   Abstract: "Supposition is a controversial logical theory. Scholars have investigated many points of this doctrine such as its historical origin, its use in theology, the logical function of the theory, or the relationship between supposition and signification. In the article I focus on this latter aspect by discussing how some Italian, and in particular Florentine, Dominican followers of Aquinas—Francis of Prato (d. 1348), Girolamo Savonarola (d. 1498), and Georgius Rovegnatinus (d. after 1500)—explained the relation betviieen the linguistic terms' properties of signifying and suppositing, and hence the division of supposition. After sketching out Thomas Aquinas, Hervaeus Natalis, and William of Ockham's positions on the relationship between signification and supposition, I closely examine Francis's criticism of Ockham. Francis follows Walter Burle/s account of supposition and considers the statement that a term has simple supposition when (i) it Is taken not significatively and (ii) stands for an intention of mind as the weak point of Ockham's explanation of supposition. According to Francis, If this were the case, there would be no semantic basis for differentiating simple from material supposition. Francis is however hesitant about the full subordination of supposition to signification, especially witb regards to material

supposition, when a term, suppositing for itself, is taken to signify itself besides its meaning. More than one hundred years later, Girolamo Savonarola and Georgius Rovegnatinus have no doubt about the fact that terms may supposit only for what they signify."

4. Ashworth, Earline Jennifer. 1969. "The Doctrine of Supposition in the Sixteenth and Seventeenth Centuries." *Archiv fur Geschichte der Philosophie* no. 51:260-285.

   "It is often assumed that the logic of terms, including supposition theory, was despised and ignored by the logicians of the sixteenth and seventeenth centuries, in spite of the sophistication with which it had been developed during the later middle ages.

   (...)

   It is perhaps not surprising that when I looked at some eighty textbooks written during the period in question, I discovered that as many as twenty authors not only referred to the doctrine of supposition sympathetically, but usually went on to offer a detailed analysis which is neither a slavish nor an inept echo of what the mediaeval logicians had said." (pp. 260-271)

   (...)

   "The claim that with the end of the fifteenth Century all interest in the more sophisticated doctrines of the mediaeval logicians also came to an end, is clearly without foundation; and the practice of those writers I have examined clearly belies the humanist claim that past learning, other than classical, was no longer to be taken seriously." (p. 285)

5. ———. 1973. "Priority of Analysis and Merely Confused Supposition." *Franciscan Studies* no. 33:38-41.

   "In a recent article John J. Swiniarski discusses William of Ockham's use of merely confused supposition. 1 He claims that, in the case of universal affirmative propositions, Ockham's method of attributing merely confused supposition to the predicate accom- plishes much the same result as Peter Thomas Geach's method of attributing determinate supposition to the

predicate and using a priority of analysis rule, whereby the subject is always analysed first. However, he notes, Ockham's analytical procedures when ap- plied to particular negative propositions can lead to erroneous re- sults, which are only avoided by the adoption of a priority of analysis rule. Since such a rule renders merely confused supposition unnec- essary, he concludes that Geach was right and that Ockham ought to have employed only distributive and determinate supposition together with a priority of analysis rule in his treatment of standard categorical propositions. I do not wish to criticize what Swiniarski has to say about the interpretation of Ockham. Instead, I wish to make a few remarks about the use of merely confused supposition by sixteenth century logicians in order to show that it is not in ge- neral so easily dispensed with.(2)" (p. 38)

(1) Swiniarski, John J., "A New Presentation of Ockham's Theory of Sup- position with an Evaluation of Some Contemporary Criticisms, " *Franciscan Studies*, 30 (1970), 209-217. Those readers who are not familiar with supposition theory should be reminded that merely confused supposition involves an analysis into a disjunctive subject or predicate, whereas distributive supposition involves an analysis into a conjunction of propositions and determinate supposition involves an analysis into a disjunction of propositions.

(2) For further details about supposition theory in the sixteenth century, see my paper: " The Doctrine of Supposition in the Sixteenth and Seventeenth Centuries, " *Archiv für Geschichte der Philosophie*, 51 (1969), 260-285.

6. ———. 1978. "Multiple Quantification and the Use of Special Quantifiers in Early Sixteenth Century Logic." *Notre Dame Journal of Formal Logic* no. 19:599-613.

"I have three reasons for writing this paper. In the first place, I want to explain the early sixteenth century practice of using the letters 'a', 'b', 'c', and 'd' as special signs governing the interpretation of terms within sentences. In the second place, I want to investigate the analysis which logicians in the medieval tradition gave of such sentences as "There is somebody all of

whose donkeys are running", "Everybody has at least one donkey which is running", and "At least one of the donkeys which everybody owns is running".(2) In the third place, I want to show that, despite what Geach has suggested,(3 logicians in the medieval tradition were capable of offering good reasons for rejecting such inferences as "Every boy loves some girl, therefore there is some girl that every boy loves". My discussion will be based mainly on the work of a group of logicians who were at the University of Paris in the first two decades of the sixteenth century, in particular Fernando de Enzinas, Antonio Coronel, and Domingo de Soto." (p. 599 a note omitted)

   Supposition theory pp. 152-158.

   "The vocabulary of supposition theory seems to be first found in the grammarians.

   Peter Helias, the twelfth-century commentator on Priscian, used the term suppositum semantically, to indicate the bearer of a form or property,(12) but, shortly afterwards, from the 1260s onward, grammarians also used the notion purely syntactically. The verb supponere meant “to put as a subject term,” and it was contrasted with apponere, “to put as a predicate term.”(13) The terminology made its way into logical treatises, and both uses are needed to make sense of thirteenth-century discussions, particularly of the questions whether supposition is only a property of substantival nouns, and whether supposition is only a property of grammatical subjects." (pp. 152-153)

Jolivet and A. de Libera (eds.) *Gilbert de Poitiers et ses contemporains: aux origines de la Logica modernorum* (Naples: Bibliopolis, 1987) 325–51. The passage about *supponere* and *apponere* frequently attributed to Peter Helias is a later interpolation (ed. Reilly, p. 448, apparatus).

8. ———. 2013. "Descent and Ascent from Ockham to Domingo de Soto: An Answer to Paul Spade." In *Medieval Supposition Theory Revisited: Studies in Memory of L. M. de Rijk*, edited by Bos, Egbert Peter, 385-410. Leiden: Brill.

   Also published as Volume 51, 1-4 (2013) of *Vivarium*.

   Acts of the XVIIth European Symposium for Medieval Logic and Semantics, held the University of Leiden, 2nd, 7th June. 2008.

   Abstract: "Paul Spade has attacked the theory of the modes of personal supposition as found in Ockham and Buridan, partly on the grounds that the details of the theory are incompatible with the equivalence between propositions and their descended forms which is implied by the appeal to suppositional descent and ascent. I trace the development of the doctrines of ascent and descent from the mid-fourteenth century to the early sixteenth century, and I investigate Domingo de Soto's elaborate account of how descent and ascent actually worked. I show that although Soto himself shared some of Spade's doubts, including those about the use of merely confused supposition, he had a way of reducing at least some propositions containing terms with such supposition to equivalent disjunctions and conjunctions of singular propositions. Moreover, he gave explicit instructions on how to avoid the supposed problem of O-propositions."

9. Bäck, Allan. 2013. "Avicenna's Theory of Supposition." *Vivarium* no. 51:81-115.

Abstract: "Although he does not have an explicit theory of supposition as is found in the works of Latin medieval philosophers, Avicenna (Ibn Sînâ) has two doctrines giving something equivalent: the threefold distinction of quiddity {*triplex status naturae*), corresponding to a division of simple, personal and material supposition, and his analyses of truth conditions for categorical propositions, where sentential context determines in part the reference of their terms. While he does address which individuals are being referred to by the universal terms used there, Avicenna concentrates more on the varied temporal durations of the predications being made. In Western terms, he has incorporated ampliation and restriction into the theory of supposition itself."

    Part Two. Historical Survey.

    Chapter IV. From the history of the logic of indefinite propositions 75-140; Chapter XII. Summary and conclusion 457-481.

    "In the entirely unoriginal albeit influential *Summulae logicales* by Peter of Spain (ca. 1205-1277; cp. de Rijk 1970), probably written around 1232, we find a division into four kinds of categorical proposition:

    “Propositionum categoricarum alia est universalis, alia particularis, alia indefinita, alia singularis” (Section 1.08). The author then gives an example of an indefinite proposition: “Indefinita est ilia in quia subicitur

    terminus communis sine signo, ut “homo currit”; vel aliter: propositio indefinita est quae significat inesse vel non inesse” (Section 1.09).

    This sentence, “homo currit”, we find in the theory of suppositio of William of Sherwood (1200/1210-1266/1271) as well in the theory of suppositio of Peter of Spain himself. This gives us sufficient reason to enquire into that theory. This famous scholastic theory of suppositio is a theory of the senses

of terms in different kinds of propositions. Since this theory starts out from and studies combinations of terms with other terms, Moody considers the doctrine of the suppositio of terms as a syntactic theory (1953/22). Geach, however, often translates “suppositio" by “mode of reference” (1968/56). We might speak of a syntactic theory of meaning. De Rijk holds that “the Mediaeval logicians based the suppositio on the capacity of a term, when used in a proposition, to be interpreted for one or more individuals” (1967/571). This capacity is the significatio of the term, not its suppositio. But in the opinion of de Rijk, there is, in the theories of authors like William of Sherwood and Peter of Spain, in fact no sharp difference between the significatio (being the first *proprietas termini*) and the suppositio of a given term." (pp. 79-80)

11. Berger, Harald. 1991. "Simple Supposition in William of Ockham, John Buridan and Albert of Saxony." In *Itinéraires d'Albert de Saxe, Paris-Vienne au XIV Siécle*, edited by Biard, Joël, 31-43. Paris: Vrin.

    "My paper is based on the following two observations: (1) William of Ockham lays down a definition of simple supposition which reflects his anti-realistic stance; John Buridan, however, dispenses with this traditional kind of supposition altogether, whereas Albert of Saxony reintroduces it. In particular with respect to Albert, who is familiar with the doctrines of both Ockham and Buridan, the question, what Albert’s reasons are for his returning back behind Buridan,

suggests itself. (2) In modem interpretations concerning the theory of Ockham some immanent problems have been pointed out; some features of Buridan’s theory, in turn, have been drawn to attention which are apt to avoid Ockham’s problems. On this background I shall try to give an interpretation of Albert’s peculiar position. Thus my paper consists of three sections, one for each philosopher; in each of these sections I shall, firstly, present the supposition theory of each author briefly, and, then, I shall discuss some relevant issues. The title of my paper originates in the fact that the analysis of the traditional paradigm of simple supposition, viz. “homo est species”, exhibits the relevant differences of the authors in question, in particular on the level of mental language." (p- 31)

12. ———. 2016. ""Sortes differt ab omni homine". A Tension in Albert of Saxony's Concept of Merely Confused Supposition." In *Formal Approaches and Natural Language in Medieval Logic*, edited by Cesalli, Laurent, Goubier, Frédéric and Libera, Alain de, 283-302. Barcelona - Roma: Fédération Internationale des Instituts d’Études Médiévales.

    "In his Logica, Albert of Saxony defi nes merely confused supposition thus, that a descent under the general term to the singular terms can be done by way of a sentence with a disjunct extreme, but not by way of a disjunctive sentence or a conjunctive sentence, that is in scholastic terms, a descent can be done disiunctim, but not disiunctive nor copulative:(1)

    (...)

    He then adds a longer passage in which he criticizes the view of «some» who add to this defi nition «vel copulatim», that is, that the relevant descent can be done by way of a sentence with a disjunct extreme or with a conjunct extreme. This addition, however, is superfl uous according to Albert(2).

    This view criticized here by Albert is clearly that of Thomas Maulfelt who defi nes merely confused supposition thus, that a descent can be done by way of a sentence with a disjunct (and conditionalized) extreme or with a conjunct extreme. (The clause «condicionatim = de condicionato extremo» need not concern us here.) Thomas for his part states that the definition

which only comprises a descent by way of a sentence with a disjunct extreme is insuffi cient, indeed false(3)." (pp. 283-284)

13. Biard, Joël. 2021. "John Buridan and Natural Supposition: From the Semantics of Names to Atemporal Propositions." *Medioevo* no. 44:123-140.

"John Buridan's adoption of natural supposition is surprising, and it has been seen as such. The concept of natural supposition was originally tied to the positing of a common nature as that which is signified by a common term, a theory which Buridan rejects in its various versions in his *Questions on the Metaphysics*. It would obviously not be sufficient to say that his *Summulae logicae* take as its guide a reworked version of Peter of Spain's *Tractatus*, which divide supposition in general into natural supposition and accidental supposition,(1) for it is clear that on many points Buridan does not hesitate to depart from the text that he uses both as manual and as material for his commentary. Moreover, he adopts and uses the concept of natural supposition in several other works. It is therefore necessary to understand the reasons internal to

Buridan's system that not only make this adoption possible, but even require it.

This task will be made easier if we recall that in the 13th-century natural supposition was not connected only, or even primarily, with the question of universals, but also with the question of the temporal determinations entailed by the way a general term is used in a proposition. Of course, the two issues are related, since singulars cease to be while the universal remains; however, even if common natures are rejected, there remains the question of the indexing of a proposition to a certain temporal determination.

The question arises when one has to specify the conditions of utterance of a necessary truth, at least if necessity is tied to omnitemporality.

Such truths pertain to propositions such as 'Every human being is an animal', but also – especially – those used in the sciences, in particular the natural sciences, in which there is an unavoidable tension between the contingency of things on the one hand and the necessity of its propositions on the other. This is why natural supposition will be called "demonstrative supposition". (pp. 123-124)

14. Boehner, Philotheus. 1946. "Ockham's Theory of Supposition and the Notion of Truth." *Franciscan Studies* no. 6:261-292.

Reprinted in: P. Boehner, *Collected Articles on Ockham,* Louvain: E. Nauwelaerts, 1958, pp. 232-267.

