistic semantics in the Neoplatonic commentaries not only to Plato but also to Aristotle's logical works. Among the late ancient Neoplatonists, particular attention is paid to Proclus and to his use of the term agalma. In fact, the textual history of this word seems to be a privileged perspective from which to reconstruct

the Neoplatonic semantic blending of symbol and image, as well as the main role played by linguistic issues in this conflation."

27. Broadie, Alexander. 1993. *Introduction to Medieval Logic*. Oxford: Clarendon Press.

    Second revised edition; first edition 1987.

"In a comprehensive guide it would be necessary to deal with the logic, and therefore with the logicians, of many centuries, perhaps starting with Abelard (1079-1142); perhaps even, and with good reason, starting with Boethius (c. 480-524). For despite the fact that Boethius belonged to the late Roman Empire rather than to the Middle Ages his writings, which include not only the *Consolation of Philosophy* but also translations of most of the logical works by Aristotle and commentaries on a number of books, are, for logicians no less than for philosophers, a crucial bridge between the ancient world and the medieval.

However, this Introduction is not intended as a survey of ten centuries. I have chosen instead to attend mainly to the period from the mid-thirteenth century to the earlier part of the fifteenth. For the purposes of an Introduction a different period could no doubt have been chosen, but the period just mentioned is one of intense activity by men with as strong a claim as any to being included among the greatest of the medieval logicians. Certainly that period yielded an extraordinarily rich harvest. The logicians upon whom I shall be drawing most heavily are Peter of Spain, Walter Burley, William Ockham, John Buridan, Albert of Saxony, and Paul of Venice. But my net will be cast sufficiently wide to take in the writings of earlier logicians and also of later ones, even considerably later ones. For in the decades before the Reformation important discoveries were being made in logic by men who were very much part of the medieval logical world." *(ntroduction*, pp. 4-5, notes omitted)

29. Brumberg-Chaumont, Julie. 2013. "The Role of Discrete Terms in the Theory of the Properties of Terms." *Vivarium* no. 51:169-204.

    Abstract: "Discrete supposition occurs whenever a discrete term, such as 'Socrates', is the subject of a given proposition. I propose to examine this apparently simple notion. I shall draw

attention to the incongruity, within a general theory of the semantic variation of terms in a propositional context, of the notion of discrete supposition, in which a term usually has a single semantic correlate. The incongruity comes to the fore In those treatises that attempt to describe discrete supposition as a sort of personal supposition, although the same term cannot be in simple supposition in another propositional context, because it has no significate distinct from its suppositum. This shows a fundamental link between common signification, simple supposition and predicability, three notions that rely on the existence of a significate distinct and Independent from the suppositum of the term. The connection is to be seen especially in William of Sherwood's *Introductiones*, the only author of a terminist *Summa* who recognizes the existence of simple supposition for discrete terms."

30. ———. 2015. "Universal Logic and Aristotelian Logic: Formality and Essence of Logic." *Logica Universalis* no. 9:253-278.

    Abstract: "The rediscovery of Aristotle's works on syllogisms in the Latin world, especially the *Sophistici Elenchi* and then the *Prior Analytics,* gave rise to sophisticated views on the nature of syllogistic form and syllogistic matter in the thirteenth century. It led to debates on the ontology of the syllogism as studied in the *Prior Analytics,* i.e. the syllogism made of letters and the four logical constants a/e/i/o, with deep consequences on the definition of logic as a universal method for all sciences and as a science itself."

    See alsdo the *Erratum*, in *Logica Universalis* 9 (2015), p. 279.

31. ———. 2021. "The Impact of Aristotelian Logic on Medieval Latin and Jewish South-European Cultures: Placing and Re-scaling Logical Knowledge." *Studia graeco-arabica* no. 11/2:157-182.

    Abstract: "This paper seeks to address the problem of the cultural impact of logic in Latin and Hebrew contexts by offering a social and spatialized history of logic during the 13th century. This approach is liable to put an end to the idea that medieval Latin logical culture was a monolithic reality, targeted by the umbrella term of "Latin scholasticism". The pluralization

of Latin educational cultures is explored in terms of history of disciplines, places of knowledge, periods, institutions, self-representation, social value, educational impact and practitioners. The first part of this paper shows how the diffusion of Aristotelian cultures was quite limited in Christian Europe before the beginning of the 13th century, and remained so untill the end of the 13th cent. The second part specifically turns to the history of logic. A first section offers an overview of the first developments of Hebrew logic. The next one describes the weaknesses of the teaching of logic in Latin southern Europe. The third section highlights some original features of the teaching of the *Tractatus*. The last section shows how the development of Dominican 'schools of logic' in southern provinces contributed to a first 'meridionalization' of the Aristotelian logical culture. The conclusion suggests possible revisions of some aspects of the standard narrative about the history of Latin-Hebrew interactions in the field of logic."

37. Campos Benítez, Juan Manuel. 2018. "Analogy and Visual Content: The Logica memorativa of Thomas Murner." *Philosophies* no. 4:1-12.

    Abstract: "In this article, after some thoughts on medieval logic and teaching, we present Thomas Murner's text, *Logica*

memorativa, showing some of his mnemonic strategies for the student to learn logic quickly. Murner offers a type of “flash cards” that illustrate much of the teaching of logic at the beginning of the sixteenth century. The first impression is visual, because the cards do not contain words that illustrate their content. Murner’s exposition rests on analogies between logic themes that are explained and the visual images presented."

    Abstract: "Walter Burley (1275-c.1344) and John Wyclif (1328-1384) follow two clearly stated doctrinal options: on the one hand, they are realists and, on the other, they defend a correspondence theory of truth that involves specifi c correlates for true propositions, in short: truth-makers. Both characteristics are interdependent: such a conception of truth requires a certain kind of ontology. Th is study shows that a) in their explanation of what it means for a proposition to be true, Burley and Wyclif both develop what we could call a theory of intentionality in order to explain the relation that must obtain between the human mind and the truth-makers, and b) that their explanations reach back to Augustine, more precisely to his theory of ocular vision as exposed in the *De trinitate* IX as well as to his conception of ideas found in the *Quaestio de ideis*."

44. De Freitas, Antonio. 2002. "Dark Age (But Not Obscure) Logic. A Brief Excursion." *Boletín de la Asociación Matemàtica Venezolana* no. 9:5-14.

    "1 Introduction

    The 20th century has witnessed a vertiginous development of logic: a discipline that traditionally belonged to the domain of philosophy, but whose recent development is due to the use of mathematics as its meta-language. Considered as one of the greatest of Greek gifts to humanity, logic is now essential as the foundational model for Computer Science. Some scholars assimilate Mathematics and Logic, some think of Logic as part of Mathematics, others include it in Philosophy, and so on.

    When we were planning this special volume of the Boletín de la Asociación Matemàtica Venezolana, an article on Mediaeval Logic seemed to be appropriate.

    This paper is an outline of that field. We follow tradition in starting this history with Aristotle, although pre-Aristotelian logic is of considerable interest, if somewhat controversial. Following Aristotle, we take a brief excursion through Roman and Early Mediaeval logic. We stop in the 13th century AD because of the influence of the work of this period on the 20th century. The natural continuation of Mediaeval Logic occurred

in the 1960's when logicians started to base new developments on translated Mediaeval texts. Two further articles dedicated to History of logic will be needed to trace these developments.

This paper, then, is an outline of Mediaeval Logic, its origins and its future."

"Foreword

The first volume of this book showed the development of the two great logical systems of Aristotle and Chrysippus. In this volume we look at the third great system of logic, that of the Scholastics. They studied the teachings of the Greeks, of the Arab and Jewish commentators, and from them evolved a *logica perennis* based on a single, well-founded philosophical doctrine. We shall see the crystallization of Scholastic logic into a well defined system, the contributions of the Scholastic logicians and the subsequent decline of the philosophical and logical doctrines to mere didactics.

At the dawn of the Renaissance the opponents of Scholastic logic were searching for new logical systems. But the Renaissance failed to achieve a unitary doctrine which could provide an adequate critique of the old logic as well as an independent, valid, logical system. The Renaissance produced new ideas and trends which though interesting failed to make any major contribution to logic comparable to other great conceptions such as Scholasticism.

Both periods have been studied in the past, but not with special reference to the logic of the period. The historian has very great

problems in his attempt to sort and classify the enormous amount of material available. In order to deal with this material synthetically and avoid repetition we have adopted a synchronous and diachronous approach.

    "Introduction

    To me it is an article of faith that medieval logic is interesting to people of our times, but since some people disagree and even sneer at „logische Quisquillen" I shall try to buttress my faith with reasons. I choose to interpret ‚medieval' as „medieval Latin", for it is hard to make statements that are valid for both the Latin and the Greek tradition, and I know too little about the Arabic and Hebrew material.

    I will argue that medieval logic is interesting

    1. — because it combines a strong activity on the theoretical level with application in scholarly argumentation.

    2. — because understanding the logic is a presupposition for understanding any medieval theoretical writings at all. So anyone who thinks that medieval philosophy or theology is interesting had better take an interest in logic.

    3. — because it is under-explored and so provides surprises for the explorer.

    4. — because it deals with many problems that are easily identifiable with problems of present-day-concern, but often views things from different angles or in different contexts.

    5. — because it deals so thoroughly with ambiguity." (p. 38)

Abstract: "Clashes between bits of non-homogeneous theories inherited from antiquity were an important factor in the formation of medieval theories in logic and grammar, but the traditional categories of Aristotelianism, Stoicism and Neoplatonism are not quite adequate to describe the situation. Neoplatonism is almost irrelevant in logic and grammar, while there might be reasons to introduce a new category, LAS = Late Ancient Standard, with two branches: (1) logical LAS = Aristotle + Boethius, and (2) grammatical LAS = Stoics &c. → Apollonius → Priscian."

    "The purpose of the article is to examine and reconstruct two contrasting medieval views of identity and non-identity. First the relativist positions of Aquinas and Scotus are examined and an attempt is made to reconstruct them to accommodate relativization to Leibniz's law via different levels of discernibility and indiscernibility. Next the absolutist position of Ockham is examined along with his reasons for rejecting relativization. An attempt is made to show how he could handle the problems of his predecessors through the doctrine of supposition of terms rather than relativization. Ockham's view is briefly compared with some twentieth century absolutist positions."

    Second emended editon 1968; third revised and expanded edition 1980.

    "The extension I am giving to the' term "medieval logic" is practically the same as that which Moody gives it in his *Truth and Consequence in Mediaeval Logic*; namely, the logic taught in the Arts faculties at Oxford and Paris, which flourished particularly in the thirteenth and fourteenth centuries. I shall also cite the writings of Aquinas, both as evidence for the doctrine of the contemporary formal logicians (*sophistae*) and also because, though Aquinas was not a logician *ex professo* and never wrote a *Summa logicae*, his views on the philosophy of logic are often of the highest value.

    A principle that I have repeatedly used to eliminate false theories of reference is the principle that the reference of an expression E must be specifiable in some way that does not involve first determining whether the proposition in which E occurs is true. The first explicit statement of this principle that I have found is in Buridan's *Sophismata* (c. vi, sophisma v); the principle might suitably be called Buridan's Law." (p. 10)

75. Goubier, Frédéric, and Pouscoulous, Nausicaa. 2011. "*Virtus sermonis* and the semantics-pragmatics distinction." *Vivarium* no. 49:214-239.

    Abstract: "Late medieval theories of language and contemporary philosophy of language have been compared on numerous occasions. Here, we would like to compare two debates: that between the nature of *virtus sermonis*, on the medieval side—focusing on a statute published in 1340 by the Faculty of Arts of the University of Paris and its opponents—and, on the contemporary side, the on-going discussion on the semantics-pragmatics distinction and how the truth-value of an utterance should be established. Both the statute and Gricean pragmatics insist on the importance of taking into account the speaker's intention and the context in establishing the signification of an utterance.

    Yet, upon closer examination, a more convincing parallel might be drawn between the statute's position and current theories in truth-conditional pragmatics. Focusing on a few aspects of the statute that seem to find a counterpart within contemporary pragmatics, we try to show how the issues they give rise to converge, but also diverge."

    "2.2 Dialectics

    2.2.1 Major Hypotheses

    In the domain of logic, the leading figure in 12th-century historiography has long been Pierre Abelard. A revolutionary

thinker, he was able to draw from the materials of the *logica vetus* a logic, a semantic, a psychology, and a metaphysics of a sophistication that commands admiration. He also illustrates the importance of the interactions between grammar and dialectics, as well as the osmosis between theological issues and developments in logic. However, the first half of the century had other major figures, the great masters who gave birth to the "schools" mentioned above. As recent works have brought to light the importance of these schools, they have called into question another historiographical tendency that made this century a preparation for the next, a

moment of progressive and at times awkward elaboration of the "logic of the moderns" *(logica modernorum*), a masterpiece of formal university semantics that appeared at the turn of the 13th century. The 12th century was, more than any other, a "linguist" century, in which the language arts developed in a symbiotic manner, permeated philosophical reflection, equipped the theological issues, which in turn enriched them with new perspectives, and honed the theoretical instruments. Grammarians, logicians, theologians, the authors of the 12th century and their schools offered a unique moment of reflection on language with its own personality and consistency." (pp. 154-155)

79. ———. 1987. "The Topics in Medieval Logic." *Argumentation* no. 1:407-417.

    Abstract: "The topics is a theory of argumentation based upon topoi or in Latin loci. The medieval logicians used works by Aristotle and Boethius as their sources for this doctrine, but they developed it in a rather original way. The topics became a higher-level analysis of arguments which are non-valid from a purely formal point of view, but where it is none the less

legitimate to infer the conclusion from the premiss(es). In this connection the topics give rise to a number of discussions about the form and the matter of arguments. Further the topic contribute to the elaboration of the important doctrine of the second intentions, i.e. higher-level concepts of the particular things. In some respects the topics may be said to form a link between formal and informal logic. The topics vanished as a part of logic at the end of the Middle Ages, perhaps because the medieval logicians never got rid of Boethius' claim to have compiled a complete list of the loci, which was an unlucky one. The topics does not have an exact parallel in modern formal logic, but some reflections on non-formal argumentation by recent authors contain certain resemblances to it."

80. Grellard, Christophe. 2007. "Scepticism, Demonstration and the Infinite Regress Argument (Nicholas of Autrecourt and John Buridan)." In *The Many Roots of Medieval Logic: The Aristotelian and the Non-Aristotelian Traditions*, edited by Marenbon, John, 328-342. Leiden: Brill.

    Abstract: "The aim of this paper is to examine the medieval posterity of the Aristotelian and Pyrrhonian treatments of the infinite regress argument. We show that there are some possible Pyrrhonian elements in Autrecourt’s epistemology when he argues that the truth of our principles is merely hypothetical. By contrast, Buridan’s criticisms of Autrecourt rely heavily on Aristotelian material. Both exemplify a use of scepticism."

81. Grondeux, Anne. 2007. "*Res* Meaning a Thing Thought: The Influence of the *Ars donati*." In *The Many Roots of Medieval Logic: The Aristotelian and the Non-Aristotelian Traditions*, edited by Marenbon, John, 189-202. Leiden: Brill.

    Abstract: "During the fourth century C.E. Donatus borrowed from the Greek tradition the idea of replacing *res corporalis* with *res* in the definition of the noun, because of the usual equivalence between *pragma* and *res*. This change had important consequences, such as a new distinction between *corpus* and *res*, as well as a new meaning proposed for the word *res*. This new meaning happened to be questioned by later

commentators, because masters of grammar seemed to reject the Donatian distinction between *corpus* and *res,* and consider that *corpus* is rather included inside *res,* before being later accepted by Sedulius and

Remigius, perhaps under the influence of the common expression *res verbi*. However, the word remained poly-semic in spite of Donatus' attempt, as can be seen in the *Glosulae in Priscianum* (s. XII)."

    "§ 2. Medieval logic and modern logic. At this point the question may well be raised as to the extent to which contemporary studies of medieval logic are capable of fulfilling the sort of promise outlined above. Medieval logic was a philosophical logic, closely geared to philosophical themes. What then could a purely formalist logic, interested purely in combinations of uninterpreted notation, have in common with medieval logic? Again, assuming that this first difficulty may be obviated by the use of a non-formalist type of modern logic, the fact still remains that both in logic and metaphysics the medievals used a highly systematised Latin, extremely rich and daring in its proliferation of forms of speech belonging to recondite semantical categories. How then is it possible for a

philosophical formal logic of the current sort in this respect to rival and exceed (as it must) the medieval artificialised language? Finally, the medievals were blithely uninhibited by any of the dark and knotty controversies which have arisen as a result of our contemporary entanglement of the notion of existence with the device central to modern formal logic, namely the device of quantification (cf. II §2). How then can modern logic, caught as it is in this entanglement, recapture the untrammelled approach to existence enjoyed by its medieval predecessors?

(...)

At the present juncture, therefore, in the light of these remarks and others which will be cited in III §1, it would appear that explanations in ordinary language, with only rare and occasional help from the language of formal logic in comparatively uninteresting contexts, is the most that can be expected of the history of medieval logic. Under these circumstances the promise of the sort of definitive conclusions which formal logical analysis would provide concerning the sense and validity of medieval logical and philosophical theses seems to be impossible of fulfillment.

Fortunately it happens that there exists a system of modern formal logic; unfamiliar to many logicians and philosophers, and sometimes misunderstood by others, which allows the investigator to overcome all of the difficulties stated above, and from the standpoint of which many of the further difficulties which may still be raised can be satisfactorily resolved. This logic is that of the Polish logician S. Lesniewski (1886-1939), a partial account of which may be found in Part II below. This logic is anti-formalist, in that its theorems are interpreted truths, and not mere syntactically-permissible combinations of uninterpreted marks (cf. II §0.00). It has the capacity for the introduction of indefinitely many new parts of speech (semantical categories) and hence can adapt itself to the required degree of exactitude for the purpose of analysing medieval logic, as Part III will demonstrate. It employs an interpretation of the quantifiers which allows dissociation of

the latter from its usually necessary entanglement with the notion of existence (II §2.23, II §2.25), and so is in a position to come to more exact terms with medieval discourse on this topic.

It follows that the purpose of the present work is three-fold. After the preliminary consideration of the field which is contained in this introduction, a practical account of one of the central theories of Lesniewski, namely his *Ontology,* will be presented in Part II. Thus armed, we will be in a position to expose in detail in Part III some examples of the way in which Ontology may be used in the analysis of medieval themes.

Now this may all sound to be a formidable undertaking for those readers who are no logicians, and they may feel tempted to remain at the level of analyses and explanations conducted in everyday language, with perhaps a few elementary terms or scraps of notation from current logic or linguistics thrown in. Indeed, there may be some who in spite of their own logical competence are as yet unconvinced of the value of making a text intelligible in the light of a fully systematised language, and who would protest that if intelligibility cannot be offered by explanation in terms of comparatively ordinary language, then so much the worse for the medievals who insist on being unintelligible in this way. To such objection three types of reply are possible. First, efforts have been made in Part II to give an explanation of Lesniewski's Ontology, with which we are to be mainly concerned, of so elementary a nature as to be easily grasped by all who have only the slightest acquaintance with the logic of propositions and the notion of quantification. Secondly, as has already been contended above, the highly systematised technical logical Latin of the medievals involved the introduction of new parts of speech which stand outside the elucidatory capacities of ordinary language. Thirdly, even if ordinary language is itself artificialised somewhat in the medieval sort of style, there are limits to its intelligibility unless the analysis is carried forward into a fully systematic language such as that of Ontology. Partly in support of this contention an effort will now be made to give a preliminary appreciation and survey of the nature of themes which are to be touched upon in

Part III. In the course of this effort ordinary language will be strained to the uttermost in order to come to terms with the way in which the scholastics modified such language for technical purposes. Even this straining will, in the end, be found wanting; this will convey concretely the necessity of going yet further, to the fully artificial language outlined in Part II." pp. 2-4

    Abstract: "This essay proposes and defends a general thesis concerning the nature offallacies of reasoning. These in distinctive ways are all said to be deductively invalid. More importantly, the most accurate, complete and charitable reconstructions of these species and specimens of the informal fallacies are instructive with respect to the individual character of each distinct informal fallacy. Reconstructions of the fallacies as deductive invalidities are possible in every case, if deductivism is true, which means that in every case they should be formalizable in an expressively comprehensive formal symbolic deductive logic. The general thesis is illustrated by a detailed examination of Walter Burleigh's paradox in his c. 1323 work, *De Puritate Artis Logicae Tractatus Longior*

(*Longer Treatise on the Purity of Logic*), as a challenge to the deductive validity of hypothetical syllogism.

The paradox has the form, 'If I call you a swine, then I call you an animal; if I call you an animal, then I speak truly; therefore, if I call you a swine, then I speak truly'. Several solutions to the problem are considered, and the inference is exposed as an instance of the common deductive fallacy of equivocation."

90. Johnston, Spencer C. 2021. "Connexive Principles After a 'Classical' Turn in Medieval Logic." *History and Philosophy of Logic* no. 43:251-263.

Abstract: "The aim of this paper is to look at the arguments advanced by three Parisian arts masters about how to understand *Prior Analytics* II 4 and the more general discussion that medieval authors situate this in, revolving around the validity of various rules of inference. In particular, this paper argues that all three arts masters read Aristotle's remarks as committing him to a weak form of connexive principles where the antecedent needs to be either true or at least formally possible; this is known in the contemporary literature as a weak connexive thesis."

22. Kretzmann, Norman. 1970. "Medieval Logicians on the Meaning of the *Propositio*." *Journal of Philosophy* no. 67 (20):767-787.

    "When the medievals spoke of a propositio they were speaking not of a propositional content but of a propositional sign, written or spoken or mental. I shall use the word `proposition' in this paper in order to speak of written or spoken propositional signs-type-sentences or token-sentences in the indicative mood. Mental propositional signs I shall call mental propositions. I shall simplify the topic by considering only completely general, nonindexical propositions, those whose meaning and truth value remain the same regardless of who utters them or the circumstances of their utterance.

    I am taking it for granted that a complete theory of linguistic meaning must include accounts of what signs stand for and of what signs convey-broadly speaking, a theory of reference and a

theory of sense. I believe that medieval logicians produced a theory of reference and a theory of sense for propositions, but in two separate developments, without recognizing that the theories were complementary. One of these was terminism, the semantic theory characteristic of terminist logic. Briefly, terminism is an elaborate analysis of the ways in which all the words making up the proposition affect one another's reference or logical status. The other development consists in a family of semantic, logical, epistemological, and ontological doctrines centering around the notion of the significatum, or enuntiabile, or dictum of the proposition. I shall speak of this development, and especially of its semantic component, as dictism.

In this paper I want to give some idea of the nature of these two developments and to suggest that we can piece together the most complete theory of propositional meaning medieval logic has to offer if we take terminism as a theory of propositional reference and dictism as a theory of propositional sense. I shall begin by considering terminism from that point of view." (pp. 767-768)

"The ten contributors to this volume hope to honor Jan Pinborg's memory by presenting studies and texts relevant to his own scholarly interests in medieval philosophy, particularly in logic and semantic theory. Though not every one of the ten studied or worked with Jan Pinborg, all of us learned a great deal from his writings. One or two of the contributors, having studied with a student of Jan's, can lay claim to being his academic grandchildren; but those of us who were born before Jan are also deeply in his debt. The ten contributions are arranged approximately in the chronological order of their subject matter.

L. M. de Rijk, Professor of Philosophy at the University of Leiden, ranging over Boethius's Aristotelian commentaries and theological treatises with his well-respected authority, finds new material for Boethius's semantic theory in his metaphysics and theology and, in the process, sheds light on Boethius's difficult and historically important conception of being.

Eleonore Stump, Professor of Philosophy at Virginia Polytechnic Institute and State University, well-known for her own work on Boethius, here describes a critical development in the history of the dialectical Topics and shows how it can be used to help explain the new direction taken by the terminist logicians of the first half of the thirteenth century.

Gabriel Nuchelmans, Professor Emeritus of Philosophy at the University of Leiden and author of an important series of volumes on the development of theories regarding propositions, analyzes the medieval distinction between doing something linguistically and merely talking about it, bringing out the remarkable power and range of medieval logicians' applications of the distinction.

The fourth, fifth, and sixth contributions form a connected series, all focusing on semantic issues associated with the treatment of concrete accidental terms (such as 'white') by medieval logicians, and all stemming from a seminar conducted at the University of Copenhagen. The first of these three pieces is by Robert Andrews, a PhD candidate at Cornell University who studied for a year at the Copenhagen Institute; he focuses on problems of denomination - the sort of relationship that obtains between 'literacy' and 'literate' - and presents an edition of a relevant text by Peter of Auvergne. The centerpiece of this set of three contributions is the one contributed by the professor who conducted the seminar, Sten Ebbesen, whose three-volume study of Greek and Latin commentaries on Aristotle's *Sophistici elenchi* is truly monumental. Here he considers the elaborate medieval analysis of the way in which a concrete accidental term manages to have a conceptually unitary meaning despite both signifying a quality and indicating that the quality has a bearer. He concludes his contribution with an edition of Peter of Auvergne's sophisma *Album potest esse nigrum*. Reinhard Hülsen, a PhD candidate of the Philosophisches Institut of the University of Hamburg, who also studied at Copenhagen with Ebbesen, is the third of this trio of contributors. He uses the medieval treatment of concrete accidental terms to illuminate the notoriously perplexing Aristotelian fallacy of "figure of speech".

Paul Vincent Spade, Professor of Philosophy at Indiana University, editor or translator of several medieval logical treatises and author of many valuable articles, focuses on a peculiar logical doctrine attached to the medieval semantic theory of *suppositio* in order to explain certain philosophical and historical developments in the latter half of the thirteenth century.

Norman Kretzmann, Susan Linn Sage Professor of Philosophy at Cornell University and principal editor of *The Cambridge History of Later Medieval Philosophy,* presents a critical analysis of one of Richard Kilvington's sophismata in order to illustrate the achievements of later medieval epistemic logic. He

provides an edition and translation of Kilvington's Sophisma 45.

Alfonso Maierù, Professor of Philosophy at the University of Rome, to whom all students of medieval logic are grateful for his *Terminologia logica,* here carries on his study of medieval attempts to develop a logical account of the intricacies of the divine Trinity, primarily by presenting an edition and study of an anonymous treatise of this sort from the late fourteenth century.

Lange Olaf Nielsen, a Danish theologian and church historian who studied at the Copenhagen Institute with Jan Pinborg and who is doing important work on the connections between philosophy and theology in the later Middle Ages, here extends his study chronologically into the seventeenth century with a remarkably rich paper on the hitherto neglected atomist Sebastian Basso."     Abstract: "A dialogue between “Intellect” and “Soul”, preserved uniquely and incompletely in a manuscript now held by the University of Pennsylvania, is a rare and precious specimen of pre-Maimonidean Hebrew philosophical literature. The author repurposes some terms drawn from rabbinic legal texts, innovates some terms on his owns, and occasionally must resort to writing out Arabic terms in Hebrew letters.

    In one passage, which clearly draws upon Galen’s *Institutio Logica*, he displays relational syllogisms which prove the superiority of the soul over the body."

    Abstract: "One of the main controversies of the Logic Schools of the 12th century centered on the question: What follows from the impossible? In this paper arguments for two diametrically opposed positions are examined. The author of the 'Avranches Text' who probably belonged to the school of the Parvipontani defended the view that from an impossible proposition everything follows ('Ex impossibili quodlibet'). In particular he developed a proof to show that by means of so-called 'disjunctive syllogism' any arbitrary proposition B can be logically derived from a pair of contradictory propositions *A* and Not-*A*. The author of the *Ars Meliduna* instead argued that *nothing* follows from an impossible proposition ('ex falso nihil sequitur'). This view is supported by various counterexamples which aimed to show that the admission of impossible premises would give rise to inconsistent conclusions. Upon closer analysis these inconsistencies do not, however, have the formal structure of a real contradiction like *A* and Not-*A*, but rather the structure of two rivalling *conditionals* like 'If *B* then *A*' and 'If *B* then Not-*A*'. Hence these counterexamples rather have to be considered as refutations of the basic principles of 'connexive logic'."

33. Manekin, Charles H. 1996. "Some Aspects of the Assertoric Syllogism in Medieval Hebrew Logic." *History and Philosophy of Logic* no. 17:49-71.

    Abstract: "This paper introduces the reader to the medieval Hebrew tradition of logic by considering its treatment of Aristotelian syllogistic. Starting in the thirteenth century

European Jews translated Arabic and Latin texts into Hebrew and produced commentaries and original compendia. Because they stood culturally and geographically at the cross-roads of two great traditions they were influenced by both. This is clearly seen in the development of syllogistic theory, where the Latin tradition ultimately replaces, though never entirely, its Arabic counterpart. Specific attention is devoted to the debate about the so-called Galenian fourth figure.

In medieval Hebrew logic one finds both defenders and detractors of the figure, the former appearing towards the beginning of the period in question. With the ascendancy of scholastic logic the fourth figure virtually disappears from Hebrew texts."

35. ———. 2011. "Logic in Medieval Jewish Culture." In *Science in Medieval Jewish Cultures*, edited by Freudenthal, Gad, 113-135. Cambridge: Cambridge University Press.

" “Logic,” to paraphrase the medievals, is an ambiguous term. Broadly speaking, it refers to the study, construction, and appraisal of argument, and in this sense it is similar to “reasoning.” More specifically, “logic” refers to a body of doctrines stemming from the Greek logical tradition, and, even more specifically, to those doctrines found in the nine books of the medieval *Organon* (Porphyry’s *Isagoge*; and Aristotle’s *Categories, De interpretatione, Prior Analytics, Posterior Analytics, Topics, Sophistical Refutations, Rhetoric*, and *Poetics*).

A comprehensive survey of the place of logic in medieval Jewish intellectual life, in the broad sense of the term, would require nothing less than an analysis of the varieties of reasoning in the various disciplines studied by Jews, nonphilosophical as well as philosophical.

Even the less ambitious task of tracing the influence of the Greek logic on medieval Jewish philosophy would call for a survey of the entire literature, because what philosophical work

could be excluded? The present essay has more modest aims: first and foremost, to present a comprehensive survey of Jewish writings on logic in the Middle Ages; then, to make some general observations about the study of logic among medieval Jews; and, as an afterword, to sketch how some Jewish intellectuals applied the doctrines of logic to the fields of biblical exegesis and rabbinic jurisprudence."

39. ———. 2021. "Towards a Social History of Medieval Logic." *Studia graeco-arabica* no. 11:183-194.

Abstract: "This paper explains how a social history of medieval logic might be written. After contrasting it with the Standard Approach, centred on great logicians, problems and debates, it suggests a series of questions which social historians of logic might ask: when, where, by whom, how and why was logic studied in the Middle Ages? There follows a discussion of pathways to the social history of medieval logic: enhanced doxology, institutional history, logic in relation to other disciplines and cultural comparison. Finally, an objection is considered: logic is discovered, not invented, and so social explanations are inappropriate for its history. The objection is rejected because, whether logic is discovered or invented, historians of it must explain how individual logicians came to think and write as they did, and such explanations include social factors among others."

45. Meixner, Uwe. 1998. "Negative Theology, *Coincidentia Oppositorum*, and Boolean Algebra." *History of Philosophy & Logical Analysis* no. 1:75-89.

    Abstract: "In Plato's *Parmenides* we find on the one hand that the One is denied every property , and on the other hand that the One is attributed every property. In the course of the history of Platonism, these assertions - probably meant by Plato as ontological statements of an entirely formal nature - were repeatedly made the starting points of metaphysical speculations. In the Mystical Theology of the Pseudo-Dionysius they became principles of Christian mysticism and negative theology. I shall show that the two assertions can each be interpreted within the ontological framework of ancient and medieval logic in such a manner that it becomes true, and I shall make plausible that they were understood, with regard to their logical core, by pagan and Christian Platonic metaphysicians just as is indicated by that interpretation. The mentioned ontological framework is basically the Boolean algebra of first-order properties. The main points of the interpretation are on the one hand the identification of the One with the maximal element of the algebra of properties, and on the other hand two alternative intuitively prominent mereological definitions of ontic predication."

"Aim and scope of the present study

The purpose of our present study is to investigate two basic branches of logical analysis which were developed by the logicians of the 13th and 14th centuries, and which appear to be of more than antiquarian interest in relation to contemporary research in the field of logic. These two branches of logical theory were known, in the mediaeval terminology, as the theory of Supposition and the theory of Consequence. In contemporary language we would describe them as the theory of truth-conditions and the theory of inference-conditions or of deduction: those logicians who differentiate between syntactical and semantical inquiries and systems would consider that these two theories belong to semantics.

The mediaeval development of these two theories took place within the context of mediaeval formal logic and found its expression in the terminology of that logic. The logic was substantially Aristotelian, with accretions from later Greek logic transmittted through Boethius; as such, it attempted to formulate the logical structure of ordinary language as used by the "scIentists" (and philosophers) of the mediaeval universities. Distinctive of such "natural" language is the fact that statements are made with verbs of present, past, or future time, in subjunctive as weIl as indicative mood, and with numerous syntactical constructions whose logical analysis is of extreme subtlety or complexity." 56. ———. 2015. "Ex impossibili quodlibet sequitur (Angel d'Ors)." *Vivarium* no. 53:353-371.

    Abstract: "While agreeing with Professor D'Ors' thesis that the notion of logical consequence cannot be exhaustively characterized (though not with his grounds for it), I depart from Professor d'Ors' conclusion that the very notion of good consequence is primitive and can only be identified with the (incompletable) set of acceptable rules of inference, and from his conviction that modal notions such as necessity and impossibility are equivocal and gain such clarity as they have by their interaction with rules

    of inference. Inspired by this picture, Professor d'Ors undertook an examination of a number of medieval attempts to analyze the notion of consequence and tried to show how certain developments in the medieval history of logic made sense in the light of

debate over such analyses. This paper examines a small fragment of Professor d'Ors programme and its relation to some aspects of Jean Buridan's account of the consequence relation."

"This book presents novel formalizations of three of the most important medieval logical theories: supposition, consequence and obligations. In an additional fourth part, an in-depth analysis of the concept of formalization is presented - a crucial concept in the current logical panorama, which as such receives surprisingly little attention.

Although formalizations of medieval logical theories have been proposed earlier in the literature, the formalizations presented here are all based on innovative vantage points: supposition theories as algorithmic hermeneutics, theories of consequence analyzed with tools borrowed from model-theory and two-dimensional semantics, and obligations as logical games. For this reason, this is perhaps the first time that these medieval logical theories are made fully accessible to the modern philosopher and logician who wishes to obtain a better grasp of them, but who has always been held back by the lack of appropriate 'translations' into modern terms.

Moreover, the book offers a reflection on the very nature of logic, a reflection that is prompted by the comparisons between

medieval and modern logic, their similarities and dissimilarities. It is thus a contribution not only to the history of logic, but also to the philosophy of logic, the philosophy of language and semantics.

The analysis of medieval logic is also relevant for the modern philosopher and logician in that, being the unifying methodology used across all disciplines at that time, logic really provided unity to science. It thus presents a unified model of scientific investigation, where logic plays the aggregating role."

The theory of the *complexe significabile* 227; 15. The oppositions against the theory of the *complexe significabile* 243; 16. The significate of a true *propositio* 273; Selective bibliography 281; Indices 289-309.

    "This book is intended as the first part of a history of those problems and theories in the domain of philosophical semantics which nowadays are commonly referred to as problems and theories about the nature and the status of propositions. [*]

    Although the conceptual apparatus and the terminology by means of which questions concerning propositions were asked and answered have considerably varied from period to period, the main types of disputes and solutions have remained remarkably constant. One of the aims of this study is precisely to trace the vicissitudes of the vocabulary in which this refractory topic was treated in the remote past. As is evident from the Bibliography, many parts of the field have been explored by predecessors. Guided by their results, I have tried

to fill in more details and to design a provisional map of the area as a whole." (from the Preface)

[*] The two other volumes are: *Late-Scholastic and Humanist Theories of the Proposition* (1980) and *Judgment and Proposition. From Descartes to Kant* (1983).

63. ———. 1980. *Late-Scholastic and Humanist Theories of the Proposition*. Amsterdam: North-Holland.

Contents: Part One: Late-Scholastic theories of the proposition. 1. Introduction 3; 2. Different kinds of propositions and their ways of signifying 9; 3. The tie between the principal parts of a proposition 27; 4. The adequate signification and the adequate significate of a proposition 45; 5. Disguised propositions 74; 6. Judgment 90; 7. The object of judgment 103; 8. Propositions as bearer of truth-values 114; Part Two: Humanist theories of proposition. 9. Introduction 143; 10. The first attempt at reorientation 146; 11. The Melanchtonian treatment of a theme 159; 12. Peter Ramus 168; 13. The diffusion of Ramist terminology 180; 14. Eclectics 189; Epilogue 204; Bibliography 209; Indices 224-237.

"After publishing, more than six years ago, my *Theories of the Proposition. Ancient and Medieval Conceptions of the Bearers of Truth and Falsity*, I initially intended to cover the remaining phases of the history of the semantics of declarative sentences in one volume. As the material proved more abundant and unwieldy than I had anticipated, I decided to limit the next instalment to the period between 1450 and 1650. Accordingly, the present book treats the theories of the proposition put forward by late-scholastic and humanist philosophers. It will be followed, in the not too distant future, I hope, by a third volume which will continue the account until the first decades of the nineteenth century.

In making my way through the intricate mass of sources, which are often works that are completely forgotten and extremely hard to obtain, I was greatly assisted by Professor Ashworth's pioneering book on *Language and Logic in the Post-Medieval Period*. Moreover, when I had practically finished my manuscript, she was kind enough to send me the draft of an

article entitled 'Theories of the Proposition: Some Early Sixteenth Century Discussions'. As this article is based on a corpus of texts which is slightly different from mine, it enabled me to check some of my results against the findings of a very competent collaborator in this lonely field of research. I can only advise the reader to do the same when the article will have been published (in Franciscan Studies [38, 1978 pp. 81-121])."

69. Parsons, Terence. 2006. "The Doctrine of Distribution." *History and Philosophy of Logic* no. 27:59-74.

    "Peter Geach describes the 'doctrine of distribution' as the view that a term is distributed if it refers to everything that it denotes, and undistributed if it refers to only some of the things that it denotes. He argues that the notion, so explained, is incoherent. He claims that the doctrine of distribution originates from a degenerate use of the notion of 'distributive supposition' in medieval supposition theory sometime in the 16th century. This paper proposes instead that the doctrine of distribution occurs at least as early as the 12th century, and that it originates from a study of Aristotle's notion of a term's being 'taken universally', and not from the much later theory of distributive supposition. A detailed version of the doctrine found in the Port Royal Logic is articulated, and compared with a slightly different modern version. Finally, Geach's arguments for the incoherence of the doctrine are discussed and rejected."

    "1. Introduction

    This paper is about the 'doctrine of distribution' as described and criticized by Peter Geach. My goal is to provide an alternative to Geach's account of the history of the doctrine and to defend the doctrine against his claims that it is incoherent. This paper discusses:

    (1) what the 'doctrine of distribution' is;

    (2) some of Peter Geach's criticisms of the doctrine;

    (3) Geach's story of the history of the doctrine;

    (4) an alternative account of the history of the doctrine;

    (5) the version of the doctrine as it occurs in the Port Royal Logic;

    (6) a defence of the coherence of the doctrine."

74. Pérez-Ilzarbe, Paloma. 2011. "Disputation and Logic in the Medieval Treatises *De Modo Opponendi et Respondendi*." *Vivarium* no. 49:127-149.

    Abstract: "In 1980 L. M. de Rijk edited some texts connected with medieval disputation (*Die mittelaterlichen Traktate De modo opponendi et respondendi*), towards which he showed a strikingly contemptuous attitude. The reason for his contempt was that the treatises did not fit the obligationes and sophismata tradition. In this article I focus on the original version, the *Thesaurus Philosophorum*, to highlight the distinction of this family of treatises with respect to the "modern" tradition. First, I study the features of the disputation that can be recognised through the collection of fallacious arguments contained in the *Thesaurus*. Second, I briefly examine the contents of the treatise and their arrangement, showing that they are closely related to the kind of disputation in question.

    I hope to support the idea that neither the technique of disputation nor the contents and their arrangement deserve a

straightforward rejection."

Contemporary Linguistics, edited by Parret, Herman, 254-278. Berlin: Walter de Gruyter.

"One main subject of medieval logic was the problem of semantic representations of natural languages. If it is true that linguistic theory must account for both the form and meaning of language, then medieval logic or some parts of it belongs to the history of linguistics; and it might perhaps even contribute to linguistics as such. E. A. Moody (*The Medieval Contribution to Logic*, 1966) has argued that the interest and value of medieval logic is not merely historical; it is also attached to "its attempt to formulate the semantical presuppositions of ordinary language ... What medieval logic has to contribute, to the further development and enrichment of modern logic, is this semantical bridge between the abstract, axiomatically derived, formal system of modern mathematical logic, and the concrete, empirically oriented forms in which natural languages exhibit the rational structure of experience on its phenomenological level"." 83. ———. 2010. "Field's Paradox and Its Medieval Solution." *History and Philosophy of Logic* no. 31:161-176.

Abstract: "Hartry Field's revised logic for the theory of truth in his new book, *Saving Truth from Paradox*, seeking to preserve Tarski's T-scheme, does not admit a full theory of negation. In response, Crispin Wright proposed that the negation of a proposition is the proposition saying that some proposition inconsistent with the first is true. For this to work, we have to show that this proposition is entailed by any proposition incompatible with the first, that is, that it is the weakest

proposition incompatible with the proposition whose negation it should be. To show that his proposal gave a full intuitionist theory of negation, Wright appealed to two principles, about incompatibility and entailment, and using them Field formulated a paradox of validity (or more precisely, of inconsistency).

The medieval mathematician, theologian and logician, Thomas Bradwardine, writing in the fourteenth century, proposed a solution to the paradoxes of truth which does not require any revision of logic. The key principle behind Bradwardine's solution is a pluralist doctrine of meaning, or signification, that propositions can mean more than they explicitly say. In particular, he proposed that signification is closed under entailment. In light of this, Bradwardine revised the truth-rules, in particular, refining the T-scheme, so that a proposition is true only if everything that it signifies obtains. Thereby, he was able to show that any proposition which signifies that it itself is false, also signifies that it is true, and consequently is false and not true. I show that Bradwardine's solution is also able to deal with Field's paradox and others of a similar nature. Hence Field's logical revisions are unnecessary to save truth from paradox."

84. ———. 2012. "The medieval theory of consequence." *Synthese* no. 187:899-912.

Abstract: "The recovery of Aristotle's logic during the twelfth century was a great stimulus to medieval thinkers. Among their own theories developed to explain Aristotle's theories of valid and invalid reasoning was a theory of consequence, of what arguments were valid, and why. By the fourteenth century, two main lines of thought had developed, one at Oxford, the other at Paris. Both schools distinguished formal from material consequence, but in very different ways. In Buridan and his followers in Paris, formal consequence was that preserved under uniform substitution. In Oxford, in contrast, formal consequence included analytic consequences such as 'If it's a man, then it's an animal'. Aristotle's notion of syllogistic consequence was subsumed under the treatment of formal consequence. Buridan developed a general theory embracing

the assertoric syllogism, the modal syllogism and syllogisms with oblique terms. The result was a thoroughly systematic and extensive treatment of logical theory and logical consequence which repays investigation."

88. Rohbacher, Berhard. 2015. " Jewish law and medieval logic: wy eating horse meat is a punishable offense." *Journal of Law and Religion* no. 30:295-319.

    Abstract: "This article presents a case study of the in□uence of Muslim and Christian logicians on medieval Jewish law. The case in question is why it is a punishable offense for Jews to eat mammals that do not have either sign of purity—that is, neither have split hooves nor chew their cud—and the article examines the answers given by three medieval Jewish sages: Rashi, Maimonides, and Naḥmanides. The Written Law of the Torah explicitly allows the consumption of mammals, such as cattle, with both signs of purity. It also explicitly prohibits the eating of mammals, such as camels or pigs, with one sign but not the other. It does not, however, appear to explicitly prohibit the consumption of mammals, such as horses, with neither sign. Using a fortiori logic, Rashi derives a punishable prohibition against eating horses from the prohibition against eating camels and pigs. Maimonides ascribes this prohibition to the Oral Law of the Talmud. Naḥmanides, by contrast, attributes it directly to the Written Law without relying on either a fortiori logic or the Oral Law. This article argues that this solution was available to Naḥmanides because he adopted inclusive

disjunction from Christian logicians, but it was not available to Maimonides because he adopted exclusive disjunction from Muslim logicians. The choice between inclusive and exclusive disjunction is shown to continue to be of importance in modern American law."

In *The Many Roots of Medieval Logic: The Aristotelian and the Non-Aristotelian Traditions*, edited by Marenbon, John, 219-237. Leiden: Brill.

    Abstract: "Priscian's *Institutiones Grammaticae*, which rely on Stoic and Neoplatonic sources, constituted an important, although quite neglected, link in the chain of transmission of ancient philosophy in the Middle Ages. There is, in particular, a passage where Priscian discusses the vexed claim that common names can be proper names of the universal species and where he talks about the ideas existing in the divine mind. At the beginning of the 12th century, the anonymous *Glosulae super Priscianum* and the *Notae Dunelmenses*, which heavily quote William of Champeaux (as master G.), interpret the passage in the context of a growing interest in the problem of universals, raising semantic as well as ontological questions, and introducing a Platonic view on universals in the discussions on the signification of the noun. Moreover, this same passage will be used by Abelard to elaborate one of his opinions about the signification of universal or common names—that they signify "mental conceptions"."

94. Spade, Paul Vincent. 1979. "Recent Research on Medieval Logic." *Synthese* no. 40:3-18.

    Reprinted as Chapter I in: P. V. Spade, *Lies, Language and Logic in the Late Middle Ages* (1988).

    "In this paper I shall survey some of the main areas of recent research on the logic of the Middle Ages. A large and flourishing body of scholars is now actively at work in this field; interest in the topic is no longer by any means confined to a relatively small group of specialists. Perhaps the most characteristic feature of this recent research is the symbiotic relationship between pure historical and textual scholarship of the highest quality - the edition of texts, the identification of authors and their sources, the establishment of their interrelations - and the critically exegetical work of scholars familiar with the results and techniques of modern logic and analytic philosophy. This fruitful relationship has begun to make the immense field of medieval logic accessible not only to specialized medievalists but also to the philosophical profession at large.

    Although it is impossible to date the beginning of this collaboration with any precision, it had taken hold firmly by about 1960. At that time, thanks to the work of Bochenski, Boehner and Moody, among others, medieval logic had been established as a rich and sophisticated field worthy of serious study. But this claim was not established without resistance. For many years, students of medieval philosophy had concentrated mainly on issues in metaphysics and epistemology. There were perhaps several reasons for this - the sociology of the revival of medieval studies in Europe and

America, the preeminence of Thomas Aquinas until recently in the intellectual life of the Catholic Church, and so on. Whatever the reasons, historians of medieval philosophy tended to focus on the great metaphysical and epistemological questions, and largely overlooked medieval work in other areas of philosophy.

(...)

I cannot of course do justice to all the facets of recent research in the field. I shall mention only a few points, and hope thereby to convey some idea of its extent. For the most part, although not exclusively, I shall confine myself to work done since 1960. My discussion will be organized in two parts. The first part will be a general review of some of the major trends and results in the area. Space does not permit extended critical and evaluative comments, although I will insert remarks on particular points here and there, and suggest areas where future research might profitably be directed. The second part will be a selective bibliographical essay designed to inform the interested layman of a few central studies and translations, and of where he may go to find out more." (pp. 3-4)

"The seventeen papers reproduced in this collection were all originally published between 1973 and 1983. They are devoted to topics in mediaeval logic and semantic theory. Within that general area, my work has been concentrated in three main subfields, represented here by the three main divisions of this volume: (1) The mediaeval treatments of antinomies such as the "Liar" paradox (papers II-VIII); (2) mediaeval semantic theory, particularly the logical doctrine of "supposition" and the theory of the relation between language and thought (papers IX-XV); and (3) the peculiar genre of disputation known as *"obligationes"* (papers XVI-XVII). Paper I is a general overview of research in the field, and may serve as an introduction to the volume as a whole.

The three main parts of this collection correspond to the three chapters I contributed to *The Cambridge History of Later Medieval Philosophy,* Norman Kretzmann, ed., (Cambridge: Cambridge University Press, 1982): Chs. 9 (pp. 188-96), 12 (pp. 246-53), and 13B (pp. 335-41). I refer the reader to those chapters for further information on the topics covered in the present volume.

With the exception of the first two, all the papers collected here deal exclusively with the first half of the fourteenth century. Except for papers I-II and VI, they are all focussed on Oxford University. If there is one name that dominates these pages, it is that of William of Ockham. All the papers in the second part of the collection (IX-XV) are studies of Ockham, as is paper III. The results of these studies are often negative; they find fault with this or that aspect of Ockham's theory. Nevertheless, I hasten to add that I have never thought of my task as one of

"debunking" Ockham. On the contrary, I find Ockham an extraordinarily appealing thinker, one with whom I am in considerable philosophical sympathy. I hope that, through the papers reproduced here, the reader will perhaps come to appreciate the depth and richness of this part of Ockham's thought, and of mediaeval logic and semantic theory more generally." 104. Tarlazzi, Caterina. 2017. "Individuals as Universals: Audacious Views in Early Twelfth-Century Realism." *Journal of the History of Philosophy* no. 55:557-581.

    Abstract: "This article investigates a twelfth-century realist view on universals, the *individuum*-theory. The *individuum*-theory is criticized by Peter Abelard and Joscelin of Soissons, and endorsed by '*Quoniam de generali*' as well as by the unpublished *Isagoge* commentary found in MS Paris, BnF, lat. 3237, which is here taken into account for the first time. The *individuum*-theory blurs traditional distinctions between nominalism and realism by claiming that the universal is the individual thing itself. In this paper, I present the main strategies for such a claim; namely, putting forward identity "by indifference," distinguishing *status* and *attentiones*, and neutralizing opposite predicates. I argue that these strategies have parallels in Abelard's own views. The *individuum*-theory's paradoxical realism seems to defend universal *res* after criticisms were advanced against more traditional material essence realism, and it seems to have been using some of the nominalists' tools (particularly Abelardian tools) in its endeavor."

106. ———. 2003. *Medieval Modal Systems: Problems and Concepts*. Aldershot: Ashgate.

"The major medieval systems of modal logic were developed during a period flanked by Pierre Abelard in the twelfth century and Jean Buridan in the fourteenth. Little of great significance pre-dates Abelard or post-dates Buridan; and these two Frenchmen are major figures indeed. In between their work lies that of the well-known Avicenna, Averröes and Ockham, as well as that of the comparatively unknown Robert Kilwardby in the thirteenth century and Richard Campsall in the early fourteenth. The work of these seven thinkers in the field of modal syllogistic will be my focus in this book.

These thinkers were motivated by two forces. First of all, there are the interpretive puzzles posed by Aristotle's modal logic as expounded in the *Prior Analytics* and *De Interpretatione*. These two texts appear not always to be in accord with one another, and the modal syllogistic as presented in the *Prior Analytics* not only lacks a semantic foundation but appears to be internally inconsistent. All this is grist to the mill of the interpreting mind. Then there is the inherent fascination of modal logic as a field of theoretical enquiry. An uneasy relationship exists between the desire to interpret Aristotle and the desire to theorize modality. The latter, of course, is a philosophical desire, autonomous but also intimately connected with broader metaphysical and theological ways of thinking. The former force is, at first sight, a philological rather than a philosophical one. But in reality matters are not so simple, since the philosophical interpretation of any text - let alone one that increasingly carried such authority as that of Aristotle -is always partially governed by philosophical rather than philological imperatives.

There are two key theoretical questions stirring the minds of medieval modal logicians. The first question concerns the doctrine that I shall call actualism. According to this doctrine, modal propositions are about the actual things that ordinary non-modal propositions are about. Contrasted with actualism is the view that modal propositions are about what *possibly* falls under the subject-terms of the corresponding non-modal propositions. This doctrine I will call ampliationism. The leading actualists in the medieval period are Abelard, Ockham,

and to a certain extent Campsall; the ampliationists are Avicenna and Buridan. A second question concerns the extent to which essentialist notions are assumed in the modal theories of our seven thinkers. All seven make use of the notion of an essential property. In addition, Averroes, Kilwardby and Campsall make use of the notion of a kind, i.e. a class whose members necessarily share their essential properties. (Preface, XI-XII)

    "Rather than attempt a necessarily over-sketchy account of the diversity of this material, I would refer the reader to what is already only a sample, the studies, texts and translations listed in the bibliography. The rest of this survey will be taken up with a brief account of the point of view of medieval logicians, a consideration of the recent attempts to compare medieval supposition theory and modern quantification theory, and a

very short notice of the sort of contribution professional logicians have made to the study of medieval logic. I should like to think that some such selection might have pleased the medieval logicians themselves in that it emphasizes the consideration of their work, not as museum pieces, but as logic, which can be reasonably compared with contemporary contributions to the discipline. It must also be added that the subject of this article must, unfortunately, be limited to the logic of the Latin West." (p. 806)

    Abstract: "In an article published in 2003 [*], Klaus Jacobi—using texts partially edited in De Rijk's *Logica Modernorum*—demonstrated that twelfth-century logic contains a tradition of reflecting about some of the transcendental names (*nomina transcendentia*). In addition to reinforcing Jacobi's thesis with other texts, this contribution aims to demonstrate two points: 1) That twelfth-century logical reflection about transcendental

terms has its origin in the *logica vetus*, and especially in a passage from Porphyry Isagoge and in Boethius's commentary on it. In spite of the loss of the major part of the Aristotelian corpus, the twelfth-century masters in logic still received some Aristotelian theses concerning the notions of one and being via Porphyry and Boethius; on the basis of such theses, they were able to elaborate a sort of proto-theory of the transcendentals as trans-categorical terms. 2) Th at this theory is centred on the idea that there exists a particular group of names which have the property that they can be said of everything; this group includes "being", "one", "thing" and "something" (*ens, unum, res, aliquid*).

Twelfth-century masters in logic try to question the (originally Aristotelian) thesis that these terms are equivocal, although they do not deny it completely."

21. Vignaux, Paul. 1977. "La problèmatique du nominalisme médiéval peut-elle éclairer des problèmes philosophiques actuels?" *Revue Philosophique de Louvain* no. 75:293-331.

    "The possible communications between the problem of mediaeval nominalism, as studied in several typical authors, and further problems have been envisaged in two stages. The first part of the article characterizes the nominalism of Abelard and that of Ockham as "non-realisms" based on a critical ontology confirmed by an analysis of language: from this point of view there appears a tie with the contemporary current of analytical philosophy and at the same time with modern philosophies like those of Leibniz and of Hume. The second part of the article contrasts, within a common non-realism, the doctrine of the "significabile complexe" of Gregory of Rimini with Ockham's terminism; in this perspective metaphysical problems arise which remained unsolved by modern philosophy."

"This collection of fifteen papers from an international symposium held at Oxford in 1983 traces the emergence and development of a distinctive British tradition in logic and semantics from the twelfth to the fourteenth century.

In a programmatic study of origins Sten Ebbesen indicates that the terminist logic, which had emerged in France in the twelfth century, maintained its vitality in Oxford at a time when it was eclipsed by modist theory in Paris, then returned to the Continent with Ockham. For the thirteenth century, P. Osmund Lewry explores the characteristic preoccupation of some neglected Cornish masters with problems of extensionality, questions of existence and tense; Alain de Libera contrasts William of Sherwood's Oxford source, the *magister abstractionum,* with the Parisian *Abstractiones* of Hervaeus sophista; C.H. Kneepkens finds some links with the Parisian tradition in Roger Bacon's treatment of meaningfulness and grammaticality, and Georgette Sinkler relates Bacon's account of grammatical dependence to his reaction against Lambert of Auxerre; Alessandro D. Conti discovers a nominalist reading of the *Categories* in Thomas Sutton.

While D.P. Henry shows how the Lesniewskian Ontology may be applied to resolve the existential paradoxes of the Oxford masters and Boethius of Denmark, Francesco Bottin outlines the metalinguistic solution devised by the fourteenth-century Mertonians for paradoxes of truth and falsity. Ria van der Lecq presents William Heytesbury as continuing the Aristotelian theory of modality; Joël Biard reveals his innovatory influence with regard to the signification of imaginary objects. N.J. Green-Pedersen suggests that the fourteenth-century sophismatic exercises of Oxford were the matrix for the widely diffused handbooks of *consequentiae* E.J. Ashworth traces the diffusion of *obligationes* texts after Roger Swyneshed. Stephen Read elucidates the conflict between nominalists such fr. Hurley and Wyclif by reference to twentieth-century discussions and the positions of Russell and Frege. Graziella Federici Vescovini pursues the reflections of Heytesbury on the border of logic and physics in Messinus of Coderonco [= Mesino da Codronchi]. E.P. Bos detects John Hunteman's hand

behind Paul of Mantua's rejection of Parisian teaching on the ampliation and restriction of terms.

The collection includes many detailed descriptions of unedited works, and newly edited material from writings of Nicholas and Peter of Cornwall, Richard Clive, Robert Kilwardby, Thomas Sutton and William Heytesbury."

7. Jolivet, Jean, and de Libera, Alain, eds. 1987. *Gilbert de Poitiers et ses contemporains. Aux origines de la Logica Modernorum*. Napoli: Bibliopolis.

   Acts of the 7th European Symposium on Medieval Logic and Semantics, Poitiers, 1985.

   Contents: Avant-propos 9;

   Les Écoles du XIIè siècle

   C. J. Mews, Aspects of the Evolution of Peter Abaelard's Thought on Signification and Predication 15; R. van der Lecq, The *Sententie secundum Magistrum Petrum* 43; F. Bottin, Quelques discussions sur la transitivité de la prédication dans l'école d'Albéric du Mont 57; E. P. Bos, La théorie de la signification de la « vox significativa ad placitum » dans les *Introductions Montanae Maiores* 73; Chr. Brousseau-Beuermann, Les *Quaestiones* de Johannes de Wolve et les *Sophismata artis grammaticae* du MS Paris, Bibl. nat. lat. 15037 91; H. A. G. Braakhuis, Signification, Appellation and Predication in the Ars Meliduna 107; J. Biard, Sémantique et Ontologie dans l'Ars Meliduna 121;

   Gilbert de Poitiers et les Porretains

   L. M. de Rijk, Gilbert de Poitiers, ses vues sémantiques et métaphysiques 147; J. Gauvin, S.J., Les sens de « nichil » chez Gilbert de la Porrée 173; J. Jolivet, Rhétorique et théologie dans une page de Gilbert de Poitiers 183; S. Knuuttila, Possibility and Necessity in Gilbert of Poitiers 199; K. Schweiss, O.F.M., Logik und Théologie im *Dialogus Ratii et Everardi* 219; M. L. Colish, Gilbert, the Early Porretans, and Peter Lombard: Semantics and Theology 229; O. Baron von Münchhausen, Thomas von Aquin und Nikolaus von Kues 707; Charles Lohr, Ramon Lull's Theory of Scientific Demonstration 729; Bibliographie 747

Index rerum 775; Index nominum der antiken und mittelalterlichen Autoren 784; Index nominum der neuzeitlichen Autoren 788-791.

9. Read, Stephen, ed. 1993. *Sophisms in Medieval Logic and Grammar*. Dordrecht: Kluwer.

   Acts of the 9th European Symposium for Medieval Logic and Semantics, St Andrews, June 1990.

   Contents: Preface IX; Stephen Read: Introduction XI;

   Part. I. Sophisms as a Genre

   Robert Andrews: Resoluble, Exponible, and Officiable Terms in the *Sophistria* of Petrus Olai, MS Uppsala C 599 3; Mario Bertagna: Richard Ferrybridge's *Logica*: a handbook for solving *Sophismata* 31; Sten Ebbesen, Boethius de Dacia et al. The sophismata in MSS Bruges SB 509 and Florence Med.-Laur. S. Croce 12 sin. 3 45; C. H. Kneepkens, Orleans 266 and the Sophismata Collection: Master Joscelin of Soissons and the infinite words in the early twelfth century 64; Roberto Lambertini, The *Sophismata* attributed to Marsilius of Padua 86; Alfonso Maierù, The sophism 'Omnis propositio est vera vel falsa' by Henry Hopton (Pseudo-Heytesbury's *De veritate et falsitate propositionis*) 103;

   Mieczyslaw Markowski, Die Rolle der Sophismata im Unterricht der Krakauer Universitat im 15. Jahrhundert 116; Fabienne Pironet, The *Sophismata asinina* of William Heytesbury 128; Paul A. Streveler, A Comparative Analysis of the Treatment of Sophisms in MSS Digby 2 and Royal 12 of the Magister Abstractionum 144; Andrea Tabarroni, 'Omnis phoenix est': Quantification and Existence in a new Sophismata-collection (MS Clm 14522) 185; Mikko Yrjonsuuri, Expositio as a method of solving sophisms 202;

   Paert. II. Grammatical Sophisms

   Christine Brousseau-Beuermann, Grammatical sophisms in collections of logical sophisms: 'Amatus sum' in BN. lat. 16135 219; Irène Rosier, La distinction entre actus exercitus et actus significatus dans les sophismes grammaticaux du MS BN lat.

16618 et autres textes apparentés 231; Mary Sirridge, *Interest mea et imperatoris castam ducere in uxorem*: can 'est' be used impersonally? 262;

Part. III. Logical Sophisms

Allan Bäck, Who is the worthiest of them all? 277; Joël Biard, Albert de Saxe et les Sophismes de l'Infini 288; Alessandro D. Conti, Il Sofisma di Paolo Veneto: 'Sortes in quantum homo est animal' 304; Jeffrey S. Coombs, The Soul of the Antichrist necessarily will be a being: A modal sophism in 16th century logic texts 319; Gyula Klima, 'Debeo tibi equum': a reconstruction of the theoretical framework of Buridan's treatment of the sophisma 333; Simo Knuuttila, Trinitarian Sophisms in Robert Holcot's Theology 348; Christopher J. Martin, Obligations and Liars 357; Angel d'Ors, Hominis asinus/Asinus hominis 382; Claude Panaccio, Solving the insolubles: hints from Ockham and Burley 398;

Index of Manuscripts 413; Index of Names 418-421,

10. Braakhuis, Henk Antonius, and Kneepkens, Corneille Henri, eds. 2003. *Aristotle's Peri hermeneias in the Latin Middle Ages. Essays on the Commentary Tradition*. Groningen: Ingenium Publishers.

Acts of the 10th European Symposium on Medieval Logic and Semantics, Leiden 1992.

Table of Contents V; Preface VII; Introduction IX-XLI; Yukio wakuma: William of Champeaux and the *Introductiones* 1; Sten Ebbesen: *Questions* and *Sophismata*: Tracking Peter of Auvergne 31; Alan Perreiah: Orality and Literacy in the *De interpretatione* Tradition 51; Robert Andrews: The *Modistae* and John Duns Scotus's *Quaestiones super Perihermeneias* 67; Claude Panaccio: Debates on Mental Language in the Early Fourteenth Century 85; Joël Biard: Le statut des énoncés dans les commentaires du *Peri hermeneias* de Gautier Burley 103; M. Kaufmann: The Discussion on the Nature of the Concept in Ockham's *Perihermeneias* Commentary 119; Mieczyslaw H. Markowski: Der Kommentar des Peter Wysz von Polen zu *De interpretatione* des Aristoteles 135; Gino Roncaglia: Mesino de

Codronchi's Discussion on *Syncategoremata* and Mental Language in His *Quaestiones on De interpretatione* 149; Irène Rosier: Variations médiévales sur l'opposition entre signification "ad placitum" et signification naturelle 165; L. M. de Rijk: The Logic of Indefinite Names in Boethius, Abelard, Duns Scotus and Radulphus Brito 207; Judith Dijs: Radulphus Brito's Use of *Intentio* in *Quaestio* 9 of His *In Peri hermeneias* 235; Christian Strub: *Propositio una / multiplex* in Abelard: A Note on the Relationship of Dialectic and Grammar 257; Joke Spruyt, The Semantics of Complex Expressions in John Duns Scotus, Peter Abelard and John Buridan 275; F. Beets: Theories of Prediction from Boethius to Thomas Aquinas 305; Allan Bäck: Aquinas on Predication 321; Andrea Tabarroni, The 10th Thesis in Logic Condemned at Oxford in 1277 339; C. H. Kneepkens, Aristotle's Transposition and the Twelfth-Century Commentaries on *De interpretatione*, 20b1-12: An Exploratory Study 363; Simo Knuuttila: Truth and Falsity as Modal Notions: Some Medieval Comments on *De interpretatione*, 12, 22a13 413; Elizabeth Karger: John Buridan's Theory of the Logical Relations Between General Modal Formulae 429; Indices 445; Index Locorum 447; Index Nominum 462; Index Rerum 468; Manuscripts Mentioned 483; Bibliography 485-509.

"The majority of the twenty essays of the present volume were originally delivered at the Xth European Symposium on Medieval Logic and Semantics held at Nijmegen, 22 - 26 June, 1992, that was devoted to the tradition of Aristotle's *Peri hermeneias* in the Latin Middle Ages. Circumstances made it impossible to publish the proceedings immediately after the symposium. Since the editors were, nevertheless, aware that the material presented was extremely important for further studies on the history of medieval logic, semantics and philosophy of language, they decided, some time ago, to ask the contributors to update, revise or rewrite their essays in preparation for the publication of this collection. Although some authors have partially drawn on material found in this collection for publications elsewhere, most of the information contained in these essays remains new, including the many

detailed descriptions and editions of unedited works that will constitute a greatly appreciated resource in the study of medieval philosophy." (From the Preface)

Logic and Rhetoric in the Philosophical Works of Cicero

Introduction

This page is dedicated to the following aspects of the philosophy of Marcus Tullius Cicero:

The creation of the Latin philosophical vocabulary;

His testimony on Stoic logic;

His book *Topica,* who in the Middle Ages become one of the texts of the *Logica Vetus*.

Attention will also be given to the *De Inventione* and *De Oratore*, who exerted a great influence on medieval thinkers.

An overview of Cicero as philosopher

"Philosophy meant Greek. Rome had nothing to offer except a stern traditional moralism exemplified by Cato, which found the rigid Semitic ethic of the Stoics congenial, and a reaction away from this, which expressed itself in a loose Epicureanism, such as Epicurus himself and his sincere exponents would have utterly disowned. 'And so it is not Epicurus who has driven them to debauchery. They have already given themselves over to immorality, and now try to hide their debauchery in the lap of philosophy; they congregate in the place where they hope to hear the praise of pleasure' (1). The words date from the next century, but they are applicable to the age of Cicero. Cicero is at some pains to explain away the apparent Roman incapacity for philosophy. He suggests that there is no real inability : rather their energies have been diverted into other channels.

Be that as it may, philosophy meant Greek, and Greek philosophy of the age of Cicero was represented predominantly by four schools.

a) The oldest of these was the Academy. Under Plato this had been a training-ground for politicians, with a course designed to lift the mind from the relativities of our normal life to the eternal verities, and a pioneering interest in logical analysis. For seventy years after his death the heads of the Academy were dogmatists whose interests were predominantly ethical. Then in the mid-third century Arcesilas transformed the whole direction of Academic thought, by retaining the dialectic but abandoning the dogmatic, so that every question was treated as an open question, certainty was abjured and probability left as a guide. This was a polemic against Stoic claims of infallibility; it was affected by the scepticism of Pyrrho and the logical acumen of Diodorus, so that the satirist Timon described Arcesilas as a kind of Homeric chimaera 'Plato the head of him, Pyrrho the tail, in between Diodorus' Arcesilas' work was taken up in the next century by Carneades, unquestionably the greatest thinker between Aristotle and Plotinus, and suspension of judgment remained a tenet of the school, though there may have been some esoteric dogmatism. According to Cicero the Academics of his day were few in number (2).

b) The Peripatetics originated with Plato's pupil Aristotle. Of all the ancient schools the Peripatetics were the most insistent that theory should be grounded in fact, and they specialized in amassing large quantities of fact on which a critical judgment could be based. Their judgments were generally free from extremism and marked by a sturdy common sense. Their special contribution lay in scientific research.

c) Stoicism emerged at the beginning of the third century to meet the demand for education occasioned by limiting the period of military training and transferring it to Athens. The philosophy was designed to meet a mood of despair in an age of 'the failure of nerve'. Its religion was a pantheistic determinism; its chief virtue resignation. Its early exponents preached a rigid moralism in which virtue was the only good, vice the only evil, and all else matters of indifference, and which divided mankind into saints and stoners without any No

Man's Land between. Later this rigidity was modified, though the quest for perfect virtue was never abandoned.

d) Epicureanism met the same needs, opportunities and mood as Stoicism. Epicurus regarded the end of life as 'pleasure', not crudely interpreted but understood as freedom from disturbance. To this end we must be rid of fear and control desire. Fear is dispelled by understanding; hence the Epicureans adopted Democritus' atomic theory as the most reasonable account of the world, and this enabled them to dismiss the fear of death, death being the painless dissolution of our atomic structure. The greatest external adjunct to the tranquil life is friendship, and the emphasis upon friendship is one of the most attractive features of the school. Finally, gods exist, but they are remote and not to be feared, spending their time in philosophic conversation.

This picture must be modified by a general tendency to eclecticism. Among the Peripatetics this is open and unashamed, and the *De mundo* contains much that is Stoic, and*De virtutibus et vitii*s is an attempt to reconcile the Academy and the Peripatos. The Platonists had, at least publicly, given up their distinctive insight in the interests of scepticism, and turned increasingly towards the Stoics, and in the age of Cicero Antiochus of Ascalon, who had at first opposed the Stoics, later capitulated and, in R.D. Hicks' words, 'taught Stoic logic, Stoic physics and an ethical theory which was only not orthodox Stoicism because it was fatally wanting in the unity, coherence and consistency which even opponents admired in the Stoics'. But the Stoics also, as we have seen, shifted -- the attacks of Carneades could not be ignored -- and in the first century Posidonius abandoned the orthodox psychology and went back to Plato. Only the Epicureans never changed an atom, and the agreement of Lucretius and even Diogenes of Oenoanda with Epicurus is a tribute to the conservatism of the school.

It is not always realized how thoroughly Cicero was grounded in philosophy. He was born in the country near Arpinum, but from the age of ten Rome was his centre. His philosophical training began before he was sixteen when in conjunction with his friend Titus Pomponius Atticus he attended the lectures of the Epicurean Phaedrus, who was teaching in Rome at the time (3). Both students

were impressed. With Atticus it lasted a life-time; with Cicero the enthusiasm for the tenets of Epicurus soon wore off, but he continued to speak of Phaedrus with respect and to enjoy his friendship. Thereafter he had little official contact with the Epicureans, and publicly disavows acquaintance with their formless writings, but it is clear that he had read more than he makes out (4). Later legend associated him with Lucretius' poem; Jerome says that he amended it and Borgius quotes some alleged corrections. The indefatigable Merrill assures us that there is no phrase in Cicero which is assuredly borrowed from Lucretius. But we know from the letters that Cicero was familiar with the poem (5), and Lucretius may have read extracts to the distinguished *littérateur*.

After leaving Phaedrus, Cicero went to study dialectic with Diodotus the Stoic. This art, which Cicero calls 'abbreviated eloquence', was at the time the monopoly of the Stoics. Cicero absorbed, but was not attracted by, the general philosophy. But Diodotus became an inmate of Cicero's house until his death some thirty years later (6).

Then, in 88 Philo of Larissa, the head of the Academy came as a refugee to Rome. He was a versatile genius, attractive to Cicero not least for his mastery of the theory and practice of oratory. But these were troubled times politically. It seemed that a public career was closed, though he took further training from Molo, the Rhodian ambassador, who linked for him rhetoric and ethics. Meantime he threw himself whole-heartedly into the study of philosophy, and his commitment to the Academy lasted a lifetime (7). Later he likes to recollect his early enthusiasm for philosophy (8), but, even allowing for exaggeration, it is clear that he worked very hard. Throughout the years 88-1 the training continued, and his translations from Greek into Latin included Xenophon's *Oeconomicus* and Plato's *Protagoras*.

Even now he was not done. In 81 he made his first public speech; in the following year he made a public attack upon one of the minions of the dictator Sulla, and shortly afterwards we find him leaving Rome 'for the good of his health'. He spent six months in Athens. There were, it seems, no eminent Stoics or Peripatetics in the city at the time. The Epicureans were under the leadership of Zeno of Sidon, a man of mordant sarcasm but an unrivalled expositor, endowed

with more clarity than charity. Cicero's old friend Phaedrus was however there also, and Cicero accompanied Atticus to some of his lectures (9). He also made the acquaintance of the Stoicizing Academic Antiochus of Ascalon, for whom he conceived a great admiration, 'pre-eminent among contemporary philosophers in ability and scholarship' (10), 'a writer of extraordinary shrewdness' (11), 'the shrewdest and most cultured of the philosophers of my time' (12). In theory, however, he sided with the more orthodox Philo (13).

From the mainland of Greece Cicero went on to Rhodes to continue his study of rhetoric with Molo. Here he met Posidonius; they struck up a friendship, and through this contact Stoicism entered his thinking for the first time as a vital influence. Cicero calls him the greatest of the Stoics, a thorough investigator and the most celebrated of all contemporary philosophers, and says that he read his works more than those of any other philosophical writer. He certainly quotes them more often (14).

From his return to Rome in 77 Cicero was fully engaged in his public career, though he never forgot that he was a scholar and was proud, for example, that as an administrative officer in Sicily he had rescued the tomb of Archimedes from oblivion. But his formative period was over. It had been long and thorough; he had been trained in three of the principal schools, and had emerged with an Academic theory of knowledge, an immense admiration for Plato, and some inclination to the Stoics without their dogmatism. (pp. 99-103).

(...)

It is important to realize what Cicero was trying to do. He never claims originality, except in the last book *De officiis*. He admits that his works are derivative -- 'I merely provide words, and I've plenty of those'. He is however no slavish translator (15); he always brings a critical and interpretative faculty to bear, as he himself claims (16). His aim is the Introduction of philosophy to Rome. War and dictatorship alike limited the scope of public oratory. Philosophy was to Cicero only a second-best, but it was that, and with the decline of oratory he was prepared to give an impulse to Roman philosophy. They needed to be able to philosophize without resort to the Greeks, and to this end he sought to provide them with a kind of philosophic

encyclopaedia. He hoped to make every department of philosophy accessible in Latin; 'what greater or better service, could I offer my country than teaching and instructing the young' (17).

He chose as his form the dialogue, and his models Aristotle, and, occasionally, Heraclides Ponticus (18). This is especially marked in the *Tusculans* where the dialogue is a dialogue with a tendency to monologue, though we cannot help feeling that Cicero, who never suffered from an excess of modesty, is consciously or unconsciously casting himself for the role of Socrates. He is himself aware of this tendency (19). In general, as in *De finibus* or *De natura deorum*, he likes first to present and then criticize the tenets of each of the leading schools in the field under discussion. His presentation is generally fair, though an unconscious bias asserts itself in that he puts the Stoic case at much greater length than the Epicurean. His criticisms are sometimes self-contradictory, but never merely silly. The whole is a fascinating and, we must believe, generally reliable Introduction to the climate of Greek thought in the time of Cicero.

It is not needful here to essay any summary of these expositions, since, it is Cicero whom we are considering rather than his sources.

(...)

But we may properly ask whether we can see what Cicero regarded as the function of philosophy. Unfortunately the work in which he must have presented this systematically, *Hortensius*, is lost. However, we can recover something of its theme. We know, for example, that it was based on Aristotle's *Protrepticus*. This also is lost, but the work of Jaeger and others has enabled us to see something of its content. The book was addressed to a prince of Cyprus named Themison. It was written in Aristotle's Platonic period, and there is no doubt that its ultimate aim was practical. Themison says Jaeger 'is to help to realize the political philosophy of the Academy. He is to be a philosopher-king. But although the aim was practical it was not utilitarian, and Aristotle argued against the proposition that philosophy is to be judged by its immediate expediency; this, as Jaeger has shown, is a defence of the Academic training against Isocrates. On the contrary, we should not be too engrossed in mortal affairs; the life of pure contemplation offers something they can never offer; it accords with man's peculiar gifts and function; in the

isles of the blest there will be no place for the ethical virtues; our aim must be to devote ourselves to truth as the fulfilment of our true personalities.

Cicero followed this, but not slavishly. He used the dialogue form, as Aristotle probably did not. Our knowledge of Cicero's text is principally from Augustine, for whom it was a seminal work. A long and famous extract contains the passage which shows that in the legendary islands after death there will be no place for virtue where there is no room for vice nor even for eloquence where there are no law-courts, but contemplation alone belongs to the highest happiness. Similarly the final conclusion of *Hortensius* directed the reader away from frail mortality to eternity.

Cicero was however by no means always so divorced from practicality. The last book of the *Tusculans* begins with an eloquent panegyric of philosophy, including a summary of the course of Greek thought which omits all mention of the natural philosophers and praises Socrates for having first brought philosophy down from the sky (that is from astronomy and cosmology) and planted her in the town and in the home; to compel men to give thought to ethical principles and their general way of life (20). 'O philosophy' he cries 'life's supreme commander, tracking virtue to its lair and banishing vice, what would have happened to us, what could have happened to man's life at all without you? You brought towns into being. When men were separate from one another you summoned them to community, drew them together first in families, then in marriage, then in the use of a common language. You devised the rule of law; you were our schoolmistress in learning and behaviour. You are our refuge, our source of help. In the past we have given ourselves to you only with reservations; now we give ourselves utterly and completely' (21). Again in the second book we read 'Philosophy has to her credit the cure of souls, the removal of idle worries, redemption from lust and the banishment of fear' (22). So in a letter to Varro he speaks of his return to his books as to old friends whose advice he has neglected in his dubious political alliances. They have forgiven him, and with their help he hopes to face more steadfastly present and future distress (23). Cicero in these passages is writing without a model open before him; he is writing from the heart, and there is

adequate indication that he is really preoccupied with ethical and practical issues.

In fact when we examine the theme and contents of his surviving work this assertion is amply borne out. They all deal with problems of politics (as in the rather earlier *De Republica and De legibus*), religion or ethics. The *Tusculans*, a collection of five miscellaneous discourses, deals successively with the propositions 'I think death is an evil' 'I reckon pain the worst of all evils' 'I think the wise man is liable to present distress' 'I think the wise man cannot get rid of all mental disturbances'. 'I think that virtue is not sufficient to produce ultimate happiness'. These themes (all the propositions are confuted) show well enough the general tenour of his thought. In some moods he was doubtful whether philosophy had all the answers, and Lactantius quotes a letter he wrote to his son 'We ought to know what philosophy teaches, but we ought to live by our national traditions' (24).

He is not interested in the physical sciences, though in *De natura deorum* he followed with keen interest the beauties of the Stoic natural theology against the Academic Carneades. He recognized the Peripatetic virtues in the field of science, and corrected some of the extravagances of the Stoics by reference to Aristotle. His theory of knowledge is Academic. As an orator he was trained to see both sides of a case, as a historian of philosophy he saw the conflicts of philosophers, as a person he was inclined to charity and saw something unworthy in arrogant dogmatism. Opinion, he insists, is free, and each man is free to defend his own position.(25) Disagreement is legitimate and understandable, but not bitterness (26). After all, *quot homines, tot sententiae* (27) Not for him the pernicious autocracy of Pythagoras with *hipse dixit* (28) or the apron-strings of Chrysippus shackling the Stoic. The Academic, abjuring certainty, guided by probability roams free. Cicero anticipated Mill in his belief that freedom of discussion leads to intellectual progress. Sometimes, it must be admitted, he uses the doctrine as an excuse for mental laziness. He has the inconsistency which is the besetting sin of those who borrow eclectically from their predecessors. The view of divination in *De legibus* is radically different from the scepticism of *De divinatione*, and the attempted explanations of this are not really satisfactory. The last book of the

Tusculans and the fourth of *De finibus* are in flat contradiction with one another. Cicero is quite cheerful about such contradictions. 'At different times different views seem more probable' he comments (29); like Dr. Johnson, he refuses to be bound by his previous utterances. He lives, from day to day (30). He is not, however, always free from dogmatism. Indeed there is an amusing passage in the *Tusculans*. Cicero has in the very previous paragraph been commending suspension of judgment. His interlocutor puts the proposition, 'I think that virtue is not sufficient to produce ultimate happiness', and Cicero's demur is almost violent in its emphasis. This is generally true of his ethics which incline to the absolute and dogmatic position of the Stoics. One of Cicero's aims was to undermine Epicurean influence by a combination of Academci scepticism and Stoic ethics.

So far he might seem another of the hack-writers of philosophical text-books who diligently and meticulously perpetuate the errors of past generations. When we turn to his methodology however he appears much more modern.

In the first place he insists on definitions. So he writes to his son in *De officiis* 'Every systematic philosophical development of a subject must begin with a definition to provide a clear explanation of the subject under discussion' (7). Throughout this work his treatment is carefully analytical, as we may note in the discussion of the cardinal virtues. In *De finibus* the first substantial point which Cicero makes against Epicurus arises out of the latter's failure to define: he does not make clear what he means by 'pleasure' (32). Again in the fourth book of the *Tusculans*, where the theme is mental disturbance in general, Cicero points out that the Stoics have spent some time in classification and definition, a thorny subject which the Peripatetics by-pass. He will therefore start with the Stoics, and gives Zeno's definition of mental disturbance as an 'unnatural spiritual upheaval uncontrolled by philosophy'. It is easy to pick holes in the definition; the point is that a definition has been given; he himself suggests an alternative 'an excessively violent appetition' (33). He then takes up an analysis from the previous book (34) according to which the irrational emotions are four in number -- pleasure, which is reaction to a present good, desire, which is an outreaching to a future good, fear, which is an outreaching to a future evil, and distress, which is

reaction to a present evil. Finally he subdivides these four sections, differentiating in each between apparent synonyms in a passage which should be compulsory reading for developing the precise use of words in Latin Prose Composition. Nowell-Smith's *Ethics* (*) is described in its blurb as 'A study of the words and concepts that we use for answering practical questions, making decisions, advising, warning, and appraising conduct '. No doubt Nowell-Smith starts with very different presuppositions and with a superior logical equipment, but in essence he is doing no more than Cicero, and Cicero's insistence on definition and analysis ought to commend him to contemporary thought.

Secondly, Cicero insists on the method of dialectic. So in the *Tusculans*, 'I have always approved the Academic and Peripatetic practice of presenting every subject in the form of a debate, partly because it is the only way of reaching the most probable conclusion on any particular topic, partly because it is good rhetorical practice' (35). 'The sole object of our discussions' he says in the *Academica* 'is by arguing on both sides to draw out and give shape to some conclusion which may be either true or the nearest possible approximation to the truth' (36). It is significant that in adopting Aristotle's *Protrepticus*, which seems not to have been in dialogue form, for his *Horensius* he recast it as a dialogue. *De finibus* is here typical of his methods. The theme is the *summum bonum*. Book I presents the Epicurean view. Book II subjects this to a criticism which is overtly Academic, though its content include, a large admixture of Stoicism. Book III presents the Stoic case, and to Book IV this in turn is attacked, though more sympathetically, from an Academic standpoint. Book V presents a synthetic Academic-Peripatetic view. In *De divinatione* the Epicurean view is omitted as it was a flat negation. Book I presents the Stoic position, Book II the Academic assault upon it. The treatment in *De natura deorum* is closely similar. The Epicurean view is stated and criticized; then the Stoic view is stated and criticized. There is some disparity of space between these treatments. To some extent this reflects the greater importance that theology held for the Stoics; it also reflects a bias in Cicero. Wilamowitz once made a curiously wrong-headed remark that there were no real debates in Cicero. Cicero is not always

objective in his presentation, but the principles underlying it are remarkably Hegelian.

Thirdly, his concept of his function as a philosopher (though not of the function of philosophy itself) was plainly the examination and criticism of what philosophers have actually said. This, so far as it goes, is a modern approach. Some of the detailed criticisms have a modern ring about them also. The Epicureans argued for the existence of gods on the grounds of universality of belief. Cotta's question 'How do you know what all the nations of mankind believe?' (37) might almost have been asked by Ayer or Findlay, and the assertion is brought to the empirical test of actual atheism. In fact, Cicero is always quoting actual Roman experience to illustrate or to test his theme.

Fourthly, and most important, Cicero gave to Rome, and hence to modern Europe, her philosophical vocabulary, and so inescapably moulded our patterns of thought. This was his greatest achievement; Please called it an 'incomparable service'. Plutarch says of him (38): 'He made it his business further to compose and translate dialogues on philosophy, and to express in Latin the vocabulary of science and logic. It is said that he was the original or principal person to supply the Romans with words for *phantasia, synkatathesos, epoche, catalepsis*, as well as *atomon, ameres*, and *kenon* he produced familiar and acceptable terms by the use of transference of language and other devices'. We must remember that Lucretius, who was ten years younger than Cicero, but writing before him, spoke bitterly and repeatedly of the poverty of his native language (39). He found himself continually forced to use Greek formations, of which *homoeomereiae* is merely the most notorious. Some significant Epicurean concepts, such as that which Cicero terms the *intermundia*, the spaces between the universes, Lucretius does not express at all. Cicero refuses to allow that Greek is a richer tongue than Latin; in a long passage at the beginning of *De finibus* he asserts the contrary (40), a claim repeated in the *Tusculans* (41). His age is to see the birth of philosophy in Latin literature and he is to be the midwife (42). He tells Atticus not to be alarmed about the Latin language (43). In the *Academica*, one of the works in which he is forming his style, he examines some of the difficulties of translating technical terms and admits that he has to 'manufacture' words (44).

This he does with marked success. We in fact owe to Cicero the words quality, individual, vacuum, moral, property, induction, element, definition, difference, notion, comprehension, infinity, appetite, instance, science, image and species. It is interesting that in two instances we have adopted the original Greek as well, as a doublet with a different shade of meaning; we use 'atom' as well as 'individual', and 'ethical' as well as 'moral'. Some of these words were coined by Cicero. *Poiotes* was a curious invention of Plato (45). Cicero puts *qualitas* in the mouth of the encyclopedist Varro, who was working at the time on his treatise *De lingua Latina*. The whole passage is worth quoting (46).

'They called the product of force and matter body and what I may call quality. You will allow me, I am sure, to use unexampled words in dealing with unfamiliar topics. The Greeks do it, and they 've been handling these subjects for a good while now'. 'Of course we will' said Atticus, 'but if you want you can use Greek too if Latin lets you down'. 'Thank you, but I 'll do my best to talk Latin except with words like philosophy, rhetoric, physics and dialectic which are habitually used as Latin together with many others. I 've given the name qualities to the things the Greeks call *poiotetes*. That's a technical term of Greek philosophy like many others, and not in general use. As a matter of fact the logical analysts have their own vocabulary, quite different from that of the man in the street. In fact almost all the sciences do it; they either have to invent new words for new things or extend the usage of old ones. The Greeks have been engaged in these studies for centuries, and they still do it; we 're now trying to handle them for the first time, and may perhaps be excused'. 'Varro', I said, 'you 've already added to our factual knowledge; if in addition you add to our vocabulary you 'll certainly have done well by our country'.

Cicero there speaks of inventing some words and adapting others. Examples of such adaptation are his application of *definire* to words, the logical use of *differre*, which has previously meant to 'put off' or 'delay' the extension of *elementa* from Lucretius' atoms to Aristotle's *stoicheia*, the use of *imago* (a statue) for the mental images of Stoic psychology, and above all the extension of species from outward shape (in late Latin *virgo speciosa* means 'a pretty girl') to the Platonic form or universal (47).

There is no need to press the point further. But Cicero's linguistic preoccupations make one wish for a reassessment of his work and influence by one of our contemporary linguistic analysts." (pp. 104-111).

(*) [Patrick-Horace Nowell-Smith, *Ethics*, London, Penguin Books, 1954]

From: John Ferguson, "Cicero's Contribution to Philosophy", in: J. Ferguson (ed.), *Studies in Cicero*, Roma, Centro di Studi Ciceroniani Editore 1962, pp. 99-111.

Cicero: the creator of the Latin philosophical vocabulary

"Philosophy, the genre in which Greek, in Rome as elsewhere, must be granted the position of the dominant language, poses a special problem for a study of the language choice in that literary expression in Antiquity was not necessarily resorted to by the philosophers. Many famous philosophers never wrote anything themselves, although their pupils may have spread their doctrines in written form using their names to do so. It is not always possible to discern the original language use behind this written form, and, in general, it may be difficult to compare the phenomenon of philosophy with such genres as, for instance, history, with which literary expression was indissolubly connected.

This problem already affects the very beginning of the philosophical tradition in Rome. We find eastern philosophers in second century Rome teaching and also writing philosophical treatises in Greek: Panaetius and Hecaton from Rhodes, Philon from Larissa and Boethus from Sidon. Many Romans were in contact with them, and listened to and spread their doctrines, probably in a Greek form and in the Greek language, although they did not use literature to do this. (p. 239)

(...)

Cicero considered himself a pioneer of Latin philosophy, and together with M. Terentius Varro and M. Junius Brutus he represents the only significant period of philosophical literature in Latin before late Antiquity. But these writers, too, had to defend their use of Latin, and their influence on contemporary society remained small.(1) As the works of Varro and Brutus are lost, we know only the apologies of Cicero, but interestingly, one of these occurs in a

conversation with Varro (*ac. post*. 1.4-8), while another is addressed to Brutus (*de fin*. 1.1-5).

The *editio posterior* of Cicero's *Academica*, written in 45 B.C., opens with a conversation between Cicero and Varro, in which the former begs Varro to write on philosophy in Latin. Varro's attitude is negative, and he uses two main arguments to support this:

nam cum philosophiam viderem diligentissime Graecis litteris explicatam, existimavi si qui de nostris eius studiis tenerentur, si essent Graecis studiis eruditi, Graeca potius quam nostra lecturos; sin a Graecorum artibus et disciplinis abhorrerent, ne haec quidem curaturos, quae sine eruditione Graeca intellegi non possunt; itaque ea nolui scribere, quae nec indocti intellegere possent nec docti legere curarent (*ac. post*. 1.4).

[As I have seen that philosophy has been very carefully expounded in Greek, I have come to the following view about people from our country who are seriously interested in it. If they have had the benefit of an education in Greek learning, they will read works in Greek rather than in our own language. But if they have taken against Greek arts or disciplines, they won't care for Latin works, either, since the latter can't be understood without knowledge from the Greeks. As a result I have been unwilling to write works that would neither be intelligible to the unlearned nor something the learned cared to read. (On *Academic Scepticism,* translated, with Introduction and notes, by Charles Brittain, Indianapolis, Hackett, 2006, p. 88)]

Varro goes on to tell us that there are philosophical works in Latin by Amafinius and Rabirius, but both their style (*vulgari sermone disputant*) and the way in which the doctrines are presented are below his own standard. (pp. 240-241)

(...)

This brings us to the best known and documented Roman translator, M. Tullius Cicero. We shall first look at what he translated -- in addition to the *Aratea* discussed above -- and then examine his opinions on the reasons for translating from Greek. The prose translations of Cicero can be divided into philosophical treatises and the speeches of Greek orators. Earliest in the former group in

Xenophon's *Oeconomicus*, translated when Cicero was little more than twenty (*de off*. 2.87). (p. 286)

(...)

Cicero himself promises in *de fin*. 1.7, to translate -- sometime in the future -- passages from Plato and Aristotle.(2) We have four fragments by Roman grammarians from a work of Cicero's called *Protagoras*, which seems to be a rather accurate translation of Plato's *Protagoras*.(3) In addition, we have in the manuscript tradition a large fragment from a translation of Plato's *Timaeus*, which is also mentioned and identified by Hieronymus as a translation (*in Esaiam* XII *prol*., *in Amos lib*. II, V, 3). But the MSS have preserved part of a preface, which seems to indicate that the translation was part of a dialogue; how Cicero himself indicated the translation, how it was incorporated into the dialogue and whether the treatise of Plato was translated completely, cannot be known. If we disregard the gaps in the manuscript tradition, the translation seems to be rather faithful.