"Our discussion of Ockham's theory of signification,[(b)] though limited to essentials, has prepared the way for an understanding of his theory of supposition and, consequently, of the notion of truth. This ingenious medieval theory of supposition, which unfortunately is much neglected by modern schoolmen and even misunderstood by historians of Medieval Philosophy, will finally answer the question: What is truth or falsity as applied to a proposition? For truth is given when and

only when the subject and predicate of the same proposition stand or supposite for the same thing. To be sure, suppo¬ sition is not truth, but supposition enters the definition of truth, at least if we are interested in a semantic definition of truth (sometimes called logical truth) and if we are not to indulge in vague circum¬ locutions about the relation of correspondence between a proposition and a state of affairs, which relation of correspondence in a general way characterizes every scholastic theory of truth. As we have shown in our first study o.n the notion of truth, a semantic elucidation of the notion of truth seems to have been attempted by almost all the scholastics. That Ockham did the same can hardly be called an innovation; that he made a more careful analysis than others before him, is his distinct contribution to scholastic philosophy. In order to show that, we must first acquaint ourselves with Ockham's theory of supposition, and then show its bearing on the notion of truth." (pp. 232-233 of the reprint)

(b) Cfr. the preceding art. in the present volume. [*Okham's theory of signification* (1946), pp. 201-232]

15. ———. 1958. "A Medieval Theory of Supposition." *Franciscan Studies* no. 18:240-289.

"Supposition, on the other hand, is, in a strict sense, the property of a term that belongs to it as subject; thus tracts on supposition, in this narrower sense, analyze the significative function of the subject as it is determined by the context of the proposition. In a broader sense, however, the name 'supposition' is applied to both supposition in this narrower sense, and to appellation. Ockham, in his *Summa logicae* takes supposition in this broader sense and deals in one tract, *De Suppositione*, (p. I, c. 63 - 77) with all the problems which are connected with appellation as well.(2)

In the following we are going to take supposition in this broader sense and bring in discussions of the other properties at their proper places. However, our discussions will not follow a strictly historical order. Two reasons discourage this order. First, the material is so vast even in spite of the fact that most of the logical writings are still in manuscript form, that it is

impossible to give a faithful historical account in a limited space. Secondly, there is a general agreement on the main teachings of this theory among all the scholastics, certainly of the 14th and 15th centuries, which warrants the presentation of one theory and by calling attention occasionally to differences in opinion on minor details." (pp. 249-250 of the reprint, anoter omitted)

(2) It is interesting to note that Burleigh in his *De puritate artis logicae*, written after and against Ockham' s *Summa*, has fundamentally the same position: Suppositio communiter accepta est proprietas termini ad alium terminům in propositione comparati. Et isto modo convenit suppositio tam subiecto quam praedicato quam etiam verbo seu consignificatis ipsius verbi. Et isto modo . . . accepta est in plus quam appellatio, quia suppositio competit tam subiecto quam praedicato, et appellatio competit praedicato tantum. Suppositio proprie dieta est proprietas termini subiecti ad praedicatum comparati ... *Op. cit.*, [*Tractatus Longior*] Tr. I, p. i, c. 1; p. i s.

16. Boh, Ivan. 1965. "Paul of Pergola on Supposition and Consequences." *Franciscan Studies* no. 25:30-89.

"Although Paul of Pergula's *Logica* is primarily a summary of various logical topics designed to help students to learn the subject quickly and painlessly, its six tracts and their arrangement reflect rather accurately the state of logic in the early fifteenth century.(1) In fact, this is one of the basic reasons for studying it; the other is the intrinsic interest of the content.

The tracts comprising the work are the following: (i) the summulae, i. e. subjects of the On Interpretation, Categories and Porphyry, Prior Analytics, and Boethius, together with an introductory enumeration of the transcendentals (23 pages in the modem edition); (2) on suppositions (21 pages); (3) on examination of terms, i. e. those terms which enter propositions as form-determining elements either because they are syncategorematics or because they are used syncategorematically (41 pages); (4) on consequences (14

pages); (5) on obligations, i. e. rales for consistent disputations (32 pages); and (6) on insolubles (14 pages). In an introductory remark Paul promises the seventh tract,dealing with objections against the first, second, and fourth tract, but this part has not yet been found either in manuscripts or in early printed editions. There is, however, in several editions an additional short work, “On the Composite and the Divisive Sense” in which nine rules are given to deal with difficulties arising from the presence of certain syncategoremata and intentional functors in propositions. (2)

Comparing the subjects and the amount of space given to their discussion with those of most textbooks on traditional logic current today, we find striking differences. Most of the materials found in our textbooks belong to Paul's first tract; they are accompanied, however, with many epistemological, ontological, and even psychological problems, irrelevant to logic considered as a science of form or structure or syntax. The distinctions between various kinds of terms other than those of structure, between various kinds of definition, between realism and nominalism, and especially between major and minor logic, are for the most part non-logical in character; some of them would be such even if one granted that logic is to be understood in a broader sense, i. e. that it is not to deal merely with the syntactical, but also with the semantic and the pragmatic dimensions of language." (pp. 30-31)

(1) Cf. statement made by the editor of the *Logica* Sister Mary Anthony Brown, O.S.F. in the introduction to the work: "The *Logica* should be regarded, not as an innovation, but rather as a mosaic of the treasury of logic known at that time." *Logica and Tractatus de Sensu Composito et Diviso*, St. Bonaventure, 1961, p. viii. It is on the basis of this work that the translations given below were made, and all the references made in the commentary to the text are, unless otherwise noted, to this edition. P. Boehner, speaking of the rules of consequences, views Paul’s work in much the same way: "Wir müssen . . . hervorheben, daß all diese Regeln nur die Frucht einer fast 200 jährigen Arbeit der mittelalterlichen Logiker sind.” Cf.

"Bemerkungen zur Geschichte der DeMorganschen Gesetze in der Scholastik" in Archiv für Philosophie 4 (1951), p. 199.

(2) Sister Mary Anthony points out that this tract is usually appended to the printed editions of Paul's *Logica* and adds that "the manuscript tradition testifies that this is certainly an authentic work of Paul of Pergula" (cf. her edition of Paul's *Logica*, p. ix). There is, moreover, at least one explicit claim even in a printed work that a tract by this name was written by Paul and was later commented upon by others, namely by Antonius Francantianus, *Quaestiones de sensu composito et diviso Pauli Pergulensi et in consequentiis Strodi* (Venice, 1494).

17. ———. 1966. "Propositional Connectives, Supposition and Consequence in Paul of Pergola." *Notre Dame Journal of Formal Logic* no. 7:109-128.

"Studying the rules of those consequentiae the validity of which depends on the internal structure of propositions, one quite often comes across Paul's remarks on various suppositions of terms; an understanding of his supposition theory is therefore essential for understanding such rules.

However, reading of the tract on supposition itself presupposes a grasp*

(a) of propositional connectives 'or', 'and', and 'if;

(b) of modal determinations;

and (c) of the validity-conditions of consequence in general;

and (d) of some specific rules of consequence.

The propositional connectives mentioned under (a) have been discussed by Paul in his *Summulae*,(1) a tract which treats of the topics of the *logica vetus* and the *logica nova*; and the modal functors were at least enumerated in the same tract.(2) His discussion of consequence and of the rules of consequences, however, follow the tract on supposition and should not have been used at this stage. But Paul can be excused from the charge of assuming a knowledge of what he will discuss later on the ground that even the *logica nova*

should give the reader an idea of 'logically following from' and of the validity conditions for an inference." (p. 109)

* Paul of Pergola was born in the end of the 14th or the beginning of the 15th century, probably in Italy, and died in 1451. He studied under Paul of Venice (d. 1429) who lectured at the Universities of Padua and Siena. Paul of Pergola was a successful teacher of philosophy; although a member of the order of Augustinian Hermites, he was a publicly paid lecturer in Venice. His numerous works include *Logica*, found in at least 10 mss. and 8 printed editions; *De sensu composito et diviso*; *Dubia super consequentiis Strodi*; and his commentaries on the insolubles and the sophismata of Heytesbury. Cf. the introduction to his *Logica* by the editor Sister Mary Anthony Brown, ofm, pp. v-xiii, published by The Franciscan Institute, St. Bonaventure, N.Y., 1961.

(1) This tract forms the first part of Paul's manual *Logica*, edited by S. M. Anthony Brown, OSF, St. Bonaventure, New York, 1961. All the references to Paul of Pergola are to this work in its modern edition.

By the subjects of the *logica vetus* are meant such topics as are discussed in *On Interpretation*, *Categories, Isagoge*, and in Boethius' logical works; the subjects of *logica nova* contain, in addition to the above, the remaining portions of the *Organon,* and Gilbert de la Porre's *Liber de sex principiis*. The collective name for both, the l*ogica vetus* and the *logica nova* was *logica antiqua*, which was opposed to *logica moderna*; the latter includes the typically medieval logical topics, in particular the syncategoremata, properties of terms, consequences, obligations, and sophismata and insolubilia.

18. Boler, John. 1985. "Connotative Terms in Ockham." *History of Philosophy Quarterly* no. 2:21-37.

"The problem with Ockham's treatment of connotative terms is that he seems to do just what such a system should avoid. For example, his exposition of sentences containing connotative

terms suggests that the expounded form is semantically primary. More importantly, however, even when he brings propositions with a connotative term under the common rubric where the predicate term stands for the same thing as the subject term does, Ockham spells that out in a special way. The import of "Sortes is white," he says, is that there is a whiteness in the same thing the subject term stands for.(47) It should be clear, I think, that if signifying is something Ockham thinks that both absolute and connotative terms do, it is not something which is explained by their being both categorematic terms. There is a fairly common perception among recent Ockham commentators that we lack a definitive interpretive theory about just what supposition is supposed to do in Ockham's system. I trust it will not be thought a purely negative contribution to suggest that we are not altogether better off when it comes to signification." (p. 33)

19. Bos, Egbert Peter. 1978. "Mental Verbs in Terminist Logic (John Buridan, Albert of Saxony, Marsilius of Inghen)." *Vivarium* no. 16:56-69.

"This essay deals with the field of medieval logic and semantics, especially that part which is usually designated as terminist logic or *logica modernorum*. It was here that, among other things, the theory of supposition— which originated in the theory of fallacies and twelfth-century grammar— was developed.(3)

The theory of supposition is a theory of the use of terms. In fourteenth-century logic (the period of our inquiry) supposition of terms occurs in propositions.(4)

(...)

"Supposition theory first and foremost is a theory of the reference of terms to individual things; the propositions are analysed primarily as to whether the constituent terms refer to individual things in the external world, in terms of which they

are verifiable. Fourteenth-century logic is directed extensionally.(6)

In this paper I intend to present a survey and analysis of the behaviour of so-called intensional verbs and of the terms that are constructed with these verbs. I mean verbs like ‘intelligere’, ‘cognoscere’ , ‘appetere’ , ‘promittere’, i.e. verbs signifying a mental act . It appears, in medieval as well as in modem logic, (7) at the reference of the terms constructed with intensional verbs, is often not very transparent.(8)" (pp. 56-57)

7 See section 4, p. 60.

8 The term ‘transparent’ , of course, is Quine’s. See e.g., his *Word and Object*, Cambridge (USA), 160 ; for this term and related notions and for the problem as such, esp. ch. 6.

20. ———. 1997. "Speaking About Signs. Fourteenth-century views on suppositio materialis." *Amsterdamer Beiträge zur älteren Germanistik* no. 48:71-86.

"The principal questions in my paper are the following: How did the medieval semanticists indicate the autonymous use of words? Does the subject term in such a proposition express a linguistic item (itself, or its likes) because of the determination by the predicate? Or is it dependent on the will or intention of man, the *voluntas utentium*, as Ockham calls it?

Or is it a convention that determines the use of terms? Is a *signum materialitatis* (a sign, or mark, indicating material supposition) necessary? To what extent do the Medievals distinguish the autonymous use of language from other uses? Or is this kind of language meaningless?

There is hardly any secondary literature on this subject. (*)" (p. 75)

Sinn und Referenz in mittelalterlicher Logik* (München/Hamden/Vv'ien 1989). 172-188. (Dufour tries to reconstruct the medieval theory of the properties of terms with the help of modern formal logic. This very interesting study did not obtain the attention it deserves, I feel). E. Karger, '*La supposition matérielle comme supposition significative: Paul de Venise, Paul de Pergola*', in *English Logic in Italy in the 14th and 15th Centuries. Acts of the 5th European Symposium on Medieval Logic and Semantics*, Rome, 10-14 november 1980, ed. by A. Maierù (Napoli). 331-342. In a penetrating analysis, Karger discusses the difficulties arising from the 'mentioning' of terms in relation to the general semantical theory of a philosopher.

21. ———. 2007. "Richard Billingham's *Speculum puerorum*, Some Medieval Commentaries and Aristotle." *Vivarium* no. 45:360-373.

    Abstract: "In the history of medieval semantics, supposition theory is important especially in the twelfth and thirteenth centuries. In this theory the emphasis is on the term, whose properties one tries to determine. In the fourteenth century the focus is on the proposition, of which a term having supposition is a part. The idea is to analyse propositions in order to determine their truth (probare). The Speculum puerorum written by Richard Billingham was the standard textbook for this approach. It was very influential in Europe. The theory of the probatio propositionis was meant to solve problems both in (empirically oriented) scientific propositions such as used by the Oxford Calculators, and theological propositions, especially those about the Trinity. The book is original, concise, but not clear in every respect. Studying medieval commentaries may help us to understand Richard's book. In the present paper three commentaries are presented. The commentators discussed problems about the status of Richard's book, and about its doctrine: what is the relation between probatio and

truth, what is the relation between probatio and supposition, what exactly are mediate and immediate terms (e.g.is the pronoun 'this' mediate or immediate?). The commentators sometimes criticize Richard. For example, one of them argues, against Billingham, that the verb 'can' ampliates its subject term and is therefore mediate."

"From June 2nd to June 7th, 2008, the XVIIth European Symposium for Medieval Logic and Semantics was held at the University of Leiden, The Netherlands.

The present volume contains the papers presented at the symposium by scholars from all over the world (the European Symposium extends beyond Europe in terms of its participants).

The general theme of the symposium was 'The Rise and Development of Supposition Theory'. It seemed appropriate

that a symposium in Leiden, held about 50 years after the publication of L.M. de Rijk's *Logica Modernorum* (Assen 1962-1967), emeritus professor of the University of Leiden, should be devoted to medieval supposition theories. On June 30, 2012, De Rijk died at the age of 87 years." (Preface, p 1)

23. Braakhuis, Henk A.G. 1999. "Scientific knowledge and contingent reality. Knowledge, signification and (natural) supposition in Buridan's Questions on *De generatione et corruptione*." In *The Commentary Tradition on Aristotle's De generatione et corruptione: Ancient, Medieval, and Early Modern*, edited by Thijssen, J. M. M. H. and Braakhuis, Henk A.G., 131-161. Turnhout: Brepols.