Of Aristotle, nothing is known except *Topica*. This represents a very curious case: Cicero has promised to translate or at least explain(4) the *Topics* of Aristotle to Trebatius; he finds no time to do this before embarking on a voyage, in which, however, he has no books to refer to. But nevertheless he completes the task and sends the work, which he calls *Topica Aristotelea*, from Rhegium on July 28th, 44 B.C. to Trebatius (*ad fam*. 7.19). The problem is that the work has almost nothing to do with the *Topics* of Aristotle; evidently Cicero never read the work in question.(5) Thus, we can be certain that this work of Cicero had nothing to do with translation.

I have elsewhere discussed the discrepancy between the indication in the preface and the contents, and suggested that Cicero's doctrine as regards the topics was based on an otherwise unknown Pseudo-Aristotelian treatise, and that in this sense the indication of the preface was true; but clearly, Cicero was very free in his treatment of his theme and source.(6) (pp. 286-287)

If we can discern the reason why Cicero translated the speeches of Demosthenes and Aeschines, sufficient evidence for his philosophical translations can also be adduced, although this is

mainly connected with the treatises, whose dependence on Greek original is less clear (see also above, pp. 240-243). In addition to the above-mentioned educational aspect, the nationalistic idea seems to supply the principal motivation for translating into Latin.(7) An extreme case is *Tusc.* 2.6, where Cicero anticipates a time when all Greek philosophical literature will be translated or transferred into Latin and Greek libraries can close down.(8) This passage belongs to a powerful exhortation to transfer the achievements of Greek philosophy to Rome.(9) One could maintain that the pioneer work of Cicero in the field of Latin philosophy consisted entirely of the adapting or translating of Greek philosophical works into Latin. He compares in *de fin.* 1.4-5 his work to that of Roman dramatists, and considers that a good Roman ought to prefer Latinized philosophy in the same way as he prefers to read the dramas of Terence and Ennius.

The fact that Cicero considers the Greek libraries worthless when the bulk of Greek literature is adapted or translated into Latin, shows that, not unlike many other Romans, he emphasized the independence of the translation or adaptation from the original. Cicero also wished to make translations very free. He had not translated Demosthenes or Aeschines as an interpreter, but as an orator (*opt. gen.* 14; 23).(10) In *de fin.* 1.6, he emphasizes that only the contents of his philosophical works are derived from the Greeks, the form is his own; he does not want to be a mere translator.(11) Cicero distinguishes sharply between *interpretatio* and *imitatio*, an independent transferring, with an artistic purpose, of the ideas of the original.(12)

Consequently, it is clear that Cicero's translations are, or intend to be, creative and ambitious with definite artistic aims and a clear nationalistic coloring. One further question remains to be answered: does Cicero have in mind those Roman readers who are incapable of reading the Greek originals due to a defective knowledge of Greek, i.e. does the modern reason for translating apply in any way? The question is discussed in *ac. post.* 1.3-4, where Varro gives as one reason why he does not deal with philosophy in Latin, his opinion that those readers with a Greek education would prefer reading in Greek and those without such an education -- we can take this to mean, unable to read Greek -- would not be interested in philosophy

anyway (see also above, p. 240). Cicero duly protests, but everything points to the fact that in the sphere of which Cicero's literary activity formed a part the reader was generally considered bilingual and that translations were therefore not necessary. (pp. 288-289)

It is time to return to Cicero, whose views on Latinity and purism have already been discussed. We have seen in the previous section that as with Livius Andronicus and his successors, the general language choice of Cicero, i.e. the choice of Latin for philosophical and rhetorical literature, rested to a large extent on a nationalistic basis. Cicero's general attitude to the Latinizing of Greek words also closely resembled that of the early poets. Again, I would not see in this a negative attitude towards the Greek language so much as a perception of the necessity of creating an indigenous vocabulary for these branches of learning.

The nationalism of Cicero's attitude shows up clearly in that his discussion of the use of Greek words is mostly connected with passages comparing the lexical resources of Latin with those of Greek, or emphasizing the needs of Latin philosophical literature: q*uare bonitate potius nostrorum verborum utamur quam splendore Graecorum* (*or*. 164). This is also the starting point in *de fin*. 3.5: because the Latin vocabulary is richer than the Greek, *elaborandum est, ut hoc non in nostril solis artibus, red etiam in illorum ipsorum adsequamur*. When in this context Cicero accepts words like *philosophia* and *rhetorica*, because as *usu recepta* they have become Roman, he states that even these could easily be replaced by purely Latin terms. Central to the whole passage is the fact that all special languages use *verba inusitata*, either Greek or Latin, and as a branch of learning philosophy cannot take its vocabulary from the streets (3.4). The same idea is continued in *de fin*. 3.15: preferably one should translate Greek terms by Latin ones; if one Latin word is not enough, several may be used. But: *tamen puto concedi nobis oportere, ut Graeco verbo utamur, si quando minus occurret Latinum*.

The theory of establishing new Latin terms for hitherto unknown concepts is discussed by Cicero several times, and almost always in a defensive tone,(67) thus anticipating criticism. The alternatives at Cicero's disposal for the expressing of Greek terms in Latin are

classified, mainly on the basis of Cicero's own theories, by Hartung as follows:(13) (a) to use the Greek term as such; (b) to use a Greek loan word in a Latinized form and with Latin characters; (c) to use Latin words which were exact counterparts of the Greek terms and well-known in this sense (*verba propria et usitata*); (d) to use Latin words which are transferred from another area of meaning (*verba similitudine translata*); (e) to form new Latin words. As has been noted, Cicero does not entirely ignore methods (a) and (b), either in theory or, especially, in practice; but he clearly prefers even (e) to (a) and (b). This reveals the mentality of the pioneer of Latin literature; Cicero regards himself as the founder of the terminological tradition in Roman philosophy and rhetoric, and his view is that in so far as solutions have not already been made by adopting Greek terms into Latin, the preferable solution is contained in (c), (d) or (e).

None of this can by judged against a background of purism, since from the purist point of view, the use of *verba inusitata* is to be condemned independently of the Latin or Greek origin. Neither does Cicero's view reveal a negative attitude towards the Greek language. In addition to the nationalistic aspect discussed above, I think that a certain language theoretical view of Cicero is also applicable here, a view which emphasizes the significance of the origin of the persons, both ethnic and social, for the language which he uses. The clearest expression of this view, together with a special reference to Greek loan words, can be found in *de off*. 1.111:

ut enim sermone eo debemus uti, qui innatus est nobis, ne, ut quidam, Graeca verba inculcantes iure optimo rideamur, sic in actiones omnemque vitam nullam discrepantiam conferre debemus.

[For as we ought to employ our mother-tongue, lest, like certain people who are continually dragging in Greek words, we draw well-deserved ridicule upon ourselves, so we ought not to introduce anything foreign into our actions or our life in general. (English translation by Walter Miller, Cambridge:Harvard University Press, 1913)]

The above-mentioned passages, in which Cicero distinguishes several special languages within the Latin language, represent another expression of this view. And in a sense, we can relate to this the famous passage *Tusc*. 1.15, in which Cicero claims that he does not

use more Greek in Latin than Latin in Greek: *scis enim me Graece loqui in Latino sermone non plus solere quam in Graeca Latine*. This occurs in a passage which is concerned with the quotation of a verse of Epicharmus, a quotation which Cicero makes, as his normal practice is, in Latin translation.

In the comparison of Cicero's theoretical attitude with his practice of writing, his letters must be discussed as a special group. The Greek loan words in these occur approximately as often as in Cicero's other work, if only frequency and occurrence is taken into account; but the words are more often such which only rarely appear elsewhere and can hardly be considered *verba usitata*. The main difference, however, lies in the fact that in his letters Cicero is fond of inserting Greek phrases and words with Greek spellings,(14) a licence Cicero has allowed himself in his other work only in special cases.(15) This phenomenon certainly reflects the style used in the normal communication of the two correspondents in question; the number of Greek phrases depends not only on the theme of the letter, but also on the person to whom the letter is written; they are commonest by far in the letters to Atticus.(16) The interpretation of the phenomenon for our purposes is clear and agrees with other sources: on the one hand, the insertion of Greek phrases and words was obviously a favourite practice in civilized conversation and communication between Romans -- it even lent some kind of intimacy to the letters; (17) Greek had retained its position as the cultural language, and the attitude towards it, in this social class at least, was favourable. Sometimes Cicero and his correspondents even boast of their knowledge of Greek -- certain words are not found in the extant Greek literature -- , but at other times it is only deficiencies in the Latin which are rectified.(73) On the other hand, the rare occurrence of Greek quotations and words in Cicero's treatises and speeches was based on a deliberate avoidance of them. One could think that this avoidance or rather the stylistic ideal to which it belongs was due either to a negative attitude to the Greek language or to a nationalistic emphasis on Latinized literature; the first alternative being excluded on grounds given above, we might perhaps state a preference for the second one.

In the speeches very rare, slightly more common in the rhetorical and philosophical treatises, in which terms with Greek spellings also

occur: this is the general picture of Greek loan words in Cicero.(74) Greek sources are cited outside the letters in Latin translation.(75) Cicero's theoretical principles on the avoidance and inclusion of Greek loan words accord rather well with his practice; perhaps there are a few more Greek words than one would expect, but this is probably due to the fact that our conception of what a Greek loan word is and Cicero's conception may differ greatly." (pp. 309-310)

Notes

Notes are renumbered for clarity.

(1) See E. Norden, *Die römische literatur*, (6 ed.) Leipzig 1961, 55.

(2) *locos quidem quondam, si videbitur, transferam, et maxime ab its quos modo nominavi (sc. Plato et Aristoteles), cum inciderit ut id apte fieri possit*. [If I think fit, I will translate certain passages, particularly from those authors (Plato and Aristotle) I just mentioned, when it happens to be appropriate].

(3) K. Büchner, *RE* VII A, 1150.

(4) *ut tibi illa traderem* are the words used by Cicero in *top*. 1.2; in the following Trebatius is urged to acquire the contents from a teacher of oratory, and this rather refers to explaining, but then Cicero again speaks of the charmful and rich style which ought to have attracted philosophers to the work. Cassiodorus (*de art. ac discipl. lib. art*. 583 Garet) says: *Topica Aristotelis ... Cicero transtulit in Latinum*.

(5) However, B. Riposati has in his long monograph *Studi sui 'Topica' di Cicerone*, Ed. dell'Univ. Catt. del S. Cuore, Ser. Pubbl. 22, Milano 1947, attempted again to show that the principal themes and ideas of Cicero can be traced back to Aristotle.

Cicero's testimony on Stoic logic

The main texts of Cicero on Stoic logic can be found in:

Lucullus 91-98;

De fato 11-21

Topica 26-34, 47-49, 53-59.

(under construction)

Logic and rhetoric in Rome at the times of Cicero

Rhetoric was intensely practised in ancient Greece by a series of orators whose names are still well-known. It seems to have appeared in Sicily as a special science with its own laws, whence it was taken over to Greece by Gorgias. Later, rhetoric was greatly improved by the Sophists, both from the point of view of the art of adorned speech and of the art of persuading by argument.

The first great orator is Isocrates (born about 436 B.C.) who studied under Prodicus and Gorgias. Aristotle (...) established rhetoric as a branch of dialectics and codified its rules, and Demosthenes brought that art to perfection.

The disciples of Isocrates and those of Aristotle, respectively, formed two rhetorical schools: the first was concerned rather with polishing and improving the oratorical form and style, the second, as one should expect, was concerned with constructing the arsenal of the art of persuasion.

What is significant and testifies to the closer link between logic and rhetoric, and generally, between the latter and philosophy, is the fact that those who studied rhetoric most were the philosophers of the Peripatetic and Stoic schools.

Starting with the second century B.C. systematized treatises on rhetoric began to be written, such as that of Hermagoras of Temnos (about 120 B.C.).

As the general preoccupations acquired an ever growing practical character, especially under Roman rule (the Roman spirit being pre-eminently practical and formalistic), studies of rhetoric flourished in Greece, which explains why later, when logic reached Rome through the Greek rhetors, it was only a discipline to be learned in connection with rhetoric.

The conservative section of the Roman society was at first rather opposed to the Greek rhetoricians who, by their pro and contra arguments of the same thesis, shocked the Romans' commonsense. Thus, in 161 B.C. by a *senatus-consultus*, all the Greek rhetors were banished from the Eternal City. Afterwards, however, Latin rhetors appeared, who had studied in Greece, but neither were they favourably regarded by the authorities, and therefore were officially blamed by the Roman censors about the year 92 B. C. In Caesar's epoch, however, rhetoric became a free art, both in respect to learning and practising it. It came to be so highly valued, that emperor Vespasianus (7-79 A.D.) ordered public schools of rhetoric to be set up, with Greek and Latin masters, who were to be state stipendiaries.

On the other hand, we see logic, which for centuries had ranked first among the concerns of the Greek philosophers, come to Rome and be overshadowed by rhetoric, groping to acclimatize its terminology and devoid of any creative force.

We shall further examine these Latin orators and philosophers whose works bear witness to the way logic was introduced to Rome, to the way in which the logical terminology was established (no easy problem), and to the general conceptions of the Roman philosophers about logic. We shall briefly survey the most remarkable among them.

MARCUS TULLIUS CICERO (106-43 B.C.)

Dialectics was introduced by M. Terentius Varro (116-28 B.C.) through his encyclopedic work *De novem disciplinis* ("On the nine sciences").

Varro was a pupil of Antiochus of Ascalon. He wrote prolifically (he himself declared he would have written up to the age of 84 years, 490 books). Contemporary inquiries ascribe to him altogether 620 books (74 independent works). His writing which interests us especially is the above mentioned, *De novem disciplinis*, a synthesis of the whole science of his time. It is undoubtedly the origin of the seven liberal arts, which will be the basis of the Scholastic learning, and of which we will speak further. In this work, Varro, treated the following disciplines, divided into two groups:

(1) grammar, dialectics and rhetoric;

(2) geometry, arithmetic, astronomy, music, medecine and architecture.

Varro enjoyed a great prestige in his time, and a long time afterwards he was considered as an unquestionable authority in the "disciplines" he wrote about. For instance, Augustine named him *doctissimus Romanorum* ("the most learned Roman") in his work *De civitate Dei* (XIX, 22).

The fragments remaining from Varro were gathered, translated and published by F. Brunetti (Venice, 1874)(*). An interesting study on the logic aspects of the work of Varro was published by Lucien Gerschel: *Varron logicien I. Etude sur une séquence du De lingua latin*a

("Latomus", 1958, pp. 65-72).

The first one interested, however, in translating the Greek logical terminology into Latin is Marcus Tullius Cicero, the greatest Roman orator and one of the greatest in the world. His work is considerable. We shall only mention his writings dealing with logic or with the manner in which the Romans conceived it.

-- *De Inventione* ("On invention") is a treatise imitating *Rhetorica, ad M. Herennium*, a work ascribed to Q. Cornificius (tribune of the plebs in 69 B.C.).

-- *De Oratore* ("On the Orator") is a work in which Cicero displays the Ancients' concept of the value and means of the oratorical art; written in the form of a dialogue, the main roles are granted to two of the greatest orators of the previous generation, L. Crassus and M. Antonius.

-- *Brutus,* also written as a dialogue between Atticus and Brutus, represents a real history of Roman eloquence. He quotes over two hundred older orators but among his contemporaries, Cicero only mentions Caesar, Sulp. Rufus, and M. Marcellus.

-- *Orator* is a short writing, in which the author depicts the type of the ideal orator.

-- *Partitiones Oratoriae* ("The Oratorical divisions") is a manual written as questions and answers for his son's instruction.

-- *Topica* comprises a kind of commentary addressed to C. Trebatius, where Cicero reveals how the oratorical art can make use of the means offered by logic.

-- *De optime genere oratorum* ("On the best style of Orators") is an opusculum in which Cicero pleads for the Attic oratorical style (this booklet was written as a preface to the translation of the speeches made by Aeschines and Demosthenes in connection with the famous "Affair of the Crown").

Cicero's works, were published under the title *Opera Omni* by C. F. Miller and G. Friedrich in 15 vols. (Leipzig, beginning from 1878). A critical Latin edition, with Italian translation, published "Centro di Studi Ciceroniani" (Rome, beginning from 1964).

For the philosophical terminology of Cicero we have the writings of H. Merguet: *Lexikon zu den philosophischen Schriften Ciceros* (2 vols., 1905-1906), and *Lexikon zu den Reden des Ciceros* (4 vols., 1877-1884). Both were printed at Jena, and reproduced, after the original, at Hildesheim (1960-1962).

More information, concerning Cicero's philosophical terminology, can be found in A. Michel's *Rhétorique et philosophie chez Cicéron* (Paris, 1961).

Two things in Cicero's works are relevant to the history of logic, namely: the invention of a Latin terminology corresponding to the Greek one, and information on Stoic logic whence we become aware that the Romans practised those forms of logic. Cicero, like the other Roman rhetors and thinkers, made no original contribution.

Cicero's logical terminology is rather hesitating. Even the name of that discipline he rendered λογική, and sometimes by διαλεκτική, which he was unable to translate into Latin and he therefore kept generally the Greek terms in the Latin text. However, he sometimes translated those two Greek words by *ars disserendi* -- "the art of discussing" (De Oratore, II, 38) or *ars disceptatrix* -- "The art of deciding".

Here is an example of his use of the Greek term λογική -- logic, in a Latin text, namely in a fragment from *De finibus bonorum et malorum* ("On the Purpose of the Good and Bad Things", I, 7): *Jam in altera philosophiae parte, quae est quaerendi ac disserendi quae λογική dicitur, iste vester plane. . . inermis ac nudus est.* ("Also in the second part of philosophy, which deals with research and discourse, and is called λογική, that [master] of yours is unarmed and defenceless").

In *De Inventione* (XXVIII, 42) Cicero began to employ such Latin terms as: *adversum, contrarium, negans*, for ἀποφατικόν (negative), oppositum for ἐναντίον (opposite) and repugnans for ἀντπατικόν (repelling). For the idea of sentence, Varro and Aelius mentioned in their texts the Greek term ἄξίομα, which they would sometimes render by *proloquium*. Cicero's translation of "sentence" varies: *effatum, pronuntiatum, enunciatum* or *enuntiato*. (*De Inventione*, 1, 37). In the texts dealing with the classification of judgements

according to their quality, Cicero started from the verb *aio* -- I affirm, and *nego* -- I deny, and translated καταφατικόν (affirmative) by *aientia*, and ἄποφατικόν (negative) by *negantia*.

In *Topica*, meant to be a rendering of the treatise bearing the same title by Aristotle, Cicero introduced terms which definitely remained in logic such as: *definitio, genus, species (forma)* etc.

He hesitated in the translation of the word τόπος for which he used in turn the terms, *locus, sedes* and *nota*: *locum esse argumenti sedem -- locus is sedes* (the seat) of the argument.

As regards the Stoic dialectics, it dissatisfied Cicero "because it only gives the art of argumentation, not that of inventing -- *invenire*, too". However, he translated and explained at the same time, the terms of the hypothetical reasoning (*De Divinatione*, II, 53). Lemma -- λεμμα -- is translated by sumptio, πρόσληψις by assumptio, and ἐπιφορά by complexio. Concerning the reasoning, Cicero introduced the term *inductio* for ἔπαγογή and divided all arguments into two groups: induction; and deductive reasoning "as most of the Greeks do [who divide them] into παραδείγματα and ἔπιχειρήματα, interpreting παραδείγμα as oratorical induction (Quintilianus, *De Institutione Oratoria*, 11).

Although he was not too interested in the Stoics' modes of argumentation, Cicero enumerated the five undemonstrable Stoic arguments, from, which, he said "numerous others" can be derived (*Topica*, 54-57). He gives the following examples to this effect, which may represent the sixth and seventh arguments:

6) *Non et hoc et illud; hoc autem; non igitur illud.*

Not both this and that; but this; therefore not that.

7) *Non et hoc et illud; non autem hoc; illud igitur.*

Not both this and that; but not this; therefore that.

Related to Cicero's rhetorical logic, mention should be made of the Greek Epicurean Philodemus of Gadara (first century B.C.). He came to Rome, became acquainted with and then highly appreciated by Cicero, and Lucretius himself seems to have been among his disciples.

Several epigrams by him were known, but after the diggings at Herculanum no less than 36 philosophical books by the same writer were found. Unfortunately, they were in rather bad state and could be only partially deciphered.

M.E. Gros published the fragments referring the oratorical art separately, under the title *Philodemi rhetorica* (Paris, 1840).

In one of these newly found treatises, significantly entitled *On Signs and Significances* (**), Philodemus opposed the Stoic conception (called "dogmatic" at the time), set up an empirical theory of knowledge and examined the inductive methods of natural sciences." (pp. 273-276)

Notes

(*) [*Libri di M. Terenzio Varrone intorno alla lingua latina,* edited and translated in Italian by Pietro Canal (first edition 1846-1854), reprinted Venice: Giuseppe Antonelli, 1874, with the addition of the fragments with notes by Federico Brunetti. The *De novem disciplinis* is lost, but Friedrich Wilhelm Ritschl collected the extant fragments in: *De M. Terentii Varronis disciplinarum libris commentarius* (Bonn, 1845), reprinted in: F. Ritschl, *Opuscula philologica*, Vol. III, Leipzig 1877, 353-402. *Note added by R. Corazzon*]

A Study in Ancient Empiricism*, edited, with translation and commentary, by Phillip Howard De Lacy and Estelle Allen De Lacy, Philadelphia, Pa., The American philological association 1941; new revised edition: Napoli: Bibliopolis, 1978. *Note added by R. Corazzon*]

From: Anton Dumitriu, *History of Logic*, Tunbridge Wells: Abacus Press 1977, Vol. I.

"For some centuries after Stoic logic had been formulated by Chrysippus we find discussion of the merits of his system and that of Aristotle, then a gradual fusion, or perhaps we should say confusion, which was completed at the end of classical antiquity in the work of Boethius. When the study of logic was resumed after the Dark Ages, the writings of Boethius were better known than those of Aristotle and his reputation as high. Some part of the Stoic contribution remained, therefore, in what we now call traditional logic, though

weakened later by a revival of interest in Aristotle, which led sometimes to a kind of Aristotelian purism. In this section we shall try to trace the transmission from Greek antiquity to the Middle Ages giving names and dates where these are likely to be useful. But we shall not attempt to treat even the famous philosophers of this long period in detail, since our purpose is only to give perspective to our view of antiquity and the Middle Ages.

During the last two centuries B.C. and the first century A.D. the philosophical schools in Athens existed side by side, competing for pupils with doctrines which followed more or less closely those of their founders; but the Stoics and the Epicureans were the most influential. Plato's Academy became presently a home of scepticism with Carneades as its most famous member, and Aristotle's influence was not very strong. If we may judge from the writings of Cicero, the Stoic school was the dominant one in his day. No doubt there were developments in that school after the time of Chrysippus, but we cannot now separate them from his work, because the ancient tradition is not full enough. Later writers such as Galen, Alexander, and Boethius speak constantly of the Stoics or 'the moderns' (οἱ νεώτεροι) without troubling to distinguish individuals.

Cicero made no original contribution to the development of logic, but his writings preserve some scraps of information about the teaching of the Stoics, and in this, as in other fields of philosophy, he did a useful service by inventing Latin equivalents for Greek technical terms. *Propositio*, for example, was introduced by him, but not with exactly the same sense as that it commonly has in later Latin. In his terminology it means the leading premiss of an argument (το` ἡγεμονικο`ν λη + ῆμμα), and is used to make a contrast with *assumptio*, which means the additional premiss (ἡ πρόσληψις). (1) This special sense is to be found later in the logical writings attributed to Apuleius and Martianus Capella, but already before the end of the first century A.D. the word was used by Quintilian, the rhetorician, in the more general sense of 'statement' or 'indicative sentence' which it retained throughout the Middle Ages.

Cicero's word for a conclusion in the passage we have just noticed is *complexio*, which means literally 'a knitting together', but it is interesting to notice that the same word occurs elsewhere in the book

with the sense of 'dilemma': '*Complexio est in qua, utrum concesseris, reprehenditur ad hunc modum: Si improbus est, cur uteris? Si probus, cur accusas?*' (2) No doubt such reasoning was popular with the Hellenistic rhetoricians fro whom Cicero took his material, and it may have been cultivated by them rather than by the Stoic logicians, who first studied conditional and disjunctive arguments. The 'theorem with two complex premisses' which we noticed in our section on the system of Chrysippus is, of course, a special case of the kind of argument called by later logicians a simple constructive dilemma (i.e. in Stoic terminology 'If the first, then the third; if the second, then the third; but either the first or the second; therefore in any case the third'), and the paradox of the crocodile and the baby, which Lucian attributes to Chrysippus, (3) involves an argument of similar pattern. So there can be no doubt that the Stoics were familiar with this development of their logic. On the other hand, according to Chrysippus all good arguments are διλήμματα in the original sense of 'arguments with two premisses'; and there is no evidence of the use of the word διλήμματον in the modern sense of 'dilemma' before the second century A.D., when it occurs in the work of the rhetorician Hermogenes with an explanation like that given by Cicero for *complexio*, namely by reference to two questions, both equally awkward to answer. (4)

Among Cicero's philosophical works there is a small treatise called *Topica* which has had considerable influence on the teaching of logic because it was highly regarded in late antiquity, when logic was associated with rhetoric in the way he thought proper. This book professes to be an adaptation of Aristotle *Topics* for the use of a friend called Trebatius, but it shows little trace of direct borrowing from Aristotle's work. It is conceived as a manual for the training of Roman orators and is therefore furnished with illustrations from Roman jurisprudence. Probably the plan, such as it is, was derived from some Hellenistic manual; for the topics discussed here are mentioned in the same order in the *De Oratore*, (5) as though they were in fact commonplaces of that age. Some topics, it is said, are connected intrinsically with the subject to be discussed (*in eo ipso de quo agitur haerent*), e.g. those concerned with definition, genus, species (or in Cicero's terminology *forma generis*), while others are brought in from without (*assumuntur extrinsecus*), e.g. that which

involves appeal to authority. With some elaborations this simple classification was retained as long as men thought there was anything to be learnt from the study of topics." (pp. 177-179)

Cicero's Topica

"It is a commonplace to talk, in general terms, of the dependence of all European thought and learning on Greek philosophy, and more particularly on Greek logic. It is a commonplace, also, to analyse the structure of individual works of Latin literature in terms of the divisions and subdivisions in the treatment of the subject involved, with their frequent prefatory definitions. This is a method that may in many cases be taken from recent Greek models of various kinds, in particular works on rhetoric or grammar, but which for Cicero goes back to the dialectic of the philosophers, and which Fuhrmann has traced even beyond Socrates to the sophists.(1) It is perhaps less of a commonplace, though doubtless rash, to try to take a comprehensive view of the Romans' attempt, over a wide spectrum of subjects, to apply this method, to try to see how important they felt it to be, and how far they were successful in it. The extent to which they regarded it as the transformation of the subjects in question into τἔκναι or *artes* must also be considered. I want to stress that we are not merely dealing with an expository method used in introductory handbooks of little intellectual originality, as Fuhrmann's useful *Das Systematische Lehrbuch* might suggest, but that it came to seem to the Romans simply the best way to think and write about a serious subject, to be applied both on a large scale, i.e. to works in a number of books, and on a small one, i.e. inside a single book. The Roman

attempt to organize almost the whole body of their knowledge into a series of systematic and comprehensible wholes along these lines can be seen as a development in intellectual history of great importance for later times. This attempt probably began before the first century BC opened, and continued to make more measured progress after it closed. But the earlier and middle first century is that of its most enthusiastic, indeed sometimes over-enthusiastic, adoption. If we see this, it should help us also to understand certain aspects of two of the most important figures of the time, Cicero himself and Varro, better than is always done, and to put into some sort of context the present lively argument as to what exactly was happening in Roman jurisprudence at this period.

In his *Topica*, which are aimed at persuading the lawyer Trebatius that rhetorico-philosophical ways of finding arguments may be useful to him, Cicero, possibly in the wake of Stoic dialectic, carefully distinguishes between *partitio*, μερισμός, listing the parts, or some of the parts, that go to make up a whole, and *divisio*, διαίρεσις, that operates with the concepts of *genus* and subordinate *species*, though because he does not like the forms *specierum* and *speciebus* he declares that he will use *forma* instead of *species* (the Greek terms are of course γένος and εἶδοσς). He also states that both *partitio* and *divisio* are forms of definition.(2) But in practice both he and other Romans are often far from precise: *genus, pars, species* and *forma* are used pretty indiscriminately,(3) and as we shall see definitions are actually often thought to be better if they are unphilosophically loose. But this does not make the adoption of the system less important, or alter the fact that it was felt to be derived from philosophy. Cicero at least was of course aware that there was much more to dialectic than the two procedures we have mentioned; but it is these that were most widely grasped and applied." (pp. 324-325 of the reprint)

Notes

(1) Manfred Fuhrmann: Das systematische Lehrbuch. Ein Beitrag zur Geschichte der Wissenschaften in der Antike Gottingen: Vandehoeck & Ruprecht, 1960, chap. 1.

(2) Cicero, *Topica* 28 f.; cf. Dieter Nörr, *Divisio und Partitio. Bemerkungen zur römischen Rechtsquellenlehre und zur antiken Wissenschaftstheorie*, Berlin:Schweitzer, 1972. M. Talamanca, Lo schema "genus-species' nelle sistematiche dei giuristi romani' (*Problemi attuali di scienza e cultura: colloquio italo-francese: La filosofia greca e il diritto romano*.), Roma 14-17 aprile 1973, Tomo II Accademia Nazionale dei Lincei, (1977) 103, 145, 156 argues that this is peculiar to Cicero.

(3) As their Greek equivalents are by Plato, probably Speusippus, and often Aristotle (in the biological as opposed to the logical works; also Theophrastus): D. M. Balme, 'Τἔϱος and εἴδος in Aristotle's Biology', *Classical Quarterly* XII (1962) 81. Diog. Laert. VII 39 reveals that some philosophers described as εἴδη of philosophical λὅγος what others called γἔνη; Strabo I 2 6 seems distinctly confused about the εἴδη of discourse, λὅγος, which is γενιχὅς.

"Contains the complete Latin works of Boethius in two volumes, with general prolegomena, notes, and commentaries in Latin and a life of Boethius in French; because of textual corruptions and authorial misattributions, text should be consulted only when a later, edited critical edition is unavailable." Philip Edward Phillips, "Anicius Manlius Severinus Boethius: A Chronology and Selected Annotated Bibliography", in: *A Companion to Boethius in the Middle Ages*, edited by Noel Harold Kaylor, Jr., and Philip Edward Phillips, Leiden: Brill, 2012, p. 553.

Modern editions of Boethius' translations of Aristotle and Porphyry

1. Minio-Paluello, Lorenzo, and Dod, Bernard G., eds. 1966. *Categoriarum supplementa. Porphyrii Isagoge translatio Boethii et Anonymi fragmentum vulgo vocatum 'Liber sex principiorum'. Accedunt Isagoges fragmenta M. Victorino interprete et specimina translationum recentiorum categoriarum*. Bruges: Desclée De Brouwer.

   Aristotele Latinus I. 6-7. "This volume constitutes a supplement to the Latin versions of the *Categories*. It contains Porphyry's famous *Introduction* to Aristotle's *Categories* in

Boethius' translation (6) [pp. 5-31] and an extract of an anonymous 12th century Latin writing, which was widespread under the title *Liber sex principiorum* (7): it deals mainly with the last six categories, treated more briefly in Aristotle's work. The volume also contains the fragments quoted by Boethius from an older Latin version of Porphyry's *Introduction*, done by Marius Victorinus."

2. Porphyre. 1998. *Isagoge*. Paris: Vrin.

   Texte grec et latin, traduction par Alain de Libera et Alain-Philippe Segonds.

   Introduction et notes per Alain de Libera.

   Table des matières: Alain de Libera: Introduction VII; L' *Isagoge*: une Introduction aux *Catégories* d'Aristote XIII; Sur les sources non aristotéliciennes de Porphyre XXVII; Le paradoxe de l' *Isagoge* XXXIII; Le questionnaire de Porphyre XXXVI; Le σκοπός de l' *Isagoge* et la question des πέντε φωναι XXXVIII; Sur l'interprétation médiévale du questionnaire de Porphyre LXII; La solution néoplatonicienne du problème de Porphyre: la théorie des trois états de l'universel LXXV; Les sources aristotéliciennes de Porphyre et la théorie des prédicables XCII; Porphyre et le vocabulaire de la prédication CVI; L'interprétation médiévale de l' *Isagoge* CXXVII-CXLII.

   Introduction de Poprphyre aux *Catégories* d'Aristote.

   Texte grec, *Translatio Boethii*, traduction française 1; Notes de la traduction française 31; Notes de la *Translatio Boethii* 71; Bibliographie 73; Index verborum. Grec-latin 77; Latin-grec 88; Index nominum. Anciens et médiévaux 95; Modernes 98-100.

   [Contient la traduction latine de Boèce, *Porphyrii Introductio in Aristotelis Categorias a Boethio translata*, en bas de page du texte grec.]

   "Soucieux d'inscrire l' *Isagoge* dans la longue durée de son interprétation médiévale, nous proposons ici un texte qui s'écarte sur plusieurs points de l'édition critique de L. Minio-Paluello et B. G. Dod. Indépendamment de plusieurs variantes de détail, nous maintenons, notamment, « *differentibus specie*

» au lieu de « *differentibus speciebus* » ou « *differentibus* » (I, § 9) et « *Priami* » au lieu de « *Primum* » (II, § 1), car, même manifestement fautives, ce sont les leçons qui ont réellement circulé au Moyen Age (comme en témoignent, entre bien d'autres, les commentaires embarrassés de Guillaume d'Occam reproduits dans notre apparat critique)" P. CXLII.

3. Minio-Paluello, Lorenzo, ed. 1961. *Categoriae vel Praedicamenta. Translatio Boethii, Editio Composite, Translatio Guillelmi de Moerbeka, Lemmata e Simplicii commentario decerpta, Pseudo-Augustini Paraphrasis Themistiana*. Bruges: Desclée De Brouwer.

   Aristotele Latinus I. 1-5. "This volume contains five Latin versions of Aristotle's *Categories*. Numbers 1 (pp. 5-41) and 2 (pp. 47-79) both stem from Boethius, who is responsible for the Latin translations that were most widespread. One of them is more literal, the other more elegant. William of Moerbeke, on the other hand, was the author of a Latin version not only of Aristotle's work (3), but also of Simplicius' commentary, which contains the abbreviated lemmas of the Aristotelian text (4). Moreover, Aristotle's work was known by means of a Roman paraphrase attributed to Augustin and influenced by Themistius (5)."

4. Verbeke, Gerard, ed. 1965. *De interpretatione vel periermenias. Translatio Boethii specimina translationum recentiorum edidit Laurentius Minio-Paluello. Translatio Guillelmi de Moerbeka*. Bruges: Desclée De Brouwer.

   Edidit Gerardus Verbeke, revisit L. Minio-Paluello.

   Aristotele Latinus II. 1-2. "This volume contains the vulgate text of the *Perihermeneias*, which goes back to Boethius (1) [pp. 5-38], and the version composed with the lemmas of the Aristotelian text in William of Moerbeke's translation of Ammonius' commentary (2)."

5. Minio-Paluello, Lorenzo, ed. 1962. *Analytica priora. Translatio Boethii (recensiones duae), Translatio anonyma, Pseudo-Philoponi aliorumque Scholia,*. Bruges: Desclée De Brouwer.

Aristotele Latinus III. 1-4. "Boethius composed a double Latin version not only of the *Categories*, but of the *Prior Analytics* [pp. 5-191] as well (1-2). However, the two versions have not been edited separately except for certain parts, the second version having been displayed, for the other parts, in the critical apparatus. Apart from these widespread texts, a good, but not quite successful anonymous 12th century translation of Aristotle's logic has come down to us (3). Special attention is paid to a set of Latin scholia to the *Prior Analytics* (4), the origin of which is disputed. According to L. Minio-Paluello and J. Shiel, they were translated by Boethius along with the Aristotelian text; according to recent research, however, they might go back to a translation by James of Venice."

Reprint with a supplement composed by James Shiel, Leiden: Brill, 1998.

6. ———, ed. 1969. *Topica. Translatio Boethii, Fragmentum Recensionis Alterius et Translatio Anonyma*. Bruges: Desclée De Brouwer.

   Aristotele Latinus V. 1-3. "Boethius' rendering of the *Topics* [pp. 5-185] has been carried out, once more, in two versions (1-2), one of which has not been preserved but partly. Moreover, a 12th century version is extant: it stems from the anonymous translator of the *Prior analytics* (3)."

7. Dod, Bernard G., ed. 1975. *De sophisticis elenchis. Translatio Boethii, Fragmenta Translationis Iacobi et Recensio Guillelmi de Moerbeke*. Bruges: Desclée De Brouwer.

   Aristotele Latinus VI. 1-3. "The vulgate text of the *De sophisticis elenchis* [pp. 5-60] stems from Boethius (1). Fragments of another version have been attributed to James of Venice (2), and William of Moerbeke did a revision of Boethius' translation (3)."

Modern editione of the Commentaries on Cicero's Topica

Contents: Editions cited XIII; Introduction. I. The work and its sources XV; II. The edition. 1. The extant tradition XXIII; 2. The interrelation of the manuscripts XXXIII; 3. Editorial principles XLVI; *Introductio ad syllogismos categoricos* 5; Synopsis 85;

Commentary 88; Bibliography 169; Word index 173; Index of passages 192; General index 205.

Abstract: "The Roman statesman and philosopher Anicius Manlius Seuerinus Boethius (c. 480-c. 525) translated and wrote commentaries on most of Aristotle's logical works. In addition, he wrote several treatises on logic, including two monographs on the categorical syllogism, which are commonly known as *De syllogismo categorico* and *Introductio ad syllogismos categoricos*. The present study is the first critical edition of the latter.

The main purpose of both *De syllogismo categorico* and *Introductio ad syllogismos categoricos* is to serve as Introductions to Aristotelian syllogistics by providing a pedagogical transition from the theory of the proposition to the doctrine of the categorical syllogism. In the case of *Introductio ad syllogismos categoricos*, however, the final section (supposedly the second book of the work) has either been lost or was never written. Certain characteristics of the extant tradition seem to indicate that the work is an improved redaction of *De syllogismo categorico*, but that it never underwent final revision before publication. As in the case of *De syllogismo categorico*, Boethius' ultimate sources are Aristotle's *Peri hermeneias* and *Analytica priora*, but dispositional, terminological, and doctrinological features give evidence that the influence of the Greek commentators is all-pervasive.

The reconstitution of the text rests on collation of 21 manuscripts dating from the 10th to the 15th century. An analysis of the interrelation of the manuscripts leads to the

conclusion that all extant manuscripts descend from a common archetype but that the tradition is severely contaminated and cannot be described by means of a stemma codicum. Hence, a formal hierarchy is established among the text witnesses. The Latin text is presented with a critical apparatus, an *apparatus fontium*, a commentary, and indexes."

English translations

1. Boethius. 1957. "The Second Edition of the Commentaries on the *Isagoge* of Porphyry, (Book I)." In *Selections From Medieval Philosophers (I): Augustine to Albert the Great*, edited by McKeon, Richard 70-99. New York: Charles Scribner's Sons.

   Translation of *In Isagoge,* 1.1-12.

   "The selection which follows, the First Book of the second *Commentaries* on the *Isagoge*, illustrates the temper and interest, no less than the importance, of Boethius. The entire Book is commentary on not more than a page of text from Porphyry, and a good two-thirds of it is devoted to

   developing and enforcing in full detail a remark of his concerning the utility of the study of logic. The remaining part is devoted to a penetrating

   -- and startlingly cautious -- discussion of the problem of the universal. As in the case of the defense of logic, the discussion grows out of a remark by Porphyry -- his refusal to discuss in an introductory work questions concerning the possible existence

of genera and species outside our mind; concerning their nature, corporeal or incorporeal; and their relations to sensible objects. To answer such problems in any detail would be to develop an entire philosophy. Particularly, it would necessitate a choice between Plato and Aristotle as Boethius conceived and stated them.

Boethius, none the less, with reservations and for reasons which he carefully states, undertakes the discussion of the basic notions of the problem. The later development of scholastic philosophy is based, significantly, upon these questions. It is needless of course to say, as has frequently been said, that Boethius introduced the question to the middle ages and set the twelfth century to discussing the universal: the problem is to be found in Augustine, and it would be difficult to proceed far in philosophy without encountering it. Yet it is striking that most usually the discussion was introduced in twelfth century writings by a reference to Boethius and to his translation of the questions of Porphyry."

(...)

"It was as a logician that the middle ages chiefly esteemed Boethius, sometimes to the extreme of preferring him to Aristotle in translation. Although that preference yielded to others, at least Boethius was for centuries the principal source of aristotelianism in the

west. This contribution alone must be estimated considerable, if one remember the despair of Cicero at the rendering of philosophy in the latin language; in the time of Boethius latin had already become a supple philosophic language, and for good or ill many of the

terms of later philosophical discussions in it were originated by him." (Richard McKeon, pp. 67-69)

4. ———. 2010. *Boethius: On Aristotle On Interpretation 1-3*. London: Duckworth.

   Translated by Andrew Smith.

   Contents: Conventions VII; Textual Emendations VIII; Introduction 1; Translator's Note 11; Translation. Book 1 15; Book 2 57; Book 3 115; Notes 151; Select Bibliography 157; English-Latin Glossary 159; Latin-English Index 160; Index of Names 162; Subject Index 164-166.

   "Boethius' second and larger commentary on Aristotle's *On Interpretation* was written in Latin in the early sixth century AD in the style of Greek commentaries on Aristotle. Both commentaries were part of his project to bring to the Latin-

speaking world knowledge of Plato and Aristotle. His project was for comprehensive translation of them and for adaptation of the Greek commentaries on them. The project was cruelly interrupted by his execution at the age of about 45 between 524 and 526 AD, leaving the Latin world under-informed about Greek Philosophy for 700 years, although his commentary on Aristotle's *On Interpretation* remained the standard Introduction throughout the Latin Middle Ages.

Aristotle's *On Interpretation*.

In the first six chapters of his *On Interpretation* Aristotle defines name, verb, sentence, statement, affirmation and negation. This has standardly been seen as a progression beyond the subject of his *Categories*, which distinguishes single terms. For *On Interpretation* already studies the complexity of a statement, and it can be seen as pointing forward to the treatment in his *Analytics* of syllogistic arguments, which combine three statements, two of them premisses and one a conclusion. But C.W.A. Whitaker has argued that what turns out to interest Aristotle from Chapter 7 onwards is contradictory or contrary pairs of statements, and that these contradictory or contrary pairs relate rather to the practice of dialectical refutation discussed in Aristotle's other logical works, the *Topics* and *Sophistici Elenchi*. (1)"

In Chapters 8 to 10, Aristotle examines exceptions to the rule that in contradictory or contrary pairs one statement will be false and the other true. Chapter 11 addresses some puzzles about complex assertions, Chapters 12 to 13 consider pairs of statements involving possibility and necessity, while the last chapter, 14, discusses beliefs that are contrary." (*Introduction* by Richard Sorabji, p. 1)

6. ———. 1998. *On Determinism. Ammonius On Aristotle On Interpretation 9 with Boethius On Aristotle On Interpretation 9 First and Second Commentaries*. London: Duckworth.

   Ammonius translated by David Blank; Boethius translated by Norman Kretzmann.

   With essays by Richard Sorabji, Norman Kretzmann and Mario Mignucci.

   Contents: Richard Sorabji: Preface VII; Acknowledgements VIII; I. Introduction. 1. Richard Sorabji: The three deterministic argumenta opposed by Ammonius 3; 2. Richard Sorabji: Boethius, Ammonius and their different Greek backgrounds 16; 3. Norman Kretzmann: Boethius and the truth about tomorrow's sea battle 24; 4. Mario Mignucci: Ammonius' sea battle 53; II. Translations. Textual Emendations 89; Ammonius *On Aristotle On Interpretation 9* translated by David Blank 91; Notes 118; Boethius *On Aristotle On Interpretation 9 (first commentary)* 129; Boethius *On Aristotle On Interpretation 9 (second commentary)* translated by Norman Kretzmann 146; Notes 187; Bibliography 193; English-Greek Glossary 197; Greek~English Index 200; English-Latin Glossary 207;

   Latin-English Index 210; Subject Index 213-216.

   "This is a volume on determinism. It contains the two most important commentaries on the determinist's sea battle argument, and on other deterministic arguments besides. It includes the earliest full exposition of the Reaper argument for determinism, and a discussion of whether there can be changeless knowledge of the passage of time. It contains the two fullest expositions of the idea that it is not truth, but only definite truth, that would imply determinism.

Ammonius and Boethius both wrote commentaries on Aristotle's *On Interpretation* and on its ninth chapter where Aristotle discusses the sea battle.Their comments are crucial, for Ammonius' commentary influenced the Islamic Middle Ages, while that of Boethius was of equal importance to medieval Latin-speaking philosophers.

It was once argued that Boethius was influenced by Ammonius, but these translations are published together in this volume to enable the reader to see clearly that this was not the case. Ammonius draws on the fourth- and fifth-century Neoplatonists Iamblichus, Syrianus and Proclus.

He arranges his argument around three major deterministic arguments and is our main source for one of them, the Reaper argument, which has hitherto received insufficient attention. Boethius, on the other hand, draws on controversies from 300 years earlier between Stoics and Aristotelians as recorded by Alexander of Aphrodisias and Porphyry.

Ammonius' commentary on the first eight chapters of Aristotle's *On Interpretation* has appeared in a previously published volume in this series, translated by David Blank." (*Preface* by Richard Sorabji)

7. Thörnqvist, Christina Thomsen. 2008. *Anicii Manlii Severini Boethii De syllogismo categorico*. Gothenburg: University of Gothenburg.