    "In view of the above, it will not come as a surprise to see that in the beginning of John Buridan's Questions on *De generatione et corruptione*, the problem of the possibility of scientific knowledge of beings coming into being and passing away is brought into sharp focus. Whereas in the commentaries of both Giles of Rome and Giles of Orleans, the problem is discussed under two headings, namely by asking whether there can be scientific knowledge of corruptible things and whether, if something has passed away, there can remain scientific knowledge of it,(4) John Buridan devotes the first three questions of his commentary to this problem. Two questions which resemble those discussed by Giles of Rome and Giles of Orleans are here followed by a third question which asks whether a word signifies the same irrespective of whether the thing it signifies exists or has already passed away (*utrum vox significet idem, re existente et corrupta*). By introducing, into this context, a semantical issue which had been eagerly discussed in the late thirteenth century, namely whether a word can lose its signification, Buridan makes it clear that for him, the problem of scientific knowledge has an essentially semantic character.

    In the present contribution, I shall discuss these first three questions of Buridan's *Questions on De generatione et corruptione*(5) Although it will become apparent that Buridan's views as expressed in these three questions do not differ considerably from those offered in similar questions to be

found in his other works,(6) the questions he discusses here nevertheless add to a better understanding of his views and form a further testimony to the importance he attached to the semantic aspect of problems of scientific knowledge and to the role he assigned to a correct analysis of the propositions in which we express our scientific knowledge." (pp. 132-133)

"In the present article we will edit and study Burleigh's earlier treatise on supposition. Certainly it is the work of Burleigh. This is witnessed by the explicits of both manuscripts which contain it.(5) Also, as Boehner indicated, it has large parts in common with the *De puritate*. Furthermore, Burleigh in the *De puritate* speaks of an earlier treatise with its manifold divisions of supposition, and the *De suppositionibus* lives up to that description. It is most probably a very early work of Walter Burleigh. As both Boehner and Weisheipl indicated, unlike the *De puritate* it shows no sign of attacking Ockham at all.(6) Also in the *De puritate* Burleigh himself speaks of an earlier treatise on supposition as "written in my youth."(7) Finally, in the manuscripts it is located beside works written in 1301 and 1302, shortly after Burleigh became a Master in the Arts Faculty. We conclude therefore that it is certainly the work of Burleigh and most probably was written about 1302." (p. 16)

In appendix: *Walter Chatton: Lectura in I Sent.* 4.1.1-2 (pp. 135-157).

"In brief, although modern students of medieval supposition theory have, for the most part, based themselves on medieval logic treatises, there is a rich parallel source for studying the development of the theory of the supposition of terms to be found in theological writings.

For, especially in dealing with the Trinity and the Incarnation, theologians had to clarify their statements, explaining in each case whether they were speaking about the divine essence or about all or one of the divine persons, or whether they were speaking about Christ as God or Christ as man. Did they develop a certain consistency in their theory of reference or supposition? Did they find some logical principles that governed their use of language and could be applied to each proposition dealing with the Trinity? If they did, would such a theory also be applicable in statements concerning the Incarnate Son, where one is dealing with only one person, but a person with a divine and a human nature?"

(...)

"Our present task is a much more modest one. We are writing this essay as an introduction to a particular text of Walter Chatton. We will be looking at one particular theological case and showing how a small number of Chatton's predecessors dealt with that case and how they tried to develop a theory of supposition to handle it. The particular theological case is found in Lombard's *Sentences* 1.4 where, picking up the Alberic-Abelard debate of 1121]*], the *Magister Sententiarum* examines the truth of the proposition "Deus genuit Deum."

Since the *Sententiae* of Lombard became the official theology textbook at Paris and Oxford before the middle of the thirteenth century, and every medieval baccalareus had as one option to present a commentary on Lombard's work as a partial requirement for becoming a Master of Theology, the commentaries baccalarii wrote on distinction 4 contain an alternate source for their theories of supposition.(9)" (pp. 113-114)

(9) For an introduction to the development of the theory of the supposition of terms in the medieval period according to logical works, see Brown, "Walter Burleigh's Treatise De suppositionibus and its Influence on William of Ockham," *Franciscan Studies* 32 (1972): 15-64.

26. ———. 2009. "Gerald Odonis' *Tractatus de suppositionibus*: What is *suppositio communicabilis?*" *Vivarium* no. 47:205-220.

    Abstract: "The *Tractatus de suppositionibus*, which is cited by Gerald Odonis in his commentary on the *Sentences*, probably dates from ca. 1315-25. In the *Sentences* commentary he refers to his treatment of 'suppositio communicabilis' and its species, indicating a type of supposition whose language seems new. This article attempts to find a source for it in contemporary authors and arrives at the conclusion that 'communicabilis' is simply a synonym for 'personalis', the most common form of supposition according to Odonis."

27. ———. 2020. "Praepositinus of Cremona and William of Auxerre on *Suppositio*. Their Influence on the Summa Halensis." In *The Summa Halensis: Sources and Context*, edited by Schumacher, Lydia, 235-250. Berlin: de Gruyter.

    Abstract: "Early medieval discussions of supposition begin with reflections on an early passage of the first chapter of St Augustine’s *De Trinitate*. Here Augustine is criticizing Sabellius and his followers who claimed that the Father had begotten himself, i. e. God begets deity, which gave rise to a kind of

modalism. These words of Augustine show up in Peter Lombard's *Sentences*, Book I, Distinction 4, and gave rise to a larger debate about the words that can properly apply to God which engaged the minds not least of Abelard and Alberic of Reims, culminating in Gilbert of Poitiers.

Praepositinus (1135–1210) and William of Auxerre (1140–1231) are the sources of a new trajectory in interpreting the supposition of the name 'God', which directly influences the *Summa Halensis*. This paper examines the nature of that influence and provides a translation of brief texts from Prepositinus and William that form its background."

28. Brumberg-Chaumont, Julie. 2013. "The Role of Discrete Terms in the Theory of the Properties of Terms." *Vivarium* no. 51:169-204.

    Abstract: "Discrete supposition occurs whenever a discrete term, such as 'Socrates', is the subject of a given proposition. I propose to examine this apparently simple notion. I shall draw attention to the incongruity, within a general theory of the semantic variation of terms in a propositional context, of the notion of discrete supposition, in which a term usually has a single semantic correlate. The incongruity comes to the fore In those treatises that attempt to describe discrete supposition as a sort of personal supposition, although the same term cannot be in simple supposition in another propositional context, because it has no significate distinct from its suppositum. This shows a fundamental link between common signification, simple supposition and predicability, three notions that rely on the existence of a significate distinct and Independent from the suppositum of the term. The connection is to be seen especially in William of Sherwood's *Introductione*s, the only author of a terminist Summa who recognizes the existence of simple supposition for discrete terms."

29. Buridan, John. 1966. *Sophisms on Meaning and Truth*. New York: Appleton - Century - Crofts.

    Translated and with an introduction by Theodore Kermit Scott.

Introduction; V. Buridan's Theory of Language. B. Supposition, 29-42.

"The theory of supposition is the core of terminist logic.(54) Signification is a function of terms and concepts taken in isolation, but supposition is a function of the predication of terms and concepts.(55) In at least one of its aspects, supposition differs from signification as using a term differs from knowing how to use it. It is treated as a property of terms, but only as they occur in propositions, and it is used both as the basis for a theory of truth and as a tool for the purely syntactical analysis of propositions.

It is this double function of supposition that has led astray most attempts to give a general characterization of the theory. It is in fact, not one theory, but two, and they require separate treatments. (56) The first, which can be called simply the doctrine of supposition proper, is a set of rules governing the reference of terms in propositions and is the basis of a theory of truth. The second, which I call the doctrine of modes of supposition, has no effect on the reference of terms, but is a set of rules for the syntactical analysis of propositions containing quantifying words and is thus the quantification theory of terminist logic." (pp. 29-30)

(54) The use of the term *suppositio* stems from the use of the verb ("to place under" or "to stand in place of") made by both classical and medieval grammarians. The habit of grammarians of using the notion of standing for primarily in connection with pronouns helps explain the adaptation, for considerations of pronominal reference are inseparable from considerations of occasions and contexts of use, which is just what distinguishes supposition from signification in terminist logic. For a brief account of the history of the use of the term and of the doctrine, see Mullally, op. cit., [*The Summulae Logicales of Peter of Spain* (Notre Dame, Indiana, 1945)] pp. xlvi-xlvii.

(55) As in the case of signification, the supposition of a concept always matches that of the corresponding term, so that discussion can be confined to the supposition of terms.

(56) Whether Buridan is himself fully aware of the distinction is uncertain.

In his only general definition of “supposition,” at Chapter III, Remark i, he takes account of only one of the theories. But he does separate the two in practice, devoting the first six sophisms of Chapter III to the first and the last four to the second.

33. Cocchiarella, Nino. 2001. "A Logical Reconstruction of Medieval Terminist Logic in Conceptual Realism." *Logical*

Analysis and History of Philosophy no. 4:35-72.

Abstract: "The framework of conceptual realism provides a logically ideal language within which to reconstruct the medieval terminist logic of the 14th century. The terminist notion of a concept, which shifted from Ockham's early view of a concept as an intentional object (the *fictum* theory) to his later view of a concept as a mental act (the *intellectio* theory), is reconstructed in this framework in terms of the idea of concepts as unsaturated cognitive structures.

Intentional objects (*ficta*) are not rejected but are reconstructed as the objectified intentional contents of concepts.

Their reconstruction as intentional objects is an essential part of the theory of predication of conceptual realism. It is by means of this theory that we are able to explain how the identity theory of the copula, which was basic to terminist logic, applies to categorical propositions. Reference in conceptual realism is not the same as supposition in terminist logic. Nevertheless, the various "modes" of personal supposition of terminist logic can be explained and justified in terms of this conceptualist theory of reference."

34. Conti, Alessandro D. 2013. "Semantic and Ontological Aspects of Wyclif's Theory of Supposition." *Vivarium* no. 51:304-326.

Abstract: "The relationship between thought and reality was a focal point of Wyclif's reflection.

On the one hand, Wyclif believed that thought was linguistically constrained by its own nature; on the other hand, he considered thought to be related to reality in its elements and constitution. Hence he deemed language, thought, and external reality to be of the same logical coherence. Within this context, the theory of supposition was intended to explain the different roles that terms can have in relation to language and the extramental world when they appear as extremes in propositions. Characteristically, his theory of supposition provides an account not only of the truth-values of a sentence, but also of its meaning; it is not therefore simply a theory of reference, but a sort of complex analysis of language viewed as

a semiotic system whose unique interpretative model was reality itself. It gives clear evidence of Wyclif's realist stance and of his conviction that any kind of linguistic and semantic features must be grounded on ontological structures."

35. Corcoran, John, and Swiniarski, John J. 1978. "Logical Structures of Ockham's Theory of Supposition." *Franciscan Studies* no. 38:161-183.

    "There are two pervasive themes in this article. In the first place this article is a defense of Ockham against a baseless charge oferror, which, if left unanswered, might tend to diminish Ockham's reputation as a technically competent logician. Study of the sources of the charge reveal that two recent commentaries each attribute ingenious and interesting logical structures to Ockham's thought on supposition. Comparison of these two structures with each other and with Ockham's writings yields three results: first, that the two structures, though separately consistent, are inconsistent with each other; second, that neither of them square with Ockham's own statements and, third, that Ockham's thought does have a logical structure which, in several respects, is even more ingenious. Thus, the second theme of this article involves an attempt to articulate the logical structure of Ockham's theory of supposition and to compare this structure with two others that have been proposed." (p. 161)

    (...)

    "It is important to realize that this article in no way impugns either the Loux interpretation or the Priest-Read formalization. In regard to Loux's work, this article refutes two inferences made in the exposition of Ockham's theory but it in no way criticizes the interpretation on which the exposition is based. The interpretation contains several worthwhile observations. Moreover, the Priest-Read formalization per se is not criticized at all. This article implies, however, that the Priest-Read formalization is not a formalization of Ockham's theory and that it is not a formalization of the Loux exposition either. We should acknowledge that without the clarity and precision provided by the Priest-Read formalization the results of this

article would have been much more difficult to obtain. Thus it can be said that this article builds on the works of Loux and of Priest and Read." (p. 163)

"On the Friday after Christmas in 1340 the Arts Faculty at the University of Paris, during the rectorship of Alain de Villa Colis, enacted a statute listing propositions and types of argumentation that should not be used in the schools by any master, bachelor, or scholar under pain of expulsion from the faculty forever.(1) Most of the articles in that statute concerned arguments employing the phrase *de virtute sermonis,* to the effect that propositions taken from authoritative sources should not simply be called false, *de virtute sermonis*." (p. 107)

(...)

"As far back as 1946 Boehner attempted to erase many of the misunderstandings about the meaning of the expression de *virtute sermonis* and shed light on Ockham's use of it.(5) The persuasiveness of his analysis was handicapped by his need for brevity (it was given as an aside in the context of another article), by a few unfortunate mistakes, and probably by the ad hominem assumption by many that Boehner had a vested interest in freeing Ockham from the taint of heresy. Yet when Boehner's analysis is considered on its own merits, it is essentially correct. It is only insufficient in the degree of attention given to the pre- and post-Ockhamist history of the phrase *de virtute sermonis* and the limitation of discussing it only in the context of supposition theory, leading to the mistaken inference that the expression *de virtute sermonis* was

equivalent to and interchangeable with proper supposition, as opposed to improper supposition, or *ex usu loquendi*." (p. 108)

37. Crimi, Milo. 2014. "Significative Supposition and Ockham's Rule." *Vivarium* no. 52:72-101.

    Abstract: "Paul Spade argues that there is a tension between Ockham's descriptions of the various types of supposition at Summa Logicae (sl) I.64 and a rule he provides at sl I.65. In later papers, Spade proposes a solution: a term supposits significatively (i.e., personally) just in case it supposits for everything it signifies. I evaluate Spade's proposal and explore some of its implications. I show that it successfully resolves the tension and that it suggests a way to more precisely describe material and simple supposition. I argue furthermore that Ockham is committed to the proposal by showing that uncontroversial features of his theory imply it. In doing so, I raise and refute three potential objections. Finally, I highlight and discuss a controversial result: self-signifying conventional terms can supposit materially. I argue that this result makes for a more satisfying theory."

38. ———. 2013. "Logic in Salamanca in the Fifteenth Century. The *Tractatus suppositionum terminorum* by Master Franquera." *Vivarium* no. 51:427-463.

    Abstract: "This paper looks into the contents of the *Tractatus suppositionum terminorum* by Master Franquera, in the context of the teaching of logic in Salamanca (and elsewhere in Spain) in the fifteenth century. Franquera's work is characterised by its explicit realist bias and its rejection of Ockhamist theses, i.e., by its recognition of the existence of a *natura communis* or a *universale in re*, which is evident in all discussions related to *suppositio simplex* and the theory of *significatio*. But, apart from this, Franquera's discussion of the

theory of s*uppositio* stands out as a strange mixture of different doctrines: some of them are derived from thirteenth-century (or earlier) analyses, others from fourteenth-century developments; realist goals are reached by means of instruments that, while not being nominalist, are definitely inspired by terminism. While upholding the theses of realist schools, Franquera adopts the definitions and rules of nominalist authors."

39. Dinneen, Francis P. 1990. "*Suppositio* in Petrus Hispanus. Linguistic Theories and Models." In *De Ortu Grammaticae. Studies in Medieval Grammar and Linguistics Theory in Memory of Jan Pinborg*, edited by Bursill-Hall, Geoffrey L., Ebbesen, Sten and Koerner, Konrad, 69-85. Amsterdam, Philadelphia: John Benjamins.

    "Hispanus opposes Signification and Supposition much like sense and reference. Each is a technical term. For Hispanus, term *(terminus*) itself is a technical term. It is distinguished from word (*dictio*), locution (*vox*), or part of speech (*pars orationis*) because those expressions are appropriate when discussing multiple ordinary or grammatical functions, while term is reserved for discussing only two logical functions that a grammarian's word, locution, or part of speech may serve: that of being relatable to another term as subject or predicate oí a.proposition.

    Hispanus is quite clear about this.

    (...)

    Hispanus is less clear in his definitions of Signification and Supposition as properties of a term. Technical terms should be precisely defined. But there are at least two different kinds of precision. One lists elements of composition positively, another indicates function or distinction negatively or relationally. Signification is positively defined as "conventional representation of a thing by a locution" (VI.2); Supposition as "acceptance of a substantive term for something" (VI.3). They are relatively defined because Supposition presupposes Signification: "Supposition and Signification differ because Signification is the imposition of a locution to signify a thing,

but Supposition is the acceptance of that term, already significant of a thing, for something" (ibid.). Both are subcategorized and related, but the chief interest is in the sense and reference of common nouns, discussed as the Signification and Supposition of common terms. (pp. 70-71)

Studies in English Dut - Kay

1. Dutilh Novaes, Catarina. 2000. *A Study of William of Ockham's Logic - From Suppositio to Truth Conditions*, , University of Amsterdam.

   Available at the University of Amsterdam.

   Abstract: "This work is the result of my attempts to combine my Philosophy background with the Mathematical Logic inclinations of the institution within which this research was developed. In fact, this twofold character is noticeable in many features thereof; I shall now outline some of them.

   The project has two main purposes: the less risky one is to provide an account of William of Ockham's logical thinking, with focus on its aspects which bear a relation with the contemporary issues of intensional logics and possible-world semantics. The more risky one consists of investigating the possibilities of developing a purely extensional treatment of intensional contexts, such as tense and modalities. For the latter, some other extensional/nominalistic systems could have played the role of `experimental sample', but there seemed to be something intriguing about Ockham, as one wonders whether a philosopher from the XIVth century would have

something relevant to add to our present logical issues. Moreover, he is considered to be the founder of nominalism, so the historical interest of such enterprise was self-evident - therefore, the legitimacy of the first purpose.

I shall try to comply with two very distinct kinds of expectations: those which are the desiderata for a History of Philosophy work, and those of logicians, who are interested in the formal correcteness of the system hereby presented. The criteria of excellence of these two lines are almost incompatible, and one wonders if it is not a suicidal enterprise to try to combine them. On the one hand, an Ockham scholar may be discontent with the absence of a few important aspects of Ockham's logic, since I deliberately priorize those related to contemporary logic. On the other hand, a logician may be bothered by the presence of too many `antiquities', perhaps hindering logical clarity. So, at the risk of displeasing everybody, I nevertheless maintain that such a combination may turn out to be fruitful and informative to both sides.

Chapter 1 will display some fundamental aspects of Ockham's logic and semantics, in a rather historical approach. However, even this part is developed taking into account what I later shall want to establish as my version of an `ockhamist system'. I consider it to be the flaw of many such reconstructions that they do not undertake a serious analysis of the underlying concepts; alternatively, some which did rely on such an analysis have reached very interesting results.

Chapter 2 relates some apparently less central (when compared to supposition theory, for example) issues of Ockham's theory to relevant topics of Contemporary Philosophy, such as possible worlds, designation, demonstratives etc... In this chapter I also introduce conceptual tools which I will make use of for the reconstruction undertaken in chapter 3. Finally, Chapter 3 is an attempt to provide truth conditions for quantified, modal and tense propositions, based on the truth of singular propositions.

I hereby hope to reach a rather broad account of Ockham's thinking, even though my main target is to build a coherent and

correctly structured reconstruction of his theory of propositions."

2. ———. 2004. "The Buridanian Account of Inferential Relations between Doubly Quantified Propositions: a Proof of Soundness." *History and Philosophy of Logic* no. 25:225-243.

   Abstract: "On the basis of passages from John Buridan's *Summula Suppositionibus* and *Sophismata*, E. Karger has reconstructed what could be called the 'Buridanian theory of inferential relations between doubly quantified propositions', presented in her 1993 article 'A theory of immediate inference contained in Buridan's logic'.[*]

   In the reconstruction, she focused on the syntactical elements of Buridan's theory of modes of personal supposition to extract patterns of formally valid inferences between members of a certain class of basic categorical propositions. The present study aims at offering semantic corroboration—a proof of soundness—to the inferential relations syntactically identified by E. Karger, by means of the analysis of Buridan's semantic definitions of the modes of personal supposition. The semantic analysis is done with the help of some modern logical concepts, in particular that of the model. In effect, the relations of inference syntactically established are shown to hold also from a semantic point of view, which means thus that this fragment of Buridan's logic can be said to be sound."

3. ———. 2007. "Theory of Supposition vs. Theory of Fallacies in Ockham." *Vivarium* no. 45:343-359.

   Abstract: "I propose to examine the issue of whether the ancient tradition in logic continued to be developed in the later medieval period from the vantage point of the relations between two specific groups of theories, namely the medieval theories of supposition and the (originally) ancient theories of fallacies. More specifically, I examine whether supposition theories absorbed and replaced theories of fallacies, or whether

the latter continued to exist, with respect to one particular author, William of Ockham. I compare different parts of Ockham's *Summa Logicae*, namely III-4 (on fallacies), and the final chapters of part I and first chapters of part II (on supposition). I conclude that there is overlap of conceptual apparatus and of goals (concerning propositions that must be distinguished) in Ockham's theories of supposition and of fallacies, but that the respective conceptual apparatuses also present substantial dissimilarities. Hence, theories of supposition are better seen as an addition to the general logical framework that medieval authors had inherited from ancient times, rather than the replacement of an ancient tradition by a medieval one. Indeed, supposition theories and fallacy theories had different tasks to fulfil, and in this sense both had their place in fourteenth century logic."

4. ———. 2007. *Formalizing Medieval Logical Theories: Suppositio, Consequentiae and Obligationes*. New York: Springer.

   Contents: Introduction I-XII; 1. Supposition theory: algorithmic hermeneutics 7; 2. Buridan's notion of *Consequentia* 79; 3. *Obligationes* as logical games 145; 4. The philosophy of formalization 215; Conclusion 293; References 301; Index of names and topics 310.

   "From a modern perspective, the medieval writings in logic are incomprehensible. Not only is the language (Latin) a barrier; medieval logic was embedded in a complex conceptual framework, with constant use of highly technical jargon. But the most serious obstacle may be the modern tendency to express logical theories in especially devised notations, and with a certain axiomatic structure, which are not to be found in the medieval writings. Either way, it is clear that one way of establishing such a dialogue between these two traditions is to formalize fragments of medieval logic. And this is precisely what I set out to do. In particular, the objects of formalization in the present study are three topics from medieval logic, namely *supposition*, *consequentia* and *obligationes*; each can be seen as a case study demonstrating the fruitfulness of formalizing medieval logic." (pp. 2-3)

(…)

"The concept of supposition was already the topic of my master thesis, where I dealt with Ockham's truth conditions for the main propositional forms, leaving aside the different kinds of supposition that are my concern here. Besides, supposition is a crucial concept in the medieval semantic framework, so it seemed appropriate to treat of it in the present context – even more so since supposition remains an unfinished topic within medieval scholarship. My main tenet is that, contrary to the accepted view, theories of supposition should not be compared to modern theories of reference.

Within the modern framework, they are best seen as theories of meaning, more specifically as theories for the algorithmic generation of the meanings that a certain body of propositions may carry. This insight came to me from a switch of perspective: theories of supposition should not be seen as static, but rather as procedural, in a sense that has recently become influential in logic." (p. 5)

5. ———. 2008. "An Intensional Interpretation of Ockham's Theory of Supposition." *Journal of the History of Philosophy* no. 46:365-394.

"I have argued elsewhere that there are significant dissimilarities between theories of supposition and theories of reference, to the extent that the assimilation of the former to the latter becomes unfounded and misleading.(3) In fact, attributing the title of 'theory of reference' to any pre-Fregean theory is, to say the least, debatable.

Here, I argue that, if supposition theories are to be compared to a group of modern theories at all, it seems to be more fruitful to view them as theories of (propositional) meaning—insofar as they aim at the generation of the possible readings of (certain) propositions—and that this is true in particular of William of Ockham's theory of supposition. To be sure, I am not contending that supposition is not fundamentally a property of terms in propositions; rather, what I claim is that, by establishing the possible supposita (i.e., the object[s] it may stand for) of a term in a proposition, Ockham intended to

generate the possible meanings of the proposition in question. In other words, Ockham's supposition theory does indeed concern this particular property of terms, their supposition, but it is in fact part of a larger program of propositional hermeneutics.

The conclusion I will draw from the textual, historical, and conceptual analysis to follow is that Ockham's theory of supposition can be seen as a formal method for the semantic analysis of (certain) propositions, generating their possible readings. That is, the theory as formulated by Ockham is essentially intended to interpret propositions; it is a project of hermeneutics, but not in the sense that it relies on the subjective skills of the interpreter. Rather, it contains a set of rules that could be applied mechanically, in some senses resembling what is now known as computational semantics. Very important for this interpretation of supposition theory is its procedural nature, as these rules are viewed as a set of instructions to be carried out." (pp. 365-366, some notes omitted)

6. ———. 2008. "Logic in the 14th Century after Ockham." In *Handbook of the History of Logic Vol. 2: Mediaeval and Renaissance Logic*, edited by Gabbay, Dov and Woods, John, 433-504. Amsterdam: Elsevier.

"This chapter is meant to complement the previous chapter on Ockham's and Buridan's respective semantic systems, and the chapters on modalities, on self-referential paradoxes and on supposition in this volume. Here, I intend to cover for as much as possible the important material from the 14th century that is not covered by these other chapters."

(...)

"As any list of 14th century authors and texts (such as in [Spade, [*Thoughts, Words and Things*. Available at www.pwspade.com[1996, 329]) will show, the main logical

topics treated in that period were: insolubilia (paradoxical propositions); modal propositions; supposition; the analysis ('proof') of propositions; obligations; and consequence."

(::.)

"As for the first two topics of this list, insolubilia and modal propositions (two of the main topics in 14th century logic), they are treated in detail elsewhere this volume, so I will not approach them here. We are thus left with the other four prominent logical genres in the 14th century: supposition, the analysis ('proof') of propositions, obligationes, and consequence. Indeed, this chapter is composed of three main parts, each of them dedicated to one of these topics – under the common heading of 'semantics', I treat supposition and, briefly, the theory of proofs of propositions. But before I move to the study of these three topics, in a preliminary section I give an overview of names, dates and places, so as to provide the reader with some of the historical background before we proceed to the conceptual analysis. The reader may also choose to turn directly to the thematic sections, if the historical aspects are not her main interest." (pp. 433-434)

7. ———. 2011. "Ockham on Supposition and Equivocation in Mental Language." *Proceedings of the Society for Medieval Logic and Metaphysics* no. 3:47-64.

   Abstract: "In my previous work on Ockham's theory of supposition, I have argued that it is best understood as a theory of sentential meaning, i.e., as an apparatus for the interpretation of sentences. In this paper, I address the challenge posed to this interpretation of Ockham's theory by the (presumed) existence of different kinds of supposition in mental language through the lenses of Ockham's theory of angelic communication. I identify two potentially problematic implications of Ockham's account of mental language as allowing for different kinds of supposition: the existence of non-significative supposition In mental language; and the possibility of ambiguous mental sentences. I then turn to angelic communication and examine these two issues from that point of view, concluding that there cannot be non-significative

supposition in mental language, but also that there may still be room for sentential ambiguity in mental language."

8. ———. 2012. "Ockham on Supposition Theory, Mental Language, and Angelic Communication." *American Catholic Philosophical Quarterly* no. 86:415-434.

   Abstract: "In my previous work on Ockham's theory of supposition, I have argued that it is best understood as a theory of sentential meaning, i.e., as an apparatus for the interpretation of sentences. In this paper, I address the challenge posed to this interpretation of Ockham's theory by the (presumed) existence of different kinds of supposition in mental language through the lenses of Ockham's theory of angelic communication. I identify two potentially problematic implications of Ockham's account of mental language as allowing for different kinds of supposition: the existence of non-significative supposition in mental language; and the possibility of ambiguous mental sentences. 9. ———. 2012. "Form and Matter in Later Latin Medieval Logic: The Cases of *Suppositio* and *Consequentia*." *Journal of the History of Philosophy* no. 50:339-364.

   "Here, I would like to focus on a particular aspect of the Aristotelian metaphysical framework and its logical applications, namely uses of the form vs. matter distinction in logic. It is well known that Aristotle does not apply the form vs. matter distinction anywhere in his logical writings; in this respect, there is only a brief passage in *Physics* 195a18–19, and an almost identical passage in *Metaphysics* 1013b19–20. There he observes without much elaboration (in the context of a discussion of the four causes) that the premises (hypotheses) are matter for the conclusion (of an argument) “in the sense of ‘that from which,’” which is a familiar formulation for the notion of material cause. At first sight, this may seem surprising for two reasons: firstly, Aristotle applies the form vs.

matter distinction in a wide variety of contexts, but not with respect to logic; secondly, subsequent traditions have made extensive use of this distinction in logic, so much so that the hylomorphic terminology is still ubiquitous in current (philosophy of) logic.