   Critical edition with Introduction, translation, notes, and indexes by Christina Thomsen Thörnqvist.

   Contents: Preface X; Editions cited XIII; Introduction. I. The author, the work, and its sources. 1. The author XV; 2. The work and its sources XVIII; 3. The interrelation and the titles of the two monographs on the categorical syllogism XXIX; II. Boethius' monographs on the categorical syllogism in the Middle Ages XLI; III. The edition. 1. The textual tradition LIII; 2. Editorial principles LXXIII; 3. The apparatus fontium and notes LXXIV; *De syllogismo categorico* 1; Translation 102; Notes 158; Appendix: Selected variant readings in the younger

manuscripts 177; Bibliography 194; Word index 199; Index of passages 218; General index 226.

Abstract. "The Roman statesman and philosopher Anicius Manlius Seuerinus Boethius (c. 480-c. 525) translated and wrote commentaries on most of Aristotle's logical works. In addition, he wrote several treatises on logic, including two monographs on the categorical syllogism, which are commonly known as *De syllogismo categorico* and *Introductio ad syllogismos categoricos*. The present study is the first critical edition of the former.

De syllogismo categorico divides into two books of which the first is an account of the categorical proposition and the second deals with the categorical syllogism. The ultimate sources are Aristotle's *Peri hermeneias* and *Analytica priora*, but certain dispositional, terminological, and doctrinological features show that the text is heavily influenced by the tradition of the Greek commentators.

From the rediscovery of Boethius' logical writings in the 10th century until the mid-12th century, Aristotle's doctrine of the categorical syllogism was known chiefly through Boethius' *De syllogismo categorico*. The influence by as well as on the work is discussed in the Introduction to the present study.

The reconstitution of the text rests on collation of 47 manuscripts dating from the 10th to the 15th century. An analysis of the interrelation of the manuscripts leads to the conclusion that all extant manuscripts descend from a common archetype but that the tradition is severely contaminated and cannot be described by means of a *stemma codicum*. The text is primarily based on the sixteen earliest text witnesses, among which a formal hierarchy is established. The Latin text is presented with a critical apparatus, an apparatus fontium, an English translation, notes, and indexes. Selected variant readings in the later manuscripts are reported in an appendix."

8. Boethius. 1988. *In Ciceronis Topica*. Ithaca: Cornell University Press.

   Translated, with notes and an Introduction by Eleonore Stump.

Contents: Acknowledgments IX; Abbreviations XI; Introduction 1; *In Ciceronis Topica*: Book I 21; Introduction: The Purpose of Topics 22; The Nature of Logic 25; The Nature of Topics 29; The Division of Topics 36; Book II 49; Introduction: The Nature of Related Things 50; The Topic from related things 55; An Extrinsic Topic 72; Book III 75; Introduction: The Relationship of Topics to the Thing at Issue 75; Definition 84; Book IV 105; Partition 106; Designation 108; Related Things 110; Book V 132; Introduction: The Nature and Sorts of Conditional Propositions 133; The Seven Stoic Modes of Hypothetical Syllogism 135; Causes 154; Book VI 167; Introduction: Review of The Nature of Topics 168; Causes 169; Effects and Comparison 171; The Division of Topics 176; The Extrinsic Topic 179; Notes to the Translation. Book I 185; Book II 194; Book III 205; Book IV 214; Book V 224; Book VI 240; Appendix: Categories and Predicables 244; Selected Bibliography 256; Indexes 265-277.

"Boethius's *In Ciceronis Topica* is one of two treatises Boethius wrote on the subject of the Topics or *loci*. The other treatise is *De top. diff.*, (11) one of the last philosophical works he composed.(12) Together these two treatises present Boethius's theory of the art of discovering arguments, a theory that was enormously influential in the history of medieval logic. (13) *De top. diff.* is a fairly short treatise, but it is Boethius's advanced book on the subject; it is written in a concise, even crabbed style, and it clearly presupposes acquaintance with the subject matter. In contrast, ICT is Boethius's elementary treatise on the Topics. It was written shortly before *De top. diff.* (14) and is a commentary on Cicero's *Topica*, though it is a much larger and more comprehensive work than the *Topica*; it is more than twice as long as the more tightly knit De top. *diff.*" (p. 4)

(...)

According to Boethius, who is dependent on both the Greek and Latin traditions, (22) two different sorts of things are Topics: a Topic is both a maximal proposition and the Differentia (23) of a maximal proposition. On Boethius's view, a maximal proposition is a self-evidently true, universal generalization,

such as 'Things whose definitions are different are themselves also different.' Boethian Topics of this sort probably have as their ancestors the Aristotelian Topics that are principles. Their official function, on Boethius's account, is to aid in the discovery of arguments, but in practice Boethius tends to use them to confirm arguments. (24) Differentiae are theoretically the differentiae dividing the genus *maximal proposition* into its subaltern genera and species, and in that capacity they serve to classify maximal propositions into groups. Some maximal propositions have to do with definition, for example, and other with genus; so from definition and from genus are Differentiae. Much more important, however, is the role Differentiae play in Boethius's method for the discovery of dialectical arguments. For the most part, Boethius thinks of dialectical arguments as having categorical rather than conditional conclusions, and he conceives of the discovery of an argument as the discovery of a middle term capable of linking the two terms of the desired conclusion. Boethian Differentiae are, for the most part, the genera of such middle terms. (In those cases where the arguments are hypothetical rather than categorical, Boethius generally but not invariably thinks of Topics as validating the conditional proposition in the argument.) To find an argument using Boethius's method, one first chooses an appropriate Differentia (criteria for appropriateness are left to the arguer's intuition). The genus of middle terms, determined by the Differentia chosen, and the two terms of the desired conclusion then indicate the specific middle term of the argument and so indicate a dialectical argument supporting the conclusion." (pp. 4-6)

9. ———. 1978. *De topicis differentiis*. Ithaca: Cornell University Press.

Translated, with notes and essays on the text, by Eleonore Stump.

Contents: Abbreviations 11; Introduction 13; Part One. *De topicis differentiis*. Book I 29; Book II 43; Book III 63; Book IV 79; Notes to the Translation. Book I 97; Book II 110; Book III 128; Book IV 141; Part Two. Dialectic in Ancient and Medieval Logic. Dialectic and Aristotle's Topics 159; Dialectic and Boethius's *De topicis differentiis* 179; Between Aristotle and Boethius 205; Peter of Spain on the Topics 215; Differentia and the Porphyrian Tree 237; Differentia 248; Bibliography 263; Indexes 275-287.

"This book is a philosophical study of Boethius's treatise *De topicis differentiis*. It includes the first English translation of this historically and philosophically important text, as well as copious notes designed to make the text accessible to philosophers and scholars interested in the medieval period. Detailed philosophical analyses of the text and of important

technical concepts, such as the concept of the predicables, are worked out in the chapters of Part II. Chapters on Aristotle's *Topics* and the treatise on dialectic in Peter of Spain's *Tractatus* explain the work of these philosophers on the Topics and explore the relationship of their views to those of Boethius. My principal aim is to make Boethius's treatise available and comprehensible to scholars for whom the technical Latin vocabulary and unfamiliar subject matter have made it inaccessible." (*Preface*, p. 7)

(...)

"Boethius's De topicis differentiis is concerned with the discovery of arguments. As there is a method for judging or evaluating arguments (what we call 'logic'), so, Boethius thinks, there is also a method for finding arguments. The method varies somewhat, depending on whether the arguments sought will be used in rhetoric for legal or political speeches or in dialectic for philosophical inquiry. Most of Boethius's attention is given to the method as used in dialectic, but the fourth and last Book of the treatise examines the method as used in rhetoric and compares it with that used in dialectic.

Whether the method for finding arguments is rhetorical or dialectical, its main instrument is something called a Topic (in Latin, 'locus'). 'Topic' is the standard English translation for the Greek 'τόπος' (the Aristotelian counterpart of 'locus'), which means, literally, a place or area. A certain sort of Topic that plays a role in the ancient methods for memorization antedates and is probably the source for the kind of Topic used in discovering arguments. In the art of memorizing, a Topic is a place, in the literal sense, which the memorizer pictures in his mind and from which he recalls what he wants to remember. He familiarizes himself with some large edifice in which a number of places are picked out as the τόποι to aid memory, and these places are fixed in the memory in their actual order of occurrence in the edifice. Then the speech, or whatever is being memorized, is divided into parts, and a vivid image is associated with each of the parts. The memorizer pictures these images put into the places of the edifice in their appropriate

order. When he is delivering his speech, he imagines himself walking through the edifice, going from place to place, and finding in each place the image he put there. Each image reminds him of a certain part of his speech; and in this way he uses the τόποι to recall the entire speech, part by part, in order. (7)" pp. 15-16)

(...)

" *De top. diff.* is Boethius's definitive work on the Topics. In it he considers two different sets of dialectical Topics, one of which he finds in Cicero's *Topica* and the other of which stems from the Greek commentator Themistius (ca. 320-390); and he attempts to reconcile the two sets of dialectical Topics. He also discusses rhetorical Topics, and he concludes the treatise by comparing rhetorical and dialectical Topics to make their similarities and differences clear. Because it is an advanced work with a broad scope of material, *De top. diff.* does not devote much attention to the way in which a Topic functions to find an argument. One is likelier to find such discussion in the more elementary *In Ciceronis Topica*. Instead, in *De top. diff.* Boethius contents himself with describing the various Topics and giving examples using each, with a minimum of explanation about the basic method. In the chapter on Boethius, I have explained what I think his technique for finding arguments is and how it works." (p. 17)

10. ———. 1988. "On Division." In *Logic and Philosophy of Language*, edited by Kretzmann, Norman and Stump, Eleonore, 11-38. Cambridge: Cambridge University Press.

    The Cambridge Translations of Medieval Philosophical Texts. Vol 1.

    "De divisione was probably written sometime between 505 and 509. It is a study of different sorts of division - e.g., the division

of a genus into its species or the division of a whole into its integral parts - an important part of the logical heritage on which the scholastic period built. Boethius investigates the way in which these various divisions are distinguished from one another and the logical relations between whatever is being divided (or analyzed, or classified) and its dividing elements. For example, he points out that a genus is naturally prior to its species but a whole is naturally posterior to its integral parts; if a genus is destroyed, so are all its species, but if a whole is destroyed, some of its integral parts may remain. A large part of the treatise is devoted to the division of genus into species, in connection with which Boethius deals extensively with the predicables (genus, species, definition, differentia, proprium, and accident), their interrelationships, and the way they combine to form a Porphyrian tree." (pp. 11-12)

11. ———. 1998. *De Divisione Liber*. Leiden: Brill.

    Critical edition, translation, prolegomena and commentary by John Magee.

    Contents: Acknowledgements IX; Abbreviations XI; Boethian Editions Cited XIII; Prolegomena XV; Date of De divisione XVII; Boethius, Porphyry, and Andronicus XXXIV; Textual Tradition of *De divisione* LVIII; *De divisione* 1; Commentary 53; Appendix: Elenchus Lectionum Singularium Selectarum 171; Bibliography 177; Word Index 187; Index of Passages 200; General Index 222-224.

    Date of composition: "All things considered, the period between 515 and 520 seems a safe surmise." (p. XXXIII)

    "Like all of Boethius' writings, *De divisione* looks both back to Antiquity and ahead to the Middle Ages. (1) It was copied with great frequency for use in the medieval schools, the MSS in which it is preserved being outnumbered only, among Boethius' works, by those of *De differentiis topicis* and the *Consolatio*. And in addition to the commentaries of Peter Abelard, Albert the Great, and Antonius Andreae, there is a wealth of glossed MSS, florilegia, and indirect evidence to suggest that *De divisione* proved of enduring interest to medieval students from the later tenth century on. This would have pleased Boethius,

who in the proem evinces particular concern for the utilitas of the treatise in the context of the Latin-speaking world. As for Antiquity, there is an important lost tradition underlying *De divisione*. More precisely, in the proem and conclusion Boethius mentions two works which are otherwise completely unattested: a "book" on diaeresis by Andronicus of Rhodes (1st c. BC) (2) and a "commentary" on Plato's *Sophist* by Porphyry (b. AD 232/3). (3) The lost ancient tradition is the concern of the present discussion, and I begin with the relevant passages. In the proem and conclusion Boethius indicates:

(1) that Andronicus published a book on diaeresis, in which he (Andronicus) remarked (a) that diaeresis is a method of great utility and (b) that the Peripatos (before Andronicus) had always held the method in high esteem: *Quam magnos studiosis afferat fructus scientia diuidendi quamque apud Penpateticam disciplinam semper haec fient in honore notitia, docet et Andronici diligentissimi senis* De diuisione *liber editus* (4,3ff.);

(2) that Plotinus approved of or recommended Andronicus' book: *et hic idem a Plotino grauissimo philosopho comprobatus* (4,5f.);

(3) that Porphyry (consequently) adapted Andronicus' book for his commentary on Plato's Sophist: *et in Platonis librì qui Sophistes inscrìbitur commentariis a Porphyrio repetitus* (4,6f.);

(4) that the *later Peripatos* (a) distinguished between diaeresis in the essential and incidental senses and (b) made subdivisions of each: *Posterior quidem Peripateticae secta prudentiae differentias diuisionum diligentissima ratione perspexit et per se diuisionem ab ea quae est secundum accidens ipsasque inter se disiunxit atque distribuii* (48,26ff.);

(5) that, by contrast, the *earlier Peripatetics* indiscriminately employed accidents in place of genera, species, and differentiae: *antiquiores autem indifferenter et accidente pro genere et accidentibus pro speciebus aut differentiis utebantur* (50,1 f.); and

(6) that the promiscuous “earlier” usage drove Boethius to explain how the various kinds of division are (a) similar to and (b) different from one another: *unde nobis peropportuna utilitas uisa est et commumones harum diuisionum prodere et eas propriis differentiis disgregare* (50,2ff.)." (pp. XXXIV-XXXV)

(1) The following is based on my “Boethius ... and Andronicus;” points of detail are treated in the commentary.

(2) The complicated issues of Andronicus’ precise dates and scholarchship I pass over here. One may consult, among others, Moraux, Aristotelismus I 45fF., with Tarân’s review, esp. 73 Iff., and Gottschalk, “Commentators” 55ff.

(3) A. Smith, (ed.) *Porphyry Philosophi Fragmenta* xf., and “Studies” 750, treats the “bulk” of *Dio*. as a Porphyrian fragment (169F). Although preferable to treating it as an Andronicean one, this entails complications of its own.

12. ———. 1983. *Boethian Number Theory*. Amsterdam: Rodopi.

Translation, with Introduction and notes, of the *De institutione arithmetica* by Michael Masi.

Contents: Preface 9; Boethian Number Theory 11; The Iconography of the Liberal Arts and the Boethian Arithmetic 13; Boethian Number Theory and Music 23; Arithmetic Proportion and the Medieval Cathedral 31; Medieval Literature andf the Theory of Number 39; *De Institutione Arithmetica*: Commentaries and Derivative Works 49; Manuscripts Containing the *De Institutione Arithmetica* 58; A View of Bethius' Life and Works 64; Boethius, to Symmachus, his Lord, the Patrician 66; Boethius, *De Institutione Arithmetica* 71; Bibliography 189-197.

"The consistency, even into the Renaissance, of the Liberal Arts curriculum, (1) its essentially mathematical nature, its influence beyond the *quadrivium* on music theory and practice, and its bearing on the nature of aesthetics (2) are all revelant to the basic concepts outlined in Boethius' *De Institutione Arithmetica*. Not only does the name of Boethius appear repeatedly in discussions of proportions and harmony, but numerous manuscripts and publications of his works and commentaries on the *De Institutione Arithmetica* continued with undiminished, even increased, vigor into the sixteenth century.

Before I present an outline of this scope of influence, the distinction between practical and theoretical mathematics should be clarified in order to help avoid a common misunderstanding. The modem meaning of *arithmetic* conveys nothing of what it meant for Boethius. The difference between arithemetic (Αριθμητική) and logistics (Λογιστική) was the same for Boethius as it was for the Greeks who originally defined it. (3) Both disciplines deal with numbers, but arithmetic designates the theory or philosophy of number, only after the Middle Ages did the term designate an elementary discipline of counting and calculation. The process whereby one undertook the solution of practical problems of computation was known to the Greeks and to Boethius as logistics and to the Middle

Ages as algorism. (4)

The nature and scope of number theory is adequately explained in the first chapter of the *De Institutione Arithmetica* -- it is essentially a preparatory study for philosophy. As such, among the Neo-Pythagoreans, it had a fundamentally moral character and bespoke the order of the world in its most basic terms. The expression of this order was eventually, in the other disciplines of the *quadrivium*, expanded into musical terminology where it acquired the dimension of harmony; in the study of geometry, it was extended to plane surfaces and solid figures. In astronomy, the geometric measurements and the metaphor of harmony found their widest applications in the definition of the order of the universe and in the supreme model of concord, the music of the spheres.

To demonstrate within the limits of this Introduction the pervasiveness of Boethius' treatise on the study of number theory, its importance as a preparatory study for music, and the bearing of number theory on architecture, literature, and moral philosophy, I have organized my discussion under five headings. With each I have provided adequate Bibliography so that those interested in particular applications of this number theory may pursue and test the application of principles in the *De Institutione Arithmetica* to other disciplines. The five headings are: (I) The Iconography of the Liberal Arts; (II) the *De Institutione Arithmetica* and the *De Institutione Musica* in the theoretical writings of later musicologists; (III) Arithmetic proportion and architecture; (IV) Literary extensions of the Theory of Number; (V) Commentaries, derivative studies, and extant manuscripts." (pp. 11-12)

(1) *Trivium*: grammar, rhetoric, logic; *Quadrivium*: arithmetic, music, geometry, astronomy.

13. Palisca, Claude, ed. 1989. *Boethius. Fundamentals of Music*. New Haven: Yale University Press.

    Translated, with Introduction and notes by Calvin M. Bower.

    Contents: Preface by Series Editor Claude V. Palisca XIII; Translator's Preface XVII; Introductio XIX-XLIV; Book 1 1; Book 2 52; Book 3 88; Book 4 115; Book 5 162; Appendix 1: Chapters 20-30 of Book 5 181; Appendix 2: Notes on the Text of the Spartan Decree 185; Appendix 3: Notes on the Diagrams and their Sources 189; Index 197-205.

    "Shortly after the turn of the sixth century a young Roman patrician began to record in Latin the sources and background of his exceptional Greek education. Although it is uncertain that he ever studied in Athens or Alexandria, those fifth-century centers of liberal learning and philosophy fundamentally shaped his thinking, even to the extent of determining his literary and pedagogical objectives. He would lay a scientific foundation by writing on four mathematical disciplines—the quadrivium as he collectively called them. Thereafter he would translate and comment on the *Organon* of Aristotle and, building on the mathematical disciplines and Aristotelian logic, would finally approach the philosophical writings of Plato and Aristotle and the world of metaphysics. (1)

    In this context, Anicius Manlius Severinus Boethius (480-524) wrote the treatise entitled *De institutione musica*, one of his earliest works, probably around the middle of the first decade of the sixth century. It was intended to be read along with the *De institutione arithmetica* and may have been one of four works setting out the foundations of Platonic scientific education: arithmetic, music, geometry, and astronomy. None of the mathematical works—or even the logical works—was considered original by Boethius or his contemporaries.

Boethius's early works record in Latin what he was reading in Greek. Reading, translating, writing, and commenting formed an integrated process through which Boethius appropriated for his culture works that not only were unknown but that in most cases surpassed the superficial dabblings in science and logic from the golden and silver ages of Roman civilization. Scholars such as Marius Victorinus und Apuleius of Madaura had produced scientific translations for Latin readers of the fourth and fifth centuries, but Boethius carried the genre to new levels of rigor and thoroughness. Written for a cultural elite already initiated into philosophical literature, Boethius's mathematical and logical works represent one of the most notable projects in intellectual history of preserving and transmitting a corpus of knowledge from one culture to another. (2)

No evidence has been found that Boethius's mathematical works were read between his short lifetime and the ninth century. But when liberal learning saw a rebirth in the Carolingian era, Boethius's treatises on arithmetic and music reappeared as authoritative works on these disciplines, rivaled only by Martianus Capella's *De nuptiis Philologiae et Mercurii*. (3) When a tradition of independent musical treatises began in the ninth century, Boethius's treatise became the unique source for the thorough mathematical underpinning of Western musical theory. It is ironic that this work intended as an approach to logic and philosophy would essentially shape the most illiberal of the liberal arts. (4)" (pp. XIX-XX)

(...)

"An overview of the structure of the five extant books should assist the reader in placing the musical details of the treatise in perspective. Book 1 forms a self-contained Introduction to the discipline, whereas books 2 and 3 present mathematical demonstrations of propositions introduced in book 1. Book 4 applies the mathematical principles developed in books 2 and 3 to the monochord and presents the theory of modes. Finally, book 5 introduces the reader to the mathematical and musical subtleties of Ptolemy." (p. XXIX)

14. Boethius. 1973. *The Theological Tractates and the Consolation of Philosophy: Text and Translations*. London: Heinemann.

    The Loeb Classical Library; new edition; Latin text and English translation.

    The Theological Tractates translated by H. F. Stewart, E. K. Rand and S. J. Tester; *The Consolation of Philosophy* translated by S. J. Tester.

Contents: Note on the Text VII; Introduction IX; Bibliography XV; *The Theological Tractates* 2; *The Consolation of Philosophy* 128; *Symmachi versus* 412; Index 415-420.

"A seventeenth-century translation of the *Consolatio philosophiae* is here presented with such alterations as are demanded by a better text, and the requirements of modem scholarship. There was, indeed, not much to do, for the rendering is most exact. This in a translation of that date is not a little remarkable. We look for fine English and poetry in an Elizabethan; but we do not often get from him such loyalty to the original as is here displayed.

Of the author " I. T." nothing is known. He may have been John Thorie, a Fleming born in London in 1568, and a B.A. of Christ Church, 1586. Thorie " was a person well skilled in certain tongues, and a noted poet of his times " (Wood, *Athenae Oxon*. ed. Bliss, I. 624), but his known translations are apparently all from the Spanish. (a)

Our translator dedicates his " Five books of Philosophical Comfort" to the Dowager Countess of Dorset, widow of Thomas Sackville, who was part author of *A Mirror for Magistrates and Gorboduc*, and who, we learn from I. T's preface, meditated a similar work. I. T. does not unduly flatter his patroness, and he tells her plainly that she will not understand the philosophy of the book, though the theological and practical parts may be within her scope.

The *Opuscula Sacra* have never before, to our knowledge, been translated. In reading and rendering them we have been greatly helped by two mediaeval commentaries: one by John the Scot (edited by E. K. Rand in Traube's *Quellen und Untersuchungen*, vol. I. pt. 2, Munich, 1906); the other by Gilbert de la Porrée (printed in Migne, *P.L.* LXIV.)."

(a) Mr. G. Bayley Poison suggests with greater probability that I. T. was John Thorpe (fl. 1570-1610), architect to Thomas Sackville, Karl of Dorset. Cf. *American Journal of Philology*, vol. XIII. (1921), p. 266.

15. ———. 1991. "De hebdomadibus." In *Being and Goodness. The Concept of the Good in Metaphysics and Philosophical Theology*, edited by MacDonald, Scott, 299-304. Ithaca: Cornell University Press.

    Translation by Scott MacDonald.

    "The Latin texts are Boethius 1978a and Peiper 1871. The line numbers from Rand's text are given in angle brackets in the text of the translation. In preparing this translation, I have consulted the translations of Stewart, Rand, and Tester in Boethius 1978a, Boethius 1981, and de Rijk's suggestions for translating the axioms in de Rijk 1987." (p. 299)

16. ———. 1999. *The Consolation of Philosophy*. Oxford: Clarendon Press.

    Translated with Introduction and explanatory notes by Patrick Gerard Walsh.

    "This is an appropriate time to launch a new translation of *The Consolation of Philosophy*. In the past few years there has been

a significant revival of interest in Boethius; this has been marked by several studies which have partially restored him to the prominence which he enjoyed for over a millennium from the Carolingian age onwards. My rendering, with its accompanying Introduction and annotation, has sought to exploit these important researches.

The translation is based on Ludwig Bieler's admirable edition in the *Corpus Christianorum* series. The annotations have benefited conspicuously from the notable commentary of J. Gruber. Henry Chadwick's general study of Boethius, and the volume of essays edited by the late-lamented Margaret Gibson entitled *Boethius, his Life, Thought, and Influence*, have furnished much of the information on which the Introduction is based. My debts to Gerard O'Daly's *The Poetry of Boethius* for interpretation of the verses, and to R. W. Sharpies' edition of the taxing philosophical content of Books 4-5, will be obvious from the frequent citations in the notes. Details of these works are presented in the Select Bibliography." (from the *Preface*)

"Summary of the Treatise.

Book 1. As the prisoner grieves over his downfall and impending fate, Lady Philosophy appears before him. Initially he fails to recognize her, but once recognition dawns he pours out to her his resentment at the iniquity of Fortune. His devoted public service has ended in his condemnation; the order evident in the world of nature does not extend to the just treatment of humankind. Philosophy diagnoses his ailment; blinded by vicious emotions, he has forgotten how the world is ordered. She promises initially a gentler cure.

Book 2. Lady Philosophy denounces the prisoner's bitter indictment of Fortune, against whom he has no real complaint. Fortune herself is invoked to justify her ways with men. Hitherto she has favoured him, and the inconstancy she now shows is at one with the similar pattern in nature. Philosophy insists that his present life has its material consolations, but true happiness is not to be sought in them. She reviews the worldly goods to which men aspire, and successively rejects wealth, ambition for high position, and the pursuit of fame as

avenues to happiness. Fortune benefits man more when adverse than when favourable.

Book 3. Before explaining where true happiness is to be found, Lady Philosophy reiterates that the quests for riches, high position, and fame, and additionally physical pleasure, are defective ways of seeking the true good. The true avenue is reversion to our beginnings. The prisoner's former wealth, the tenure of public office, the kingship under which he has served, the desire for fame, the pursuit of bodily pleasure, the reliance on physical strength and beauty are all false goods which fail to attain sensation, imagination, reason, and understanding; these correspond with the four levels of existence, namely immobile life, that of the lower animals, the human, and the divine. The reconciliation between Providence and free will is achieved at the fourth level of divine understanding. God's knowledge is always in the present, not in the future or past. Though from the divine aspect all future events will be necessary, in their own nature some will be necessary but others freely chosen. In this sense the freedom of the will remains intact."

17. ———. 2001. *The Consolation of Philosophy*. Indianapolis: Hackett.

    Translated, with Introduction and notes, by Joel C. Relihan.

    "Principles of translation.

    Latin poetry does not rhyme; its rhythms, far more complex than those of English, are not related to the accents of the words themselves but to the succession of long and short syllables; that is to say, they depend upon the length of time that it takes to pronounce each syllable. The music of Latin poetry is accordingly quite polyphonic; sometimes word accent agrees with verse accent, and sometimes conflicts with it. Within this rhythmic environment is found a highly artificial poetic language: The great Latin poets (Vergil, Horace, Ovid) did not just write memorable works in verse but, for each writer who came after them, offered new solutions to the old problem of how to fit the Latin language into the shapes of Greek verse. Consequently, every Latin poem is a mosaic of phrases learned from earlier poems; the reading of any Latin poem is a

complicated intertextual game, as even a lone word in a given place in a line of a certain rhythm may evoke associations with an earlier poem that then becomes part of the context in which the new poem is meant to be read.

There are thirty-nine poems in *Consolation*, written in a wide range of meters and combinations of meters. The poetic nature of the text cannot be ignored; only *Satyricon* and Martianus Capella's *Marriage* come close to the richness of its mixture of prose and verse. No English translation of a Latin poem can hope to mirror the music of these Latin originals, or the complexities of their associations with the whole of Latin literature. That is for specialists; students curious to see Boethius the poet in his workshop, adapting the themes and language of his originals, may be referred to the study of O'Daly, [*Poetry of Boethius,* Chapel Hill and London, The University of North Carolian Press] 1991. What I have done here, and what has not been done before in the long history of translation of

Consolation into English, is reproduce through English accents the rhythms and meters of the original poems. I have thought it important to do so in order to make the reader stop and take the poems seriously; there is a tendency to take the poems as mere metrical restatements of the arguments of the preceding prose sections. I would claim that in fact the poems often shift the focus of arguments, or redirect them in surprising ways; the reader needs to linger on them. The rhythms of the Latin will for the most part not be familiar; I have included accent marks to show where the stresses should fall, and have added in the notes to each poem a brief discussion of the meter and its associations. The reader needs to know only that the stress marks are intended to have their Latin force: That is, they show where the syllables should be dragged out a bit, pronounced more slowly, given more time. (1) It is possible for other English accents to be heard against this background, and I flatter myself in thinking that the resulting synthesis of these two competing rhythms, while not the equivalent of the Latin complexity, makes a worthy music of its own.

The language of poetry is not the language of prose. I have tried to represent the prose speeches of the participants in this dialogue with full respect for what may be called their pedanticisms and niceties: And so it is for this very reason that . . . ; it cannot in any way be doubted . . . ; I see that that is indeed the logical consequence. . . . *Consolation* tells of the worlds of God and of mortals, of timeless reality and physical things, and I have not tried to substitute, as would be the standard translation practice, more elegant English abstract nouns for these crucial “things". " (pp. XXVIII-XXIX)

(1) Stress marks fall on the second element of a diphthong (e.g., eách). When on the first element, they help suggest a polysyllabic pronunciation (e.g., concéaled is trisyllabic at IV.m.5.9.).

(2) For example, IV.6.9: “Should one look at the force of these two terms in one’s own mind, it will appear quite easily that they are different; for Providence is the divine reason itself, established in the highest ruler of all things, which arranges all things; Fate is the arrangement that inheres in the things that have motion, the arrangement through which Providence weaves all things together in their proper orders.” In the verse sections, necessities of meter at times force me to exploit a fuller range of translation options.

"The two texts considered here are linked by more than one common feature. They are examples of the writings of the two men who did more to communicate Greek philosophy to the Latin-speaking West than anyone else in antiquity, with the possible exceptions of Augustine and (in one particular field) Lucretius. They are works which reflect two very different branches of the tradition that goes back to Plato, or to Plato's Socrates. Cicero writes as a follower of the sceptical New Academy, which derived its readiness to challenge dogmatic positions from Socrates even if its belief that certainty is impossible was not one he would have shared; Boethius' *Consolation* is in the tradition of the revived dogmatic Platonism of the Imperial period, a Platonism that welcomed, and made use of, ideas from Aristotle as well as from Plato. They are works of philosophy written by two men each of whom played a part in the public life of their times - and paid with their own lives for doing so; though there is the difference that Boethius' *Consolation of Philosophy* was written when its author was already under sentence of death, while Cicero's *On Fate* was written in haste as its author was planning the return to the political arena that was ultimately to be his downfall. Above all, however - and this is the justification for uniting the two texts, or rather one fragmentary text and one partial extract, in this single volume - they represent two stages in a story, the story of man's attempt to understand whether he is or is not in control of his own destiny; this story in one guise or another pervades the literature of antiquity, and is not finished yet.

That said, there are also great differences between the two texts. Cicero's treatise *On Fate* survives in fragmentary form only; we may have about two-thirds of the whole text, but it lacks its beginning and its end, and there are major gaps which seriously affect our interpretation of the whole. Questions concerning the literary form and structure of the treatise as originally composed, of Cicero's sources and of philosophical interpretation are here all closely intertwined with one another, giving this work a particular fascination over and above that of the subject-matter itself; but, while it has been extensively quarried for technical discussions, and extensive extracts have been included in source-books, English readers have been poorly served until now as far as the availability in a single volume of a reliable continuous text and translation is concerned.

The situation with Boethius' *Consolation* could hardly be more different. It is one of the major works of world literature; the work that - along perhaps with Augustine's *City of God* - marks the boundary between ancient and medieval thought; a work which profoundly influenced the thought of the Middle Ages; a work translated into English by, among others, Alfred the Great, Chaucer, and Elizabeth the First. It is a daunting prospect to write about such a work, a work moreover that can be approached from many different perspectives: its relation to earlier Latin literature both in prose and in poetry, its relation to Boethius' philosophical interests on the one hand and his Christian beliefs on the other, its influence on later thought and literature. In a book of the present size it would scarcely be possible to do justice to all these perspectives; given the reason for including Cicero and Boethius together in this book in the first place, I hope that my comments may at least be helpful for those who wish to consider the part of the *Consolation* here included as a stage in a particular philosophical debate.

That, too, must be the justification for violating Boethius' design by including only a part of the whole, even though it is the final part and culmination. I can only hope that those who read the end of the work here will want to go on and read what precedes. Boethius does mark a new stage in the discussion by

Philosophy's observation that "You summon me to a matter which involves the greatest enquiry of all"; the reason for including the end of book 4 as well as book 5 is that it introduces the question of how fortune and freedom are to be reconciled with the divine providence which has formed the topic of the discussion since 3.12." (*Preface*, VI-VII).

Raul Corazzon || e-mail: rc@ontology.co

Boethius' Logic as a Discourse on Being

Introduction: An Overview of the Logical Works of Boethius

"According to Minio-Paluello, the editor of most of the translations, the medieval manuscript tradition shows traces of both a first and a second version of the Latin *Categories*, *Peri hermeneias*, *Prior Analytics* and *Topics*. (5) Boethius did not take his task as a translator lightly!

Only one commentary on the *Categories* is extant, but in it Boethius announces a plan to write a second one, and it seems likely that an anonymously transmitted text may be a small fragment of the second commentary (whether it was ever completed or not). (6) Of the two commentaries on *Peri hermeneias*, the second is considerably longer and generally more interesting than the first. There is no dedicated companion monograph, but parts of the lore of the *Peri hermeneias* are presented in the works on categorical syllogisms and the one about topical differences.

It seems possible that Boethius composed or prepared a commentary on the *Prior Analytics*. While preparing an edition of Boethius' translation of this Aristotelian text, Minio-Paluello discovered that a twelfth-century manuscript contains marginal scholia on that work which must be translations from the Greek or adaptations of a Greek source, and the translator's habits seemed to indicate that he was no one other than Boethius. (7) Possibly, then, these scholia were raw materials intended for use in a commentary. Later I discovered traces of more translated Greek scholia in a twelfth-century

commentary on the *Prior Analytics*. (8) This suggests that either (1) Boethius had left more extensive raw materials than the ones discovered by Minio-Paluello, or (2) he had actually left a whole commentary, of which we have only discovered little fragments, or (3) in spite of the agreement with Boethius' habits as a translator, what Minio-Paluello and myself discovered were in fact traces of a twelfth-century translation – complete or partial – of a Greek commentary. The matter is in need of further research. The monograph on categorical syllogisms may reasonably be seen as a handy summary of the subject treated at length and in depth in the *Prior Analytics*, while the one on hypothetical syllogisms is only linked to the Aristotelian work in the sense that it was customary in late antiquity to think that, by laying the foundations of categorical syllogistic in *Prior Analytics*, Aristotle had also laid the foundations of hypothetical syllogistic, and commentators seem routinely to have said something about the latter in connection with *Prior Analytics* I.23.

Boethius' treatment of hypothetical syllogisms is (to put it mildly) very strange; recently a Greek parallel to a little part of it was discovered, (9) but for the most part it is unparallelled in ancient literature, though, admittedly, we do not have much by which to gauge what may have been the standard approach to the matter in late antiquity. Boethius probably never translated or commented on the *Posterior Analytics*, though he obviously had some acquaintance with the work, and must be assumed to have intended to include it in his program. (10) He himself mentions that there was a book by Vettius Praetextatus (c.320–84) which claimed to be a Latin translation of both of Aristotle's *Analytics*, while in fact it contained translations of Themistius' fourth-century paraphrases, "as is obvious to anyone who knows both." (11) Nor does Boethius seem to have commented on the Sophistical Refutations, although he did translate it. About Boethius' lost commentary on the *Topics* not much can be said except that it probably depended on a paraphrase-commentary by Themistius, which he also used in his *De topicis differentiis*, and from which he seems to have derived the idea that a topic (Greek *topos*, Latin *locus*) is not only a highly general notion such as "genus" or "form," but also an associated axiom (Greek *axioma*, Latin *maxima*), such as "A thing is capable of exactly as

much as its natural form permits" and "Things that have different genera are also different from one another." (12)

In a way, *De topicis differentiis* might more properly be classified as a companion to Cicero's *Topics*, which was taught in Roman rhetoric schools, it seems, and on which first Marius Victorinus and then Boethius had composed commentaries. Boethius, however, in On Topical Differences, inserts so much material with a background in Aristotelian exegesis that the result is something that might well be taken to contain the essentials of the lore of Aristotle's *Topics* – and, indeed, that was how medieval schoolmen were to read the work." (pp. 37-38)

Notes

(5) See Minio-Paluello's Introductions to volumes I, II, III and V of *Aristoteles Latinus* [= *AL*]. His arguments seem very strong, but I cannot quite suppress a fear that his similar results for each work may be due to some flaw in his methodology. Dod 1982: 54 cautiously says that "[t]he revisions may be Boethius' own, or they may be the work of an unknown editor, possibly working in Constantinople where Boethius' works are known to have been transcribed (and perhaps edited) already in the sixth century."

(6) See Hadot 1959.

(7) See Minio-Paluello 1957. Cf. Shiel 1982. Edition in *AL* III.4, supplements in Shiel 1984.

(8) See Ebbesen 1981b.

(9) See Bobzien 2002.

(10) A reference to a Boethian commentary on *Posterior Analytics* I is found in a thirteenth-century MS (Munich, clm 14246), but this is surely an error. The work referred to was really the translation of Philoponus' commentary that most schoolmen attributed to Alexander of Aphrodisias. I regret having called attention to the Munich MS in a small article of 1973 (CIMAGL 9: 68–73), and I beg my readers not to waste their time on looking up that article.

Bibliography on Boethius' logical works and Commentaries (A-Ebb)

Studies in English

1. Ashworth, Earline Jennifer. 1989. "Boethius on Topics, Conditionals and Argument-Forms." *History and Philosophy of Logic* no. 10:213-225.

   "Eleonore Stump's splendid translation of *Boethius's In Ciceronis Topica* (Ithaca and London: Cornell University Press, 1988) is a very welcome companion to her earlier translation of Boethius's *De topicis differentiis* (Ithaca and London: Cornell University Press, 1978). Together the iwo volumes provide us with a hitherto unequalled opportunity to come to grips with the logical work of an author whose influence on medieval and Renaissance developments in this field was surpassed only by Aristotle himself. Indeed, it was only because of Boethius, his translations and commentaries, that Aristotle was first transmitted to the Latin speaking West. The importance of Boethius's work on the Topics is not purely historical, for it offers us a valuable insight into a type of logic which is aimed not at the production of formal languages or the examination of valid inference forms, but at ways to produce belief in the context of debate and against a background of straightforwardly metaphysical doctrines.

   In this essay review I shall first make some general remarks about the nature of Topics-logic, with particular reference to *In Ciceronis Topica*. I shall then explore just one Topic, that of incompatibles, which is a particularly interesting Topic for

several reasons. First. Boethius's attempt to define incompatibles shows the limitations of any formal approach to the material in hand. Second, Boethius's use of the Topic casts considerable light on his view of conditionals and their basis in metaphysical features of the world. Third, the examination of these issues helps explain Boethius's interpretation of certain key argument forms and their relation to Stoic logic. Finally, I shall make some remarks about Stump's translation and notes." (p. 213)

2. Asztalos, Monika. 1993. "Boethius as a Transmitter of Greek Logic to the Latin West: the *Categories*." *Harvard Studies in Classical Philology* no. 95:367-407.

   "...my purpose in this paper is to bring out what these commentaries, and especially the ones on the *Isagoge* and the *Categories*, reveal about Boethius' working methods in his earliest works on Greek logic. I intend to deal less with the end product than with the road to it, and to point to the stages of development and improvement exhibited within these early works." (p. 367)

   (...)

   "Boethius devoted his first effort in Greek philosophy to Porphyry's *Isagoge*, and later, in the year of his consulate (510), when he was in all likelihood in his late twenties, he spent all his spare time commenting for the first time on a work by Aristotle, the *Categories*. Ever since Samuel Brandt attempted a chronology of Boethius' works on the basis of their internal references, it has been commonly held that when Boethius began commenting on the *Categories*, he had already written both his expositions of Porphyry's *Isagoge* (hereafter *Isag*. *1* and *Isag*. *2*), the first one a dialogue in two books based on Marius Victorinus' apparently incomplete Latin version, the second a five book commentary on his own, complete translation. (2) This is certainly not the place for a full discussion of the chronology of Boethius' works, but for the arguments of this paper it is necessary to establish the order between *Isag*. *2* and the commentary on the Categories (CC)." (p. 368)

(..)

"... I am not in a position to judge whether or not Boethius displays real originality in his later, more mature works. But I think that it would be unfair to expect novel interpretations in commentaries like the *Isag*. *1* and CC, which, if my assumptions in the first sections of this paper are correct, are not only the earliest of Boethius' works on Greek philosophy but also the context in which he first encountered Aristotle. He seems to have come quite unprepared to both the *Isagoge* and the *Categories*, unarmed with proper translations and unfamiliar with the work he was commenting on. Boethius is indeed an epitome of the expression *docendo discimus*." (p. 407)

(2) 2 S. Brandt, "Entstehungszeit und zeitliche Folge der Werke von Boethius," *Philologus* 62 (1903), 141-154 and 234-275. See also pp. XXVI-XXIX of the Prolegomena to *Anicii Manlii Severini Boethii In Isagogen Porphyrii commenta*, rec. S. Brandt, *Corpus Scriptorum Ecclesiasticorum Latinorum* 48, Wien/Leipzig, 1906. In his " Stylistic Tests and the Chronology of the Works of Boethius," *Harvard Studies in Classical Philology* 18 (1907), 123-156, A. P. McKinley's conclusions concerning the chronology of *Isag*. *7*, *Isag*. *2,* and the commentary on the *Categories* (hereafter CC) are the same as Brandt's.

McKinley studied the frequency of certain particles in these commentaries as well as in Boethius' translations of the *Isagoge* and *Categories*, assuming that Boethius' language was influenced by his translations of Porphyry and Aristotle. Now, some of McKinley's data corroborate Brandt's chronology whereas others support the one I will suggest below. Furthermore, McKinley's tests were made before the appearance of L. MinioPaluello's critical editions of Boethius' translations in the *Aristoteles Latinus* and would therefore have to be remade. I also believe that a necessary preliminary stage in examining whether Boethius' translating activities influenced his choice of particles is to compare his Latin commentaries with the extant Greek sources. Since there is no adequate source apparatus in any of the editions of Boethius'

commentaries, this would mean a great deal of work. Concerning the question whether Boethius wrote *Isag. 2* before or after CC, L. M. De Rijk follows Brandt's view on pp. 125-127 of "On the chronology of Boethius' works on logic," *Vivarium* 2 (1964), 1-9 and 125-162, on exactly the same grounds as the ones on which Brandt based his conclusions and without corroborating them further.

3. ———. 2003. "Boethius on the *Categories*." In *Boèce ou la chaîne des savoirs*, edited by Galonnier, Alain, 195-205. Louvain-Paris: Éditions Peeters.

   "Among Boethius' commentaries on Greek works on logic (that is to say, on Porphyry's *Eisagoge* and on Aristotle's *Categories* and *Peri hermeneias*), only the one on the *Categories* has so far not been critically edited. At present I am editing the text and at the same time preparing an English translation of it to appear in *Ancient Commentators on Aristotle*. (1) So far only translations of Greek commentaries have appeared in this series, and consequently the fact that Boethius' work on the *Categories* will be included is a statement about his heavy dependence on Greek sources. It is of course a well-known fact that all Boethius' commentaries on Aristotle's works are heavily dependent on Greek Neoplatonic interpretations. However, the extent to which this is true has so far not been revealed in the form of a source apparatus accompanying the texts edited. In the case of the commentaries on the *Peri hermeneias*, the two volumes of which appeared in 1877 and 1880 respectively, the editor did not have access to a modern edition of the extensive commentary by Ammonius which has since appeared in *Commentaria in Aristotelem Graeca*. (2) But for an editor of Boethius' commentary on the *Categories* the work is easier: first of all, there are a number of Greek commentaries on this work that have been edited in CAG. In addition, those by Porphyry, Dexippus, and Ammonius have appeared in commented translations in *Ancient Commentators on Aristotle*.

   So, while in the process of editing Boethius' work on the *Categories*, I have provided the text with an apparatus indicating parallels in the Greek commentaries. A great deal of

work has already been done in order to map out the nature and extent of Boethius' dependence on the Greeks in this particular work of his. There is Bidez' groundbreaking article "Boèce et Porphyre", where Porphyry's little commentary on the *Categories* in the form of questions and answers (3) is described as "la source unique, ou a peu près unique, du commentaire de Boèce" (p. 195); James Shier's provocative papers presenting Boethius as a translator of scholia that he allegedly found in the margins of his copy of Aristotle, some of them originating from the school of Proclus but the majority taken from *Q&A*; Sten Ebbesen's article on Boethius as an Aristotelian scholar, in which *Q&A* is described as Boethius' main source, a source from which he deviated when he wished to avoid introducing Neoplatonic entities such as the Eternal Mind into his own elementary work; a contribution of my own in which I claim that Boethius used *Q&A* but also a commentary on the *Categories* written by a follower and occasional critic of Iamblichus; and the valuable footnotes to Steven Strange's English translation of *Q&A* with their references to Boethius' commentary. (4) What all these different studies have in common is that they consider Porphyry's *Q&A* to be Boethius' main source.

So, one may justifyibly ask, is there anything really new to be said about Boethius' use of the Greek sources in his commentary on the *Categories*? The purpose of this paper is to show that while putting together a source apparatus for Boethius' text I have come to the conclusion that our view of Boethius' dependence on Porphyry needs to be modified. (5)" (pp. 195-196)

(...)