I shall focus on two specific Latin medieval applications of hylomorphism in logic: to the concepts of supposition and consequence. Significantly, these are among the most important topics of the *logica modernorum* tradition, and this lends support to the main thesis of the present contribution, namely that the assimilation of some elements of Aristotelian metaphysics into logic is a significant factor in the development of this tradition." (p. 340, a note omitted)

10. ———. 2013. "The Role of 'Denotatur' in Ockham's Theory of Supposition." *Vivarium* no. 51:352-370.

    Abstract: "In the scholarship on medieval logic and semantics of the last decades, Ockham's theory of supposition is probably the most extensively studied version of such theories; yet, it seems that we still do not fully understand all its intricacies. In this paper, I focus on a phrase that occurs countless times throughout Ockham's writings, but in particular in the sections dedicated to supposition in the *Summa logicae*: the phrase 'denotatur'.

    I claim that an adequate understanding of the role of the concept of *denotatur* within Ockham's supposition theory shall yield a deeper understanding of the theory as a whole. Here, I first examine a few uses of the term 'denotatur' and its variants by other authors. I then turn to Ockham: first I briefly mention some uses of the term in contexts other than his theory of supposition. Following that, I focus on his supposition theory, in particular on how 'denotatur' allows him to deal with two crucial puzzles, namely the supposition of empty terms and the supposition of terms in false affirmative propositions.

    The treatment of these two puzzles suggests that Ockham's theory of supposition must be understood as a theory chiefly intended for the generation of the meanings of propositions."

11. ———. 2015. "The Formal and the Formalized: The cases of Syllogistic and Supposition Theory." *Kriterion* no. 131:253-270.

    Abstract: "As a discipline, logic is arguably constituted of two main sub-projects: formal theories of argument validity on the basis of a small number of patterns, and theories of how to reduce the multiplicity of arguments in non-logical, informal contexts to the small number of patterns whose validity is systematically studied (i.e. theories of formalization). Regrettably, we now tend to view logic 'proper' exclusively as what falls under the first sub-project, to the neglect of the second, equally important sub-project. In this paper, I discuss two historical theories of argument formalization: Aristotle's syllogistic theory as presented in the "Prior Analytics", and medieval theories of supposition. They both illustrate this two-fold nature of logic, containing in particular illuminating reflections on how to formalize arguments (i.e. the second sub-project). In both cases, the formal methods employed differ from the usual modern technique of translating an argument in ordinary language into a specially designed symbolism, a formal language. The upshot is thus a plea for a broader conceptualization of what it means to formalize."

12. ———. 2018. "Ockham's Supposition Theory as Formal Semantics." In *Modern Views of Medieval Logic*, edited by Kann, Christoph, Loewe, Benedikt, Rode, Christian and Uckelman, Sara L., 85-110. Leuven: Peeters.

    "In what follows, I intend to show that William of Ockham's theory, besides concerning the interpretation of propositions, is also essentially formal: it provides a procedure for the analysis of propositions that could be mechanically applied by anybody (or even by a machine), always yielding the same results. In this sense, his theory contrasts with traditional hermeneutical methods, which typically rely on the subjective skills of the interpreter. Moreover, Ockham's supposition theory abstracts from the specific content of each particular proposition (since the meaning of propositions is precisely what is to be established), as it is based on a finite, small number of propositional schemata; what determines the schema to which

a given proposition belongs – and thus the reading(s) it allows for – are (quasi-)formal features such as the semantic kind of its terms and the presence/absence of syncategorematic terms5, and not the particular meanings of its terms.

In order to spell out the formal, algorithmic character of Ockham's supposition theory, I present here a non-symbolic reconstruction of it. Elsewhere(7), I have outlined this aspect of the theory by means of a formalization. But symbolization and formalization are not pre-conditions for formality: as I hope to show here, the formal character of Ockham's theory can also be captured in 'plain' words. This reconstruction presents the theory as a formal procedure to generate the possible readings of some propositions, based on the relation between words and what they stand for." (pp. 85-86, som notes omitted)

13. ———. 2020. "Supposition Theory." In *Encyclopedia of Medieval Philosophy: Philosophy Between 500 and 1500. Second Edition*, edited by Lagerlund, Henrik, 1819-1827. Dordrecht: Springer.

Abstract: "Supposition theory is one of the most important later medieval semantic theories (in the Latin tradition). Supposition is the property of terms (occurring in propositions) of standing for things, so that these things can be talked about by means of propositions, and supposition theory (in its different versions) is a theory codifying the different uses of terms in propositions, based on the idea that one and the same term can stand for different things when occurring in different propositional contexts. The different kinds of supposition are attempts to

capture the phenomenon of semantic variation prompted by different propositional contexts.

The theory emerged in the twelfth century, and the two main traditions contributing to its development were the tradition of commentaries on Aristotle's *Sophistical Refutations* and the tradition commenting on the fourth-century grammarian Priscian. Supposition theory acquired its first mature form in the thirteenth century, with the terminist/summulist tradition (in the works of William of Sherwood, Peter of Spain, Roger Bacon, and Lambert of Lagny/Auxerre), and was further developed in the fourteenth century by authors such as Walter Burley, William of Ockham, and John Buridan."

14. Ebbesen, Sten. 1979. "The Dead Man is Alive." *Synthese* no. 40:43-70.

"One of the thirteen fallacies treated by Aristotle in the *Sophistici Elenchi* turns on "something being said absolutely or in a certain respect" (in Latin: secundum quid et simpliciter). The false move in paralogisms falling under this fallacy consists in neglecting the difference between a qualified predicate and the same predicate unqualified.

In a short late 13th century Latin companion to the *Elenchi* we read(1) : "Secundum quid et simpliciter [. . .] The first mood of this fallacy is when there is an oppositio in adiecto, as in 'dead man'". The sophism referred to runs 'This is a dead man, therefore this is a man'. It is not mentioned in the *Elenchi* but Aristotle briefly alludes to it in *De Interpretatione* c. 11 21a21 which Ackrill (1963) translates: "When in what is added some opposite is contained from which a contradiction follows, it is not true but false (e.g. to call dead man a man)"." (p. 43)

(...)

"The 13th century knew two fundamentally different approaches to logical semantics, one concentrating on deducing the meaningof a sentence from the meaning of its terms. Roughly speaking this approach leads to intensional semantics. The other approach leads to an extensional semantics concentrating on the kind of meaning of a sentence that

consists in its method of verification. Starting from the observation that people will and can communicate facts about the world to each other and do so by means of sentences consisting of words, the logician who chooses this approach studies the way this is conventionally done striving especially to discover the formal devices by means of which people indicate which comer of the world they are speaking about. Having formulated his discoveries in rules the logician is able for every" actual sentence to explain where one ought to look for verification of falsification of it."

(...)

"The notion of supposition is a genuinely Western invention. It has no counterpart in Greek scholasticism, although a series of Stoic problems which had been treated or mentioned by Porphyry in his major commentary on the *Categories* and which had passed from there into works the Westerners knew, viz. Boethins' commentary on the *Categories* and "Alexander's" on the *Elenchi,* played an important role in stimulating this kind of approach to logical semantics.(9)" (p. 46)

(1) Anonymus Bavaricus, Comm. in *SE*, f. 6vA: "Secundum autem quid et simpliciter [. . .] est primus modus quando est oppositio in adiecto, ut 'homo mortuus' vel quando est determinatio deminuens de ratione entitatis, ut 'opinabile' deminuit de entitate."

(9) For exatnple, the Stoic sophisms of the type called 'outis' passed through Porphyry and 'Alexander' to the West. Cf. Ebbesen (1976a, p. 155).

15. ———. 1981. "Early Supposition Theory (12th-13th Century)." *Histoire, Épistémologie, Langage* no. 3/1:35-48.

    Reprinted in: S. Ebbesen, *Topics in Latin Philosophy from the 12th-14th Centuries. Collected Essays Volume 2*, Aldershot, Ashgate, 2009, pp. 1-14.

    "The theory of supposition with the associated theories of *copulatio* (sign-capacity of adjectival terms), *ampliatio* (widening of referential domain), and *distributio* constitute one of the most original achievements of Western medieval logic. There is nothing really similar in any ancient text the medievals knew -though surely some Stoic writings once contained investigations of the problems these theories deal with -- nor had contemporary Byzantium anything similar.

    The twelfth century produced a considerable harvest of rules about the referential range of terms in various contexts. When the 13th century arrived, a standard terminology had prevailed with such names as *suppositio confusa* and *suppositio determinata* for some particularly important types of referential range and a chapter on supposition had become a standard feature of Introductions to Logic *(summulae)*. But then the development of the theory stopped. It appears that at least on the Continent, the chapter on supposition in the *summulae* became one that young students would be taught very early in their career, perhaps before entering university; and then forget all about through the rest of their student career.

    In this paper I shall refrain from listing treatises 'de suppositionibus'; I shall on the whole refrain from following the developments of terminology and systematics. The spade-work in those fields has been done by De Rijk in his *Logica Modernorum*.

    I will try to point to and explain some characteristic features of 12th and early 13th speculation about supposition without going into details and without paying much attention to the opinions of individual authors, not even when they protest they disagree with something I say they thought. I am not looking

for the particular, but for general attitudes and patterns of thought underlying their investigation of *suppositio*." (p. 2 of the reprit)

16. ———. 2013. "Early Supposition Theory II." *Vivarium* no. 51:60-78.

    Abstract: "In 1981 I published an article called *Early Supposition Theory*.[*] Then as now, the magisterial work on the subject was L.M. de Rijk's *Logica Modernorum*, and then as now any discussion of the topic would have to rely to a great extent on the texts published there.

    This means that many of the problems that existed then still remain, but a couple of important new studies and several new texts have been published in the meantime, so it may be time to try to take stock of the situation. I will first look at the origin of the term suppositio and then at the chronology of our source texts. " (...)

    "Conclusion

    A host of questions concerning the dates of the relevant texts remain unresolved, but this is what I think the available evidence points to at this moment:

    The main outlines of the story about supposition remain as in 1967, but the dates change. First, the birth of supposition theory took place in the very late twelfth century. The first signs of what was to come appear in the 1170s, but in logic centered round the notion of appellation, while supposition was becoming a key notion in theology.(43) A stage with a fairly developed terminology for types of supposition is not reached till about the 1190s, when also *suppositio* begins to outmanoeuvre *appellatio*, though this was to be a slow process. The majority of our early texts that teach or employ supposition, English and continental alike, were composed in the thirteenth century.

    Finally, I think that although some authors may have had very clear ideas of which of the many uses of *supponere* was relevant in each particular context, they would generally be influenced both by the grammatical 'putting as a subject'- tradition, the

logical one of saying that what may be subsumed under a term supponitur under it, and the metaphysical thesis that bearers of forms *supponuntur* under their forms." (pp. 72-73)

(43) I am inclined to think that the *Summa Zwettlensis* is a work from about the 1170s. Häring's date 'before 1150' rests on his very doubtful attribution of the work to one Peter of Poitiers/Vienna. See Valente (2008a), 25. If I am right, the *Summa* is approximately contemporary with Peter of Poitiers' *Sententiae*, in which *supponere* is used in a relevant way, but without any developed system of types of supposition.

17. Eco, Umberto. 1984. "Signification and Denotation from Boethius to Ockham." *Franciscan Studies* no. 44:1-29.

"*Prima facie*, Ockham has little to say about the tortured story of the term "denotation." Baudry's *Lexicon* does not mention it. As far as I know- and in any case in his crucial texts on signification and supposition, Ockham does not use "denotation" but at most "denotari," in the passive form. However in this paper I shall try to provide some evidences for a further history of the term "denotation" and I shall suggest that this term started to shift from the intensional side to the extensional one just with or after Ockham." (p. 1)

(...)

"In its more mature formulation, supposition is the role played by a term, when inserted into a proposition, in order to refer to extra- linguistic things. From the first vague notions of "suppositum" to the most elaborate theories, such as the one of

Ockham, the way was a long one, and there is a consistent literature on this topic (see de Rijk 1967 and 1982).(8) With the theory of supposition, the cognitive approach was overwhelmed by the extensional one and "reference and denotation was far more important than the more abstract notion of signification. What is primarily meant by a term is the concrete individual object the term can be correctly applied to" (de Rijk 1982:167)." (p. 12)

(8) It would be interesting to follow step by step the rise of a different idea of the relationship between a term and the external thing, where the notion of signification (as the relationship between words and concepts, or species, or universais, or definitions) becomes less and less important. See for instance in de Rijk (1982:161 ff.) how the followers of Priscian spoke of names as signifying a substance together with a quality, where the latter was undoubtedly the universal nature of the thing, but the former was the in- dividual thing (163): "so we find as early as the twelfth century 'supponere' (to supposit) as an equivalent for lignificare substantiam,' i.e. to signify the individual thing" (164). It is true that authors as William of Conches insist that names do not signify substance and quality but only the universal na ture and not the actual existence (168), and that during the whole twelfth century there is still a constant distinction between signification (of concepts and species) and nomination and appellation (denotation of concrete individual things- see for instance the *Ars Meliduna*).

18. ———. 1989. "Denotaton." In *On the Medieval Theory of Signs*, edited by Eco, Umberto and Marmo, Costantino, 43-77. Amsterdam: Benjamins Publishes.

"Semioticians, linguists and philosophers of language frequently meet the term 'denotation'. Denotation (along with its counterpart, 'connotation') is alternatively considered as a property or function of (i) singular terms, (ii) declarative sentences, (iii) noun phrases and definite descriptions. In each case one has to decide whether this term has to be taken intensionally or extensionally: is 'denotation' tied to meaning or to reference? Does one mean by 'denotation' what is meant by the term or the named thing and, in case of sentences, what is the case.

As far as 'connotation' is concerned, if denotation has an extensional scope, it becomes the equivalent of intension, that is, of meaning as opposed to referent. If on the contrary denotation has an intensional scope, then connotation becomes a sort of further meaning depending on the first one." (p. 43)

(,,,)

"In the course of this paper I am interested in: (i) ascertaining what happened to the term *significatio*; (ii) when *denotatio* (along with *designatio*) occurs in connection with *significatio* and when it occurs as opposed to it.

As far as *denotatio* is concerned I am interested in registering its occurrence in one of the following three senses: (i) strong intensional sense (denotation is related to meaning); (ii) strong extensional sense (denotation is related to things or states of affairs); (iii) weak sense (denotation remains uncommitted between intension and extension with good reasons to take it intensionally).

We shall see that the weak sense predominates at least until the fourteenth century." (p. 49)

19. Fitzgerald, Michael Joseph. 1978. "Ockham's Implicit Priority of Analysis Rule?" *Franciscan Studies* no. 37:213-219.

"Some philosophers have doubted that Ockham intended his logical descent to singulars to be an analysis of quantified propositions.

Matthews has argued that fully descended propositions do not entail undescended ones because certain scope problems arise for the quantifiers when O propositions are analyzed.(1) Swiniarski has even provided us with a counterexample to descent as analysis.(2)"

(...)

"It is important to note, however, that neither Swiniarski nor Matthews has provided any textual support from Ockham's writings to show that he would allow the process of descent to begin with the predicate term prior to the subject term.

Now it seems to me that there are two distinct issues which are being blurred in their discussion of descent. The first issue is whether or not Ockham intended his descent to singulars to be an analysis of quantified propositions, snd the second is whether or not Ockham would allow the process of descent to begin with the predicate term.

Only if the process of descent begins under the predicate term, prior to the subject term, d o scope difficulties and possible counterexamples arise. Now, if it can be shown that Ockham would have rejected a case where descent begins with the predicate term, then the scope difficulties and counterexamples would not arise. If these scope difficulties do not arise, then one has no reason not to suppose that Ockham intended descent to be an analysis of quantified propositions.

What I would like to argue is that Ockham did intend for descent to be an analysis of quantified propositions, but he did not intend to allow descent to begin with the predicate term." (pp. 213-214)

21. ———. 1984. "An Interpretative Dilemma in Burlean Semantics." *Franciscan Studies* no. 44:181-192.

    "In his discussion of the debate between Walter Burley and William of Ockham, concerning the theories of signification and supposition, P. V. Spade has left us with a dilemma in interpreting Burlean semantics. Spade claims that the semantic relations between the notion of signification and the notion of supposition, in Burley's writings, clearly reflect the theory of cognition of the Arab-Aristotelian tradition where "understanding is of universals and sensation is of particulars." (1)

    St. Thomas subscribed to such a theory, and argued that the intellect has an indirect knowledge of sensible particulars via a process he calls 'abstraction'." (p. 181)

    (...)

    "More precisely, Spade's dilemma can be formulated as follows:

    1) If Burley allows simply supposing terms to indicate species, then he accepts the abstraction theory of cognition; and if he allows for a direct cognition of particulars by the intellect, then his epistemological theory does not reflect his semantic theory of proper supposition.

    2) Either Burley allows for simply supposing terms to indicate species, or he allows for a direct cognition of particulars.

    3) Therefore, either Burley accepts the abstraction theory of cognition, or his epistemological theory does not reflect his semantic theory of proper supposition.

    This paper will undertake to grab this "bull" by the horns, and show the conjuctive premiss of the dilemma to be false. Burley does allow for the direct cognition of particulars by the intellect, yet simply supposing terms, for him, indicate species. Further, even though he allows for the direct cognition of particulars by the intellect, it does not follow that his

epistemology is not reflected in his semantic theory of proper supposition." (pp. 182-183)

22. ———. 2012. "Unconfusing Merely Confused Supposition in Albert of Saxony." *Vivarium* no. 50:161-189.

    Abstract: "In this essay I argue that Albert would reject the need for a separate fourth mode of common personal supposition, and that his view of merely confused supposition has not been fully explicated by modern scholars. I first examine the various examples of conjunct descent given by modern scholars from his *Perutilis logica*, and show that Albert clearly adopts it in resolving the sophistic examples involved. Second, I explicate the view of merely confused supposition that Albert defends in his *Sophismata*, and then attempt to answer the question: which view of merely confused supposition was his final view, the view articulated in the Perutilis logica or the view in the *Sophismata*? I conclude that based upon his *Sophismata* view of merely confused supposition, Albert came to realize the logical strength his revised theory of personal supposition afforded, and consequently, that he is one of the earliest 14th-century logicians to adopt conjunct terminal descent to resolve various sophisms, a move which gave his theory of personal supposition a logical symmetry having two sorts of propositional descents to singulars, and two sorts of terminal descents to singulars."

23. Freddoso, Alfred J. 1979. "O-Propositions and Ockham's Theory of Supposition." *Notre Dame Journal of Formal Logic* no. 20:741-750.

    "In their recent article "The Formalization of Ockham's Theory of Supposition" Priest and Read [4] make the following two claims:

    1. In propositions(1) of the form of '$(\exists x)(P_1x \ \& \sim P_2x)$' the predicate term, in this case P, has merely confused supposition,

although Ockham mistakenly thought it to have confused and distributive supposition.

2. Contrary to the opinion of those who, like Geach, maintain that merely confused supposition is superfluous, there is at least one type of propositions (viz., negative indefinite exclusive propositions such as 'Only pigs don't fly') in which both the subject and the predicate have merely confused supposition, and in dealing with them the notion of merely confused supposition is ineliminable.

I will try to show in what follows that both of these claims are false.

Further, in my discussion of the first claim I will construct an alternative, though Ockhamistic, account of the supposition of the predicate in a particular negative proposition (O-proposition). I will then use this account in constructing an explication of negative indefinite exclusive propositions without recourse to the notion of merely confused supposition. Since my purpose is not explicitly to discuss or evaluate the formalization of Ockham's theory proposed by Priest and Read, I will make use instead of the sort of schematization employed by Loux in "Ockham on Generality" ([3], pp. 23-46). Thus, '{*AD/'A*'}' will stand for the appellative domain of *A*, i.e., for all those things which *A* can supposit for in a present-tense non-modal proposition. Also, the symbol v will be used as both a terminal and propositional connective, with the context of its occurrence making clear which use is intended. Finally, although I agree with Priest and Read that an adequate formalization of Ockham's theory must be given in an infinitary language, that issue is not germane to the points I wish to make here. So I will simplify the following discussion by treating the appellative domains of general terms as finite." (p. 741)

24. Geach, Peter Thomas. 1956. "The doctrine of distribution." *Mind* no. 65:67-74.

    "The doctrine of distribution occupies a peculiar position in logic.It is integral to the ' Aristotelian,' doctrine of categoricals and syllogisms; but it was quite unknown to Aristotle. Aristotle never uses rules like the modern rules about distribution to determine the validity of conversions and syllogisms; his whole procedure is different." (p. 67)

    (...)

    "We need only look at the traditional doctrine with a little carein order to see its deficiencies." (p. 67)

    (...)

    "The traditional doctrine is naturally popular; it is easy to apply mechanically, and it sounds intelligible. But we cannot really understand it without first reconstructing the logical edifice in which it is at home-- as it is not in contemporary class-logic.

    We have already looked at one foundation of the edifice; we have seen how general terms are taken to be names, indeed as similated to proper names. (" Man " would then be a name of each man, not of the class of all men.) Another foundation is the identity theory of predication: viz. that in an affirmative categorical we have two names joined by a sign of identity, the predication being true if one and the same thing does indeed bear the two names. In " a dog is white ", " a dog " stan~s for ,a dog, " white " stands for something white, " is " is a sign of identity, and the whole is true if indeed one and the same thing is called both" a dog" and "white ".-Now the name-theory of general terms and the identity theory of predication are easily accepted even when they are explicitly formulated; still more so, when they are tacitly assumed.

    In the Middle Ages many logicians explicitly held these two ·theories. Starting out from such simple-minded assumptions, they had to devise a complicated technical apparatus in order to fit the facts. This apparatus was the doctrine of *suppositiones* of terms. They were too acute to explain the varying inferential

force of categoricals by the same term's signifying different objects - -"man" e.g. signifying now all men, now only some men -- -so they assumed instead variations in the *modus significandi* of a term, in what they called its *suppositio*." (pp. 70-71)

25. ———. 1962. *Reference and Generality: An Examination of Some Medieval and Modern Theories*. Ithaca: Cornell University Press.

    Second emended edition 1968; third revised and expanded edition 1980.

    "The medieval term for what I call the mode of reference of a referring phrase was" suppositio". Apparently in origin this is a legal term meaning "going proxy for"; Aquinas and Ockham say quite indifferently that a term has *suppositio* for (*supponit pro*) and that it stands for *(stat pro*) one or more objects. In paraphrasing medieval writers I shall quite often tacitly use "mode of reference" for their" suppositio"." (p. 84 of the third edition)

    (...)

    "The medievals called the mode of reference of "any A" *confused* and *distributive*, that of "some A" *determinate*.

    The point of the second epithet is that "*f*(some dog)" will be true iff some determinate interpretation of "*x*" in "*f(x)*" as the name of a dog makes "*f(x)"* true; a blurred awareness of this was what led to the untenable views that we studied in Chapter One, about the reference of "some man" to some man. For the epithet "confused and distributive" I shall generally substitute "distributive".

    The doctrine of distributed terms is in fact originally a muddled memory of the mcdieval *suppositio confusa et distributiva*.

    Distributive *suppositio* was called "confused and distributive" because of a supposed resemblance to another mode of reference (which we shall come to presently) called "merely confused"; but since I can see no specially important feature common to these two modes of reference rather than any other

two, I shall for simplicity just call them the *distributive* and the *confused* mode of reference or *suppositio*." (p. 90)

(...)

"This concludes my treatment of the doctrine of *suppositio*.

The reader may well suppose that, in spite of the errors of detail into which Russell and the medievals fell, the theory must be essentially sound -- that something on these lines is needed, to deal with definite fallacies. I shall now try to show that the doctrine of *suppositio* is radically inconsistent, though less obviously so than the doctrine of distribution, and that we need to start all over again on new lines. Of course the fallacies which the doctrine of *suppositio* tried to eliminate are fallacies, and we shall have to give some account of them; but this no more justifies the doctrine of *suppositio* than the fallaciousness of syllogisms with an 'undistributed middle' is a ground for accepting the doctrine of distribution." (p. 104)

26. ———. 1976. "Distribution and *Suppositio*." *Mind* no. 84:432-435.

"The doctrine of distribution is historically a simplified, indeed muti-lated, form of the medieval suppositio theories; in these theories the maindivision is made not between distributed and undistributed terms, butbetween confused and determinate *suppositio*." (p. 433)

(...)

"Some recent articles betray a confusion of mind as to the relation between medieval *suppositio* theories and the doctrine of distribution.

What is distinctive of the latter doctrine is its making fundamental the division between distributed and undistributed terms; in modern presentations of the doctrine, the terms possessing (to use medieval language) determinate *suppositio* and *suppositio confusa tantum* are indiscriminately called undistributed terms. In medieval theories, on the other hand, the main division is between *suppositio confusa* and determinate s*uppositio*, and terms that are said to be

distributed form one sub-class of terms having *suppositio confusa*: technically, they have *suppositio confusa et distributiva mobilis*. In 'Every nobleman possesses a dog', the prenex 'every' would be held to exert the power of giving confused suppositio (*vim confundendi)* as regards both following terms: the second has *suppositio confusa tantum,* the first has *suppositio confusa et distributiva mobilis*. Though it is not quite clear what common feature of terms *suppositio confusa* is here supposed to be, this doctrine is manifestly different from the doctrine of distribution in its standard modern presentation; and that doctrine is not to be read back into medieval authors merely on the ground that *terminus distributus* in medieval syllogistic rules extensionally coincides with the modern distributed term so far as terms occurring in ordinary syllogisms are concerned." (pp. 433-434)

27. Gordon, Alec. 2008. "Philosophical Translation, Metalanguage, and the Medieval Concept of Supposition." *Medieval Philosophy* no. 14:45-71.

    Abstract: "In his Welcome Message for the XXII World Congress of Philosophy hosted by Seoul National University in August 2008 the President of the International Federation of Philosophical Societies (FISP), Peter Kemp, said that—inter alia—it will be an occasion “for rethinking the great philosophical questions.” Amongst there questions how we in the present understand the philosophical past is surely a perennial query before us. In this short paper I will refer to the endeavor of understanding past philosophical thought on its own terms or as presented in a current idiom as “philosophical translation.” The latter can take three forms: logical, analytical, or hermeneutic. This paper will briefly discuss all three forms vis-à-vis modern attempts to understand the medieval concept of “supposition” with special regard to the role metalanguage plays in philosophical translation."

28. Goubier, Frédéric. 2017. "The Role of the Speaker in Roger Bacon and William of Ockham's Supposition Theories: A Contrast." In *The Language of Thought in Late Medieval Philosophy: Essays in Honor of Claude Panaccio*, edited by

Pelletier, Jenny and Roques, Magali, 169-182. Cham, Switzerland: Springer.

"While supposition theory is perhaps the closest thing medieval logicians have to a formal approach to semantics, it grants speakers a role. This role varies in importance from one logician to another. If we were to place the different positions on an axis stretching from the most semantic to the most pragmatic, William of Ockham and Roger Bacon would likely occupy the two extremes. On the semantic side, we would find William of Ockham and his apparent willingness to propose a system that seeks to determine sentences' truth conditions as formally as possible.

On the pragmatic side and a few decades before Ockham, we would find Roger Bacon and his attempt to translate supposition theory into an intensional semantics of signification, so that the central importance of speakers is better described. This paper will rely on Claude Panaccio's work on Ockham's semantics and attempt to show that, in spite of the considerable differences that oppose the two theories, they share some fundamental ideas about the speakers' involvement in the semantic processes."

29. Goubier, Frédéric, and Perini-Santos, Ernesto. 2015. "When the World is Not Enough: Medieval Ways to Deal with the Lack of Referents." *Logica Universalis* no. 9:213–235.

    Abstract: "According to several late medieval logicians, the use the universal quantifier 'omnis' creates the requirement that the sentence refers to at least three items—the principle of *sufficientia appellatorum*. The commitment is such that, when the quota is not fulfilled, one has to import the missing items from the realm of the nonexistent. While the central argument for this principle, whose origin is Aristotle's *De Caelo,* stems from the contrast between unrestricted universal quantifiers and binary quantifiers, the discussion is often mixed with another issue, concerning the requirement of a plurality of referents for universals. In this paper, we try to distinguish those different issues and map the reactions of xiiith authors to the principle of *sufficientia appellatorum*."