"To conclude: Boethius naturally used Porphyry's extant little dialogue on the *Categories*. But his main source is a later Greek commentary that makes use of Iamblichus' commentary but whose author takes an uncompromisingly Aristotelian stance. Since Iamblichus made ample use of Porphyry's no longer extant *Ad Gedalium*, the influence of Porphyry is quite heavy on Boethius' commentary. When the two sources (*Q&A* and the

later commentary) expressed different views, for example on the scope of the *Categories*, Boethius did not bother to try to harmonize between the two. In that respect, he is not a full-fledged scholastic in his commentary on the *Categories*, which is an early work of his, at least not as full-fledged as he was to become later, when he wrote the *Consolation of philosophy*." (pp. 204-205)

4. ———. 2014. "*Nomen* and *Vocabulum* in Boethius’s Theory of Predication." In *Boethius as a Paradigm of Late Ancient Thought*, edited by Kirchner, Andreas, Jürgasch, Thomas and Böhm, Thomas, 31-52. Berlin: Walter de Gruyter.

"Anyone who tries to make sense of Boethius's commentary on Aristotle's *Categories* will be intrigued by his use of the terms *nomen* and *uocabulum*. Sometimes it is clear that he cannot be using the terms to refer to names (in our sense of the word) and words, but then how does he use them? They may appear to be interchangeable, (1) but there is a difference in how Boethius uses these terms, and it is important to establish what the difference is, given that they are essential in Boethius's theory of predication. Then there is a cluster of verbs — *uocare, nominare, nuncupare* —which are clearly connected with *uocabulum* and *nomen*, but how? The purpose of this paper is to present Boethius's thoughts on predication by exploring the way he uses these key terms.

I will be quoting extensively from my own forthcoming edition of Boethius's commentary on the *Categories*. I have not given references to the text printed in Migne's *Patrologia Latina* vol. 64 but have specified which lines in Aristotle's text the passages quoted comment on. This will make it fairly easy for readers to find the appropriate places in the Migne edition. All translations are my own.

In Boethius's commentary on Aristotle's *Categories*, *nomina* and *uocabula* are couched in a theory involving also *res, uox, significare, significatio, and designare*.

These are main protagonists in Boethius's commentaries on the *De interpretatione*, a work in which *nomina* and *uocabula* take the back seat." (p. 31)

(...)

"Does Boethius's use of *uocabulum* and *nomen* make him a paradigm of Late Ancient thought? In the case of *nomen* as a term for a mental collection of things he could to a certain extent lean on tradition, given that the word is commonly used for a collection like a family or a people in classical Latin. Furthermore, it cannot be ruled out that Aristotle uses ὄνομα in the same way. But what about *uocabulum* and its connection with *uox* and *uocare*? Only a study of earlier Latin texts can confirm that Boethius has introduced a new tool in the theory

of predication. And it remains to be investigated whether or not medieval philosophers appreciated the value of the tool and employed it in their own discussions of predication." (p. 50)

(1) In her recent book *Boethius on Mind, Grammar and Logic. A Study of Boethius' Commentaries on* Peri hermeneias, (= Philosophia antiqua; 127), Leiden/Boston 2012, Taki Suto holds: "Even though there may be some difference in Boethius' usage of these two expressions, the difference is slight, and he may not differentiate between them." (p. 68, note 109).

5. Barnes, Jonathan. 1981. "Boethius and the Study of Logic." In *Boethius: His Life, Thought and Influence*, edited by Gibson, Margaret, 73-89. Oxford: Blackwell.

   Reprinted in J. Barnes, *Logical Matters. Essays in Ancient Philosophy II*, New York: Oxford University Press, Chapter 26, pp. 666-682.

   "Boethius' logical oeuvre contains works of three types. First, and at the centre, there are the Latin translations of the Greek texts: Boethius put into Latin the *Categories*, the *de Interpretatione*, the *Prior* and *Posterior Analytics*, (5) the *Topics*, the *Sophistici Elenchi;* and he prefaced his Latin *Organon* with a version of Porphyry's *Isagoge*, the standard Greek introduction to Peripatetic philosophy. (6) Secondly, there are the commentaries: Boethius planned commentaries on the *Isagoge* and on each book of the *Organon*, and he added, as a supplement, a commentary on Cicero's *Topics*. (7) The commentaries on Aristotle's *Topics* and *Analytics* have not survived; and some scholars doubt if Boethius lived to complete his commentatorial task. (8) Thirdly, there are the treatises: *On Division* covered much of the ground tilled in the *Categories*; *On Categorical Syllogisms* and the unfinished *Introduction to Categorical Syllogisms* correspond in part to the *de Interpretatione* and the *Prior Analytics*; *On Hypothetical Syllogisms* has no counterpart in Aristotle's works, but answers to a fixed feature of later Peripatetic logic; *On Topical Differences* matches Aristotle's *Topics*. (9)

   Thus on three distinct levels Boethius translated Peripatetic logic from Greece to Rome. His achievement is remarkable by

any reckoning; and his work in logic stands as a paradigm of sustained and systematic scholarship. The next three sections will discuss separately the translations, the commentaries, and the treatises; but it should not be forgotten that, for Boethius, those three types of scholarly production were complementary parts of a unitary whole." (pp. 74-75)

(...)

"What, then, was Boethius' contribution to the study of logic?

First, Boethius was not an original logician: he did not pretend to be. He saw himself as a translator, conveying Greek wisdom to a Greekless world; the insights which his works contain are not his own, his knowledge is tralaticious. From time to time we can, I believe, hear Boethius' own voice; and some at least of the disposition and organisation of his material originated in his own head. But those touches of personality are relatively rare and relatively unimportant: the *summa logicae* which Boethius determined to present was traditional Peripatetic logic; and it is an error to speak of a Boethian logic.

Secondly, it must be admitted that today we owe little to Boethius' immense labours. He strove to transmit Aristotle to the West; but our present knowledge of Aristotle depends hardly at all on his strivings. Aristotle's texts, and the texts of his Greek commentators, have survived in their original Greek: we can study Peripatetic logic, as Boethius himself did, in the original sources. Had all Boethius' logical writings been lost, ihr modern student of logic would have little to bewail, apart perhaps from the treatment of hypothetical syllogistic.

It is rather within the context of his own dark times that Boethius' service to logic must be sought. Greek learning was increasingly inaccessible, and the Latin world was rude. By his sole efforts Boethius ensured that the study of Aristotle's *Organon*, and with it the discipline of logic, was not altogether eclipsed in the West. Boethius' labours gave logic half a millenium of life: what logician could say as much as that for his work? what logician could desire to say more?" (pp. 84-85)

(5) The translation of the *Posterior Analytics* has not survived; but see *AL* [*Aristoteles Latinus*], IV. 1-4, pp. XII-XV.

(6) For the status of the *Isagoge* see in *Isag* ed 1. 14-5. Boethius regarded the *Organon*, prefaced by the *Isagoge*, as a unitary — but not a fully comprehensive — treatment of logic.

(7) At first blush, the commentary on Cicero seems anomalous; but in fact Cicero presents his *Topics* as a version indeed, a translation — of Aristotle's *Topics*, and Boethius regarded Cicero's work as forming an integral part of Peripatetic logic (*in Cic Top* 271-3).

(8) (i) *Topics*: Boethius states categorically that he has written a commentary (*Top diff* 1191 A, 1209 C, 1216 D). Nothing is known to have survived.

(ii) *Prior Analytics*: we possess only preliminary notes (published in *AL*, III. 1-4) ; at *Syll cat* 829D Boethius says that he will comment on the *Analytics*, but he nowhere asserts that he has composed such a commentary.

(iii) *Posterior Analytics*: a note to a thirteenth-century commentary on the *Sophistici Elenchi* quotes from 'Boethius' commentary on Book I of the *Posterior Analytics*': see S. Ebbesen, 'Manlius Boethius on Aristotle's *Analytica Posteriora*, CIMAGL IX (1973), 68-9. If we believe the note, then — contrary to orthodox opinion — Boethius did write such a commentary.

(9) The dating of Boethius' logical works is to some extent conjectural: see the long discussion of L. M. de Rijk, 'On the chronology of Boethius' works on logic', *Vivarium* II (1964), 1-49, 125-62. His first *opus* was in *Isag* ed 1, composed in 504/5; he was probably working on *Intr syll cat* and *in An Pr* in 523; *in Cat* is dated to 510. There is not much awry with the following ordering: *in Isag* ed 1; *Syll cat*; *Div*; *trans Isag*; *in Isag* ed 2; *trans Cat*; i*n Cat*; trans *de Int*; *in Int* ed ı; *in Int* ed 2; trans *Top*; trans *Soph El*, *Syll hyp*, *in Top*; i*n Cic Top*; trans *An*; *Top diff*; *Intr syll cat*; *in An Pr*.

6. Belli, Margherita. 2014. "Boethius, disciple of Aristotle and master of theological method: The term *indemonstrabilis*." In

Boethius as a Paradigm of Late Ancient Thought, edited by Kirchner, Andreas, Jürgasch, Thomas and Böhm, Thomas, 53-82. Berlin: Walter de Gruyter.

"*Indemonstrabilis*. This term belongs to the Late Latin language and is a legacy of Aristotle's logic, especially of the *Analytica posteriora*. It can be considered, therefore, a useful tool to focus on three aspects of the deep and wide knowledge of the Aristotelian logic, which contributes to making Boethius a unique figure among the Late Ancient authors of the Latin West and the leading guide of the so-called *boethiana aetas*. The three aspects entail:

a) the relationship between Boethius and the Author of the *Peri hermeneias*, as both committed themselves to transmitting the Aristotelian logic to the Latin West and to developing a suitable terminology;

b) the methodological meanings that Boethius conveyed to *indemonstrabilis*, in order to open it to rational theology, through the convergence between *maxima propositio* and *comunis animi conceptio*;

c) the way in which some 12th-century authors transformed the previous convergence into an identity, making it the starting point of a method that distinguishes theological knowledge from the other arts and places it above them all.

From a research conducted by using the *Library of Latin Texts A–B, Aristoteles Latinus Data-base, Patrologia Latina Data-base, and Repertorium edierter Texte des Mittelalters*, (1) it results that *indemonstrabilis* was rarely employed until the first half of the 12th century, when the *Analytica Posteriora* came back to the Latin West, along with Aristotle's other treatises. During the Late Antiquity *indemonstrabilis* was used only by the Author of the *Peri hermeneias* and by Boethius. It does not matter if the Author of the *Peri hermeneias* cannot be identified as Apuleius of Madaura, because in the worst hypothesis the *Peri hermeneias* must be dated no later than the 4th century, having been quoted by Martianus Capella in *De nuptiis Philologiae et Mecurii*. (2) Among the pages of the *Peri*

hermeneias and Boethius's *De syllogismo categorico* (505–506), *In librum Aristotelis De interpretatione secunda editio* (513–516), and *De topicis differentiis* (522–523),3 there are 16 occurrences of *indemonstrabilis*, which signify (for the related passages see the appendix):

1.1.a. the first four moods in the first figure of categorical syllogism

1.2. the Stoic hypothetical indemonstrables

1.3.a. the maximal propositions of dialectic." (pp. 53-54)

(1) *Brepolis Latin*, www.brepolis.net (accessed 30/05/2014); *Patrologia Latina Database*, Alexandria/Cambridge 1995–2008; *Repertorium edierter Texte des Mittelalters aus dem Bereich der Philosophie und angrenzender Gebiete*, ed. by Rolf Schönberger et alii, Berlin 2011.

(2) The authorship of the *Peri hermeneias* is still questioned. Some scholars maintain Apuleius's paternity of the treatise and others reject it. Among the scholars in favour are Sandy, Sullivan, Londey, Johanson, and Sallmann, whilst Beaujeu, Lumpe, Moreschini, and Harrison are contrary. See Stephen J. Harrison: *Apuleius. A Latin Sophist*, Oxford/New York 2000, 11; Gerard Sandy: *The Greek World of Apuleius. Apuleius and the Second Sophistic*, (= Mnemosyne. Supplementum; 174), Leiden/New York/ öln 1997, 38–41; *Die Literatur des Umbruchs. Von der römischen zur christlichen Literatur, 117 bis 284 n. Chr.,* ed. by Klaus Sallmann, (= Handbuch der Altertumswissenschaft; 8,4), Munich 1997, 301; Claudio Moreschini: "Ricerche sulla tradizione manoscritta del *De interpretatione* pseudoapuleiano", in: *Pan* 10 (1990), 61–73; David Londey/Carmen Johanson: *The Logic of Apuleius. 7. Bertagna, Mario. 2017. "Arguments and Proofs in Boethius's *De topicis differentiis*." In *La filosofia medievale tra antichità ed età moderna: saggi in memoria di Francesco Del Punta*

   edited by Bertagna, Mario, Bertolacci, Amos and Paravicini Bagliani, Agostino, 101-138. Firenze: Sismel - Edizioni del Galluzzo.

8. Bird, Otto. 1960. "The Formalizing of the Topics in Mediaeval Logic." *Notre Dame Journal of Formal Logic* no. 1:138-149.

   "The Topical Difference, or more literally the Difference of the Maximal Proposition, is that by which one Topic differs from another (BDT. 1186A).

   Thus the Topic of Definition, for instance, differs from that of Whole and Part in that the Maxim of the one warrants an inference among terms in which a Definition occurs, while the other warrants an inference among terms in which Whole and Part occur.

   Topical Differences, according to Boethius, "are drawn forth from the terms constituting the question and then discoursed about" (BDT. 1186A).

   Thus in our example, it is the question, whether trees are animals, that makes it possible to appeal to the Topic of

Definition, since, knowing the definition of "animal" and that trees do not satisfy it, we are warranted by the Topical Maxim to conclude that trees are not animals.

The De Differentiis Topicis is little more than a listing of such Topical Differences with representative Maxims for each. Book II gives the compilation of Topics made by Themistius from Aristotle; Book III that of Cicero, followed by a comparison of the two. Book I is a general introduction dealing with the terms used for analysing an argument, and Book IV, the final book, considers the Topics used by rhetoricians.

This work became the source for mediaeval Topical doctrine. It seems to be the only work Abelard used for his extensive treatise on the Topics.

Peter of Spain made a precis of it (primarily of the second book) and provided additional Maxims in the fifth tract of his Summulae. Since this became a standard elementary text in logic from the late 13th through the 15th centuries, Boethius thus remained indirectly the auctoritas for the Topics, and this seems to have remained true even after the recovery of the Aristotelian Topic a in the late 12th century." (pp. 140-141)

9. Bobzien, Susanne. 2000. "Wholly hypothetical syllogisms " *Phronesis* no. 45:87-137.

Abstract: "In antiquity we encounter a distinction of two types of hypothetical syllogisms.

One type are the 'mixed hypothetical syllogisms'. The other type is the one to which the present paper is devoted. These arguments went by the name of 'wholly hypothetical syllogisms'. They were thought to make up a self-contained system of valid arguments. Their paradigm case consists of two conditionals as premisses, and a third as conclusion. Their presentation, either schematically or by example, varies in different authors. For instance, we find 'If (it is) A, (it is) B; if (it

is) B, (it is) C; therefore, if (it is) A, (it is) C'. The main contentious point about these arguments is what the ancients thought their logical form was.

Are A, B, C schematic letters for terms or propositions? Is 'is', where it occurs, predicative, existential, or veridical? That is, should 'A ἔστι be translated as 'it is an A', 'A exists', 'As exist' or 'It is true/the case that A'? If A, B, C are term letters, and 'is' is predicative, are the conditionals quantified propositions or do they contain designators? If one cannot answer these questions, one can hardly claim to know what sort of arguments the wholly hypothetical syllogisms were.

In fact, all the above-mentioned possibilities have been taken to describe them correctly. In this paper I argue that it would be mistaken to assume that in antiquity there was one prevalent understanding of the logical form of these arguments - even if the ancients thought they were all taLking about the same kind of argument. Rather, there was a complex development in their understanding, starting from a term-logical conception and leading to a propositional-logical one.

I trace this development from Aristotle to Philoponus and set out the deductive system on which the logic of the wholly hypothetical syllogisms was grounded."

10. ———. 2002. "A Greek Parallel to Boethius *De hypotheticis syllogismis*." *Mnemosyne* no. 55:285-300.

"In this paper I discuss a longish anonymous scholium to Aristotle's *Analytics* which is a Greek parallel to Boethius' *De Hypotheticis Syllogismis*.

The scholium is available in print only in Theodor Waitz's edition of Aristotle's *Organon* (Leipzig 1844). It is Codex Laur. 72.5, ff. 210-2, appended at the end of a manuscript of the *Prior* and *Posterior Analytics*. Dieter Harlfinger has dated this part of the codex to the second half of the 10th century (7) this gives us a terminus *ante quem*.

The scholium has, I believe, so far not been recognized as a parallel to Boethius, nor has it been discussed in the literature on hypothetical syllogisms. (8) I am also not aware of any

translation. The scholium is important for the history of hypothetical syllogistic, because it is the only extant Greek text that provides a close parallel to the particular theory Boethius presents in Latin. We can assume that the scholium was composed no later than the 10th century (see above). But it preserves elements of a theory that was most probably developed before the 6th century. There are a number of idiosyncrasies in the terminology, a fact that sets the text apart from all other Greek sources on hypothetical syllogistic, and thus adds to its interest.

In the following I present the text of the scholium, a translation, and a commentary, including some general remarks about the theory the scholium preserves." (p. 286)

(...)

"In the commentary section it should have become increasingly apparent that the anonymous scholium on hypothetical syllogisms in Waitz is Peripatetic, and not Stoic, in its theoretical approach as well as its terminology. There are several elements of early Peripatetic hypothetical syllogistic preserved in it, although section (10) is likely to be witness to a later development of Peripatetic or Platonist hypothetical syllogisms. The most striking feature in the scholium is the large number of close parallels to Boethius' *De Hypotheticis Syllogismis*. Since it is rather unlikely that the scholium is based on a Latin source, we can assume that there must have been a Greek source from which both the scholium and large parts of Boethius' *De Hypotheticis Syllogismis* are ultimately derived." (p. 300)

(7) D. Harlfinger, in: Paul Moraux (ed.), *Aristoteles Graecus*,vol. 1 (Berlin 1976), Nachtrâge, 475-80, discusses Laur. 72.5.

(8) Except that Prantl, *Geschichte der Logik im Abendlande*, vol. I (Leipzig 1855), 656, quotes part of the scholium in footnote 167.

11. Bosman, Bianca. 2018. "The Roots of the Notion of Containment in Theories of Consequence. Boethius on Topics,

Containment, and Consequences." *Vivarium* no. 56:222-240.

Abstract: "In medieval theories of consequence, we encounter several criteria of validity. One of these is known as the containment criterion: a consequence is valid when the consequent is contained or understood in the antecedent. The containment criterion was formulated most frequently in the thirteenth and fourteenth centuries, but it can be found in earlier writings as well. In *The Tradition of the Topics in the Middle Ages,* N.J. Green-Pedersen claimed that this criterion originated with Boethius. In this article, the author shows that a notion of containment is indeed present in Boethius, but is not used to define or describe the relation between antecedent and consequent, i.e., the relation of consequence, as Green-Pedersen asserted. The author then offers two interpretations of the notion of containment that are present in Boethius – a metaphysical and a semantic interpretation – and shows how these relate to the containment criterion."

12. Cameron, Margaret. 2009. "Boethius on Utterances, Understanding and Reality." In *The Cambridge Companion to Boethius*, edited by Marenbon, John, 85-104. Cambridge: Cambridge University Press.

    "In this chapter, we will look at the three elements that form the basis of the theory of signification for Boethius, namely expressions, understanding and reality, and their relation to one another. Boethius did not write separate treatises on the philosophy of language, cognition or metaphysics. Instead, he wrote commentaries on Aristotelian logic. By the time he began to work on them around the start of the sixth century, the texts of Aristotelian logic were read in a fixed sequence: the first three were the *Isagoge*, *Categories* and *On Interpretation*, and Boethius treated topics as and when they are discussed in these texts by Porphyry and Aristotle. To grasp Boethius' theory of signification, we must therefore gather his views on utterances, understanding and reality from a variety of places in his commentaries and put them together. As evidenced by the sheer length of the treatment of Aristotle's brief comments on signification in his commentaries on *On Interpretation*, there is no question but that Boethius was aware of the importance of a

theory of signification in explaining how the words we use are able to make sense to others and to refer to reality. We might expect, therefore, that Boethius' views on language broadly cohere with his theory of cognition and metaphysics given elsewhere in the commentaries on the *Isagoge* and Categories. (1)

The following sections aim to give a general overview of Boethius' theory of signification by considering in turn what he says about expressions, understanding and reality in his logical commentaries.

In the final section, we will consider the ways in which Boethius' views have been variously interpreted from medieval and contemporary perspectives." (p. 85)

(1) This is not to suggest that Boethius' views did not change over the course of writing his several commentaries. With the exception of Aristotle's *Categories*, Boethius wrote two commentaries per treatise. Here we are concerned to acquire a general overview of Boethius' theory of signification, and we will concentrate mainly on two commentaries by Boethius, 2IS [*Second Commentary on Isagoge*] and 2IN [*Second Commentary on On Interpretation*], as well as CAT [*Commentary on Categories*].

13. Casey, John Patrick. 2012. "Boethius's Works on Logic in the Middle Ages." In *A Companion to Boethius in the Middle Ages*, edited by Kaylor Jr., Noel Harold and Phillips, Philip Edward, 193-219. Leiden: Brill.

    "This chapter discusses important Boethian contributions to medieval logic, in particular his definition of the problem of universals and his translation of Aristotelian logical works. It provides a brief introduction to the basic features of ancient logic relevant to Boethius's most noteworthy contributions to medieval logic. The chapter also discusses the three primary avenues of Boethius's influence upon medieval logic: his translations, commentaries, and original logical treatises. In the late ancient world, the Aristotelian and the Stoic systems of logic were considered to be incompatible rivals. The form of Aristotelian logic survived and was translated into the Middle

Ages in the work of Boethius. This meant that medieval logicians learned about categorical propositions, syllogisms, and the problem of universals, rather than propositions, disjunctions, and conditionals." (p. 193)

14. Chadwick, Henry. 1981. *Boethius: The Consolations of Music, Logic, Theology, and Philosophy*. Oxford: Clarendon Press.

    Chapter III. Logic Part of Philosophy or a Tool of all Philosohy? 108; Logic and Rhetoric 111; Porphyry 120; Neoplatonists after Porphyry: Iamblichus, Syrianus, Proclus, Ammonius 127; Boethius' commentaries on the *Isagoge* 131; Translator of Aristotle 133; The Ten Categories 141; On Interpretation 152; Future Contingents 157; The Monographs on Logic 163; Propositional Logic and the Hypothetical Syllogism 166.

    "The place of logic in the hierarchy of knowledge was one of the many matters long in dispute between the Aristotelians and the Stoics. To the Stoics 'logic' meant something wide, an independent branch of philosophy, the other two contrasted branches being ethics and 'physics' (the scientific study of nature). The Stoics could point out that this threefold classification had a basis in the *Topics* (A, 14) of Aristotle himself. The Aristotelians, on the other hand, treated logic almost in our modern sense as a practical instrument for the discovery of fallacies in argument on any subject, an indispensable tool for every department of human inquiry. This Peripatetic attitude, from which the title *Organon* derives, presupposes a narrow understanding of the discipline as concerned with propositions and syllogisms and terms.

    The Platonic tradition originally preferred to speak of 'dialectic', according to Boethius because it is a power of dividing *(In Cic. Top*. I, 1045B following Plato, *Sophist* 253d). Through its distinctions we learn to divide genera into species, and classify different things under their proper genus. But neither the Neoplatonists of Athens and Alexandria nor Boethius mark a significant difference in force between 'logical' and 'dialectical' reasoning. (1) Until the twelfth century, when an attempt was made to classify dialectic with grammar as two

branches of *Logica*, the terms were to be used more or less interchangeably.

The Peripatetic case for their estimate of logic is most eloquently put by Alexander of Aphrodisias in his commentary on the *Prior Analytics* (CAG II, 1) in a way that makes minor concessions to the Platonic tradition. We have a number of late Platonist accounts of this dispute, e.g. the commentaries on the *Prior Analytics* by Ammonius (CAG IV, 6 pp. 811) and Philoponus (CAG XIII, 2 pp. 69). It is incautious to assume with Courcelle that Boethius had Ammonius before him when writing his second commentary on Porphyry in which the dispute is discussed. (2) One major element in Boethius' argument there, that logic is not confined by the limits and aims of other parts of philosophy, and is not restricted to a particular set of questions, stands without parallel in Ammonius. It is difficult to affirm a literary relation when one is dealing with a convention of the schools which every Neoplatonic teacher will think it his duty to expound." (pp. 108-109)

(1) The contrary is asserted, on a waferthin basis, by G. Pfligersdorffer, ['Zu Boethius, *De Interpr*. ed sec. I p. 4, 4 sq. Meiser nebst Beobachtungen zur Geschichte der Dialektik bei den Römern'], *Wiener Studien* 66, 1953, 131-154.] p. 152.

17. Conti, Alessandro D. 2016. "Relations and Relatives in Boethius's Commentary on the Categories: the Invention of Monadic Two-place Predicates." *Documenti e studi sulla tradizione filosofica medievale* no. 27:107-129.

Abstract: "That of *ad aliquid* is the most problematic category among the ten listed by Aristotle in the homonymous treatise. In Late Antiquity and the Middle Ages many authors attempted to develop new formulations of the Aristotelian theory of relatives, since Aristotle's account of *ad aliquid* in the *Categories* is imprecise and incomplete. From a purely theoretic point of view, in Late Antiquity the most successful attempt to improve the Aristotelian doctrine was that of the Greek Neoplatonic commentators. They were able to elaborate a notion of relation (*schesis*) almost equivalent to a hypostatization of our modern notion of two-place predicates, as they conceived of relations as abstract forms whose distinctive feature was the property of being present-in and joining two different substances at once. Yet, for the history of Medieval philosophy, far and away the most influential attempt to clarify Aristotle's text was that of Boethius, who, faithful to Aristotelian teaching, maintained that relation was an accident (we could say 'a property') which was-in a substance (its substrate of inherence) and simply entailed a reference to another, without inhering in it.

Thus, unlike Greek Neoplatonic commentators of the *Categories* (and modern logicians as well), Boethius did not think of a relation as a two-place predicate, but he seems rather to consider it as a sort of *monadic two-place predicate*, or function. The difference betweenBoethius's conception and ours is that according to him each relation has only a place empty for individual variables and the other filled by an individual constant. The paper is aimed at clarifying the legacy Boethius left to the Medieval thinkers in relation to the theory of *ad aliquid*, namely the logical and terminological apparatus drawn up in order to solve the chief problems raised by the seventh chapter of the *Categories*, with the general interpretative context in which the apparatus itself was set."

18. Correia, Manuel Antonio. 2001. "Boethius on Syllogisms with Negative Premises." *Ancient Philosophy* no. 21:161-174.

"According to Aristotle, no syllogism is conclusive with two negative premisses (Prior Analytics i 4.41 b7-9). The observation is a central rule of his Theory of Syllogism and

recognized so by ancient, medieval, and modern logicians. In ancient scholastic discussions, however, there is a case made in support of thepossibility of conclusion from two negative premisses. It takes, as an authoritative proof, a syllogism made by Plato in the Theaetetus and affirms that syllogisms with two negative premisses are more frequent in philosophical literature than one might suppose.

The problem, recovered especially by Boethius' second commentary on Aristotle's De Interpretatione (Meiser 1877-1880), arises from considerations of the logical properties of indefinite names in categorical or simple propositions." (p. 161)

(...)

"The question of whether Plato was conscious of the syllogistic technicality that Boethius indicates is surely controversial. We can instead try to resolve the question of whether this syllogism can be reasonably derived from Plato.

Meiser's edition gives a valuable notice: the syllogism in question can be found at *Theaetetus* 186. In fact, the exact passage seems to be Theaet. 186c5-e10." (p. 168)

(...)

"I have argued that the case of a syllogism in Plato's *Theaetetus*, where two apparent negative premisses draw a conclusion, is simply a confirmation of the rule that there are no syllogisms with negative premisses and not, as Boethius suggests, a proof that a universal negation like 'Every man is not just' is equivalent to another one like 'Every man is not-just'. I have discussed this equivalence and similar ones arising from singular, particular, and unquantified propositions.

but the result is that if the equivalence in question does work, it cannot be a characteristic of every categorical proposition. Indeed, even though formal proofs can be provided for some cases of categoricals, unquantified ones are explicitly stated as consequences by Aristotle (‚A man is not just' follows from' A man is not-just', but not vice versa). Moreover, equivalences are indeed inconsistent with the principle that there is only one

negation for a single affirmation, which Aristotle emphasizes in *De Interpretatione* and *Prior Analytics*. In the end, the question of which was Aristotle's idea of logic arises: whether a formal idea or a dialectical one (i.e., one compatible with the principle that an affirmation can have only one negation)." (p. 174)

19. ———. 2009. "The Syllogistic Theory of Boethius." *Ancient Philosophy* no. 29:391-405.

    "Boethius played an important role in transmitting logic to the Latin West. His translations, commentaries, and treatises deal amply with the most important thesis of Aristotelian logic, a theory whose influence is perceptible even in the last century (cf. Corcoran 2009 [‘Aristotle’s Demonstrative Logic’ *History and Philosophy of Logic*, 30: 1-20]). Two of his surviving logical treatises have traditionally received the title of ‘syllogistic’, the *Introductio ad syllogismos categoricos* (=ISC) and *De syllogismis categoricis* (=DSC), but DSC is the only one explaining syllogistic, for ISC does little more than mention, belatedly in the course of the text, its being an introduction to syllogistic." (p. 391)

    (...)

    "Since there has been much discussion concerning the literary unity of DSC’s two books and its relation to ISC—including attempts to take book 2 of DSC as book 2 of ISC (which would be the actual *Introductio* Boethius wrote), it is my purpose to argue that DSC proposes a unitary view of Aristotelian logic, in which syllogistic comes to be the third of the three branches organizing the main logical inferences of the theory: opposition, conversion, and syllogism. Accordingly, DSC is indivisible from a doctrinal point of view and no book of DSC can be the part of the other treatise. This discussion is long overdue and it should contribute to understanding the scope of the respective treatises and their relation to each other." (p. 393)

20. ———. 2012. "Boethius on the Square of Opposition." In *Around and Beyond the Square of Opposition*, edited by Béziau, Jean-Yves and Jacquette, Dale, 41-52. Basel: Birkhäuser.

Abstract: "This article intends to reconstruct the textual tradition of the square of oppositions from the earliest textual sources just as treated in Boethius' commentaries on Aristotle's *De Interpretatione* and his treatises on syllogistic, *De syllogismo categorico* and *Introductio ad syllogismos categoricos*. The research discovers two different tracks. One way comes from Plato's *Sophist* and Aristotle's *De Interpretatione*, and the aim is to distinguish contrariety from contradiction. The second influence also starts from Aristotle, but now in connection with his *Prior Analytics* and its commentaries and treatises on categorical syllogistic, where the aim is to show the square as one of the three main chapters of the complete theory of categorical logic. I suggest that this double ingredient has accompanied the development of the square from the very original beginning of logic."

21. ———. 2017. "Logic in Apuleius and Boethius." *Revista portuguesa de filosofia*:1035-1052.

    Abstract: "The aim of this paper is to offer an alternative explanation to the notorious similitude detected in two ancient treatises on logic, namely, the *Liber Peri Hermeneias*, attributed to Apuleius of Madaura (II AD), and *De syllogismo categorico*, written by Boethius (VI AD).

    Both were enormously authoritative in posterity. I argue that their similitude is due to the presence of an internal division of categorical propositions that Boethius gives in full in his *De syllogismo categoricos*, and repeats with extensions in his *Introductio ad syllogismos categorico*. The division outlines the three main parts of the theory: opposition, conversion and syllogism. This leads us to argue that similarity and correspondence of these two ancient logical treatises can be sufficiently explained from this resource, and insufficiently explained by a certain common literary source, which was proposed by Isaac (1953), without clarifying some important dissimilarities and divergences contained in these treatises. Also, our hypothesis does not need to suppose, as Sullivan (1967), that Boethius borrowed from Apuleius."

22. Cranz, Edward F. 2006. "Boethius and Abelard." In *Reorientations of Western Thought from Antiquity to the Renaissance*, edited by Struever, Nancy, 1-20. Aldershot: Ashgate.

    "Let me conclude with two brief general addenda. First, I have tried to outline the main development of Abelard's logic and the one most dependent upon Boethius. What we have seen may be summarized by saying that, where Boethius closely connects, sometimes even identifies, intellections, universals and propositions with *'res*' or beings, Abelard shifts all these relationships to a new context and then denies them all: intellections, universals and propositions are not *'res*" as physical things. To repeat a phrase; he desubstantializes them all.

    But Abelard never stops thinking. Sometimes his conclusions are more new questions than new answers, and his second treatment of a problem is sometimes very different from his first. Some scholars have described the last stage of his thought as a 'return to Platonism': but I think he is more creative and original. He has changed Boethius' res into 'physical things,' and he has denied that intellections or meanings were 'physical things' and turned them into 'nothings.' But there are hints, and there is no time to analyze them here, that at the end he began to move to another new solution in which meanings from having been nothings turn into the ultimate realities. If I had to suggest parallels to his last stage, Petrarch, Lorenzo Valla and Nicholas of Cusa come to mind. So if I have tried to describe Abelard's transformation of Boethius, what was left, and I don't believe it was ever completed, might be called Abelard's transformation of Abelard.

Second, while Abelard's writings had no wide dispersion and while he was not followed by any school or even by very many pupils, I believe his diffuse influence was greater than one might expect. The reorientations of thought one finds in his logic and elsewhere often spread more widely in his own time than did his specific ideas; they were not destroyed by the reception of Aristotle and in some ways provided a context within which Aristotle was received. So in concluding I cannot resist noting that, while I have characterized what happened as a transformation of Boethius, let us not in this group forget that it was a transformation of Boethius." (p. 20)

23. Curley III, Thomas. 1987. "The *Consolation of Philosophy* as a Work of Literature." *American Journal of Philology*:343-367.

    "Much, in fact most of the scholarship devoted to Boethius' *Consolatio* has dealt with the work as a philosophical treatise. And this it certainly is. The author is almost ostentatiously conversant with Platonic, Aristotelian, Stoic, Epicurean, and neo-Platonic thought; what is more, he weaves these various strands into an organic whole. But in addition to philosophy the *Consolatio* is also literature. Formally, it is an example of an ancient literary genre, the Menippean Satire, a medley of alternating verse and prose, which had served the very different purposes of Petronius, the author of the *Apocolocyntosis*, Martianus Capella, and the mythological allegorist, Fulgentius. But even those critics who do treat the *Consolatio* as a work of literature too often limit themselves to tracing Boethius' sources and to indicating his influence on subsequent authors, Dante and Chaucer being the most renowned.

    What I should like to do, and the present paper is merely a premier essai in this direction, is to determine Boethius' literary purposes and to suggest what implications the literary aspects of the work may have on its philosophical content. More specifically, I shall try to explain how Menippean Satire functions in the *Consolatio* and why Boethius chose this medium for a philosophical treatise." (p. 343, notes omitted)

24. de Rijk, Lambertus Marie. 1964. "On the Chronology of Boethius' Works on Logic. Part I." *Vivarium* no. 2:1-49.

"The chronological order of Boethius' works appears to be a rather difficult problem. Hence, it is not surprising that the numerous attempts to establish it led the scholars to results which are neither all conclusive nor uniform. In this article I confine myself to Boethius' works on logic. Before giving my own contribution it would seem to be useful to summarize the results of preceding studies and to make some general remarks of a methodological nature.

(...)

My conclusion from this survey is that the best we can do in order to establish approximately the chronological order of Boethius' works on logic is to start a careful and detailed examination of all our data on this matter. In doing so an analysis of their contents seems to be quite indispensable, no less than a thorough examination of doctrinal and terminological differences." (pp. 1 and 4).

25. ———. 1964. "On the Chronology of Boethius' Works on Logic. Part II." *Vivarium* no. 2:125-162.

"We shall now sum up the results of our investigations. First some previous remarks. Our first table gives of nine of the works discussed the chronological interrelation, which can be established with a fair degree of certainty. The figures put after the works give the approximative date of their composition (the second one that of their edition); when printed in heavy types they are based on external data; the other ones are based on calculation.

Table 1

Boethius' birth about 480 A.D.

In Porphyrii Isagogen, editio prima about 504-505

In Syllogismis categoricis libri duo (= ? Institutio categorica) about 505-506

In Porphyrii Isagogen, editio secunda about 507-509

In Aristotelis Categorias (? editio prima) about 509-511

In Aristotelis Perhemeneias, editio prima not before 513

In Aristotelis Perhemeneias, editio secunda about 515-516

De syllogismis hypotheticis libri tres between 516 and 522

In Ciceronis Topica Commentaria before 522

De topicis differentiis libri quattuor before 523

Boethius' death 524

The rest of the works discussed cannot be inserted in this table without some qualification. (...)

We may establish the following table for the works not contained in out first table:

Table 2

Liber de divisione between 505 and 509

possible second edition of the *In Categorias* after 515-516

Translations of the *Topica (and Sophistici Elenchi*) and of the

Analytica Priora and *Analytica Posteriora* not after 520

Commentary on Aristotle's *Topica* before 523

the so-called *Introductio* (? = *In Priora Analytica Praedicanda*) certainly after 513; probably c. 523

Scholia on Aristotle's *Analytica Priora* first months of 523 at the latest"

pp. 159-161 (notes omitted).

26. ———. 2003. "The Logic of Indefinite Names in Boethius, Abelard, Duns Scotus, and Radulphus Brito." In *Aristotle's Peri hermeneias in the Latin Middle Ages. Essays on the Commentary Tradition*, edited by Braakhuis, Henk A.G. and Kneepkens, Corneli Henri, 207-233. Groningen: Ingenium Publishers.

"Aristotle's doctrine of indefinite names (nouns) was handed down to the Middle Ages together with Boethius' comments and explanations. Boethius' view of the matter has two characteristic features. For one thing, there is a certain ambiguity on his part concerning the precise semantic value of

such terms; for another, Boethius deviates considerably from Aristotle in that he explicitly assigns the property of 'holding indifferently of existents and non-existents' not only to the indefinite *rhéma* (as it is found in Aristotle, *De interpr*. 3, 16b15) but to the indefinite name (*onoma*) as well.

Until the end of the 12th century the logic and grammar (1) of indefinite terms (nouns and verbs) was a much debated issue. Although assiduously echoing the well-known *auctoritates* Medieval thinkers did not always go the whole way with their predecessors. For example, Abelard and Scotus, starting from their own philosophical tenets, more or less inconspicuously corrected some dubious elements in Boethius' interpretation of Aristotle's doctrine of the indefinite name. Peter Abelard, especially, took great pains to precisely define the meaning of indefinite terms. He focussed his attention on the proper meaning of indefinite terms rather than on the question whether they are 'holding indifferently of existents and non-existens'. In contrast, 13th-century scholars like Duns Scotus and Radulphus Brito based their discussion of the proper meaning of the indefinite name upon the question '*Utrum nomen infinitum aliquid ponat*' ("Whether an infinite name posits something"), which calls to mind Boethius' claim that indefinite names 'hold indifferently of existent and non-existents'.

Abelard's discussion of the proper meaning of the indefinite name is also interesting in that it helps us to gain a good understandiiip of what Boethius had in mind in claiming that the indefinite name 'siginifes an infinite number of things' ('*significat infinita*'). For, thanks to Äbelard's expositions, it becomes clear that the phrase '*significare infinita*', which, on the face of it, may be taken as referring to the extensional of the indefinite name, on closer inspection proves to concern its intension, because the controversy between Abelard and Boethius turns out to be about two different views of the indefinite name's intension rather that about any opposition of intension as against extension." pp. 207-208.

(1) For the grammatical approaches to the problem of the indefinite term in the 12th century, see C.H. Kneepkens, "Orléans 266 and the Sophismata Collection: Master Joscelin of Soissons and the infinite words in the early twelfth century", in St. Read (ed.) *Sophisms in Medieval Logic and Grammar*.     Boe. = *Anitii Manlii Severini Boethi . . . opera, quae extant, omnia*. Basileae (1570).

    "The text of the treatise "The Propositional Logic of Boethius" was finished in 1939. Prof. Jan Lukasiewicz wished at that time to issue it in the second volume of "Collectanea Logica"; as a result of political events, he was not able to carry out his plan.

    In 1938, I published an article in "Erkenntnis" entitled "Aussagenlogik im Mittelalter"; this article included the contents of a paper which I read to the International Congress for the Unity of Science in Cambridge, England, in 1938 (Cf. Erkenntnis, vol. 7, pp. 160-168). The subject matter of this paper touched upon that of the above-mentioned treatise. Recently an article of Mr. René van den Driessche, "Sur le 'de syllogismo hypothetico' de Boèce", was published in the journal "Methodos" (vol. I, no. 3, [1949]). Mr. van den Driessche referred in this article to the article on propositional logic in the Middle Ages, which had appeared in "Erkenntnis". This reminded me of my yet-unpublished treatise on the propositional logic of Boethius." (From the *Preface*)

"§ 1. The Two Books of Boethius on the Theory of the Proposition.

It is the unique property of propositional logic that the variables which are used are propositional variables, i.e. variables whose values are propositions.

Among the logical writings of the man whom, for short, is called “Boethius” and whose full name is “Anicius Manlius Severinus Boethius”, we find two which can be characterized as presentations of propositional logic.

The first of these is entitled “de syllogismo hypothetico” (on the hypothetical syllogism).

Incidentally, it should be noted that this title, as Samuel Brandt has shown, does not originate with Boethius, and it would be more correct to give the book the title “de hypotheticis syllogismis” (on hypothetical syllogisms) (Cf. Samuel Brandt: 'Entstehungszeit und zeitliche Folge der Werke des Boethius'. *Philologus*, Bd. LXII (1903) p. 238). Nevertheless, one does well to quote the work under its incorrect title “de syllogismo hypothetico” as long as the old editions are in use.

The second book is a commentary on the *Topics* of Cicero. Here we do not consider the entire commentary, but only certain sections; we will indicate later which sections come into consideration (Cf. infra § 38)." (p. 1)

(...)

"§ 4. More Precise Charactrization of Boethius' Propositional Logic.

At the beginning of this treatise, we declared that the logic which is represented in the two works of Boethius, may be characterized as propositional logic. We add the remark that all of the sentences that have an independent value (i.e. that do not occur only as auxillary sentences) in this logic were deductive rules, or, which comes to the same thing, inference schemes.

In this connection we recall the explanation of Clarence Irving Lewis in the book “Symbolic Logic”: “Exact logic can be taken in two ways: (1) as a vehicle and canon of deductive interference, or (2) as that subject which comprises all principles the statement of which is tautological” (Cf. ClarenceIrving Lewis and Cooper Harald Langford: *Symbolic Logic* (1932 p. 235). We can now say that the logic of Boethius belongs to the first of these two forms of exact logic. Boethius’ aim is not to set up sentences which are tautological, but rather to present all of the deductive rules." (p. 3)

(...)

§ 38. The Three Enumerations of the Seven Conditional Syllogisms.

We now turn to the consideration of the form of propositional logic to be found in Boethius’ commentary on Cicero’s *Topics*.

At the beginning of the fifth book of this commentary, Boethius notes that he has treated all the hypothetical syllogisms in another book; he obviously has “de syllogismo hypothetico” in mind (Cf. Boe., p. 823). The exposition which follows this remark covers more than the first half of the fifth book of the commentary; it constitutes that part of the commentary that is of interest to us here (Cf. *supra*, § 1).

In order to determine this section more precisely one can best indicate its beginning and its end. It begins with the words “de omnibus quidem hypotheticis syllogismis” (Cf. Boe., p. 823) and continues to the place immediately preceding the following words of Cicero, “proximus est locus” (Cf. Boe., p. 934).

Boethius notes that Cicero mentioned some modi (inference types). From the exposition that follows, it is to be assumed, that Boethius identifies the *modi* that Cicero mentioned with the system of the seven conditional syllogisms (Cf. Boe., p. 823). By conditional syllogisms we understand inference schemes.

At the place which Boethius has in mind, Cicero enumerates seven inference schemes. Boethius quotes this place in the fifth

book of his commentary (Cf. Boe., p. 817). We will call the quotation of this place from Cicero's *Topics* in Boethius' commentary "the quotation".

In the text of the commentary as given by the editions we find the seven conditional syllogisms enumerated three times. The first and the second enumerations precede the quotation, while the third follows it (Cf. Boe., p. 831-833). It may be mentioned that the second enumeration agrees so closely with the first, that it may be called a duplication of the first.

Propositional variables are used only in the third enumeration of the seven conditional syllogisms; the system of propositional variables which we called the simple system is used (Cf. supra, § 17). In all three enumerations each of the conditional syllogisms is illustrated by an example. These examples are expressions related to the inference schemes; like the inference schemes, they contain functors and always contain a sign which can be identified with the functor "*igitur*"; they contain however no propositional variables, instead having simple, i.e. atomic, sentences.

The examples of conditional syllogisms which Boethius gives with the first and second enumerations, are extremely simple and the two sequences agree almost completely member for member.

We will quote these examples in English; in this translation the English word "therefore" occurs instead of the functor "igitur" It seems desirable to divide the seven conditional syllogisms into four groups; we will divide them in such a way that the first and second modi constitute the first group, the third modus constituhs the second group, the fourth and fifth modi the third group and finally the sixth and seventh modi form the fourth group." (pp. 66-67)

28. Ebbesen, Sten. 1973. "Manlius Boethius on Aristotle's *Analytica Posteriora*." *Cahiers de l'Institut du Moyen-Âge Grec et Latin* no. 9:68-73.