30. Henry, Desmond Paul. 1963. "The Early History of *Suppositio*." *Franciscan Studies* no. 23:205-212.

    "The origins of the doctrine of suppositio are "shrouded in darkness" (BML p. 27) and it has not hitherto been possible to trace the details of its development (KDL p. 246). In BML (p. 27), however, the late Fr. Philotheus Boehner did conjecture that its roots might well stretch back to St.Anselm, but he added no further detail, the note accompanying this remark merely referring the reader to MSL, which contains no mention of St. Anselm. Hereunder, by selecting certain aspects of the Burleigh-Ockham debate on suppositio it is shown not only that the same issues were being debated by Anselm in the eleventh century, but also that they were being resolved by means of distinctions in ways of signifying, thereby confirming Fr. Boehner's conjecture. The sigla used are detailed at the close of this paper." (p-205)

31. ———. 1964. "Ockham, *Suppositio*, and Modern Logic." *Notre Dame Journal of Formal Logic* no. 5:290-292.

    "In a discussion (*Philosophical Review*, Jan. 1964) of the alleged difficulties of rendering the *descensus* of Ockham's *suppositio*-doctrine in terms of modern logic, G. B. Matthews is concerned with the inferences corresponding to the following theses:

    .1 If some man is animal, then this man is animal or that man is animal or

    .2 If all men are animal then each man is either this animal or that animal or

    .3 If some man is animal then some man is this animal or some man is that animal or

.4 If all men are animal then this man is animal and that man is animal and

.5 $(3x)(Fx \,.\, Gx) \supset (Fx_w \,.\, Gx_q \,.\, v\, Fx_2 \,.\, Gx_2 \,.\, v\ldots\ldots)$

It will be more convenient to continue the discussion in terms of such theses, rather than in terms of the corresponding inferences, but this, of course, has no material effect on the points at issue. The first of these is

whether (as alleged by P. Boehner in his Medieval Logic)(5) is a proper modern logical rendering of the form of .1 as understood by Ockham. That it cannot be is then shown by pointing out that the consequent of .5 would also have to be the prima facie modern rendering of the consequent of .3, thereby missing Ockham's point that there is a difference here. More complex renderings in terms of predicate calculus enriched by identity are suggested, but rejected on account of their involving double quantification over nominal variables and a "wastage of disjuncts" (or conjuncts) in that a consequent such as that of .5 must range over all the all the x's and not just all the men, as does the consequent of .1. The second issue is whether Boehner's reason for alleging that modern logic and Ockham's part company because the former has nothing parallel to .2 is adequate; the conclusion reached, after an attempt to render the consequent of .4 in terms similar to those earlier applied in respect of that of .3, is that in all the cases in question, i.e. .1 to .4, the basic trouble is that "Ockham quantifies over terms, whereas modern logicians quantify over variables"; ergo modern logic is here inadequate." (p. 290)

32. ———. 1981. "*Suppositio* and *Significatio* in English Logic." In *English Logic and Semantics from the End of the Twelfth Century to the Time of Ockham and Burleigh*, edited by Braakhuis, Henk A.G. and Kneepkens, Corneille Henry, 361-387. Nijmegen: Ingenium Publishers.

"It is well-known(1) that there is a difference of opinion between Walter Burleigh and William of Ockham on the subject of *suppositio simplex*. Both agree that a term having *suppositio personalis* stands for individual objects,(2) and that, for example, in "Homo est species" the "homo" is a term having

suppositio simplex.(3) Their disagreement centres on Ockham's in effect making *suppositio personalis* the model for his basic sense of *significatio*.(4) For him terms having *suppositio personalis* are used significatively: they then stand for (*supponunt pro*) what they signify, whereas terms having s*uppositio simplex* do not do so; they stand for mental concepts.(5)

Burleigh, on the other hand, is clearly attempting to avoid a sense of "signify" which amounts to "standing for" in the *suppositio personalis* manner: contrary to Ockham he holds that s*uppositio personalis* does not involve a term's standing for what it signifies. He is, however, prepared to say that this "standing for what it signifies" occurs when a term has *suppositio simplex*.(6)

It all depends, of course, on what is meant by "signify"." (p. 361)

    Abstract: "In a number of late medieval treatises, the question is raised whether material supposition should be treated in logic or in grammar. Traditionally, this kind of supposition was dealt with in logic. However, some late medieval authors argued that it should rather be treated in grammar. At first glance, this debate may seem to be a fruitless scholastic exercise. Upon closer inspection, however, this issue sheds fundamental light on the different ways in which late medieval scholastics understood the relationship between thoughts, terms, and things.

    In my paper I will focus mainly on the position of Magnus Hundt, who taught the arts at the University of Leipzig towards the end of the fifteenth century. He is not often mentioned in the modern literature. His position, however, is highly remarkable. As will become clear, Hundt’s rejection of material supposition as belonging to the field of logic is illustrative of his strategy of separating logic from grammar, in order to bring it closer to the science of metaphysics."

34. Hülsen, Reinhard. 2000. "Understanding the Semantics of "Relativa Grammaticalia". Some medieval logicians on anaphoric pronouns." In *Reference and Anaphoric Relations*,

edited by Heusinger, Klaus von and Egli, Urs, 31-46. Dordrecht: Kluwer.

"When in the early nineteen-sixties Geach presented his by now well known theory of the semantic roles of anaphoric pronouns, he did something quite unusual in those days: time and again he critically referred to certain medieval approaches to the same subject. He thought, apparently, that these sophisticated approaches showed the enormous difficulties a coreferential approach was bound to lead into. Geach (1960) even went so far as to claim sweepingly that "the medievals who discussed relativa - pronouns with antecedents - were groping in the dark despite all their ingenuity." It is one of the ironies of the history of philosophy that one such medieval theory - to be found in the fourteenth-century philosopher Buridan and his pupils (though foreshadowed a century earlier) - has now raised his head again in the work of Gareth Evans - this time against Geach.

Geach was mainly thinking of logicians and philosophers working in the thirteenth and fourteenth centuries (virtually all the names he drops are from this period). However, interest in relativa grammaticalia - this is the complete title for expressions called "anaphoric" nowadays to separate them from "logical" relatives, expressions such as 'father' and 'master' - can be found already in twelfth-century writers such as Peter Abelard, William of Conches or their pupil John of Salisbury." (p. 31)

35. Ile, Vlad-Lucian. 2016. "Some Remarks on Peter of Spain`s Theory of *Suppositio*." *Philobiblon* no. 22:75-92.

Abstract: "The present paper aims to reconsider our approaches to the suppositio theory (in the particular case of Peter of Spain’s Summaries of logic) in light of a new hypothesis of the double nature[1] of medieval logic. Starting from the existing points of view, i.e. the theory of suppositio as a theory of reference and suppositio as a theory of an untranslatable, this paper will examine their underlying commitments to the nature of medieval logic. Such an analysis will entail for the former approach a commitment to a formal nature, while for the latter to a non-formal one. The possibility

of a new approach emerges when both natures can be traced in Peter's theory."

36. Kann, Christoph. 2016. "Supposition and Properties of Terms." In *The Cambridge Companion to Medieval Logic*, edited by Novaes, Catarina Dutilh and Read, Stephen, 220-244. Cambridge: Cambridge University Press.

    "Probably the most prominent among the new topics were the doctrines of the so- called properties of terms (*proprietates terminorum*), which are generally considered the basis for later medieval semantic theorising and adjacent issues.

    Terms (*termini*) in the technical sense presupposed here (and pointing to the "terminist" tradition) are descriptive words which function as subject or predicate in a proposition. The basic idea of the "properties" (or terministic) approach is that an analysis of the semantics of (compound) linguistic expressions should proceed by analysing the semantic properties of the terms occurring in it.

    In handbooks of logic from the later Middle Ages, the treatment of the properties started with signification *(significatio*), the capacity of terms to function as signs; supposition (*suppositio*), the property

    of terms functioning as subject or predicate in propositions, was its centrepiece, but the framework also covered related properties like copulation, appellation, ampliation, restriction, and distribution." (p. 220)

37. Karger, Elizabeth. 1984. "Modes of Personal Supposition: The Purpose and Usefulness of the Doctrine within Ockham's Logic." *Franciscan Studies* no. 44:87-106.

    "The so-called "theory of modes of personal supposition," in particular Ockham's version of it, has been a recurring source of perplexity to recent commentators. One especially persistent worry has been that of determining whether and how the doctrine could be reformulated in *modem* logic." (p. 87)

    (...)

"However no textual evidence was offered in favor of the basic hypothesis that the purpose of TM [theory of modes] is to operate such wholesale reductions of general sentences. For my part, I have been unable to discover a text which would confirm it. Consequently proposed "formalizations' of TM so interpreted ought, I think, be regarded with some suspicion, it being far from established that what has been formalized should be identified with TM at all." (p. 88)

(...)

"I conclude that the contribution which TM makes to Ockham's logic as a whole is a major one: although, by lack of the required concept of sentential form, Ockham himself would not have described the matter in such terms, TM alone provides the means of dealing, albeit in a limited way, with the logic of categorical sentences other than A-O form sentences. It must not be forgotten however that TM is essentially a semantical doctrine lacking a syntactical foundation, such as an adequate analysis of categorical sentences, leading to an enumeration of the logical forms involved, would have provided. Where such a basic requirement fails to be met, the doctrine is unavoidably imperfect, and the existence of such flaws as those we drew attention to in a footnote 25 should come as no surprise. What is surprising rather is that the doctrine nevertheless works as well as it does." (p. 106, notes omitted)

38. ———. 1993. "A Theory of Immediate Inferences Contained in Buridan's Logic." In *Argumentationstheorie. Scholastische Forschungen zu den logischen und semantischen Regeln korrekten Folgerns*, edited by Jacobi, Klaus, 407-429. Leiden: Brill.

"Within scholastic logic however these rules [of subalternation and conversion] are derivable from more general rules or principles, capable of determining which inferences are formally valid within a much more inclusive set of inferential forms, forming thereby a more powerful theory. Let us call this theory "the generalized theory of subalternation and conversion", for short "the generalized SC-theory". This is a theory which requires the apparatus of' "modes of personal

supposition", the purpose of which, as I have argued elsewhere, (2) it reveals.

Among the logicians in whose writings this theory is to be found is Buridan. The principles in which the theory consists are formulated, more or less completely, in different places, notably in his *Tractatus de Suppositionibus* (hereafter "De Suppositionibus"), in his *Sophismata* and in his *Tractatus de Consequentii*s (hereafter "De Consequentiis"), Book 1, Chapter 8, where they form the 9th, l0th and 11th "conclusion".

(...)

"This paper falls into four parts, two of which are preliminary to its main task. In part I, the framework within which the generalized SC-theory will be reconstructed is defined and the basic concepts introduced which the theory requires. Part II provides, within this framework, syntactical characterizations of the modes of personal supposition. In part III the principles of the generalized SC-theory are represented within the same framework and examples are given demonstrating the scope of their application. In part IV a parallel is drawn between the theory thus reconstructed and the logic of doubly quantified sentences." (pp. 407-408)

(2) Cf. E. Karger, "Modes of Personal Supposition: the purpose and usefulness of the theory within Ockham's Logic", *Franciscan Studies* 44, 1984, 87-106. I am indebted to Ned Markosian, a student of Gareth Matthews, for a very lucid criticism of that paper which has in part motivated the present reworking of the theory of immediate inferences based on the doctrine of modes of personal supposition, cf. Ned Markosian, "On Ockham's Supposition Theory and Karger's Rule of Inference", *Franciscan Studies* 48, 1988, 40-52. I would recommend any reader of the earlier paper to substitute the rule labelled here " P2" for the rule referred to in that paper as the "non-reciprocal TM rule" -Cf. also the article by Paul Spade on the subject of the theory of modes of personal supposition: "The Logic of the Categorical: The Medieval Theory of Descent and Ascent", in *Meaning and Inference in Medieval*

Philosophy, ed. N. Kretzmann, Dordrecht: Kluwer, 1988, 187-224.

39. ———. 1997. "Some 15th and Early 16th Century Logicians on the Quantification of Categorical Sentences (*)." *Topoi.An International Review of Philosophy* no. 16:65-76.

    (*) This paper deals not with supposition theory, but with a syntactical theory which, in late medieval logic, underlies the theory of supposition.(...)

    "The focus of this paper is on a late development of medieval logic, namely the recognition of multiply quantified categorical sentences. I shall be drawing mostly on authors who were active in the 15th or early 16th century. They are not, to be sure, household names.

    One author even has the misfortune of not having had his name recorded: he is the anonymous author of a 15th century logical treatise sometimes referred to as the “Hagenau commentary”, because it purports to comment on works by earlier logicians, and because its second printing was made in Hagenau.(1) I shall refer to him as to the author of the Hagenau commentary. I shall also draw on the *Summulae* of the Spaniard Dominicus Soto(2) and on a work by the Flemish Judocus Clichtoveus who, though a humanist, wrote a remarkably clear exposition of scholastic logic. This useful book is an exposition and commentary of a summary of logic, called the “Introductiones Artificiales”, written by his friend Jacques Lefèvre d’Etaples, a noted theologian.(3) These three men had, at some time of their career at least, lived in Paris, for a logician and philosopher undoubtedly a very stimulating place to be, in those days. I shall also draw on earlier authors, to whom those I just mentioned, “our authors” as I shall call them, were heavily indebted.

    These earlier authors, who had also been active in Paris, include the first rate logician and commentator on John Buridan, John Dorp, a late 14th century author and, of course, their common spiritual father, John Buridan himself." (p. 65)

(1) The treatise in question bears as title “Commentum in primum et quartum tractatum Petri Hispani et super tractatibus Marsilii de suppositionibus, ampliationibus, appellationibus et consequentiis”(hereafter “Comm.”), Hagenau; “1495, reprint Minerva, Frankfurt, 1967. On the printings of this treatise, see S. Read, “Thomas of Cleves and Collective Supposition”, in *Vivarium* vol. 29, 1991, 50–84, p. 79.

(2) Summulae (hereafter “SL”), third revised edition, Salamanca, 1554, reprint Olms, Hildesheim-New York, 1980. The first edition of this treatise was published in 1529.

(3) *Jacobi Fabri Stapulensis artificiales nonnullae introductiones, per Judocum Clichtoveum in unum diligenter collectae, familiarique commentario per eumdem declaratae* (hereafter “IA”), Paris, 1535 (already published in 1500). On the milieu to which this author belonged, see E. J. Ashworth, *Language and Logic in the Postmedieval Period*, Dordrecht, 1974, p. 10.

40. Kaye, Sharon. 1997. "Later Medieval Nominalism and the Politics of Supposition." *Eidos.The Canadian Graduate Journal of Philosophy* no. 14:29-50.