"A reference to a Boethian commentary on *Posterior Analytics* I is found in a thirteen th-century MS (Munich, clm 14246), but

this is surely an error. The work referred to was really the translation of Philoponus' commentary that most schoolmen attributed to Alexander of Aphrodisias. I regret having called attention to the Munich MS in a small article of 1973 (*CIMAGL* 9: 68–73), and I beg my readers not to waste their time on looking up that article." S. Ebbesen, "The Aristotelian Commentator" in John Marenbon (ed.). The Cambridge Companion to Boethius, Cambridge: Cambridge University Press, 2009, p. 52.

29. ———. 1987. "Boethius as an Aristotelian Scholar." In *Aristoteles. Werk und Wirkung. Paul Moraux zum 65 Geburtstag gewidmet - Band 2: Kommentierung, Uberlieferung, Nachleben*, edited by Wiesner, Jürgen, 286-311. Berlin: Walter de Gruyter.

    Reprinted as *Boethius as an Aristotelian Commentator* in: Richard Sorabji (ed.), *Aristotle Transformed. The Ancient Commentators and Their Influence*, London: Duckworth, 1990, pp. 373-392.

    Citations are from the reprint in Sorabji 1990.

    "It has been suggested that the only material at Boethius' disposal was a copy of the *Organon* with marginal scholia, and that this collection of scholia is no longer extant. (14) We may often be able to ascertain the remoter origin of one of the scholia Boethius knew, but we shall never know whether he deviated from his direct source in any way and the standard answer to the question 'Why does Boethius say this?' can only be, 'Because it was in his only source.'

    The 'one source - no thinking' theory has the support of eminent scholars and it cannot be refuted by any means that I can think of. But neither can it be proved by any conceivable means short of finding the supposed manuscript of the *Organon* with the marginal scholia. To my mind, the circumstantial evidence in favour of this theory, though not negligible, is less than convincing. (15) The observable facts are quite as easily explained on the assumption that Boethius had access to several Greek monographs and commentaries and that he followed the common practice of using for each work

one main source while also exploiting secondary sources. It is an old discovery that this hypothesis works well in the case of the extant short commentary on the *Categories,* the only case in which we still have what may be the main source. Boethius acknowledges a debt to Porphyry (16) and actually keeps so close to the latter's extant minor commentary on the *Categories* (*CAG* 4, 1) that it is simpler to assume that he had direct access to a complete copy of it than to assume second-hand acquaintance by way of a book which also contained the post-Porphyrian material detectable in Boethius' commentary.

Granted that Boethius' main source was Porphyry's extant work, we can begin to examine the way he used it. As it turns out, he follows his predecessor to the extent of reproducing most of the questions he raised and the answers he gave, but not to the extent of reproducing long segments of his text in direct translation. Boethius expanded arguments which he found too compressed while curtailing or suppressing other passages. (17) In fact, he followed the procedure which his own remarks in this and other works indicate (18) -- and that procedure involved making choices. It looks as if it might be worth while to speculate about his possible motives for choosing as he did." (pp. 376-377; note 15, 17 and 18 omitted)

30. ———. 2003. "Boethius on the Metaphysics of Words." In *Boèce ou la chaîne des savoirs*, edited by Galonnier, Alain, 257-275. Louvain-Paris: Éditions Peeters.

Reprinted in: S. Ebbesen, *Greek-Latin Philosophical Interaction. Collected Essays of Sten Ebbesen Volume 1,* Aldershot: Ashgate, 2008, pp. 115-128.

"Boethius distinguished himself from most panegyrical orators by having pursued the study of the words he lived by beyond

ordinary grammar and rhetoric school. He may not have delved deeply into the theory of grammar, but his works on topics demonstrate a live interest in the borderland between rhetoric and logic, and he spent much time on Aristotelian logic. He saw logic as fundamentally a language science: logic and grammar study the same matter, he says; but though logic gives a deeper understanding of language than grammar, it cannot replace grammar, for they study the subject from different points of view.

We might expect Boethius to have thought about the question "What is a word" and the related questions "What is a phrase?" and "What is a sentence?" (pp. 257-258, note omitted)

(...)

"Boethius' discussion of molecular propositions is revealing of his way of thinking. A conjunction of propositions is semantically several propositions, but a conditional is somehow one proposition: 'If it is day there is light' does not signify several things, but rather one "following", one consequently as he says, translating the Greek ακολουθία. In other words: it takes two facts to make two conjoined propositions true, but only one to make a conditional true. A fact that can be described in a conditional is at least as good a fact as one describable in a categorical proposition.

One might think Boethius should have distinguished between assertion and signification; he could have held that the conditional signifies whatever the antecedent signifies and whatever the consequent signifies, whereas it asserts that one follows from the other. Boethius actually had the necessary tools for so doing. The verb "proponere", which does occur in the context, would do nicely for "assert".

I doubt, though, that he would have embraced the recommendation with alacrity. If I am not mistaken, his intuition was that words signify real things, and things are more real the more they are understood as unit-seeds capable of unfolding in multiplicity. Consequents of true conditionals really are contained in their antecedents in the sense that what

the whole conditional signifies is one thing the richness of which may be gauged by seeing it unfold in a conditional. (34) (pp. 272-273, notes omitted)

(34) For the unity of conditionals and the antecedent-consequent relationship, see Boethius, *Top. Cic.* IV. 1124-1126.

31. ———. 2008. "Boethius on Aristotle." In *Greek-Latin Philosophical Interaction: Collected Essays of Sten Ebbesen Volume 1*, 107-114. Aldershot: Ashgate.

This chapter was written for the present volume, but to a considerable extent it recapitulates Ebbesen (1987) [‘Boethius as an Aristotelian Scholar’, in Wiesner (ed.) (1987) *Aristoteles, Werk und Wirkung*, (Berlin–New York: Walter de Gruyter): 2.286–311).]

"Anicius Manlius Boethius (d. c.525) was *the* great mediator between ancient Greek and medieval Latin philosophy. He completed a tremendous piece of work by translating all of the Organon (except, it seems, the *Posterior Analytics*) into Latin and writing commentaries as well as other companion volumes. It is remarkable that there are two commentaries of his on Porphyry and two on *Perihermeneias*, but only one on the *Categories*. Actually, there may have existed a second one on that work too, but at least it did not survive for the medievals to use. (2) As for the *Ars nova*, Boethius himself refers to a commentary on the Topics (3) of which there is no trace in later times. It is uncertain whether he accompanied his translation of the *Prior Analytics* with a commentary (the question is discussed in Chapter 13 [*Analysing Syllogisms or* Anonymus Aurelianensis 111 - *the (presumably) Earliest Extant Latin Commentary on the* Prior Analytics *and its Greek Model*, pp. 171-186] Boethius’ monographs on categorical and hypothetical syllogistic, on divisions and on topical argumentation were intensely studied from the late eleventh to the early thirteenth century, and they left their mark on Latin logic long after they ceased to be standard reading. A commentary on Cicero's *Topics* was less influential.

Finally, it must be mentioned that Boethius composed treatises on the quadrivial arts: arithmetic, music, geometry (uncertain,

not extant), and just possibly astronomy •as well. In one famous passage he himself reveals a grandiose plan to translate the whole of Aristotle and Plato. (4)

Remarkable as the list of Boethius' accomplishments is, two lacunas stand out. There is no grammar at all and no proper treatise on rhetoric, only the somewhat related commentary on Cicero's *Topics* and the fourth book of *De topicis Differentiis*, which was actually used as a textbook of rhetoric in medieval Paris. We can only guess at the reasons, but quite possibly Boethius thought of grammar and rhetoric as sub-philosophic disciplines. After all, as opposed to logic and the quadrivial arts, grammar and rhetoric had traditionally been taught by their own professional teachers, not by philosophers. (5) Moreover, he may have felt that such existing handbooks as Donatus' *Ars* were sufficient for the grammatical needs of the Latin world, and there surely was no dearth of rhetorical treatises in the tongue of Cicero." (p. 108)

(...)

"So. the way 1 read Porphyry and Boethius, they shared the view that becoming a good Aristotelian is a necessary step on the way to becoming a good Platonist, and what you have learned in the first step of your intellectual career does not become false when you ascend to a higher level -- you are just able to put it into a much wider context.

The medieval West inherited from late antiquity numerous texts that could help send people off on fanciful Neoplatonic stratospheric flights. The fact that Boethius provided them with a proper set of down-to-earth, but still interesting, logic books ensured that quite a few preferred safer and saner flights closer to the surface of mother earth, or at least tried to secure proper ground support before lifting off." (p. 114)

32. ———. 2009. "The Aristotelian Commentator." In *The Cambridge Companion to Boethius*, edited by Marenbon, John, 34-55. Cambridge: Cambridge University Press.

    "The point, then, is that we have to start from the lowest level to work our way toward the higher. We have to learn our grammar before we can get a deeper understanding of language-related matters by studying logic.

    We have to achieve a simplified understanding of logic before we can undertake an in-depth study. We have to know our logic properly before we can ascend to higher matters, such as Neoplatonic metaphysics, in the light of which our initial understanding of logic will appear primitive.

    This way of looking upon thingswas not Boethius' invention. In its essentials it was already Porphyry's, it was what allowed Porphyry to include the study of Aristotle in a curriculum aimed at producing good Platonists ready to take leave of their bodily frame. As Aristotle's logic was supposed not to have trespassed on Plato's metaphysical territory, teachers of Aristotle need not and ought not Platonize him. Boethius' extant commentaries evince a decision to follow Porphyry, though he was clearly sympathetic to some of the more extravagant Neoplatonists – people of the stripe of Iamblichus, Syrianus and Proclus – and it makes one shudder to imagine what the "Pythagorean" exposition of the *Categories* that his extant commentary says he was contemplating was or would be like." (p. 51)

33. ———. 2011. "Boethius as a Translator and Aristotelian Commentator." In *Interpreting the Bible and Aristotle in Late*

Antiquity. The Alexandrian Commentary Tradition between Rome and Baghdad, edited by Lössl, Josef and Watt, John W., 121-133. Farham: Ashgate.

"Virtually the whole of Boethius' literary output – including his final *Consolation of Philosophy* – may be viewed as a Herculean effort to transfer Greek philosophical thought to Latin, but only his Latinizations of the works of the *Organon* were strictly speaking translations. The commentaries and companion volumes are free adaptations of Greek prototypes. Exactly how free is difficult to gauge because in all cases but one we are sure that we no longer possess any of the Greek texts he used. The exception is Porphyry's commentary on the *Categories*.

There is some scholarly disagreement about whether he used that text directly or only indirectly, but if he did have direct access to it, as I believe, he did not at all follow it slavishly. In any event, even if he made a very free use of his Greek sources, producing the commentaries and companion volumes involved a considerable amount of translation, because he had to find out how to render all the technical terminology of his sources in Latin.

Boethius did not have to start from scratch. Already in the first century B.C., Cicero and Varro had coined Latin equivalents of many philosophical terms, and more had been added over the centuries. In fact, for most of the technical terms of logic Boethius could depend on his predecessors. He was probably the first to use *subalternus* and *subcontrarius* when dealing with the square of opposition, and he was almost certainly the first to translate ἀξίωμα 'axiom' as *maxima propositio*, which is the origin of the English – and pan-European – *maxim*. But more often than not he would use an existing translation. His problem was rather one of choice, because in several cases Latin usage was not uniform. (pp. 123-124)

(...)

"In the short run, Boethius' translations, commentaries and monographs met with no success, due to the collapse of the

political structure and of higher schooling in the western part of the Roman empire shortly after his death. In the long run, he was immensely successful.

Use of his works began slowly in early Carolingian times, but by 1100 his translations of Porphyry, *Categories* and *Perihermeneias* were in common use in several schools, and so were his commentaries on those works and his handbook-like works. By about 1120 people were beginning to also use his translations of the *Prior Analytics*, the *Topics* and the *Sophistical Refutations*.

This laid the foundation for the Aristotelian scholasticism that was to dominate the study of philosophy in the West for some four centuries. It also meant that it was Boethius' choices that decided what was to become the technical vocabulary of Latin Aristotelian logic." (p. 124)

34. ———. 2016. "Boethius as an Aristotelian commentator." In *Aristotle Transformed: The Ancient Commentators and Their Influence*, edited by Sorabji, Richard, 403-421. New York: Bloomsbury.

Second revised edition; first edition London: Duckworth 1990, pp. 373-391.

"In periods when the scholastic attitude to the auctores prevails, the exegesis of the classics of philosophy acquires great importance. By the year 500 a considerable number of commentaries and auxiliary treatises relating to the works of Aristotle and Plato had been written in Greek. Quite a few would be available to anyone with the will and the fi nancial means to obtain them. But in spite of an attempt in the fourth century to produce a Latin scholastic library,(3) philosophy had not come to Latium. It had to wait for Boethius. How little his predecessors had achieved may be gauged from the fact that he has no standard Latin equivalents for several elementary Greek terms. To render organon (instrument) he feels obliged to use a hendiadys, *ferramentum et quodammodo supellex*.(4) For *phantasia* he uses v*isum*. The term had been coined by Cicero five hundred years earlier, but Boethius introduces it in a way which shows that he expects his readers to be as unfamiliar

with it as were Cicero's contemporaries.(5) To benefit from Plato's and Aristotle's useful writings a mastery of Greek was still required." (pp. 403-404)

(3) Texts relating to the *Organon*: Isagoge (free translation) + commentary + monograph on definition, all by Victorinus; paraphrase of *Cat*. (= ps.-Augustine, *Categoriae Decem*); paraphrases of *An. Pr*. and *An. Post*. by Themistius, translated by Praetextatus; monograph on hypothetical syllogisms by Victorinus. It is very doubtful whether there was a translation or paraphrase of *Int*. ; possibly Apuleius' *Peri Herm*. was used. Instead of Aristotle's *Topics,* Cicero's was read; Victorinus composed a commentary on it. Cf. on these matters, P. Hadot, *Marius Victorinus,* Paris 1971.

(4) Boeth. *in Isag*.1 10; cf. i*n Isag*.2 93.

(5 Boeth. *in Isag*.2 25: the Greeks call them *phantasiai,* we may call them *visa*. Cicero *Acad*. 1 40: which they call *phantasia* we may call it *visum*.

Bibliography on Boethius' logical works and Commentaries (Eco-Ree)

Studies in English

1. Eco, Umberto. 1984. "Signification and Denotation from Boethius to Ockham." *Franciscan Studies* no. 44:1-29.

   "Boethius translates "semaînein" with "significare" but he follows the Augustinian line of thought according to which "significatio" is the power that a word has to arouse in the mind of the hearer a thought, through the mediation of which one can implement an act of reference to things. He says that single terms signify the corresponding concept or the universal idea and takes "significare"— as well as, less frequently, "designare"— in an intensional sense. Words are conventional instruments used to make known one's thoughts (*sensa* or *sententias*) (*In Per. Herm.* I).

   Words do not designate *res subiectas* but *passiones animae*. The designated thing is at most called "underlying the concept of it (*significationi supposita* or *suppositum*)", see de Rijk 1967:180-181. (3)

   As for "*denotatio*," Boethius uses extensively "*nota*," but we know how vague was the meaning of this term in the Latin Lexicon — at least as vague as the meaning of the equivalent Greek "*symbolon*." It must be remembered that Boethius, in the translation of *De lnterpretatione* used "*nota*" for both

"*symbolon*" and "*semeîon*," thus creating a first "sad tale of confusion"." (pp. 5-6)

(3) *in Peri herm*. II, pp. 26-27, ed. Meiser, debating the question whether words refer immediately to concepts or to things, Boethius uses in both cases the expression '*designare*.' In II, p. 20 he says in the same context, "vox vero conceptiones animi intellectusque significat" and "voces vero quae intellectus désignant." In II, pp. 23-24, speaking of "litterae, voces, intellectus, res," he says that "litterae verba nominaque significant" and that "haec vero (nomina) principaliter quidem intellectus secundo vero loco res quoque designant. Intellectus vero ipsi nihil aliud nisi rerum significativi sunt." *In Arist. Categ*. col. 159 B4-C8, says that "prima igitur ilia fuit nominum positio per quam vel intellectui subiecta vel sensibus designaret." It seems to me that "designare" and "significare" are taken as more or less equivalent. The real point is that first words signify concepts and, because of that, and mediately, can be referred to things. Cf. on the whole question de Rijk (1967, II, I, p. 178 ff.) Nuchelmans (1973:134) remarks that even though Boethius also uses "significare," along with "designare, denuntiare, demonstrare, enuntiare, dicere" with an object-expression to indicate what is true or false, however when he uses the same terms with a person as a subject he means that someone makes known his opinion that something is or is not the case: "the definition of the *enuntiatio* or *propositio* as an utterance which signifies something true or false reflects the fact that in Aristotle's view it is the thought or belief that something is the case which is true or false in the primary sense. As Boethius puts it, truth and falsity are not in things but in thoughts and opinions and secondarily (*post haec*) in words and utterances— *in Cat*. 181b. Cf. also such a passage as in *In Per*. I, p. 42, 1" (Nuchelmans 1973:134).

2. Gambra, José Miguel. 2015. "To Be *in* a Subject and Accident." *Vivarium* no. 53:170-193.

   Abstract: "Boethius identifies beings that are *in* a subject with what the Scholastics called predicamental accident, and predication by accident with the predication of what is in a subject. The first of these questionable assimilations went on to become terminology commonly accepted by Scholastics of all eras. On the other hand, the second, which seems quite consistent with the thinking of Aristotle, was only admitted with many reservations, probably because of the bewildering claims of Aristotle in *Cat*. 5, 2a27-34 about the predication of what is in the subject. In what follows I will try to show how these phrases, properly understood, are consistent with the idea that what is in the subject is said by accident of the substance, although they implicate a difficulty poorly resolved by Boethius himself and those who followed him on this point, of whom I will only mention by way of example some Scholastics from the 16th century."

3. Gersh, Stephen. 1997. "Dialectical and Rhetorical Space. The Boethian Theory of Topics and its Influence during the Early Middle Ages." In *Raum und Raumvorstellungen im Mittelalter*, edited by Aertsen, Jan A. and Speer, Andreas, 391-401. Berlin: de Gruyter.

   "According to L. Obertello's chronology, Boethius' writings on topics: the commentary on Cicero's 'Topica' and the 'De Topicis Differentiis' date from the last few years of his life (ca. 518 — 524)'. They do indeed reveal the maturity of reflection characteristic of a thinker who has translated and commented upon Aristotle's *Organon* and is perhaps on the threshold of elaborating the Platonic synthesis of which 'De Consolatione Philosophiae' stands as a poignant reminder. In this paper I hope to show how the notion of 'place' {*locus*) developed in Boethius' topical writings lies at the heart of important issues not only in rhetoric and dialectic but also in metaphysics." (p. 391)

   "B. Boethius' Works on the Topics

   1. Introductory

   In chronological order the next work to discuss would be Cicero's *Topica*, which is the first work on the topics after Aristotle that has come down to us. I shall, however, proceed directly to Boethius's works, partly because an acquaintance with Boethius' doctrines contributes to a better understanding of Cicero. Partly also because there are no medieval

commentaries on Cicero's *Topica*. Apparently this work was only influential on the teaching in the very early period, probably not much after c. A. D. 1050. The teachers of those days did not write commentaries, as far as we know, but only compendia or summaries of the texts they based their teaching on; or they added glosses to these texts. Ina later chapter we shall see how Cicero's *Topica* - directly or indirectly - is the basis of the earliest medieval teaching about the topics which we know of. Yet even in these early years the medievale use not only Cicero's book, but also Boethius' commentary on it. All these facts suggest that at least in a medieval context it is better to consider Boethius before Cicero. The things which we need to know about Cicero can be set out in connection with Boethius or with the discussion of the works which base their teaching upon Cicero.

Boethius wrote about the topics primarily in two works, the *Commentary on Cicero's Topica* (*In Ciceronis Topica*, ICT) and the monograph *De differentiis topicis* (DDT). The commentary on Cicero is the earlier of the two, as we can infer from references in the DDT back to the ICT and from remarks in the ICT about plans for the DDT. But the distance in time between the two is small, both were written in the last years of Boethius' life, i. e. after c. 520. (1) Boethius also refers to a commentary which he claims to have written on Aristotle's *Topics*, (2) but such a work has not come down to us. As the references to it are found in the DDT and no references are found in the ICT, we may conjecture that the commentary on Aristotle's *Topics* was written in the period between the ICT and the DDT. On the other hand Boethius refers to his translation of Aristotle's *Topics* in the ICT, 3 and it is natural to assume that he wrote the commentary while working on the translation.

Boethius' commentary on Cicero's *Topica* (ICT) follows the text in Cicero's work continuously, but it is either preserved incompletely or it was never finished by Boethius, since it ends in the comments on Cicero's § 76. Cicero's work contains a prologue (§§ 1-5), an introduction (§§ 6-8), a summary statement of his list of loci (§§ 9-24), a detailed exposition of the same list (§§ 25-78), and finally a section of a more

rhetorical character (§§ 79-100). The most interesting parts of the ICT are the rather long discussions about the nature and the division of the loci which Boethius has inserted before both Cicero's first and second enumeration of the loci. Further Boethius utilizes Cicero's second exposition of the locus 'from antecedents' etc. for a long discussion of conditionals and hypothetical syllogisms. We shall have occasion to look at these discussions more closely.

We need not know more about the contents of the ICT, but we shall instead turn to the DDT with which we must be well-acquainted in order to understand the medieval doctrine of the topics." (pp. 39-40)

   "Boethius's two commentaries on Aristotle's *De interpretatione* contain an account of the metaphysical foundations of contingency in their discussions of Chapter 9. (1) For the countless medieval discussions of future contingents only *De interpretatione* 9 itself is of greater historical importance than Boethius's discussions of it. In this chapter, however, my

concern is with the content of Boethius's theory of contingency and not with its historical sources or influences. In order to give his theory the kind of consideration I think it deserves, I need to extract it from the other material in the commentaries and expound it in its own right; I also want to examine some of its consequences. Because those tasks are the only ones I can undertake in this paper, I am not now concerned with what the later medievals thought about Boethius or with what Boethius thought about Aristotle or with what Aristotle thought about contingency, but only (or as nearly as possible only) with what Boethius thought about contingency in his two commentaries on *De interpretatione*.(2)"

   Reprinted in D. Blank, N. Kretzmann (eds.), Ammonius on Aristotle *On Interpretation* 9 with Boethius on Aristotle *On*

Interpretation 9, London: Duckworth, 1998, pp. 24-52.

"My concern here is with the principal ancient rival to the so-called traditional interpretation, a rival whose subsequent medieval career was so long and so eminent that it provides another reason for feeling uneasy about calling the simple denial of universal bivalence 'the traditional interpretation'.

Since the one I am focusing on is the second-oldest on record, I will refer to it simply as the second-oldest interpretation and continue referring to the denial of universal bivalence as the oldest. I will also continue to refer to both of them as interpretations even when I am primarily interested in them as responses to logical determinism, regardless of their accuracy as interpretations of Aristotle. The second-oldest interpretation's claim to preserve bivalence while rejecting determinism is what essentially distinguishes it from the oldest interpretation. Its details will emerge gradually." (p. 25 of the reprint)

(...)

"Having said all I have to say about sources of the second-oldest interpretation, I want now to try to say what it comes to. My ulterior motive for undertaking this critical exposition is my interest in the development of the response to logical determinism (and the interpretation of Aristotle's response) among medieval philosophers, for whom the second-oldest interpretation had the stamp of Boethius' authority. For that reason I have examined the interpretation in Boethius' rather than in Ammonius' version of it.(26) Ammonius' commentary remained inaccessible to the Latins until William of Moerbeke translated it in 1268, and so it is irrelevant to at least the earlier stages of the medieval development.(27)" (p. 29 of the reprint)

(26) I have noticed the following passages in Ammonius' discussion of *Int*. 9 where he makes use of at least the distinctive terminology of the second-oldest interpretation. On definitely (or indefinitely) true (or false): 130,23-6; 131,2-4; 138,11-139,20; 141,18-25; 143,17-22; 144,9-14; 145,29-31; 147,20-2; 148,9-10; 149,16-18; 154,10-12; on definite or

indefinite cognition: 133,15-16; 134,25; 135,2; 136,3; 136,14-15; 36,30-137,4; 137,13-14; on definite or indefinite nature: 134,28; 136,2; on nature bringing about all things 'definitely and necessarily'; 148,21-2.

Isaac, *Le Peri Hermeneias en occident de Boèce à Saint Thomas: Histoire littéraire d'un traité d' Aristote*, Paris 1953

9. Leff, Michael C. 1974. "Boethius and the history of medieval rhetoric." no. 25:135-141.

   Near the end of his life, Boethius wrote a treatise entitled *De differentiis topicis*.

   This work was an analysis of topical logic in four books. Its purpose was to rationalize the field of topical logic; the first three books attempted to explicate and synthesize the dialectical theories of Aristotle and Cicero,(3) while the fourth sought to place rhetorical topics within the ambit of this synthesis. Consistent with his purpose, Boethius dealt with rhetoric only insofar as it was relevant to the study of topical logic.

   He certainly did not intend to compose an introductory textbook on rhetoric.(4) Nevertheless, a number of later medieval scholars detached the fourth book of *De differentiis topicis* from its context and approached it as though it was a primer on the art of speaking. This article proposes to explain how and why this development occured.

   As the problem is now stated, it appears to be rather narrow, but, as we shall soon observe, its solution hints at some major conclusions about the history of medieval rhetoric." (pp. 135-136)

10. Lenzen, Wolfgang. 2019. "A Critical Examination of the Historical Origins of Connexive Logic." *History and Philosophy of Logic* no. 41:16-35.

Absract: "It is often assumed that Aristotle, Boethius, Chrysippus, and other ancient logicians advocated a connexive conception of implication according to which no proposition entails, or is entailed by, its own negation. Thus Aristotle claimed that the proposition 'if B is not great, B itself is great [. . .] is impossible'. Similarly, Boethius maintained that two implications of the type 'If p then r' and 'If p then not-r' are incompatible. Furthermore, Chrysippus proclaimed a conditional to be 'sound when the contradictory of its consequent is incompatible with its antecedent', a view which, in the opinion of S. McCall, entails the aforementioned theses of Aristotle and Boethius. Now a critical examination of the historical sources shows that the ancient logicians most likely meant their theses as applicable only to 'normal' conditionals with antecedents which are not self-contradictory. The corresponding restrictions of Aristotle's and Boethius' theses to such self-consistent antecedents, however, turn out to be theorems of ordinary modal logic and thus don't give rise to any non-classical system of genuinely connexive logic."

11. Lewry, Osmond. 1981. "Boethian Logic in the Medieval West." In *Boethius: His Life, Thought and Influence*, edited by Gibson, Margaret, 90-134. Oxford: Blackwell.

    "Almost three centuries after his death, Boethius entered the school-room. With Alcuin of York as master and Charlemagne as pupil, a halting dialogue ensued. This *Dialectica* is a tenuous link between the learning of a member of the old Roman nobility, from the early sixth century, and the studious aspirations of the Frankish kingdom, at the end of the eighth. But the title is an ambitious one for these exiguous remains of classical culture, and even the presence of Boethius here is faint. In sixteen chapters, Alcuin rehearses the rudiments of the old logic. (1) He begins with Porphyry's *Isagoge*, for his account of the five universals, and ends with Aristotle's *Perihermeneias*, for the statement and its parts but, as his dedicatory verses to Charlemagne show, the categories are the core of his work, and for these, lacking the *Praedicamenta* of Aristotle himself, he had to turn to the Themistian paraphrase, the *De Decem Categoriis*, which he ascribes to Augustine. The Pseudo-

Augustine only omits matters of minor importance, but Alcuin received an account of the categories affected by transpositions and mixed with many non-Aristotelian elements. (2) The solid contribution of Boethius himself is in his translations of the *Isagoge* and *Perihermeneias* if there are borrowings from his commentaries and treatises, they are meagre. (3) Of the nineteen valid moods of the categorical syllogism, only four appear in the treatment of argumentation, and these, the moods of the first figure with their premisses interchanged, in a form derived from the *Perihermeneias* of Apuleius and not from the *De Syllogismis Catégoricis* of Boethius. (4) The fifteen kinds of definition derive from a treatise which the Middle Ages attributed to Boethius, but this *Liber de Definìtionibus* was in fact by Marius Victorinus, (5) as Boethius recognised in summarising its teaching. (6) They came to Alcuin through the *Institutiones of Cassiodorus*, (7) and it was sixth-century interpolations in the same source that gave Alcuin some second-hand knowledge of Boethius' *De Differentiis Topicis*. (8)" (pp. 90-91)

(...)

"In the first half of the fifteenth century, however, a reaction against the influence of Boethius can be seen in Lorenzo Valla's preface to his Dialecticae Disputationes. His reference to 'eruditorum ultimus Boetius' and his question, 'How many were there after Boethius whom one would consider worthy to be called a Latin and not a Barbarian?', (150) may suggest more than a grudging recognition for his authority, but elsewhere Boethius is sharply criticised for his doctrine. (151) Valla also thinks that he was overrated by Albertus Magnus among the scholastics and Poggio among the humanists. (152) Despising Aristotle as a man who contributed nothing to civic life and lacked practical skills, Valla's endeavour was to bring logic back from a realm of abstractions to what he regarded as its proper concern, natural expression : in effect dialectic was to be reduced to rhetoric. (153) This enterprise of reduction could not be carried through without a reform of terminology, and this led him, at the beginning of his work, to attack the teaching of the categories as it had been mediated by Boethius (154) and

the Porphyrian hierarchy of substance. (155) His second book extended the reduction to propositional logic; his third to reasoning. Here he poured scorn on Boethius and those who praise him, for their failure to see that the fourth figure syllogisms are but indirect forms of the first. (...) In this humanist reaction the authority of Cicero and Quintilian is preferred to that of Boethius." (pp. 120-121)

(...)

"The preface to the Basel edition of 1570 [*of the works of Boethius*] tempers the criticism of Valla, but passes quickly over the logic to celebrate the achievements of Boethius in mathematics and music. The dedicatory letter recalls the aims of Boethius himself as a translator and commentator and praises him for opening to the Latin world what Aristotle had hidden from many, and judiciously weighing the opinions of antiquity. Regret is voiced that nothing survives of his commentaries on the *Analytica* and *Topica* of Aristotle. Of the logical works, it is the double commentary on the *Perihermeneias* which is particularly valued, and the 'four beautiful books *De Differentiis Topicis*, by which he distinguished dialectical from rhetorical topics'. Mention is still made, though, of the works on the syllogistic and division, (159) so that even if rhetoric had made its inroads here too, the legacy of the Boethian logic was still prized for its own sake." 12. Lopez-Astorga, Miguel. 2021. "Aristotle and Boethius: Two Theses and their Possibilities." *Praxis Filosófica* no. 53:69-84.

Abstract: "There is a kind of logical theses that can be a cognitive problem. They are theses that are not tautologies and people tend to accept as absolutely correct.

This is the case of theses such as those of Aristotle and Boethius. This paper tries to give an explanation of the reasons why this happens. The explanation is based on the theory of mental models. However, it also resorts to modal logic and the account of the ideas presented by Lenzen. Thus, relating the general framework of the theory of mental models to basic aspects of modal logic and this last account, a possible solution of the problem is proposed."

13. Magee, John. 1989. *Boethius on Signification and Mind*. Leiden: Brill.

    Contents: Acknowledgements IX; Sigla X; Abbreviations and Editions XI; Introduction 1; I. Aristotle: *Peri Hermeneias* I, 16a3-9; 7; II. Boethius' Translation 49; III. Orandi Ordo 64; IV. Cogitabilis Oratio 93; Afterword 142; Bibliography 150; Index Locorum 155; Index Nominum et Rerum 162-165.

    "The following is a study of Boethius' thought on signification which attempts to situate that thought historically and to evaluate it philosophically. Its justification is found in the present lack of any systematic examination of the subject, (1) and in the intrinsic importance of that subject for the history of later ancient and especially of medieval thought. It is frequently the case that medievalists will have read Boethius' philosophical works with an eye only to subsequent developments; those classicists who bother with him at all will probably have done so out of an interest (one which shows signs of increasing) in investigating the very last stages in the history of ancient learning. That Boethius has sometimes run afoul of misunderstandings originating on both sides of the academic fence can, I believe, be explained in part by the fact that his work as both commentator *and* translator sets him somewhat apart in the history of ancient commentary on Aristotle. As a commentator, he has tended to be ignored by those classical scholars who are accustomed to the massive and weighty Greek commentaries from the likes of Alexander (late 2nd-early 3rd c. AD) and Simplicius (6th c. AD). As a translator, he has sometimes obscured, for the medievalists not working in the Greek tradition of commentary (as indeed for the many medieval writers who depended upon his translations), the prehistory of certain ideas expressed during the course of his commentaries on the texts of what in the Middle Ages came to be known as the *logica vetus*."

    (...)

    "The present work is divided into four chapters, taking as its starting point the lines of Aristotle's *Peri Hermeneias* around which Boethius' theory of signification turns. The first chapter

of the study plunges in *medias res*, and for that the reader's patience is requested. The Greek text is both difficult and compressed, and necessarily brings into consideration questions of the history of transmission and commentary, as well as numerous aspects of Aristotle's thought both in this and in other works. But since Boethius translated either all or part of the *Peri Hermeneias* before commenting upon it, and then revised the translation for the second commentary; and since in his translation, as in all translations, there is an element of "commentary" upon the meaning of the original, it has been thought necessary to come to a clear understanding of what Aristotle wrote before proceeding to the translation and commentaries. After careful examination of the Greek passage and of the questions it poses, there follows in the second chapter an analysis of Boethius' Latin translation of the same, and of the interpretation implicitly contained therein. The third and fourth chapters treat of Boethius' commentaries on the passage, as seen from two points of view: (a) from the way in which Boethius thinks Aristotle to have disposed or ordered the four things (*res, intellects, vox, litterae*) laid down in the context of the doctrine of *Peri Hermeneias* 16a3-9; (b) from the point of view of the theory of cognition Boethius develops in support of the above. The question Boethius ultimately poses for our consideration is: How are the operations of the passive mind converted into words and statements that can be spoken aloud? If his commentaries allow no certain answer to this question, important ground will nevertheless have been gained in studying carefully the way in which Boethius introduces the problem, and then in suggesting the solution which seems most consistent with what is said in his commentaries." (pp. 1-2)

(1) There are two valuable studies by L.M. De Rijk, as well as a short article by K. Berka. Beyond this, however, very little has come to my attention. [De Rijk 1981 and 1988, Berka 1968]

14. ———. 1994. "The text of Boethius' *De divisione*." *Vivarium* no. 32:1-50.

"The *De divisione* of Boethius (= B.) has come down to us in nearly 200 MSS dating from the 10th c. onward. The treatise maintained a position of some importance in the medieval

schools and as a result the textual tradition is highly complex, although it remains unstudied for the most part. L. Minio-Paluello investigated and compared some of the early MSS in the course of editing a fragment of B. 's revised *Topics* translation that sometimes circulated as part of *De divisione*, and he put forward tentative conclusions as to the bearing of his findings on the history of the transmission of De divisione itself. In what follows I undertake to examine the earliest extant MSS of *De divisione* known to me, and to reconsider Minio-Paluello's hypothesis concerning the early period of transmission. The study is in three parts: (a) analysis of the evidence indicating a lost ancient "edition" of *De divisione*, (b) the text of the treatise as transmitted to us by the oldest MSS; (c) a handlist of MSS containing *De divisione*." (p. 1)

15. ———. 1997. "Boethius, *De divisione* 875–76, 891–92, and Andronicus Rhodius." In *A Distinct Voice: Medieval Studies in honor of Leonard E. Boyle, O.P.*, edited by Brown, Jacqueline and Stoneman, William P., 525-560. Notre Dame: University of Notre Dame Press.

    "Thus Boethius begins and ends his treatise on Diaeresis. To ascertain the precise meaning of these two passages is crucial not only for determining the sources from which Boethius worked but for the light they shed on Andronicus of Rhodes, the Peripatetic scholarch (first century B.C.) who is thought to have initiated a revival of Aristotelian studies following the decline that set in after the deaths of Theophrastus and Eudemus. Boethius furnishes specific information concerning Andronicus in only two other places, in which he reports Andronicus's athetizations of the *Postpraedicamenta* and *Peri hermeneias*.

    In the case of the first, what he says is attested also by Simplicius, so that we are not dependent upon Boethius alone in ascertaining Andronicus's view of the final chapters of the *Categories*. In the case of the second, the importance of Boethius's testimony is elevated by the fact that the only parallel for it, in Ammonius, is really no parallel at all: both sources agree that Andronicus condemned the *Peri hermeneias*

as spurious, but they disagree in giving the reasons why." (p. 526, note omitted)

16. ———. 2010. "On the Composition and Sources of Boethius' Second *Peri hermeneias* Commentary." *Vivarium* no. 48:7-54.

    Abstract: "The paper is in three parts, prefaced by general remarks concerning Boethius' logical translations and commentaries: the text of the *Peri Hermeneias* as known to and commented on by Boethius (and Ammonius); the organizational principles behind Boethius' second commentary on the *Peri Hermeneias*; its source(s). One of the main purposes of the last section is to demonstrate that the *Peri Hermeneias* commentaries of Boethius and Ammonius are, although part of a common tradition, quite independent of one another, and special consideration is given to the question of how Boethius interpreted and shaped the doxographical material concerning Aspasius, Herminus, and Alexander that had been handed down to him by Porphyry."

    "Sifting through the interpretations of earlier commentators was painstaking and laborious, Porphyry's interpretation of 19b22-24 alone requiring, as we have seen, seventeen pages of commentary. By about the year 515 Boethius' attention must have been turning toward other projects, to new translations and commentaries, the theological tractates, logico-rhetorical monographs, and so on. If the Peri Hermeneias were allowed to consume so much time and energy, what would become of the rest of the *Organon* and Aristotle, not to mention Plato? Even for a treatise as rich and complex as the *Peri Hermeneias* Boethius may have had finally to calculate his "point of diminishing returns." He may have grown impatient with the project, his copy of Porphyry may have failed, or both. Had he known of the premature end that awaited him, he might have thought differently about how to weight the commentary, might have sought compensation in other projects for problems left unsolved in connection with the *Peri Hermeneias*; but as it is, he left a work which, despite its imperfections, has proved to be one of his most fascinating and influential." (p. 54)

17. ———. 2011. "Preliminary Observations on the Textual Tradition of Boethius' First *Peri Hermeneias* Commentary." In *Logic and Language in the Middle Ages: A Volume in Honour of Sten Ebbesen*, edited by Fink, Jakob Leth, Hansen, Heine and Mora-Márquez, Ana María 13-26. Leiden: Brill.

    "In editing the first of Boethius' two commentaries on Aristotle's *Peri Hermeneias* Carl Meiser essentially worked from a single witness, F (below), which he ranked both *antiquissimus* and *optimus*. (1) Readings from three other munich manuscripts, e (MS Bayer. Staatsbibl. clm 14401, s. XI), M (below), and T (MS Bayer. Staatsbibl. clm 18479, s.XI), he reported *perpetuo more* but with varying degrees of accuracy. (2) He further consulted two st. Gall manuscripts, G (below) and S (MS Stiftsbibl. 817, s. XI-XII) *omnibus locis paulo difficilioribus* — citing them only infrequently, however, in his critical apparatus. from *Peri Hermeneias* 17b20 on, F preserves excerpted lemmata, and Meiser correctly recognized that the supplemented versions found in other witnesses violate Boethius' intention. (3)

    But F is in fact neither *antiquissimus* nor *optimus*, and Meiser's edition suffers from a particular failure to distinguish between the three versions of Boethius' *Peri Hermeneias* translation, two of which form his commentary lemmata. Hence a full assessment of the evidence seems called for. In what follows, I hope to shed some light on certain salient characteristics of the textual tradition." (p. 13)

18. Magnano, Fiorella. 2013. "Boethius: the Division of Logic between Greek and Latin Traditions." In *Ad notitiam ignoti. L'Organon dans la translatio studiorum à l'époque d'Albert le Grand*, edited by Brumberg-Chaumont, Julie, 141-171. Turnhout: Brepols.

"Basically Boethius's division of logic is the foundation of a large number divisions of logic belonging to other medieval philosophers as Peter Abaelard and Albert the Great; for this reason it is extremely important to understand first of all how Boethius developed and understood his own division, and in this paper I will explore just these aspects of Boethius's logical works. Thus, first I will describe Boethius's two divisions of logic presented in his *Isagoge* commentaries. I will then look at his mature attempt to merge the Greek heritage of Aristotle with the Latin heritage of Cicero. Finally, I will focus on Boethius's own division of logic, in order to observe where the art of the topics is exactly placed. To better achieve my goals, it will be necessary to use several diagrams through which the reader can better visualize these complex aspects of Boethius's logical thought." (pp. 142-143, note omitted)

(...)

"Conclusion.

In short, in Boethius's view the *Topics* is the foundational discipline for the dialectician, the rhetorician, and the philosopher, precisely because it is the only way to discover the starting points of all types of argumentation. Boethius arrives at this view through combining in a particularly ingenious and original way the division of logic and the sciences more generally descended from the Aristotelian and Ciceronian, the Greek and the Latin traditions. It is necessary to think of this endeavor as a mosaic composed of many pieces, because combination of the two divisions of logic is only one stage of a much large project, and the instruments used to carry out this plan are numerous. In his second commentary on the *Isagoge*,

Boethius began to stress that this book is also indispensable in order to understand Cicero's *ratio disserendi*. As regards the art of the topics, he translated and commented on Aristotle's *Topics* and, after having commented also on Cicero's Topics he stressed the original axiomatic nature of Ciceronian *loci*, in order to bring out their dialectical value — a process completed in the third book of the *De topicis differentiis* where the Ciceronian *loci* are presented as dialectical *loci*. Finally, after having shown the substantial agreement of Cicero's division of logic (*ratio disserendi*) lwith that directly attributed to Aristotle and called λογικἡ, he also tried to show the agreement between Themistius's and Cicero's divisions of the topics, i.e. the Greek and the Latin traditions on the topics.

All these considerations allow us to conclude that in the fundamental reorganization of the entire logical material of antiquity made by Boethius, it is possible to discern his intention not only to rehabilitate the dialectical value of the topics, but also to return them to the centrality that they had in the authentic Aristotelian system. In this respect, Boethius does not simply repeat a neo-platonic thesis, because no neo-platonic philosopher gave, as far as know, real attention to Aristotle's *Topics*. On the contrary, Boethius re-established their use, and this is one of the most important aspects of Boethius's own contribution to the development of logic. The importance of this cultural phenomenon was really enormous, since this division of logic, like this role of the topics, were the specific ways in which philosophers received and used them in the Middle Ages." (pp. 170-171, note omitted)

19. ———. 2017. *Boethius on Topical Differences: A Commentary*. Barcelona - Roma: Fédération Internationale des Instituts d'Études Médiévales.

"A few years after writing his commentary on Cicero's *Topica* (finished before AD 522), Severinus Boethius (ca. AD 480 to 524) composed his last monograph on logic, the aim of which was to present a defi nitive work on the discipline of topica. The *De topicis differentiis* (completed before 523) is divided into four books, and the text is remarkable for the systematic nature in which the subject is put forth, a clear sign of Boethius's

desire to achieve completeness and of the didactic motivations for his writing the text." (*Introduction*, pp. IX-X, notes omitted)

(...)

"3. The partition of the *De topicis differentiis*

The first book presents a compendium of basic knowledge on logic that a student must possess in order to embark on the study of this discipline.

Boethius explains the meaning of the terms *propositio, quaestio, conclusio, maxima propositio*, and *argumentum* – it is to be noted that these last concepts recall the elements of which a syllogism is composed. In the second book, the concept of *argumentatio* is introduced, along with two species of loci that can be linked directly to Themistius, the *maxima propositio* and *maximarum propositionum differentiae*, while the following portion of the second book is dedicated to a presentation of the list of Themistius's *maximae propositiones* and their *differentiae*. In the third book, Cicero's division of the loci is introduced, so that the first objective announced in the *intentio operis* is achieved, namely to show the ways in which the divisions of the Themistian and Ciceronian loci are different and similar, and in what way each can in turn contain the other. The fourth and last book is entirely dedicated to rhetoric and the exhibition of the *loci rhetorici,* so that the second objective announced in the intentio operis is accomplished, namely to show how the

loci rhetorici are distinguished from each other and from the *loci dialectici*." (*Introduction*, p. XV, a note omitted)

20. Maloney, Thomas S. 2003. "Boethius on Aristotle on the Division of Statements into Single/Multiple and Simple/Composed." *Carmina Philosophiae* no. 12:49-74.

"The goal of this paper, then, is to set forth and clarify the second and third divisions of statements proposed by Aristotle in Chapter 5 of *On Interpretation* and to see what, if any, additions or corrections are made by Boethius. The quest proceeds by responding to six questions, and these will be

followed by comments on a few statements that can be taken as statement types that present special problems for Aristotelian and/or Boethian analysis." (pp. 50-51)

(...)

"But, on balance, Boethius is to be much commended for his labor to make Aristotle's comments on the division of statements into single/multiple and simple/composed more comprehensive and comprehendible. His clarifications lead us considerably beyond the Aristotelian text. His is surely a successful effort, and we are left to wonder just what use the Medievals will make of this valuable assistance.(51)" (p. 69)

(51) For a response, see my "Roger Bacon on the Division of Statements into Single/Multiple and Simple/Composed," *The Review of Metaphysics*, forthcoming. [Vol. 56, No. 2 (Dec., 2002), pp. 297-321]

21. Marenbon, John. 2003. *Boethius*. Oxford: Oxford University Press.

    Contents: Abbreviations of Boethius's Works XV; 1 Introduction 3; 2 Life, Intellectual Milieu, and Works 7; 3 Boethius's Project: The Logical Translations and Commentaries 17; 4 The Logical Textbooks and Topical Reasoning: Types of Argument 43; 5 The *Opuscula Sacra*: Metaphysics, Theology, and Logical Method 66; 6 The *Consolation*: The Argument of Books I-V.2 96; 7 The *Consolation*, V.3-6: Divine Prescience, Contingency, Eternity 125; 8 Interpreting the *Consolation* 146; 9 Boethius's Influence in the Middle Ages 164; Notes 183; Bibliography 219; Index Locorum 237; General Index 243-252.

    "As a translator, Boethius was extremely literal, sacrificing Latin style, of which the *Consolation* shows his mastery, to precision. So far as possible, he follows the word order of the Greek and tries to render each word, even the particles. The result, though grammatical, is often awkward and heavy, but it is accurate — although there are some cases where his choice of word and phrasing does betray his own, particular interpretation of the text. (6) He seems to have revised each of

his translations, and there is evidence of two forms for all of them except the *Sophistical Refutations*. (7)

As a commentator, again Boethius concentrated on logic, although he did apparently write some sort of glosses or commentary to Aristotle's *Physics*. (8)

His work as an exegete stretched less widely over Aristotelian logic than his translations: he provided, as already mentioned, two commentaries each for the *Isagoge* and *On Interpretation*, one (or perhaps two) for the *Categories*, a commentary on Cicero's *Topics*, 9) very probably a commentary on (Aristotle's) *Topics* and some glosses, at least, for the *Prior Analytics*. (10) He also wrote a set of logical monographs, mainly on different sorts of argument (see chapter 4).

Since Boethius's working life was unexpectedly and violently curtailed, his failure to complete his original plan cannot be taken as proof that he did not propose it in earnest. Still, he seems to have given logic the priority and was willing in this area to go beyond the project he had set out, writing double commentaries and logical monographs, rather than hurrying on to Aristotle's nonlogical works and to Plato."

(7) In the case of the *Categories*, the two versions that survive are Boethius's final version and a 'composite' version, which is probably an earlier draft by Boethius, improved by using the lemmata of his commentary (close to his final version of the translation); see Asztalos (1993) 371-72. There is a very clear summary of scholarship on Boethius's translations in Chadwick (1981) 131–41; the fundamental work was done by Minio-Paluello — see Minio-Paluello (1972) and the introductions to the *Aristoteles Latinus* editions (*Aristoteles Latinus*, 1961–).

(8) See Chadwick (1981) 139, who cites *2InDI* 190:13, 458:27 and *TC* 1152B.

(9) I discuss this commentary in chapter 4 below, because it is closely related to Boethius's treatise on topical reasoning.

(10) As Obertello (1974) 229 has noted, Boethius refers to a commentary by him on Aristotle's *Topics* in his *On Topical*

Differentiae, 1191A, 1216D. But none has survived. He also clearly refers to having expounded 'the *Analytics*' (cf. Obertello (1974) 229–30); Minio-Paluello has discovered marginal annotations in a medieval manuscript of the *Prior Analytics* which, he argues, are Boethius's: see *Aristoteles Latinus* (1961–) III.1–4, lxxix–lxxxviii and (for edition of the scholia) 295–372.

22. ———. 2008. "Logic before 1100: The Latin Tradition." In *Mediaeval and Renaissance Logic*, edited by Gabbay, Dov and Woods, John, 1-63. Amsterdam: Elsevier.

See pp. 6-21: 2.2 Boethius 6; Boethius the Translator 7; The Neoplatonic Aristotelian Tradition 8; Boethius and the Commentary Tradition 9; Boethius's Logical Treatises 14; Boethius and Topical Argument 18; Boethian Logic and its Survival 20-21.

"Boethius is by far the most important figure in the ancient tradition of Latin logic, but it is important to realize that the Boethian Tradition was not the only ancient Latin one. The logic of the earlier Latin authors, along with, or transmitted by, later encyclopaedic accounts, provided a separate tradition, which would be the one on which, more than Boethius, medieval logic depended in the period up to the late tenth century. It is in the eleventh century that the Boethian Tradition begins to dominate (See §4 below). The twelfth

century was the Golden Age of Boethian Logic: the six works that formed the core of the logical curriculum were Boethius's monographs and his translations of the *Isagoge*, *Categories* and *On Interpretation*, which were taught making extensive use of his commentaries. And the *Prior Analytics* and *Sophistical Refutations*, also in his translation, began to be known.

As a result of the introduction of the whole range of Aristotle's writing and its adoption, by the mid-thirteenth century, as the Arts course in the universities, and with the development of the *logica modernorum*, branches of logic newly devised by the medieval logicians themselves, Boethian Logic became less important in the thirteenth and fourteenth centuries, although his translations continued to be used by all students of logic, and some outstanding theologians, such as Albert the Great, Aquinas and William of Ockham, made some use of his commentaries.

Moreover, *On Division* and *TD* [*De Topicis differentiis*] remained part of the standard university logical collections — and commentaries were even written on *TD* in the thirteenth century.

The monographs on categorical syllogisms were no longer useful now that the *Prior Analytics* itself was known, and the treatise on hypothetical syllogisms too was forgotten [see C. J. Martin. Denying Conditionals: "Abaelard and the Failure of Boethius' Account of the Hypothetical Syllogism", *Vivarium*, 45, 153-68, 2007.].

23. ———. 2008. "Logic at the turn of the Twelfth century." In *Mediaeval and Renaissance Logic*, edited by Gabbay, Dov and Woods, John, 65-81. Amsterdam: Elsevier.

"The model for the most widespread type, the 'composite' commentary, was provided by Boethius's commentaries, where each section of the text was discussed discursively, and problems were raised, explained and resolved.

(...)

Boethius, however, did not go in detail through every word of the text (although the elementary first editio on *On Interpretation* does from time to time gloss individual sentences). The twelfth century logicians added an element of literal, phrase by phrase commentary, quite often put in the first person, so that the commentator is speaking for Aristotle, Porphyry or Boethius, as if these authors were to have paused to explain their texts more explicitly and ponderously. In the other, slightly less common type, 'literal commentary', this very detailed commentary predominates, and discursive discussion is more limited. Literal commentaries are, then, distant formally

from the model of Boethius, and they are usually distant in content too, whereas some composite commentaries contain many passages borrowed from, or closely based on, Boethius. 'Literal' and 'composite' should not, however, be thought of as designating two completely distinct classes: literal commentaries contain some more discursive comments, and composite commentaries can have sections where the exegesis is merely literal. There were also 'problem commentaries' (the best known is Abelard's *Logica Nostrorum petitioni sociorum*), which concentrated on discussing the difficult issues, with very little or no literal commentary. None of these has been dated to before c. 1120, but they should be born in mind, since it will turn out that the chronology of the commentaries is far less fixable than has been believed." (pp. 66-67)

24. Martin, Christopher John. 1991. "The Logic of Negation in Boethius." *Phronesis* no. 36:277-304.

"Boethius' *de Hypotheticis Syllogismis* is by far the most extensive account of the conditional and its logic to have survived from antiquity. A rather obscure and tedious work, it has puzzled commentators from Peter Abaelard to Jonathan Barnes. Most of the difficulties that they have had in extracting the principles of Boethian logic seem to me to follow from the assumption that what he offers is an account of the application of propositional operators to propositional contents. Though generally not made explicit by modern historians, the concepts of propositional content and propositional operation are

nevertheless presupposed by the symbolic apparatus which they typically use to represent the claims of ancient and mediaeval logics. I will try to show that an examination of Boethius' theory of language forces us to give up the assumption that his logic is propositional and that when we do so his remarks on compound propositions turn out to be rather less mysterious than they have seemed." (p. 277)

25. ———. 1999. "Non–reductive Arguments from Impossible Hypotheses in Boethius and Philoponus." *Oxford Studies in Ancient Philosophy* no. 17:279-302.

    "While there seems to be no record of an ancient debate over the paradoxes of strict implication anticipating those of the twelfth and twentieth centuries, we can, I think, advance our understanding of ancient attitudes to conditionals with antecedents acknowledged to be impossible by considering some hitherto neglected remarks made by Boethius. I shall try to show in the present paper that at least in late antiquity some philosophers were happy to introduce acknowledged impossibilities as hypotheses and to draw inferences from them without any suggestion that there might be indefinitely inflationary consequences. By these philosophers at least, the conditional was understood relevantistically." (p. 281)

26. ———. 1999. *Theories of Inference and Entailment in the Middle Ages*.

    Unpublished dissertation available at ProQuest Dissertation Express ref. n. 9948627.

    Contents: Abstract III; Brunellus VI; Introduction VII; 1 The Logic of Negation in Boethius 1; 2 Thinking the Impossible 56; 3 Embarrassing Arguments and Surprising Conclusions 106; 4 The Logic of the Nominales 148; 5 Obligations And Liars 243; 6 Nothing Grows 310; 7 *Impossible Positio* and the Foundations of Metaphysics 344; Abbreviations 439; Bibliography 441-457.

    "Boethius provided the middle ages with much of its information about ancient logic and philosophical semantics and in chapter 1 I try to rescue his work from some of the false and misleading claims that have been made about it. I argue

that Boethius has no notion of propositionality in our sense and so no notion of a propositional operation and that this explains two peculiar features of his logic. First his apparent commitment to conditional excluded middle. Second the fact that rather than offering a single schema for a hypothetical syllogism and a rule of substitution he rings all the changes on the the various forms of premisses and conclusion. Boethius knows only how to negate categorical propositions and it is his application of predicate negation to conditional propositions which explains his account of their logical

relations. Once this is properly understood it is possible, as I show, to give a plausible reconstruction of his theory of the hypothetical syllogism. Boethius has been thought to be committed to the logical principles of what is now known as connexive logic. I argue that this is not true in the sense proposed but that he does accept and transmits to the middle ages an argument for 'connexivity' from the Prior Analytics which is crucial for the development of theories of the conditional in the twelfth century." (Introduction, pp. VIII-IX)

27. ———. 2009. "The Logical Textbooks and their Influence." In *The Cambridge Companion to Boethius*, edited by Marenbon, John, 56-84. Cambridge: Cambridge University Press.

"The time at which Boethius wrote was not a great one in the history of logic and he himself was certainly not a great logician. His importance lies rather in acting as an intermediary between the logicians of antiquity and the those of the Middle Ages. With his translations (1), commentaries (2) and independent logical works (3) Boethius provided mediaeval philosophers with most of what they knew about ancient logic and so with the foundations upon which mediaeval logic was built. The most important parts of those foundations were the metaphysics of substance and semantics of common names which could be extracted from Boethius' commentaries on the *Isagoge*, *Categories*, and *De interpretatione*, his account of conditional propositions in *De hypotheticis syllogismis*, and his treatment of topical argumentation in *De topicis differentiis*. Boethius' own peculiar contribution to the history of logic was an exposition of the hypothetical syllogism which, for the

reasons we will consider here, would play no role in the development of logic after the middle of the twelfth century." (p. 56)

(1) Boethius' translations of Porphyry's *Isagoge*, and Aristotle's *Categories* and *De interpretatione*, were known throughout the Middle Ages. His translations of the *Sophistical Refutations*, *Topics* and *Prior Analytics* were rediscovered during the first half of the twelfth century. Boethius' translation of the *Posterior Analytics* (if he made one) apparently did not survive into the Middle Ages.

(2) On the *Isagoge* (1IS, 2IS), on the *Categories* (CAT), on *De interpretatione* (1IN, 2IN), on Cicero's *Topica* (TC).

(3) On the categorical syllogism covering the material dealt with in *Prior Analytics* I.1–7 (ISC and SC), on topical inference (TD), on the hypothetical syllogism (SH), on division (D).

28. ———. 2011. "*De Interpretatione* 5-8: Aristotle, Boethius, and Abelard on Propositionality." In *Methods and Methodologies. Aristotelian Logic East and West, 500-1500*, edited by Cameron, Margaret and Marenbon, John, 207-228. Leiden: Brill.

"Boethius' commentaries on *de Interpretatione* provided the Middle Ages with their introduction to the theory of meaning. Boethian semantics is developed on the basis of the distinction made by Aristotle in *De Interpretatione* 1, between the signification of terms and that of affirmations and negations – defined, remember, as the species of simple assertions. On this account of them affirmations signify mental states in which the mental items signified by their component significant terms are combined and negations signify mental states in which they are separated. Missing in the theory is an account of compound propositions showing how their meanings are obtained from the meanings of their components. Such an account requires a notion of unasserted propositional content. With it we may also locate what is common to different speech acts and explain how it is that they differ. The relevant differences are the differences in what we now call their force." (p. 211)

29. Martin, John N. 1989. "A Tense Logic for Boethius." *History and Philosophy of Logic* no. 10:203-212.

    Reprinted as Chapter 5 in: J. N. Martin, *Themes in Neoplatonic and Aristotelian Logic. Order, Negation and Abstraction,* Aldershot: Ashgate, 2004, pp. 53-63.

    Abstract: "An interpretation in modal and tense logic is proposed for Boethius' reconciliation of God's foreknowledge with human freedom from *The Consolation of Philosophy,* Book V. The interpretation incorporates a suggestion by Paul Spade that God's special status in time be explained as a restriction of God's knowledge to eternal sentences. The argument proves valid, and the seeming restriction on omnipotence is mitigated by the very strong expressive power of eternal sentences."

Freeport, N.Y: Books for Libraries Press.

31. Mignucci, Mario. 1989. "Truth and modality in late antiquity: Boethius on future contingent propositions." In *Le teorie delle Modalità. Atti del Convegno internazionale di storia della logica*, edited by Corsi, Giovanni, Mangione, Corrado and Mugnai, Massimo, 47-78. Bologna: CLUEB.

    Reprinted as Essay 11 in Andrea Falcon, Pierdaniele Giaretta (eds.), *Ancient Logic, Language, and Metaphysics: Selected Essays by Mario Mignucci,* New York: Routledge 2020.

    "Aristotle's analysis of future contingents in *On Interpretation* 9 has generated a great deal of discussion, ranging from the interpretation of his own words to the philosophical meaning and adequacy of the solution proposed by him. Unfortunately, the former question is entailed by the latter, and there is no agreement about the kind of answer that Aristotle gives to the question of determinism despite the astonishing quantity of

works dedicated to it. I do not want to involve myself in the problem of Aristotle's interpretation. My task here is to illustrate the meaning and relevance of Boethius' s analysis of future contingents, and I will consider his commentary on the *On Interpretation* for its own sake. In other words, I will not try to evaluate the adequacy of Boethius' s proposal with respect to Aristotle, even if, of course, he believed that his interpretation was faithful to the text of the *On Interpretation*. Nor will I try to compare Boethius's solution with other solutions that have been proposed by ancient and modern interpreters alike who have tried to

explain Aristotle's text. I will consider only one view other than that of Boethius because Boethius himself discusses it and his discussion is relevant to the understanding of his position." (p. 47, a note omitted)

32. Minio-Paluello, Lorenzo. 1942. "The Genuine Text of Boethius' Translation of Aristotle's *Categories*." *Mediaeval and Renaissance Studies* no. 1:151-177.

    Reprinted in L. Minio-Paluello, *Opuscula. The Latin Aristotle*, Amsterdam: Hakkert, 1972, pp. 1-27.

    "It is known that Boethius wished to make translations of all the works of Aristotle and to comment on them, (1) but fate brought him to imprisonment and death before he was able to carry out his plan. That he translated the works on logic is certain. True, some scholars have doubted whether he translated the *Analytics, Topics* and *Sophistici Elenchi,* (2) but no one disputes that he both translated and commented on the *Categories* and the two books *De interpretatione*. This can be established with certainty by the references he makes elsewhere to these works of his, (3) by the tradition which begins with Cassiodorus (4) and is thus contemporary, and by the unanimity of the manuscripts of the *Commentaries*. (5) All scholars agree, and rightly so, on this point.

    On another point, however, scholars have been entirely mistaken. They have held that the translation of the *Categories*, which from the tenth century onwards appears in innumerable manuscripts, now scattered over European and even American

libraries, is by Boethius. This is the text, often printed in the fifteenth and sixteenth centuries and also reproduced in the Patrologia Latina of Migne and in the editions of Notker's works. (6)

It is the objet of the present study to prove that this is a mistake and to make known the genuine translation of Boethius, which until a short time ago remained buried in a small number of manuscripts. It is hoped also to correct certain errors arising out of this mistaken attribution and thus to throw fresh light on the history of the study of the *Categories* and of the translations from the Greek in the tenth century." (pp. 151-152)

(...)

"To conclude, I hope I have made clear the following points:

(1) That a version of the *Categories*, whose author has hitherto not been recognized, is the work of Boethius;

(2) that the version, which up till now has been ascribed to Boethius partly belongs to the tenth century; and therefore

(3) that there is a mediaeval translation of Aristotle into Latin at a date much earlier than is commonly supposed." (p. 26)

I wish to thank Dr. Decima Douie for her help in translating this article, and the Editors of this Journal for their criticism and advice.

(1) 'Ego omne Aristotelis opus, quodcumque in manus venerit, in Romanum stilum vertens eorum omnium commenta latina oratione perscribam . . .' (*Comment. Second, in Arist. De interpret.* 79, 16 ff. Meiser). P. Mandonnet (*Siger de Brabant*, Fribourg 1899, xxiv f.) alone believes that Boethius had really translated all Aristotle, and quoting Migne (!) Sstates that 'on possède les commentaires de Boèce sur tous les livres de la logique'.

(2) E.g. M. Grabmann, *Gesch. d. schol. Meth.* II, 71. Even he, however, recognised the value of the references of Boethius to his translations (*In top. Cic.* PL 64 col. 1051; 1052; *De diff. top.* 1173; 1184; 1193; 1216). On the question of the authorship of the

translations of these works preserved under the name of Boethius, see B. Geyer, *Die alten lat. Uebersetz. d. arist. Analytik, Topik und Elenchik* (Philos. Jahrb. d. Görres-Gesellsch. 30 [1917] 25 ff.); C. H. Haskins, *Studies in the histiory of mediaeval science*, Cambridge Mass. 1927, p. 228 ff.; M. Grabmann, *Forsch, üb. d. lat. Arist.-Uebersetz. d. XIII. Jahrb*. (BGPM XVII, 5-6, p. 130); id., *Bearbeitungen u. Ausleg. d. arist. Logik aus d. Zeit v. Abaelard bis Petrus Hisp*. (Abh. Preuss. Akad. 1937), p. 10; E. Franceschini, *Aristotele nel Medio Evo latino* (Atti del IX Congr. naz. di filos., Padova 1934-35, p. 5 ff.).

(3) See S. Brandt, *Entstsehungsz. u. zeitl. Folge d. Werke von Boethius* (Philologus, N. F. 16 [1903] 141-154 and 234-275).

    Reprinted in L. Minio-Paluello, *Opuscula. The Latin Aristotle*, Amsterdam: Hakkert, 1972, pp. 347-356.

    "Cod. Florence Bibi. Nazion. Centn Conv. Soppr. J.VI.34—formerly in Niccolò Niccoli's and St. Mark's libraries—written in a beautiful French hand of c. a.d. 1150-1200—contains the second edition of Boethius's translation of *Pr. An.* (1) Many scholia, written on the margins and between the lines by the same calligraphic hand which wrote the Aristotelian text or by a hand very similar to and contemporary with it, accompany the translation in this MS. They are mainly concentrated in about one-half of the work, viz. in book I.23 -30 (400-463) and book II (52a-70b); quite a few accompany I. 1,5-6,30-45 (24a, 27b-28a, 46a-50a) ; almost none is to be found in I.10-14,17-22 (30b7-33b25, 37a25-40b10). Arrangement and writing suggest that the scribe intended to give the reader Aristotle's text together with what was available to him of an authoritative commentary.

The scholia range, in nature and extent, from short glosses on single words or phrases and short summaries of sections of Aristotle's work to detailed explanations and doctrinal developments of important or difficult passages. Here and there carefully drawn diagrams illustrate logical rules and geometrical examples." (p.93)

(...)

"The Florentine MS. is quite unique among all the Latin manuscripts of *Pr. An.* It is the only one, out of about two hundred and seventy, that contains—and contained—only the *Pr. An.*; out of a hundred and twenty so far examined, it is the one which seems to contain the second, and very rare, edition of Boethius's translation in its purest form, and the only one which contains the 'corpus' of Greek scholia translated into Latin; (21) the paleographical characteristics—big letters throughout, even for the scholia, spaciousness, very careful transcription—suggest that we are in the presence of a library copy of an important text of the past.

The attribution to Boethius remains hypothetical; but the linguistic argument in its favour, if expounded in detail, might prove very strong; our other arguments strengthen it. No argument against this attribution has so far suggested itself." (p. 102)

(21) Only scanty fragments from the scholia are also preserved in two or three of the many manuscripts inspected. The only important exception is in the figure of the 'pons asinorum', which exists in most MSS.; but it is likely that Boethius ha included it in the text of Aristotle itself, as it appears in Greek copies of *Pr. An.* independently of any commentary or scholia.

35. Nikitas, Dimitrios Z. 2012. ""Exemplum logicum Boethii": reception and renewal." In *Greek into Latin from Antiquity until the Nineteenth Century*, edited by Glucker, John and Burnett, Charles, 131-144. London - Turin: The Warburg Institute - Nino Aragno Editore.

"In his essay (" Exemplum logicum Boethii : Reception and Renewal") D. Nikitas shows the extent and nature of Boethius's

reception of the exemplum logicum from a long tradition that goes back to Aristotle himself, as well as his innovations in this technique. As a member of the Aristotelian-Neoplatonic school of Alexandria, Boethius draws the material for his use of exempla logica from Greek and Roman sources and from his own contemporary environment. Nikitas analyzes numerous exempla translated by Boethius along with Aristotle's text, others in which Boethius's active intervention is clear, new exempla absent from Aristotle, and exempla drawn from other sources." (Ioannis Deligiannis, from the Review of *Greek into Latin from Antiquity until the Nineteenth Century*, Bryn Mawr Classical Review, 2012.)

36. ———. 2019. "The early literary construct of Boethius: *In Isagogen Porphyrii commenta*, editio prima." In *Aristotle and his Commentators: Studies in Memory of Paraskevi Kotzia*, edited by Golitsis, Pantelis and Ierodiakanou, Katerina, 107-130. Berlin: de Gruyter.

    "I wished to present above, in the most concise way the literary particularities of the dialogue *In Isagogen Porphyrii commenta, editio prima*. With this work Boethius, in the prime of his youth, begins to realize his authorial plan and his patriotic goals.

    In a time when the *urbs aeterna* has ceased to be the center of the World, he wishes to revive it with the fresh spring water of the Aristotelian Platonism of Alexandria.

    His two dialogues serve this purpose: his maiden commentary on Porphyry and his sublime allegorical Menippial satire, bound with his own blood. Boethius' considerable literary abilities, recognized in the *De consolatione Philosophiae*, can also be observed in his maiden Aristotelian dialogue which, true to the praecepta of the Neoplatonic school of Alexandria, contains literary embellishment. The "last of the Romans" in this "scholastic" treatise achieves the connection of specialized contemplation with literature, beauty and sweetness of word with the depth and preciseness of thought. Alexandrian Neoplatonism here embraces the Roman language and literary tradition while at the same time the Aristoteles Latinus, who

would decisively water the tree of European civilization, is formed." (pp. 129-130)

37. Pizzi, Claudio. 1977. "Boethius' Thesis and Conditional Logic." *Journal of Philosophical Logic*:283-302.

38. Prior, Arthur Noman. 1953. "The Logic of Negative Terms in Boethius." *Franciscan Studies* no. 13:1-6.

    "Historians of logic have recently been turning their attention to the *De Syllogismo Hypothetico* of Boethius, and have found in it a quite highly developed propositional calculus.(1) So far as we are aware, however, his *De Syllogismo Categorico* and his *Introductio ad Syllogismos Categóricos* have not yet been subjected to similar scrutiny; and in the latter work at least there are features of considerable interest.

    The *Introductio ad Syllogismos Categoricos* resembles the *De Syllogismo Hypothetico* in exhibiting a special interest in the results of attaching a negative particle to an element or to the elements of a proposition. Just as he gives in the latter work an exhaustive account of such varieties of the conditional proposition as 'If p then not q', 'If not p then q', 'If not p then not q', 'If p then if q then not r', and so on, so in the *Introductio* he considers the relations of opposition, entailment, and so on which hold between categorical propositions with and without negative (or as he calls them 'infinite') terms. In doing this he does not use variables such as 'a' and 'b' , but the concrete terms which he uses are selected on a definite principle, which we shall now illustrate." (p. 1)

    (1) See, in particular, K. Diirr, *The Propositional Logic of Boethius* (NorthHolland Publishing Co., 1951); R. van den Driessche, " Sur le 'de syllogismo hypothetico' de Boèce," Methodos Vol. I, No. 3; I. M. Bochenski, *Ancient Formal Logic* (North-Holland Publishing Co., 1951), pp. 106-109.

39. Reesor, Margaret E. 1972. "*Poion* and *Poiotes* in Stoic Philosophy." *Phronesis* no. 17:279-285.

    "The second category, *poia*, is the most puzzling of the four Stoic categories.' The general term *poion* (qualified) included the *koinos poion* (generically qualified) and the *idios poion*

(individually qualified), but the relationship between these two concepts is by no means clear. It is even more difficult to see how they were connected with the *idia poiotes* (particular quality) and the *koine poiotis* (common quality).

In order to explain how the four terms were related, I shall undertake in this paper as thorough an investigation as possible of a diaeresis described by Boethius in his Commentary on Aristotle's De Interpretatione." (p. 279)

(...)

"In this paper I have stated my reasons for believing that the *idios poion*, the *koinos poion*, the idia poiotes, and the *koine poiotes* all have a place in the second Stoic category and that the relationship of one term to another can be reconstructed from Boethius' diaeresis." (p. 285)

(1) For the fragments of the Old Stoa I have used H. von Arnim, *Stoicorum Veterum Fragmenta*, Berlin, 1905, and I have referred to them by the number of the book and fragment. The categories are listed by Simplicius (11.369), and Plotinus (II.371).

Bibliography on Boethius' logical works and Commentaries (Shi-Z)

Studies in English

1. Shiel, James. 1957. "Boethius and Andronicus of Rhodes." *Vigiliae Christianae* no. 11:179-185.

   "G. Pfligersdorffer has recently described the attitude of the ancient editor, Andronicus of Rhodes, towards the final notes in Aristotle's Categories on opposites, simultaneity, priority, motion and possession-what the medievals called the postpraedicamenta. (1)

   The scholar has based his intricate arguments on a passage of Boethius' commentary on the *Categories*, and as this passage in the printed editions (2) is syntactically unintelligible he has suggested an emended text of it." (p. 179)

   (...)

   "On the basis of the passage thus emended (...) the author argues that: (a) Andronicus does not imply that Aristotle was not the real author of the postpraedicamenta but only that Aristotle was not responsible for annexing them to the Categories; ..." (p. 180)

   (...)

   "I believe that the text of the Boethius passage can be more convincingly presented from a wider survey of the extant manuscripts of the *In Categorias*." (p. 181)

   (...)

"The text I have proposed will still support Pfligersdorffer's argument (a) noted above -- but none of the others." (p. 185

(1) G. Pfligersdorffer, "Andronikos von Rhodos und die Postpradikamente bei Boethius" (*Vigiliae Christianae* 7 (1953), 98-115).

(2) ed. Glareanus, Basel, 1546; reprinted (badly) in Migne PL 64 [263b].

2. ———. 1958. "Boethius' Commentaries on Aristotle." *Mediaeval and Renaissance Studies* no. 4:217-244.

   Revised version in: R. Sorabji (ed.), *Aristotle Transformed. The Ancient Commentators and Their Influence,* London: Duckworth, 1990, pp. 349-372 (Second edition New York: Bloomsbury 2016, pp. 377-402) also reprinted in: Manfred Fuhrmann und Joachim Gruber (Hrsg.), *Boethius,* Darmstadt: Wissenschaftliche Buchgesellschaft, 1984 pp. 155-186.

   Citations are from the reprint in Sorabji 2016.

   "It is recognised that Aristotelian logic, which was to become an integral part of medieval scholasticism, was first transmitted to Latin Christianity through the work of Boethius. But the way in which he set about his self-imposed task has never been determined in detail. (1) We know that he promised to translate and comment 'upon every single work of Aristotle I can lay hands on (*omne Aristotelis opus quodcumque in manus venerit*)'. (2) To form the idea was a silent judgment on the learning of his day; to realise it was more than one man could accomplish; but Boethius accomplished much.

   (...)

   The genuine texts of Boethius' versions of Aristotle (except that of the *Posterior Analytics*) have now been identified among the manuscripts and his distinctive method of translation firmly identified.(5) The present article therefore proposes to examine the other extant results of Boethius' promise, the commentaries and treatises. Are they really original or are they too translated from Greek?" (p. 377)

   (...)

"The general impression produced by this study is that Boethius in composing his commentaries on the *Organo*n translated Greek notes which he found added to his text of Aristotle. If this is true, it gives us new insight into the way Boethius worked.

From the beginning it is evident that he considered the works of the *Organon*, including Porphyry's *Isagoge* (which Neoplatonic schoolwork put on a par with Aristotle), as a united whole." (p. 398)

(...)

Cicero retired to his Tusculan study, Boethius to his 'study walls adorned with ivory and glass (*bibliothecae comptos ebore ac vitro parietes*)'. Our study of him as a translator emphasises anew his remarkable role of transmission: through him Aristotelian logic, the equipment of Neoplatonic paganism, is carried into the Christian Church to be eventually part of its armour of faith. (84)" (p. 401)

(1) M. Cappuyns, '*Boèce*', in *Dict. d'hist. et geog. eccles.* 9, Paris 1939, 367: 'The exact role of Boethius in the transmission of Aristotle's works is hard to disentangle at present.' This statement prompted the present enquiry. Dom Cappuyns' article is the best introduction to the subject. [Now however see the prefaces of *Aristoteles Latinus*, vols 1-6, and the supporting essays in L. Minio-Paluello, *Opuscula: the Latin Aristotle*, Amsterdam 1972.]

(2) *in Int.* II 79,16 Meiser.

(5) L. Minio-Paluello, 'The genuine text of Boethius' translation of Aristotle's Categories', in *Mediaeval and Renaissance Studies* (MRS), 1942, 151-77 (=*Opuscula*, 1-27) and 'The text of the *Categoriae*: the Latin tradition' in *Class. Quart.* 39, 1945, 63-74 (= *Opuscula*, 28-39).

(84) This illustrates a seasoned historian's judgment that 'ancient philosophies, rediscovered, are found to possess a disturbing vitality, even in modern times' (Hugh Trevor Roper, *Catholics, Anglicans and Puritans*, 1987, VII).

3. ———. 1974. "Boethius and Eudemus." *Vivarium* no. 12:14-17.

"In writing his explanation (1) of Porphyry's 'tree' Boethius inevitably encountered a subdivision of 'substance' where Porphyry has divided 'rational animate substance' into'mortal'and 'immortal'.

An immortal animate could only be a god, and, since 'animate' had already been classed under 'corporeal', this would be a corporeal god as described by the ancients who identified the world and the heavens with Zeus. Boethius does not quarrel with this doctrine. Only by abruptly detaching the reference to the ancients can Pierre Courcelle (2) see in it a Christian reservation voiced by Boethius himself.

Since similar philosophic reference to the ancient beliefis to be found in Greek (3) I believe that Boethius translated it from Greek. And the Greek he translated from was not the extant commentaryof Ammonius (4) on Porphyry." (p. 14)

(...)

"Now one cannot help noticing that Boethius has a somewhat more complex classification than Ammonius.

The latter includes no distinction for the two kinds of non-dialectical question. Besides, in place of 'non-dialectical' Ammonius has a more positive term, 'investigative' (*pysmatike*),which is not translated in Boethius. And whereAmmonius says "according to the ancients" Boethius has the more precise "according to the Peripatetics." All this should make one cautious of asserting that Ammonius is the exact source of Boethius.

What is more, Eudemus turns out to be the rightman. This is perfectly clear from a passage of Alexander's commentary on the *Topics* (8) where the Boethian classification is given with an explicit ascriptiono Eudemus. Boethius however does not seem to be translating Eudemus directly, for the Latin scheme is slightly more elaborate, especially as regards substantial definition. And of course it is only part of the larger classification "according to the Peripatetics."

And so I come back to the general conviction I have written about elsewhere, that Boethius translated his explanations from some Greek book later than Porphyry but anterior to Ammonius, and that in numerous cases one could visualise the exact Greek words he copied from. In the present case, as in that previous gloss on Porphyry's 'tree', a brief marginal scheme in Boethius' uncial Greek manuscript would have given him all the material he needed for his Latin.

It is rather a pity, then, that this Ammonius text does not work as evidence that Boethius received his education in the school of Ammonius at Alexandria. Nor does any similar text that I have so far been able to examine." (pp. 16-17)

4. ———. 1982. "A Recent Discovery: Boethius' Notes on the *Prior Analytics*." *Vivarium* no. 20:128-141.

"As a matter of fact all the genuine texts of Boethius' Aristotelian translations are recent discoveries. They were all out of reach thirty years ago and they have come to light only after the long and intricate labour involved in discerning and collecting the manuscrip tmaterial for *Aristoteles Latinus*. This is an edition, planned for thirty-three volumes, of all the Latin

versions of Aristotle surviving from the Middle Ages; each volume of the collection is devoted to a single Aristotelian work, gathering together the various translations of it so far identified. (1) The first six volumes cover the treatises on logic, collectively known to the tradition as the *Organon*: *Categories*, *De Interpretatione*, *Prior* and *Posterior Analytics*, *Topics* and *Elenchi*, together with Porphyry's *Isagoge*('Introduction'). In these volumes the pioneer translations done by Boethius have been edited for all of the treatises except the *Posterior Analytics*, of which the genuine Boethian version is still missing. (2)

The procedure by which these genuine versions were discovered may prove to be one of the most impressive feats of scholarly achievement in this century. (3)" (p. 128)

(...)

"But the *PriorAnalytics* is the most interesting in this regard.The copy of this work (*b*) which was inserted by Thierry of Chartres in his famous volume of the liberal arts was one of the very few which the *Aristoteles Latinus* editor found to be genuinely Boethian. (9) But he discovered another version (B), also of French provenance, in a manuscript at Florence, (10) and on examination this proved to have so much in common with Thierry's copy that it had to be regarded as a second draft by the same translator.(11) The most noticeable differences between the two drafts, *b* and B, occur in thefirst sixteen chapters of Book I and in chapters 17-20 of Book II.(12)" (p. 130)

(1) A brief description of the enterprise was given by me in *Medium Aevum,* 33 (1964), 61-64; 42 (1973), 147-152.

5. ———. 1987. "The Greek Copy of Porphyrios' *Isagoge* used by Boethius." In *Aristoteles. Werk und Wirkung*. *Paul Moraux zum 65 Geburtstag gewidmet - Band 2: Kommentierung, Uberlieferung, Nachleben*, edited by Wiesner, Jürgen, 312-340. Berlin: Walter de Gruyter.

   "In this paper I wish to ask what type of Greek book Boethius possessed for his study of the *Isagoge*. He certainly did use a Greek book of some kind because although he based his first commentary (c) (1) on the Latin version or paraphrase already made by Marius Victorinus, for his *editio secunda* (C) he made his own translation (p) of Porphyry's work, which is a concise introduction to five basic Aristotelian terms: Genus, Species, Difference, Property, and Accident.

   Boethius' first commentary, c, opens with an experiment in the dialogue style that had been familiar to Latin authors from Cicero to Macrobius and Augustine. That such Platonizing dialogue might employ fictional elements is admitted by Macrobius (*Sat*. I 1), and it has been noticed that Augustine felt less than happy in using this Platonic mode. The characters here are Boethius himself and a possibly fictional Fabius whose total knowledge of the *Isagoge* seems to be confined to the Latin version made by Victorinus. Boethius at the outset (c 4,6) gives Fabius a Ciceronian promise (cf. *Cic.Top*. 1) of deeper instruction that he could have gathered from Victorinus alone. Boethius also admits that he will be transmitting this information from others, from the *introductorii commentarii* of learned masters, and he seems in fact to be actually consulting some such work (c 4,4: *super eisdem rebus meditantem*). A question may occur to the modern reader over these sources of his instruction. How is Boethius, so often praised for his originality of thought, in fact adapting or translating some earlier commentary, when he here undertakes in the best dialogue manner to convert *otium* into intellectual

negotium? A Latin source for his work would seem unlikely, for it appears from Cassiodorus (*Inst*. 2,3,18) that Victorinus had made only the Latin translation and not a commentary as well.

The extant Greek commentaries on the Isagoge have a special character because of the work's position at the beginning of the *Organon*, and therefore at the beginning of all Neoplatonic school-work in philosophy. They begin with lengthy sets of prolegomena, first on philosophy in general and then on the *Isagoge* itself. The general set adheres to a standard school order of topics for lectures (πράξεις): definitions of philosophy both theoretical and practical, and the subdivisions of these; then a further list of preliminaries (κεφάλαια, προλεγόμενα, προτεχνολογούμενα) which must be followed before beginning the study of any philosophic work.(2) The prolegomena proper to the *Isagoge* then apply these considerations, one by one, to the book itself." (pp. 312-313)

(1) For brevity of reference I employ these sigla, based on the usage of the Aristoteles Latinus (*AL*):

Π Porphyrii Isagoge, ed. Busse, CAG IV 1 (1887)

p Isagoge Porphyrii: translatio Boethii, ed. Minio-Paluello, AL I (1966) c Boethii in Isagogen, editio prima, ed. Brandt, CSEL 48 (1906)

C Boethii in Isagogen, editio secunda, ed. Brandt, *ibid*.

(...)

6. Solmsen, Friedrich. 1944. "Boethius and the History of the *Organon*." *American Journal of Philology* no. 65:69-74.

   Reprinted in F. Solmsen, *Kleine Schriften II*, Hildesheim: Olms, 1967, pp. 38-43 and in: Manfred Fuhrmann und Joachim Gruber (Hrsg.), *Boethius*, Darmstadt: Wissenschaftliche Buchgesellschaft, 1984, pp. 127-132.

   "Boethius had set himself the task of bringing into Latin the entire body of Plato's and Aristotle's writings. (1) What he actually accomplished, the translation of Aristotle's logical treatises, was a small part of this huge enterprise. There is, besides, his translation of Porphyry's *Eisagoge*.

The chronological order of these translations (and of the commentaries which accompany them) has been determined with reasonable certainty by two scholars, Samuel Brandt and Arthur P. McKinlay who, though differing in their method and criteria, have yet arrived at fundamentally identical results. (2) The sequence appears to have been as follows: Porphyry's *Eisagoge*, Aristotle's *Categories*, *Peri Hermeneias*, *Analytica Priora, Posteriora, Topica, Sophistici Elenchi*. It could not remain unnoticed that this sequence is identical with the order in which the original works are integrated in the standard collection of Aristotle's logical works commonly known as the *Organon*; in fact, Brandt (3) points out that Boethius simply followed the order which he found established in his Greek original. This suggestion is, as we shall see, perfectly correct; but a student of Aristotle will be aware that the existence of the *Organon* (or of any fixed order of these writings) by A. D. 500 has never been proved. (4) Shall we then say that the studies of Brandt and McKinlay have supplied the *terminus ante quem* for its existence which the students of Aristotle's own works have failed to find?

In a sense this is true, but if we wish to have the complete picture a few more facts must be taken into account.

Byzantine manuscripts of Aristotle's logic, which are very numerous, invariably have the writings in the "orthodox" order, given above. Just as invariably they include Porphyry's *Eisagoge* as the first item, i. e. preceding the *Categories*. (5) To most scholars these facts would indicate that there were one or more late ancient editions in which the works were thus arranged. I do not know whether anyone would be inclined to think of a Byzantine scholar as responsible for the arrangement, but if anyone did he would certainly find it very difficult to maintain this view against the witness of Boethius; for it is precisely here that Boethius' testimony becomes important." (pp. 69-70)

(1) *In librum peri hermeneias Comment., Secunda editio*, II, 3, p. 79, 16 Meiser.

(2) S. Brandt, *Philol*., LXII (1903), pp. 141-54, 234-79; A. P. McKinlay, *H. S. C. P*., XVIII (1907), pp. 123-56. See also E. K. Rand, *Jahrbücher f. class. Philol*., Supplem. XXVI (1901), pp. 428 ff.

(3) *Loc. cit*., p. 260. Aristotle (*A. Pr*. A4, 25 b 26) had made it clear that the *Analytica Posteriora* was to be considered a sequel to the *Priora*. Apart from this, he has nothing to do with the order sanctioned in the *Organon*. On the term *organon* and its application to Aristotle's logica, see e. g. Karl Prantl, *Geschichte der Logik im Abendland* (Leipzig, 1855), I, p. 532 (especially notes 4 and 5); see also W. Christ and W. Schmid, *Griechische Literaturgeschichte* (6th ed., Muenchen, 1920), I, p. 729, n. 3.

(4) W. D. Ross, *Aristotle* (3rd ed., London, 1937), p. 20, n. 6, suggests that the term "Organon" was in the sixth century applied to the collection of Aristotle's logical works.

7. Sorabji, Richard. 1998. "Boethius, Ammonius and their different Greek backgrounds." In *Ammonius on Aristotle On Interpretation 9 with Boethius on Aristotle On Interpretation 9*, edited by Blank, David and Kretzmann, Norman, 16-23. London: Duckworth.

"Ammonius, c. 435/445–517/526 AD, was taught by Proclus in Athens, took the Chair of the Neoplatonist school in Alexandria and had all the greatest sixth-century Neoplatonists as his pupils. His commentary on Chapter 9 of Aristotle's *de Interpretatione* is a treatise on ancient arguments for determinism. By determinism I mean the view that whatever happens has been inevitable or necessary all along. The famous Sea Battle argument for determinism, reported and attacked by Aristotle, was commonly presented in a new form in the Middle Ages(1) in terms of definite truth and definite falsity. Ammonius' was not the first such exposition, but it is the earliest detailed one to survive. It was almost immediately followed by the Latin exposition of Boethius, which uses the same idea, drawing independently on an overlapping set of Greek sources.(2) Boethius influenced the medieval Latin tradition, while the medieval Arabic was influenced by

Boethius' sources and by Ammonius possibly through the derivative commentary of Stephanus.(3)" (p. 16)

(1) 1. N. Rescher, in *Studies in the History of Arabic Logic*, Pittsburgh 1963, ch. 5, and in 'Truth and Necessity in Temporal Perspective', in R. Gale (ed.), *The Philosophy of Time: a Collection of Essays,* London 1968.

(2) Ammonius' sources are described by David Blank in the introduction to his translation in this series of Ammonius, *in Int. 1-8*. For Boethius' use of Alexander, Porphyry, and Syrianus see the index nominum in Meiser's edition of Boethius' two commentaries on *Int*. For Ammonius' use of these and of Iamblichus and Proclus as well, see the index nominum in Busse's CAG edition of Ammonius' commentary on *Int*. Ammonius declares himself particularly indebted to Proclus, 1,6-11; cf. 181,30-1, Boethius to Porphyry, *2nd comm. on Int*. 7,5-6; cf. 219,17.

Robert Sharples has found an attack on definite truth as incompatible with contingency as early as Alexander *Quaestio* 1.4, pp. 12-13, translated London and Ithaca N.Y. 1992, p. 35, n. 81, which updates his 'An Ancient Dialogue on Possibility: Alexander of Aphrodisias Quaestio 1.4', *Archiv für Geschichte der Philosophie* 64, 1982, 23-38. For the comment on this in Norman Kretzmann's 1987 paper at p. 67, corrected in the reprint below, see Chapter 2. [Ammonius on Aristotle *On Interpretation* 9 with Boethius on Aristotle *On Interpretation* 9]

3. Stephanus is suggested by F.W. Zimmermann, Al-Farabi's *Commentary and Short Treatise on Aristotle's de Interpretatione*, Oxford 1981, LXXX-XCVIII, at XCIV. William Charlton's translation of Stephanus will be appearing shortly in this series.

Abstract: "Aristotle recorded his intention to discuss hypothetical syllogistic fully (*An. pr.* 50a39), but no such treatment by him has been available since at least a.d. 200, if even it ever existed. The contributions of his successor Theophrastus have also perished, as have those of his followers of the subsequent few centuries. At the same time, almost all of the surviving sources, especially the Greek commentators and Boethius, did not report hypothetical syllogistic accurately. Rather, they conflated it with Stoic logic, which it resembles in some respects, but from which it is significantly different. Modern scholars, who have not appreciated the nature or extent of this conflation, have unintentionally perpetuated the problem. As a result, the original form of hypothetical syllogistic has been misunderstood, and part of the influence of Stoic logic in late antiquity has remained unclear.

This book is an account of the conflation of hypothetical syllogistic and Stoic logic. The first chapter is a study of Aristotle's remarks on hypothetical syllogistic, which suggest that it was not a sentential logic such as the Stoics would develop. The second chapter details the conflation as it appears in the Greek commentaries on Aristotle, which consists principally in a confusion between the original Peripatetic division of hypothetical statements and syllogisms, whose criteria are semantic, and the Stoic division of complex propositions and inference schemata, whose criteria are syntactic. The third and fourth chapters focus on Boethius's *On hypothetical syllogisms* and *On Cicero's Topics*, in which even further conflation demonstrates that hypothetical syllogistic and Stoic logic had completely ceased to retain their distinct natures by the end of antiquity."

9. Stump, Eleonore. 1974. "Boethius "Works on the Topics"." *Vivarium* no. 12:77-93.

"The *De topicis differentiis* appears to be the mature product of an axcellent mind. It shows the same acumen, subtlety, and care as Boethius's other logical treatises; and it seems to build

on the training and insight Boethius manifested in his earlier treatises. (1) It is a complete study of the discipline for finding arguments, both dialectical and rhetorical. Boethius works his diverse material, from different traditions and from different disciplines, into one coherent and elegant system unequaled, as far as I know, in any of the material that has come down to us from antiquityand the early middle ages. (2)

(...)

But a thesis which runs counter to the common-sense view has been published; James Shiel in his article *Boethius' Commentaries on Aristotle* (4) has argued that Boethius's works on logic are not original compositions but are rather his translations of Greek Neo-Platonic scholia on Aristotle's *Organon*. His thesis seems to be gaining currency; two eminent scholars in the field, Minio-Paluello (5) and De Rijk, (6) accept or support it. In this article,after considering very briefly some treatment of Shiel's thesis in the literature, I want to discuss the thesis in detail as it applies to Boethius's work on the *Topics*. My main concern is to examine and discuss Shiel's evidence for his counter-intuitive theory; if it does not stand up under scrutiny, we are free to return to the common-sense view and to take Boethius's works on the *Topics*, at least, to be just what they appear to be -- his original compositions." (pp. 77-78)

10. ———. 1978. "Dialectic and Boethius's *De topicis differentiis*." In *Boethius's De topicis differentiis*, edited by Stump, Eleonore, 179-204. Ithaca: Cornell University Press.

    Contents: Abbreviations 11; Introduction 13; Part One. De topicis differentiis; Book I 29; Book II 43; Book III 63; Book IV 79; Notes to the Translation; Book I 97; Book II 110; Book III 128; Book IV 141; Part Two. Dialectic in Ancient and Medieval Logic Dialectic and Aristotle's Topics 159; Dialectic and Boethius's De topicis differentiis 179; Between Aristotle and Boethius 205; Peter of Spain on the Topics 215; Differentia and the Porphyrian Tree 237; Differentia 248; Bibliography 263; Indexes 275-287.

    "This book is a philosophical study of Boethius's treatise *De topicis differentiis*. It includes the first English translation of this historically and philosophically important text, as well as copious notes designed to make the text accessible to philosophers and scholars interested in the medieval period. Detailed philosophical analyses of the text and of important technical concepts, such as the concept of the predicables, are worked out in the chapters of Part II. Chapters on Aristotle's Topics and the treatise on dialectic in Peter of Spain's T*ractatus* explain the work of these philosophers on the Topics and explore the relationship of their views to those of Boethius. My principal aim is to make Boethius's treatise available and comprehensible to scholars for whom the technical Latin vocabulary and unfamiliar subject matter have made it inaccessible." (From the *Preface*)

11. ———. 1981. "Boethius' Theory of Topics and its Place in Early Scholastic Logic." In *Congresso Internazionale di Studi Boeziani (Pavia, 5-8 ottobre 1980): Atti*, edited by Obertello, Luca, 249-262. Roma: Editrice Herder.

    "Boethius's *De topicis differentiis* is a philosophically interesting and historically influential work having to do with the art of Topics (or *loci*), a branch of philosophy which antiquity bequeathed to the Middle Ages but which

philosophers of the scholastic period transformed almost past recognition. In this article, I want to explain briefly Boethius's theory of Topics and then discuss in some detail that of Abelard, which seems superficially quite similar to Boethius's but is in fact very different from it. As a result, I hope to make clearer both Boethius's theory of Topics itself and the significant role played by Boethian Topics in the history of twelfth-century logic." (p. 249)

12. ———. 1981. "Boethius and Peter of Spain on the Topics." In *Boethius and the Liberal Arts: A Collection of Essays*, edited by Masi, Michael, 35-50. Bern: Peter Lang.

    "Boethius's influence on later medieval philosophy is, of course, enormous, and his treatment of the Topics is no exception to that general rule. Later medieval philosophers had a strong interest in dialectic. The whole technique of the *disputatio*, for example, and the consequent literature on *obligationes* have their ultimate origin in dialectic; and the study of the Topics was considered a regular part of logic and treated in a section of its own in elementary logic texts. For a long time, Boethius was the most important, and sometimes the sole source for the study of the Topics, and his work remained an important indirect source even when it was superseded by later treatments of the subject. For example, three of the best known thirteenth-century logicians, William of Sherwood, Peter of Spain, and Lambert of Auxerre, all have a chapter on Topics in their introductory logic texts; and all three reproduce the Boethian list of Topics and the major Boethian categorizations or divisions of the Topics.

    For the sake of putting Boethius's work on the Topics into medieval perspective and of understanding the changes and developments in the Topics, it is useful to consider the treatments of the Topics among some of these later medieval philosophers. In particular, it is worthwhile examining the discussion of the Topics in Peter of Spain's *Tractatus*, (9) which was the most widely used textbook of logic on the Continent from the late thirteenth to the end id the fifteenth century (10). Its discussion of the Topics is very similar to discussions found in several of the scholastics contemporary with or earlier than

Peter. Besides being a representative and influential treatment of the Topics, Peter's discussion is heavily dependent (directly or, more likely, indirectly) (11) on Boethius's account. The chapter on dialectic in the Tractatus is like *De top. diff.* in organization. It begins with a series of definitions and then lists the Topics with a description and example of each. The definitions and the listing are those in *De top. diff.*, and in some places Peter's words are equivalent to a quotation from Boethius. (12) Consequently, comparison of Boethius and Peter is not difficult. Some of the recent literature has suggested that Peter's work on the Topics is simply a slightly varied compilation drawn from Boethius's *De top. diff.* Otto Bird, for example, who has published a number of very useful articles on the medieval Topics, says that Peter's discussion of the Topics "is little more than a summary of the first half of BDT [*De top. diff.*],"13 and that "Peter of Spain made a précis of it [*De top. diff*] (primarily of the second book) and provided additional Maxims in the fifth tract of his *Summulae* [*Tractatus*]." (14) But such a view shows a mistaken understanding of both Peter and Boethius. In what follows here, I will examine Peter's discussion of the Topics in considerable detail in order to exhibit with some accuracy a method for using Topics that, despite its apparent similarity to Boethius's method, is in fact very different from it; by doing so, I hope to show what Peter's method comes to and as a result to clarify the nature of the Boethian art of Topics." (pp. 37-38)

echoes Bird's view of Peter. Cf. "Topik und Syllogistik im Mittelalter", in *Sapienter Ordinare: Festgabe für Erich Kleineidam*, ed. F. Hoffmann, L. Scheffczyk, and K. Feiereis (Leipzig, 1969), p. 164; and *Logik und Semantik im Mittelalter* (Stuttgart-Bad Cannstatt, 1972), p. 75. De Rijk, ed., *Tractatus*, p. XCIII seems to agree at least in part with Bird's view: "This tract [chap. V of *Tractatus*] is not a compilation from Aristotle's *Topica* but from Boethius' *De topicis differentiis* I and II, with some additions from Aristotle's *Topics*." He argues in note 5 on the same page that Peter's treatment is not taken directly from Boethius: rather, he says, it is "useful to point to the treatment of the loci in the *Logica Cum sit nostra*, pp. 438-445 or to that in the somewhat older work, *Dialectica Monacensis*, pp. 528-555." De Rijk's point is very likely right, but what can be inferred from the claim in the text and the note is that Peter's work on Topics amounts to an indirect compilation from Boethius's *De top. diff.*

13. ———. 1987. "Boethius's *In Ciceronis Topica* and Stoic Logic." In *Studies in Medieval Philosophy*, edited by Wippel, John F., 1-22. Washington: Catholic University of America.

    "But perhaps the most interesting unexplored section in *In Ciceronis Topica* is Boethius's presentation of Stoic logic, and that is the part I want to concentrate on in this paper. Rather than dwell on the main theme of *In Ciceronis Topica*, the art of discovery and its instruments, the Topics, I want to focus instead on just that small part of Boethius's commentary in which he relates the Topics to Stoic dialectic or logic and reveals his understanding of that part of Stoicism. We are beginning to understand the ancient art of discovering arguments, and it has garnered increasing attention among contemporary scholars. But as far as I know, Michael Frede(30) is alone among recent historians of philosophy in considering Boethius's contribution to our understanding of Stoic logic; and even he gives only a brief discussion of a small part of the relevant Boethian text. So in what follows I will concentrate on just the fifth book of *In Ciceronis Topica*, in which Boethius discusses the so-called undemonstrated modes or argument forms of the Stoics. I need to make plain here that my area of

interest and expertise is Boethius and not the Stoics; but I think that in *In Ciceronis Topica* Boethius sheds some light on a vexing problem which has troubled students of Stoic logic for some time." (pp. 6-7)

14. ———. 1988. "Topics: Their Development and Absorption into the Consequences." In *The Cambridge History of Later Medieval Philosophy*, edited by Kretzmann, Norman, Kenny, Anthony and Pinborg, Jan, 273-299. Cambridge: Cambridge University Press.

"According to Boethius, who is dependent on both the Greek and Latin traditions,(8) two different sorts of things are Topics: a Topic is both a maximal proposition and the Differentia(9) of a maximal proposition. On Boethius' view, a maximal proposition is a self-evidently true, universal generalisation, such as 'Things whose definitions are different are themselves also different.' Boethian Topics of this sort probably have as their ancestors the Aristotelian Topics that are principles. Their official function, on Boethius' account, is to aid in the discovery of arguments; but in practice Boethius tends to use them to confirm arguments.(10) Differentiae are theoretically the differentiae dividing the genus maximal proposition into its subaltern genera and species, and in that capacity they do serve to classify maximal propositions into groups. Some maximal propositions have to do with definition, for example, and others with genus; so from definition and from genus are Differentiae. Much more important, however, is the role Differentiae play in Boethius·s method for the discovery of dialectical arguments. For the most part, Boethius thinks of dialectical arguments as having categorical rather than conditional conclusions, and he conceives of the discovery of an argument as the discovery of a middle term capable of linking the two terms of the desired conclusion. Boethian Differentiae are, for the most part, the genera of such middle terms. To find an argument, using Boethius' method, one first chooses an appropriate Differentia (criteria for appropriateness are left to the arguer's intuition). The genus of middle terms, determined by the Differentia

chosen, and the two terms of the desired conclusion then indicate the specific middle term of the argument and so indicate a dialectical argument supporting the conclusion. In Book II of *De topicis differentiis*, Boethius gives what he claims is an exhaustive list of Differentiae, taken from Themistius. These Themistian Differentiae or some subset of them constitute the core of most scholastic discussion of the Topics (except, of course, for scholastic commentaries on Aristotle's Topics)." (pp. 274-275)

(8) For a summary of the controversy over Boethius' sources, sec Stump 1974.

(9)) I am capitalising 'Diff'rentia' here to distinguish this technical usc of the word from its more ordinary use designating one of the predicables.

(10) a detailed analysis of oethius' usc and understanding of opics, see Stump 1978, especially pp. 179-204.

"Since 1975 my work in medieval logic has concentrated on dialectic. I have tried to trace scholastic treatments of dialectic to discussions of it in the work of Aristotle, the Greek commentators on Aristotle, and the Latin rhetorical tradition. But I have been especially interested in Boethius, whose discussions of dialectic were among the most important influences on scholastic treatments of that subject. Accounts of dialectic based ultimately on Boethius's views continued to play a fundamental role in philosophy through the fourteenth century. The earliest scholastic logician whose work we know, Garlandus Computista, devoted a great deal of attention to Boethian dialectic, and I have tried to follow the development of scholastic dialectic from Garlandus through various twelfth-century logicians (including Abelard) and the thirteenth-century terminists into the fourteenth century in the work of William Ockham." (p. 1)

16. Suto, Taki. 2009. "Logic and Grammar in Boethius: A Logical Analysis of the Parts of Speech." In *The Word in Medieval Logic, Theology and Psychology. Acts of the XIIIth International Colloquium of the Société Internationale pour l'Étude de la Philosophie Médiévale, Kyoto, 27 September - 1 October 2005*, edited by Shimizu, Tetsuro and Burnett, Charles, 65-80. Turnhout: Brepols.

    "There is no doubt that Boethius places Aristotle's *Peri hermeneias* and his commentaries in the field of logic. In chapter 1 (16a8-9) of the work, Aristotle famously reserves some matters for his work on the soul, considering them beyond the scope of the subject in discussion. In commenting on this reservation, Boethius claims that "it is one thing to dispute principally on thoughts (*intellectibus*) of the soul, but another to take them for disputation so far as they can pertain to logical knowledge," (1) thus holding the topic in discussion as that of logic.

    On the other hand, Boethius' discussions in the commentaries rely heavily upon the noun (*nomen*) and the verb (*verbum*), which we usually take as grammatical distinctions." (p. 65)

    (...)

"Although using the terminology employed by grammarians, Boethius sometimes contrasts his view with theirs. He claims that grammarians regard “garalus” (which is a not a real Latin word) as a noun but philosopher do not. (10) He also claims that a grammarian counts eight parts of speech, i.e., noun, pronoun, verb, adverb, participle, conjunction, preposition and interjection, but that a philosopher counts only two, that is, noun and verb. (11) Calling the holder of the view contrasted to that of a philosopher simply “a grammarian” (*grammaticus*), (12) Boethius never actually names any grammarians in his discussions. (13)

In this paper, by considering the question of how Boethius distinguishes logic from grammar, I will analyse the nature of Boethius’ investigation of logic in his commentaries. (14) Specifically, I will look at his division of the parts of speech and his notion of conjunction. The result of the examination will show that Ackrill’s criticism of Aristotle does not apply to Boethius." (p. 67)

(1) “Etenim aliud est principaliter de intellectibus animae disputare, aliud tantum sibi ad disputationem sumere, quantum ad logicae possit pertinere peritiam.” Boethius (A.M.T. Severinus), *In Peri hermeneias, Prima editio*, ed. C. Meiser in *Anicii Manlii Severini Boetii Commentarii in Librum Aristotelis Peri Hermeneias*, Leipzig 1877, 41.11-14. Hereafter *In PH I* refers to the first commentary and *In PH II* to the second commentary.

(10) Boethius, *In PH II*, ed. Meiser, 32.17-22.

(11) Boethius, *De syll. cat.*, in PL 64, 796C-D; *Introd. syll. cat.*, in PL 64, 766A-B (note 39).

(12) Note that a “grammarian” was a scholar engaged in the study broader than grammar in modern sense (including poetry especially): “Primus in eo qui scribendi legendique adeptus erit facultatem, grammatici est locus. Nec refert de Graeco an de Latino loquar, quanquam Graecum esse priorem placet: utrique eadem via est. Haec igitur professio, cum brevissime in duas partes dividatur, recte loquendi scientiam et poetarum

enarrationem, plus habet in recessu quam fronte promittit." (Qunitilianus, *Institutiones oratoriae* I c. 4 [1-2] in *The Orator's Education*, ed. and trs. D. Russell, Cambridge MA 2001. See also the appendixes of R. Kaster, *Guardians of Language: The Grammarian and Society in Late Antiquity*, Berkeley, 1988.

(13) We can find the names of Aristarchus and Donatus in Boethius' writings (Aristarchus: Boethius, *In Categorias Aristotelis = In Cat.,* in PL 64, 171D, 182C, 189C, 260A; Donatus: *In Cat*., 257D). Boethius mentions their names as examples of a grammarian and says nothing about their grammatical theories.

(14) There are only a few secondary writings on this topic: J. C. Magee, "Truth, Discourse and Mind in Boethius", Ph.D. dissertation, University of Toronto, 1986, chapter 2 and S. Ebbesen "Boethius on the Metaphysics of Words", in A. Galonnier ed. *Boèce ou la chaîne des savoirs*, 2003, 257-75.

"This work aims to be a study of his commentaries on Aristotle's *Peri hermeneias* (*De interpretatione*). For my discussion of these commentaries, I use Carl Meiser's edition,

which is the only critical edition currently available. Deviations from the critical edition are recorded in the footnotes of the quotations.

Boethius wrote two commentaries on *Peri hermeneias*. In Meiser's edition, the first commentary is only 195 pages while the second commentary is 502 pages, more than double the length of the first. Writing two commentaries on the same work was not unusual for him. He also wrote two commentaries on Porphyry's *Isagoge*, but the first commentary is three-fifths the length of the second commentary.(3) The striking difference in length between the two commentaries on *Peri hermeneias* reflects his careful planning of the role of each commentary: the first one to present basic lines of Aristotle's thought, the second one to provide much more detailed explanations.(4) In the second commentary, he often introduces past discussions of Greek commentators and notions that he does not mention in the first commentary. The fact that he purposely wrote two commentaries should be seriously taken into account in considering the apparent inconsistencies and contradictions between them.

This work is primarily devoted to the second commentary. I include the first commentary principally in the following two cases: First, I point out where his explanation significantly differs from that of the second commentary. His account in the second commentary can be mostly regarded as a development of the first, but the first commentary sometimes has explanations incompatible with those in the second commentary.(5) Boethius seems to make contradictory statements rather deliberately, intending to present simple interpretations in the first commentary, knowing that they are not the best.(6) Second, I refer to the first commentary when it illuminates or enhances his explanations in the latter.

I sometimes look at Boethius' other works, mainly logical ones, in relation to the main questions surrounding the second commentary.

Where the texts contribute to our understanding, I discuss them in the relevant sections. Otherwise, I refer to them in the

footnotes. For my interpretations of the commentaries, I have relied very little on his treatises on theology, liberal arts, and his renowned masterpiece, The *Consolation of Philosophy*. It is important to consider why the same individual wrote all these works in different disciplines. I would not deny that these independent treatises could illuminate his logical works. In fact, I believe they do, and I will argue so in the concluding chapter.

I find, however, that these independent treatises have many differences from his logical works. For an accurate interpretation of his logical works we should be very careful in relying on these treatises.(7)" (pp. 1-2)

(3) In Brandt's edition of Boethius' commentaries on Isagoge, the second commentary is 214 pages while the first commentary is 130 pages. Boethius does not allude to a second commentary in the first.

(4) In *PH1* 31.6-32.3; In *PH2* 186.2-9; 250.20-251.4; 294.5-8. For the dates of composition of these commentaries, see Chart 2, p. XIX.

(5) His distinction between simple and composite propositions, which I discuss in Chapter 5, is an example of this.

(6) Sten Ebbesen (*The Aristotelian Commentator* (2009): 49) points this out with textual evidence: In PH1 132.3 sqq. and In PH2 276.8 sqq.

(7) Scholars have pointed out this danger. Antony Lloyd (*The Anatomy of Neoplatonism* (1990): 2, n.2) cautions against cross-referencing Boethius' different works. Ebbesen says, "one should be cautious in assuming consistency between the doctrines of the Aristotle commentaries and that of *Consolation of Philosophy*" ("Review of J. Magee's *Boethius on Signification and Mind*." *Vivarium* 29, 1991, p. 153). Vincent Spade (*Boethius against Universals: Arguments in the Second Commentary on Porphyry*, 1996) criticizes Peter King's use of Boethius' *De trinitate* for understanding his second commentary on *Isagoge*.

18. ———. 2015. "From Analysis of Words to Metaphysical Appreciation of the World: the Platonism of Boethius." *Quaestio. Journal of the History of Metaphysics* no. 15:321-332.

    "Anicius Manlius Seuerinus Boethius has been regarded one of the major sources of Platonism in the Middle Ages(1). Many scholars have argued that Boethius was deeply influenced by Platonism, mentioning such Platonists as Apuleius, Plotinus, Porphyry, Iamblichus, Proclus and Ammonius. However, recent studies on Boethius have shown that Boethius was not influenced by those Platonists to the extent that some past studies had claimed(2). Furthermore, reading Boethius' Aristotelian commentaries casts a different light on his relationship with the Platonists and reveals his understanding of Aristotle's works, which is generally quite accurate.

    That said, I am not going to claim that Boethius is not a Platonist at all.

    Indeed, he is. Rather, I'd like to discuss in what ways and to what extent this Aristotelian commentator is a Platonist. To begin, I will look at different attitudes toward Plato in Boethius' works, first in his *Consolation of Philosophy* and then in his Aristotelian commentaries." (p. 321)

    Introduction.

    "While Augustine is the source of what has aptly been called "the semiological consciousness of the Christian West," Boethius is the source of its technical vocabulary and academic form. (9) For the twelfth century as a whole, Boethius's logical commentaries and theological tractates are the standard works of reference and provide the technical vocabulary for new work. As we shall see, Abelard and Alan take up not just Boethius's vocabulary but his questions and issues in their accounts of language and theology. Moreover, they take up not just the logical and theological parts of Boethius's project but also the questions and themes of the Consolation in their poetry.

    Boethius's project was to translate, comment on, and transfer the language of philosophy into theology, to incorporate secular disciplines and texts into his own philosophical/theological vision. Boethius's imaginative world is one populated largely by other texts, and is notably different from Augustine's appropriation of secular texts in the more positive and autonomous place given to Aristotelian logic and pagan literature. The voices of these texts speak themselves in the work of Boethius." (p. 2)

Chapter 1.

"Although I do not pretend to have found the definitive solution to I he problem of interpreting Boethius, following the theme of language through the main parts of the corpus has yielded a stronger sense of the unity, autonomy, and originality of Boethius. One way to express it is in visual terms, terms suggested, I will show below, by the *Consolation* itself. (7) My contention is that Boethius’s innovation is the construction in some detail of multiple and correct, though limited, perspectives from which human understanding can view itself and the nature of reality. As we will see, the method of the Boethian project is linguistic: different perspectives are constructed by developing different vocabularies and different senses of the same terms. Then, the perspectives are arranged hierarchically, the lower encompassed by the higher.

The themes to which Boethius returns again and again in the logical commentaries are the distinction between the order of words and things and the conventionality of language. From this fundamental distinction between what is the case and what we say, it is only a short step to the elaboration and amelioration of this gap in terms of multiple senses of terms, multiple disciplines with distinct methods and terminologies, and even multiple ontologies which either describe the same reality in different terms and/or are true descriptions of different strata of reality. The conviction that motivates a good portion of the tractates is the view that disagreement and contradiction can be mediated by the creation of or the distinction between different vocabularies. And while it is true that the Consolation attempts to hierarchize the different perspectives on Boethius’s fate, it still gives voice to those “lower” perspectives through the voice of Boethius, the prisoner.

Boethius’s own use of language mirrors this multiplicity of meanings, methods, and rhetorics. He goes from close, careful

translation, paraphrase, and commentary designed to provide an introduction to the greenest of beginners, to the terse, esoteric, and technical language of the tractates, to the complex interweaving of poetic and philosophical language and allusions in the *Consolation*.

Boethius surely had important models for such multileveled and synthetic views in his Neoplatonic masters and contemporaries, who would have seen his stated plan to translate, comment on, and show the agreement between Plato and Aristotle as an understandable if bold undertaking. Boethius's vision differs from theirs both in being Christian and in being worked out in almost exclusively textual terms — in the mediation of texts in the translation and commentary, in the self-conscious production of new textual forms, and in the development of new vocabularies. Boethius both creates his own vocabulary in his translations and transfers it from its "proper" and original location to theological topics where it is radically reworked in the theological tractates. The same project continues in the *Consolation*'s attempt to ascend from the prisoner's worldly perspective to that of Lady Philosophy by means of the language and arguments of different philosophical schools.

I will trace the construction of this peculiarly Boethian textuality in Boethius's *Isagoge* and *Peri hermeneias* commentaries, theological tractates and *Consolation*. In all these texts, Boethius's most common methods are, first, the division or distinction, and second, the construction and relating of different perspectives. Following Boethius's own pedagogical plan, then, I begin with the logic commentaries." (pp. 7-8, notes omitted)

21. Thomsen Thörnquist, Christina. 2017. "Bridging the Beginner's Gap: Apuleius, Boethius, and Porphyry on the Categorical Syllogism." In *The Aristotelian Tradition: Aristotle's Works on Logic and Metaphysics and Their Reception in the Middle*

Ages, edited by Bydén, Börje and Thomsen Thörnquist, Christina, 228-248. Turnhout: Brepols.

"Between Boethius in the early sixth century and Abelard at the beginning the twelfth, Aristotle's *Prior Analytics* was lost to the Latin West and its content was known solely through indirect and fragmentary sources. Boethius' *De syllogismo categorico* held a key position in this initial stage of the medieval reception of the *Prior Analytics*,(1) but other Latin sources were also known, such as Apuleius's *Peri hermeneias*. The great number of striking similarities between Boethius's *De syllogismo categorico* and Apuleius's *Peri hermeneias*, taken together with their chronological interrelation, have often led scholars to believe that the former draws on the latter. This article will propose a different explanation and discuss its implications for previous theories on the possible sources and overall aim of Apuleius's work." (p. 228)

Abstract: "Boethius represents one of the most important milestones in Christian reflection about fate and providence, especially considering that he takes into account Proclus' contributions to these questions. For this reason, The Consolation of philosophy

is considered a crucial work for the development of this topic. However, Boethius also exposes his ideas in his commentary on the book that constitutes one of the oldest and most relevant texts on the problem of future contingents, namely Aristotle's *De interpretatione*.

Although St. Thomas refers to Boethius many times in his systematic works and even devotes two commentaries to two of his theological opuscules, it is of special interest that both authors composed a commentary on the above mentioned work by

Aristotle. The commentary of Saint Thomas does not interpret the whole book, but it does study the pages about future contingents in dialogue with Boethius. We will study such texts in our presentation. They constitute one of the greatest contributions

of Aquinas to the problem of necessity and contingency and therefore to the *vexata quaestio* of divine intervention in the world and particularly in human free will. Not only Augustin but also Aristotle (read by Boethius) and Nemesius of Emesa will be

decisive in Aquinas' perception of this matter."

Chapter II: Boethius on Porphyry pp. 53-88. 1. orphyry's Doctrine: a.The Five Predicables; b. The Quidditative-Denominative Distinction; 2. Boethius' Statement of the Problem; (a) Interpreting Porphyry;, (b) Universal Can be Neither Single Nor Many; (c) But a Universal Must Be Something; (d) Alexander's Solution; (e) Uiversals Are "Likenesses"; 3. he Problem Restated.

"The previous chapter was an informal discussion of the origins and significance of the problem of universals in Plato and Aristotle. We now skip nine hundred years to discuss a passage in a commentary by Boethius (c. 480-524) on a work entitled *Isagoge* written two centuries earlier by the neo-Platonist philosopher Porphyry. During those eight centuries after Aristotle there was certainly a great deal of thought given by many men to the topic of universals, but we safely ignore this ill explored region of the history of philosophy since what the early scholastics knew of it was pretty much limited to what could be dredged from Boethius, and for the most part from

this single passage that we are about to study. And since we are now dealing directly with what Peter Abailard and his contemporaries considered not just a statement, but the statement of the problem of universals, we shall have to be much more precise in our analysis." (p. 53)

"I must warn the reader from the start that what we are about to examine is a confused, vague and disorderly piece of philosophical writing. Since it was in Abailard's day the only detailed discussion of universals bequeathed to the scholastics by antiquity, we shall be driven to the conclusion that the scholastics of that time had on this topic received no clear instructions at all from the classical authorities they so revered. Probably this was all to the good. Here was an area where the sharp minds of the twelfth century were almost totally unfettered by the tradition and could explore many different approaches.

But Boethius' text is far from worthless. It sets forth a terminology that was sufficiently vague to allow for use by almost any conceivable theory, but yet sufficiently meaningful to facilitate communication and argument. Furthermore, it related the rather battered remains of some ancient ideas on the topic, and these were still potent enough to excite intelligent people to construct their own theories around them.

A second warning is necessary. It is not at all clear that Boethius himself believes that what he is saying here has any more than provisional validity. At the very end he tells us that he has set forth the solution he gives not because he agrees with it but because it was Aristotle's and, after all, the reader is, presumably, preparing himself for the study of Aristotle's *Categories*. It is well known that Boethius himself was a Platonist, and thus it is not entirely surprising that his account of the Aristotelian view here is not very coherent and opens more questions than it answers. Perhaps Boethius himself intended it that way. With all this in mind let us examine the text in detail.

(a) Interpreting Porphyry

The passage from Porphyry that Boethius has translated from the Greek and is about to comment on runs as follows:

On the subject of genera and species I shall at present decline to say whether they subsist or are given in mere bare ideas, and whether as subsistents they are corporeal or incorporeal, and whether they are separate from sensible items or given in sensible items. For topics of this sort are very deep and demand a long inquiry.

Mox de generibus et speciebus illud quidem, sive subsistant, sive in soils nudis intellectibus posita sint, sive subsistentia corporalia sint an incorporalia, et utrum separata a sensibilibus posita: et circa haec consistentia dicere recusabo. Altis-simum enim negotium est hujusmodi, majoris egens inquisitionis.(11)" (pp. 63-64)

24. Wang, Qi. 2014. *Boethius and the Importance of Basic Logic and Mathematics for Philosophy*, Leiden University.

    Unpublished Ph.D. thesis availbale at Leiden University.

    "My dissertation has three main parts. The first part (Chapter II) focuses on Boethius' elementary disciplines, logic and mathematics. I will give a short introduction to these two disciplines and their roles in Boethius' whole knowledge; then I will point out applications of each one to the other. The second and third parts (Chapter III and Chapter IV) trace applications of mathematics and basic logic in Boethius' theological treatises and in the *Consolatio Philosophiae* respectively. Before the three main chapters, the background of Boethius will be introduced first. In this chapter, I will give a description of the curriculum before Boethius and an introduction toBoethius' curriculum on mathematics, logic, theology, and his *Consolatio Philosophiae*." (p. 3)

Études en Français

1. de Libera, Alain. 1999. *L'art des généralités. Théories de l'abstraction*. Paris: Aubier.

Chapitre II: *Boèce*, pp. 159-280.

"Médiateur quasi exclusif des doctrines porphyriennes, Boèce a également déterminé en profondeur l'interprétation du questionnaire de Porphyre : c'est donc lui qui, jusqu'au XIIe siècle, a aussi fourni aux Latini de quoi entendre et argumenter le « problème des universaux » enté par les commentateurs néoplatoniciens du VIe siècle sur le formulaire de Porphyre. Ce rôle massif, bien reconnu par l'historiographie, en dissimule cependant un autre, qui est demeuré inaperçu. On peut le résumer d'une phrase, dont les pages qui suivent apporteront la démonstration : dans son interprétation même de Porphyre, Boèce a assuré la pérennité, voire l'articulation même, de ce que nous avons appelé l'« épistémé alexandrinienne ».

C'est par Boèce, en effet, que les doctrines d'Alexandre, et plus encore ses concepts et ses théorèmes les plus fondamentaux, ont été connus, sans toujours être reconnus, par les Latins. Dans le naufrage global des sources littéraires de l'Antiquité tardive, qui impose à l'historien l'idée fausse d'une rupture entre le monde antique et le monde médiéval, l'oeuvre de Boèce est comme une Arche où survivent - pour la plupart anonymes - les théories, les débats, mais aussi les réseaux de concepts et d'arguments, tissés au long des siècles à partir des écrits d'Alexandre d'Aphrodise. Pour comprendre la pensée philosophique latine jusqu'à son accomplissement dans la figure préscolastique, gréco-latine, du savoir, qui se déploie au XIIe siècle chez Pierre Abéïard, le passage par Boèce est donc obligé. C'est par lui que, à leur insu, les médiévaux ont communiqué avec Alexandre, ses interprètes et ses critiques. L'*Aetas boethiana* a donc été aussi l'« époque » ou l'« ère » philosophique d'Alexandre, l'« âge » de l'Alexandre de Boèce (comme on dit le Socrate de Platon) : l'Alexandre des Q*uaestiones*. À partir du XIIIe siècle, le Moyen Âge en connaîtra un autre : celui d'un Alexandre commentateur des écrits naturels d'Aristote et théoricien de l'intellect - l'Alexandre d'Averroès, l'Alexandre arabo-latin (7). C'est au premier que nous nous intéresserons ici." (pp. 161-162)

(7) Sur cet autre visage d'Alexandre, le lecteur pourra consulter les notes que nous avons rédigées pour Averroès. *L'Intelligence et la pensée. Grand commentaire du De anima, III*. Trad., introd., bibliogr.,

chronologie, notes et index, Paris (GF, 974), GF-Flammarion, 1998.

2. Hadot, Pierre. 1959. "Un fragment du commentaire perdu de Boèce sur les *Catégories* d'Aristote dans le *codex Bernensis* 363." *Archives d'histoire doctrinale et littéraire du Moyen Âge* no. 26:11-27.

   Repris dans P. Hadot, *Plotin, Porphyre. Études néoplatoniciennes,* Paris: Les Belles Lettres, 1999, pp. 383-410 et dans P. Hadot, *Études de Patristique et d'histoire des concepts*, Paris: Les Belles Lettres, 2010, pp. 323-343.

   "En 1863, dans ses *Rhetores Latini Minores*(1), K. Halm publiait une suite d'*excerpta* contenue dans le Bernensis 363 (seconde moitié du IXe siècle), sous le titre, qu'il adopta dans son édition : *Ars rhelorica Clodiani de statibus*. Comme il le signalait dans sa préface(2), cette suite d'excerpta comprenait d'abord un emprunt à un ouvrage *de stalibus*, puis un extrait plus long emprunté à un commentaire sur les *Catégories*

   d'Aristote, enfin quelques lignes se rapportant au γνῶθι σαυτόν.

   Halm constata que l'extrait du commentaire sur les *Catégories* d'Aristote ne correspondait pas au commentaire de Boèce que nous connaissons. Mais il n'émit aucune hypothèse au sujet de l'origine de cet extrait. Or, il semble bien que nous soyons ici en présence d'un fragment de la seconde édition du commentaire de Boèce sur les Catégories(3). En effet, cè commentaire :

   1° se rapportant aux deux premières lignes des *Catégories* d'Aristote,

   2° utilise le commentaire de Porphyre sur ces mêmes *Catégories*, κατὰ πεϋσιν καἰ αποκρισιν qui nous a été conservé,

   3° utilise également le second commentaire {perdu) de Porphyre « à Gédalius », dont on retrouve les traces chez

Dexippe et Simplicius,

4° et enfin, pour différent qu'il soit du commentaire de Boèce que nous connaissons, contient néanmoins beaucoup de particularités de style, propres à Boèce."

(1) 1) C. Halm, *Rhetores Iatini minores,* Leipzig, 1863, p.560-592.

(2) Ibid., p. XIV.

(3) Sur ce second commentaire, aujourd'hui perdu, cf. plus bas, p. 23-24.

3. Tremblay, Bruno. 2005. "Boèce, *In Cat.* : proème et commentaire aux *antepraedicamenta*." *Carmina Philosophiae* no. 14:1-56.

"Le traité des *Catégories* occupe une place de choix et dans les étudesaristotéliciennes en général à travers les siècles, et dans l'école des commentateurs dits "néoplatoniciens" de la fin de l'Antiquité à laquelle

Boèce se rattache et pour laquelle le traité constitue un préambule à l'ensemble de la philosophie,(3) et dans l'oeuvre de Boèce lui-même, ne serait-ce que parce que son travail sur les *Catégories* constitue le premier pan de son projet gigantesque et bien sûr inachevé de traduire et de commenter tout Aristote et Platon.(4)

Une grande partie de l'intérêt que suscite ce petit ouvrage d'Aristote vient de sa difficulté d'interprétation. À cet égard, la plus importante des questions posées par sa lecture tourne sans doute autour de la détermination du sujet ou du propos de l'ouvrage, sur lequel Aristote donne peu d'indications explicites, ce qui a évidemment causé une grande diversité dans les vues des commentateurs.(5) La question est

d'autant plus sérieuse que c'est à la lumière de sa réponse qu'on se prononcera sur le caractère logique, métaphysique ou linguistique de l'oeuvre, ainsi que sur le rôle et l'unité réelle ou factice des trois parties

de l'ouvrage tel que l'édition ancienne nous l'a transmis : *antepraedicamenta* (chap.1-4), *praedicamenta* proprement dits (chap.5-9) et *postpraedicamenta* (chap.10-15).

Boèce lui-même rend bien compte dans son commentaire du caractère difficile de ce problème, puisque après y avoir répondu en disant que les sons vocaux qui signifient les choses ou les genres des choses, en tant qu'ils les signifient, constituent le sujet des *Catégories*, il s'empresse d'ajouter que la réponse qu'il a donnée ne vaut que pour les débutants, parce que la vraie solution, qui est de fait beaucoup plus subtile, demandera qu'on y revienne en un autre lieu et exigera la science pythagoricienne et un enseignement parfait (160AB). Quoi qu'il en soit de cette autre solution, peut-être contenue dans un deuxième commentaire, perdu, au traité des *Catégories*, la formulation du propos mentionnée et de fait l'ensemble du commentaire allaient être pris très au sérieux par les logiciens médiévaux." (pp. 1-2)

(4) Boèce, *Commentarii in librum Aristotelis Peri Hermeneias, editio secunda,* éd. K. Meiser (Leipzig: Teubner, 1877-1880), 79, 9-80, 9.

(5) Simplicius, *In Cat*., 9, 4-13, 18, nous donne une bonne idée de cette diversité.

Estudos en Español

1. Bertelloni, Francisco. 2012. "El resultado del conocimiento universal en el segundo comentario de Boecio a la *Isagogé* de Porfirio." *Scripta* no. 5:11-34.

   Resumen: "El autor trata tres temas presentes en el segundo comentario de Boecio a la *Isagogé* de Porfirio. El primero muestra que cuando Boecio argumenta contra el universal ontológico de Porfirio, lo hace en términos *cuantitativos;* por ello la argumentación de Boecio contra el realismo porfiriano es

diferente, por ej., de la argumentación que utiliza Abelardo en su *Logica Ingredientibus*. Mientras para Boecio *lo que es uno no puede ser simultáneamente múltiple* a causa de una imposibilidad cuantitativa, para Abelardo la misma imposibilidad resulta de una *reducción al absurdo*, pues la misma res universalis no puede ser racional en un sujeto e irracional en otro. El segundo tema es la distinción boeciana entre *modo de ser* y *modo de ser conocido*

del universal. El tercer tema es la posibilidad de aferrar el universal boeciano a través de una fórmula apta para tipificar ese universal que, según Boecio, sería deficiente si fuera solo gnoseológico o solo ontológico; esa fórmula debe poder dar cuentas, simultáneamente, de ambas dimensiones del universal, es decir, la dimensión real-ontológica y la intelectual-gnoseológica."

2. Correia, Manuel. 2007. "Los tratados silogísticos de Boecio: sus fuentes, historia e influencia en la cristiandad latina." *Teología y Vida* no. 48:131-140.

   Resumen: "En este artículo se describen los contenidos de un tratado sobre lógica aristotélica escrito por Boecio en el VI d. C., llamado por nuestras ediciones modernas *De syllogismo categorico* (=DSC). A través de sus contenidos, es posible mostrar: (i) la importancia de este tratado en el proceso de transmisión de la lógica de Aristóteles al medioevo latino; (ii) su relación con otro tratado monográfico similar, titulado por la crítica moderna *Introductio ad syllogismos categoricos* (ISC) y su relación temática con DSC; (iii) las fuentes más probables de ambos tratados; y, finalmente, (iv) su influencia en el medioevo latino. La hipótesis que se defiende en este artículo es que los contenidos lógicos de este tratado, en particular la clasificación de las proposiciones categóricas, contenida en el corazón del DSC, entregan no solo el objeto temático al tratado, sino también coherencia argumentativa y unidad. En especial, el estudio de esta clasificación permite demostrar la unidad de DSC y en particular que el segundo libro de DSC es genuino y no espurio como sostuvieron, no hace mucho, los estudiosos Murari y McKinlay; además, esta misma clasificación permite apreciar su diferencia con ISC, por el hecho de que este último

tratado posee una clasificación diferente a la de DSC. La base de la hipótesis propuesta se halla en que la clasificación mencionada es un intento por generar, a partir de los elementos proposicionales, las principales operaciones lógicas definidas por Aristóteles en sus escritos lógicos, asunto que en la revisión de De Rijk (1964) no quedó totalmente establecido."

3. Ferreira, Paulo. 2021. "Sobre a tese de que a bivalência implica o determinismo causal, do estoicismo ao aristotelismo." *Journal of Ancient Philosophy* no. 15:173-189.

   Abstract: "According to Simplicius' commentary on Aristotle's *Categories*, the Platonic philosopher Claudius Nicostratus (fl. mid-2nd c. A.D.) challenges Aristotle's claim in the *Categories* to the effect that statements about future contingents are neither true nor false. I argue that Nicostratus' charge traces back to Chrysippus' argument for causal determinism in Cicero's *De Fato* and plays a significant role in motivating Ammonius' and Boethius' solution to the problem of future contingents."

4. Molina Cantó, Eduardo. 2001. "Traducción y comentario en le Medioevo temprano: Boecio y el *De interpretatione* 14." *Onomazein* no. 6:149-162.

   Resumen: "La traducción y el comentario al tratado *Sobre la interpretación* de Aristóteles, llevados a cabo por Boecio, son examinados en este artículo con el fin de discutir una tesis recientemente sostenida, según la cual la tarea de Boecio como comentarista del corpus lógico aristotélico se limitaría a una

traducción mecánica de glosas. Frente a esto, aquí se sostiene (1) que al examinar la labor como traductor de Boecio resulta más verosímil seguir adjudicándole la autoría intelectual de los comentarios y (2) que si se atiende al contexto de los comentarios del temprano medioevo, no cabe ir en busca de originalidad en un caso como este, sino de capacidad de asimilar y evaluar las discusiones y observaciones de que podía disponerse, cosa que puede afirmarse convincentemente de Boecio."

Medieval Theories of Supposition

Introduction

"Interest in medieval logic, and recognition of its significance as an original development of the formal logic founded by Aristotle, has arisen only within the past thirty-five years [*written in 1966*]. For more than three centuries it had been assumed, by logicians and historians alike, that medieval logic was no more than a scholastic trivialization of Aristotelian logic, its principal contribution being a fixation of terminology and invention of the mnemonic verse "Barbara", Celarent" etc., used in teaching the figures and moods of the syllogism. [...] The rediscovery of medieval logic had to wait on the rediscovery of formal logic itself [...] Frege's Begriffschrift appeared in 1879, but its significance was not appreciated until the beginning of the twentieth century when the Principia Mathematica of Whitehead and Russell gave the major impetus to the development of modern mathematical logic. On the contrary, the leaders of the new movement claimed that nothing had been done to advance the subject between the time of Aristotle and that of Boole, Peirce, Peano and Frege. Two developments which have taken place during the past thirty years have rescued medieval logic from oblivion and have stimulated a steadily increasing study of its content. First, the publication by Jan Łukasiewicz, in 1934, of a study which showed that the logic of unanalyzed propositions, on which modern mathematical logic rests as its most fundamental part, had been discovered in antiquity by the Stoics, led to the further discovery that the later medieval logicians, in their theory of Consequentiae, had independently developed this fundamental and non-Aristotelian part of logic. In the year 1935 J. Salamucha, a pupil of Łukasiewicz, published a detailed study of the propositional logic

of William of Ockham, and in that same year the present writer published (as his doctoral dissertation) the first modern study of Ockham's logical writings as a whole. A second development, which has taken place during the past thirty years within modern logic itself, has been the extension of logical investigations into the fields of semantics, modal logic, and philosophy of language, which turn out to be the areas in which the medieval logicians made their most interesting contributions. By reason of these developments, medieval logic has received increasing study since 1935 by historically minded logicians and by logically educated historians, and fragments of medieval logical doctrine have become part of the stock in trade, so to speak, of many contemporary logicians and philosophers of language.

"From "Ernest A. Moody, "The Medieval Contribution to Logic", *Studium Generale*, Jahr. 19, Heft 8, Heidelberg 1966, pp. 443-452; reprinted in: *Studies in Medieval Philosophy, Science, and Logic*, Berkely: University of California Press 1975, pp. 371-392.

"As the name implies, the theory of properties of terms is intended to provide an account of the different rôles that words can have when they appear as terms in propositions. As a matter of fact these terms are commonly distinguished in Mediaeval logic into such terms as have meaning in their own right (termini significativi) and such as are only significant when joined to terms of the first sort (termini consignificativi).

The former are also named categorematic terms (termini categorematici), the latter syncategorematic terms (termini syncategorematici). However, there seems to be some confusion in so far as syncategorematic terms may be discussed as determining to some extent the actual signification or denotation (=supposition) of the categorematic terms to which they are joined, rather than taken in their own right. It must be borne in mind, then, that when those terms were only taken in their function of determining categorematic terms, Medieval logicians used to deal with them in the tracts on the properties of terms (namely, in the tract De distributionibus).

Whenever they were taken as having some kind of meaning (con-significatio) of their own, or when were determinants (functors) of

phrases or of simple propositions, there were dealt with in special tracts, such as those entitled De syncategorematibus, and De consequentiis. Besides, there is another feature peculiar to the Medieval view of the properties of terms: Mediaeval logic apparently assumed that only those categorematic terms truly have significatio which signify forms (or: universal natures), either with the underlying substances of such forms or without. This assumption appears to have widespread in Medieval logic to such an extent, indeed, that the Medieval theory of the properties of terms was, in fact, reduced to a doctrine of significatio in its proper sense. This doctrine was concerned with significatio and its three functions: suppositio, appellatio, and copulatio." (pp. 513-514)

   "This issue of *Topoi* centers on medieval supposition theory, with two new translations of original sources and six papers on

issues regarding the interpretation of the theory.(1)

Supposition theory came into full formulation sometime in the latter half of the 12th century, and flourished until sometime after the end of the 15th century. It was mostly discounted during Renaissance times, and mostly unknown from then until the second half of the 20th century.

Current scholars have become interested in supposition theory partly because some portions of it closely resemble twentieth century developments in semantics, including a recognition of quantificational phenomena that goes well beyond almost all other developments before Frege. In this introduction we explain briefly what supposition theory was, and we relate the translations and papers to issues in the development of the theory." (p. 1)

(1) The papers in this volume mostly developed out of a conference on “Signifier and Supposita” that was held at the University of California at Irvine in Spring 1996. We are grateful to the UCI Council for Collaborative Research in the Humanities for support for that conference.

2. Adams, Marilyn McCord. 1976. "What Does Ockham Means by 'Supposition'?" *Notre Dame Journal of Formal Logic* no. 17:5-37.

"Supposition theory is one of the most unique and important aspects of thirteenth and fourteenth century logic. The role played by the notion of supposition in medieval logic can be compared with the role of the notions of satisfaction and reference in modern logic. As the notion of satisfaction is introduced into modern discussions of truth, so supposition and truth are related in William Ockham's discussion, and their relation was debated by late fourteenth and early fifteenth century logicians.(1) And what little there is of a medieval attempt at developing a theory of quantification is imbedded in medieval discussions of the divisions of personal supposition. (2)

Despite the demonstrated importance of the notion of supposition, medieval logicians did not bother to make it very

clear just what it was for a term to supposit for something in a proposition. William Ockham's

general account of this at the outset of his discussion of supposition in the *Summa Logicae* I, c. 63, is among the fullest and, on the face of it, looks fairly explicit." (p. 375)