Abstract: "The salient dispute between realists and nominalists of the fourteenth century concerns the metaphysics of supposition. Do general terms stand for extra-mental universals or not? By answering in the affirmative, Walter Burley loses his ability to provide a plausible account of indefinite promises such as "I promise you a horse." By answering in the negative, Ockham not only explains indefinite promises, but also paves the way for a conception of the faith community more revolutionary than Protestantism. In the Bible, Jesus promises his disciples that he will be with them "always, to the end of the age." In Ockham's view, this is an indefinite promise parallel to the case of the horse; it means "I promise you a Christian." According to this analysis, the universal church can survive in a single, unlikely, and even unknown, individual. Ockham thereby undermines the doctrine of papal infallibility as well as institutional religion itself."

Bibliography of the Medieval Theories of Supposition: Third part

Bibliography

Studies in English Kli - Rea

1. Klima, Gyula. 1995. "Existence and Reference in Mediaeval Logic." In *New Essays in Free Logic: In Honour of Karel Lambert*, edited by Morscher, Edgar and Hieke, Alexander, 197-226. Dodrecht: Kluwer.

   ""The expression 'free logic' is an abbreviation for the phrase 'free of existence assumptions with respect to its terms, general and singular' .

   Classical quantification theory is not a free logic in this sense, since its standard formulations commonly assume that every singular term in every model is assigned a referent, an element of the universe of discourse. Indeed, since singular terms include not only singular constants, but also variables2, standard quantification theory may be regarded as involving even the assumption of the existence of the values of its variables, in accordance with Quine's famous dictum: "to be is to be the value of a variable"(3)." (p. 197)

   "In this paper I am going to give a brief, primarily systematic (as opposed to primarily historical) account of how it was possible for medieval logicians to maintain Aristotle's theory of the four categoricals and to dispense with these existential assumptions in the framework of their theory of reference, the *theory of supposition*. Besides the informal account I will also

indicate how these informal ideas can be put to work in a formal semantic systems. By this I hope to show that the ideas of medieval logicians can provide us with valuable insights even in the apparently modern field of free logic." (p. 198, a note omitted)

2. Kneale, William Calvert, and Kneale, Martha. 1962. *The Development of Logic*. Oxford: Clarendon Press.

   Reprinted 1975 with corrections.

   Chapter IV. *Roman and Medieval Logic*, § 4.*Proprietates Terminorum*pp 246-274.

   "The theory of the *proprietates terminorum*, which is very prominent in later medieval logic, took shape in the second half of the twelfth century, and it seems to have grown out of the discussions of Abelard and his contemporaries about the structure of categorical propositions. Since, however, it is not yet possible to trace the details of this development, we shall begin our consideration with the earliest printed version of the theory, namely that of William of Shyreswood in his *lntroductiones in Logicam*. From the manner in which this is

presented and from its occasional references to other views we may safely conclude that the general doctrine was already well known when the author wrote." (p. 246)

(...)

"As its name implies, the theory of the *proprietates terminorum* is intended to provide an account of the different roles that words or phrases can have when they appear as terms in propositions.

But it is assumed in this theory that a word or phrase which is capable of serving as a term must first have significatio in the sense of conveying or presenting, as William says, a form." (p. 247)

4. Knuuttila, Simo. 2013. "Supposition and Predication in Medieval Trinitarian Logic." *Vivarium* no. 51:260-274.

   Abstract: "Many fourteenth-century logicians took affirmative propositions to maintain that the subject term and the predicate term stand or supposit for the same. This is called the identity theory of predication by historians and *praedicatio identica* (or one form of *praedicatio identica*) by Paul of Venice and others. The identity theory of predication was an important part of early fourteenth-century Trinitarian discussions as well, but what was called *praedicatio identica* by Duns Scotus and his followers in this context was something different. After some remarks on Scotus's view and its background, I shall analyse Adam Wodeham's explanation of Scotus's *praedicatio identica* and how he understood the assumptions pertaining to supposition in the Scotist approach.

   I also describe Wodeham's own solution to Trinitarian sophisms, which did not deviate from the identity theory of predication."

5. Libera, Alain de. 1982. "The Oxford and Paris Traditions in Logic." In *The Cambridge History of Later Medieval Philosophy*, edited by Kretzmann, Norman, Kenny, Anthony Patrick and Pinborg, Jan, 174-187. Cambridge: Cambridge University Press.

   "Terminist logic grew to maturity in the period 1175-1250, a period that was also crucially important in the development of the universities of Paris and of Oxford. Scholars have recently focused their attention on divergences in the early development of the logical and semantic theories that constitute terminist logic, divergences suggesting that one cluster of doctrines is to be associated with Oxford, another with Paris. In view of the very marked differences between British and continental logic in the early fourteenth century, it seems important to investigate whether such differences can be traced backwards into the thirteenth and late twelfth centuries. As I hope to show, such divergences do in fact exist even if they are not so great as to make the traditions of Oxford and of Paris entirely independent.

   Although by the turn of the thirteenth century terminist logic was acknowledged by all logicians as a common frame of reference, various interpretations of important issues were still being put forward. If divergences between the traditions of Oxford and Paris are to be established, the evidence is likely to be found in the discussions concerning the various properties of terms, such as supposition, appellation, ampliation, and restriction." (p. 174, a note omitted)

6. Loux, Michael J. 1979. "*Significatio* and *Suppositio*. Reflections on Ockham's Semantics." *The New Scholasticism* no. 53:407-427.

   Abstract: "In this paper, I examine Ockham's views on "significatio" and "suppositio" in the light of pre-ockhamistic terminist treatments of these notions. What I try to show is that Ockham's views here are not simply nominalistic variants on traditional terminist themes. While conceding that Ockham's nominalism is central in his theory of terms, i try to locate the "semantical" underpinnings of his views on "significatio" and

"suppositio". What I suggest is that Ockham's account deviates from those of his predecessors in taking the notion of standard reference or personal "suppositio" as conceptually prior to the notion of meaning or "significatio", and I conclude that perhaps a rejection of the atomistic semantics of his predecessors motivates this revision of the traditional theory of terms."

7. Malcolm, John. 1977. "On the Disappearance of *Copulatio* as a Property of a Term." *Franciscan Studies* no. 37:120-138.

   "Perhaps the most original contribution of the medieval logicians was the development of the doctrine of the properties of terms. William of Sherwood lists four such properties: *significano, suppositio, copulatio* and *appellatio*.(1) The other two leading 13th century “terminists,” Peter of Spain (2) and Lambert of Auxerre, (3) include these four in their discussions. By the 14th century, however, *copulatio* is gone from the list. It does not appear in Ockham and is used by Burleigh, De Puritate (4) p. 54, to signify the uniting or connecting of a predicate with a subject. But this is to describe the function of the copula which joins (the subject and predicate) terms and hence *copulatio* is no longer considered as a property of a term.

   I am going to present an hypothesis to account for the disappearance of *copulatio*. I shall maintain, in short, that when *suppositio* and *copulatio* were first introduced there was a distinctive role for *copulatio* to play, but they underwent a parallel change in meaning which rendered *copulatio* superfluous. To try to substantiate this claim I shall offer a four-stage development. The first stage, which predates the actual use of the expression “properties of terms,” concerns *significatio* and *appellatio*. The second and third stages reflect the introduction and transformation, respectively, of the *suppositio-copulatio* distinction. The fourth stage is *post-copulatio*." (p. 120)

8. Markosian, Ned. 1988. "On Ockham's Supposition Theory and Karger's Rule of Inference." *Franciscan Studies* no. 48:40-52.

   "Abstract: "Elizabeth Karger has suggested an interpretation of Ockham's theory of the modes of common personal supposition ("TM") according to which the purpose of TM is to provide certain distinctions that Ockham will use in formulating a unified theory of immediate inference among certain kinds of sentences. Karger presents a single, powerful rule of inference that incorporates TM distinctions and that is meant to codify Ockham's theory of immediate inference. I raise an objection to Karger's rule, thereby calling into doubt the interpretation of Ockham that is based on attributing that rule to him."

9. Marmo, Costantino. 2013. "Scotus on Supposition." *Vivarium* no. 51:233-259.

   Abstract: "In his commentaries on Porphyry and Aristotle's *Organon* (*Categories, Peri hermeneias, Sophistici elenchi,* and *Topics*) and in his other works, John Duns Scotus shows his knowledge of both the modistic theory of language and the theory of supposition. My contribution sheds some light on the relationship between Scotus' philosophy of language and the theory of supposition, collecting and commenting on all the passages in which he makes use of it or discusses some theoretical points. I take into special account the almost unknown commentary on the *Topics*, which is preserved in a Vatican manuscript."

10. Matthews, Gareth. 1964. "Ockham's Supposition Theory and Modern Logic." *The Philosophical Review* no. 73:91-99.

    Reprinted in *Inquiries into Medieval Philosophy: A Collection in Honor of Francis P. Clarke,* edited by J. F. Ross, Wesport:

Greenwood, 1971, pp. 131-140.

"Reading Philotheus Boehner on medieval logic,2 one may get the idea that medieval supposition theory is, in part, a kind of quantification theory. Up to a point this is a helpful idea to have. But one may also get the idea from reading Father Boehner that the main difference between modern quantification theory and the relevant portion of medieval supposition theory is a difference over the interpretation of universal propositions. This last idea, it seems to me, is quite wrong-headed. It needs to be done away with completely if one is to be at all clear about how medieval supposition theory is related to modern mathematical logic. I wish to do my part in doing away with it.

In his discussion of supposition theory Father Boehner has something to say about Peter of Spain, William of Ockham, and Walter Burleigh. But in comparing the medieval theory with modern logic Boehner seems most interested in the logic of Ock¬ ham. So, since I can also make my own points with reference to Ockham alone, I shall take Ockham's Swnma Logicae as the medieval source for the remarks to follow." (p. 131 of the reprint)

(...)

"I conclude that the idea that Ockham and modern logicians agree on the interpretation of particular propositions but differ on the interpretation of universal propositions is both wrong and wrong-headed. It is wrong because in fact they differ on both counts. It is wrong-headed because, once one realizes that Ockham quantifies over terms whereas modern logicians quantify over variables, one can see that Ockham and the moderns are not free to agree on the interpretation of any catergorical propositions —whether A, E, I, or O." (p. 140)

11. ———. 1973. "*Suppositio* and Quantification in Ockham." *Noûs* no. 7:13-24.

"We have been able to dispose of the idea that the doctrine of descent in Ockham constitutes a rudimentary quantification theory without returning to the issue of equivalence. Let me say

in conclusion that there are ways of re-raising the issue of equivalence so as to make it worth discussing, even though the quantification issue is now settled. The doctrine of descent forms part of the account Ockham gives of the meaning that general terms have when they are used in propositions to stand for (*supponere pro*) individuals falling under them. These are, perfore, nonempty terms; in the usual case they will be polyreferential. (Ockham has to tell a special story about the meaning of empty terms-see, for example, 2.14.) We can now ask whether Ockham considers the expansion got by descending on a polyreferential term in an A, E, I, or O proposition equivalent to the original. Counting in favor of saying 'No' to this question are chiefly (a) the fact that Ockham never claims equivalence, and (b) the obviousness of the nonequivalence of an O proposition like (4) and its predicate term expansion (in this case, (4b)). Counting in favor of saying 'Yes' is the fact that it is far easier to see how one might seek to elucidate the meaning of a general term in a given proposition by producing an equivalent proposition than by producing merely an entailed proposition. To decide this question one would need to get clear on the central issue of what Ockham thinks it is for a general term in such-and-such a proposition to stand (determinately, confusedly, or what have you) for individuals falling under it. I should like to have tackled that issue in this paper. But I have found I had enough to do clearing aside the idea that the doctrine of descent in Ockham is a rudimentary theory of quantification." (pp. 22-23)

(4) Suppose we say that

(a) 'unicorn' is an *empty term*, on the grounds that there is no presently existing individual falling under it; that

(b) 'god' is a *monoreferential term*, on the grounds that there is one and only one presently existing individual falling under it, and that

(c) 'man' is a *polyreferential* term, on the grounds that there are two or more presently existing individuals falling under it. (p.21)

12. ———. 1984. "A Note on Ockham's Theory of Modes of Common Personal Supposition." *Franciscan Studies* no. 44:81-96.

    "The last half of this century has seen an amazingly energetic and resourceful effort to understand Ockham's supposition theory. The result is that we are much more sophisticated in our approach to the subject today than anybody could have been before. Yet, despite the fact that we now have, not only critical editions and translations of Ockham's logic texts, but also elaborately formal reconstructions of the theory of supposition itself, there is no clear consensus about what Ockham was up to in presenting his theory of the Modes of Common Personal Supposition (hereafter, following Alfred Freddoso,(2) "MCPS")." (p. 81, a note omitted)

    "In his long introduction to Part II of Ockham's *Summa Logicae*, Alfred Freddoso suggests, somewhat off-handedly, that Ockham's theory of MCPS may be "part of his theory of inference." (p. 28) I once heard a similar suggestion from Calvin Normore. In the remainder of this note I want to begin to fill out the Freddoso-Normore suggestion. As we shall see, my way of beginning to fill it out provides an additional reason for denying the equivalence claim and hence for denying that Ockham's theory of MCPS is meant to be a quantification theory." (p. 84)

13. ———. 1997. "Two Theories of Supposition?" *Topoi. An International Review of Philosophy* no. 16:35-40.

    Abstract: "In a recent paper [*] Paul Vincent Spade suggests that, although the medieval doctrine of the modes of personal supposition originally had something to do with the rest of the theory of supposition, it became, by the 14th century, an

unrelated theory with no question to answer. By contrast, I argue that the theory of the modes of personal supposition was meant to provide a way of making understandable the idea that a general term in a categorical proposition can be used to refer to the individual things that fall under it.

Once that idea had been made acceptable, truth conditons for the various forms of categorical proposition could be given without any specific appeal to the ideas of descent and ascent in terms of which the modes had been defined."

14. Meier-Oeser, Stephan. 2000. "The meaning of 'significatio' in Scholastic logic." In *Signs and Signification. Vol. II*, edited by Gill, Harjeet Singh and Manetti, Giovanni, 89-107. New Delhi: Bahri Publications.

    "Studies in scholastic theories of signification usually focus on what Roger Bacon (*De signis*: 132) has called the "difficilis dubitatio utrum vox significet species apud animam an res" (the difficult question, whether spoken words signify mental concepts or things), or, in Scotus' words (*Ordinatio*, vol. 6: 97), the "magna altercatio... de voce, utrum sit signum rei vel conceptus" (the great altercation, whether the spoken word is a sign of the thing or of the concept). But as interesting and important this question may be, it covers just one aspect of the numerous and complex problems linked with the scholastic concept of 'significatio'. For since scholastic terminology generally made a clear cut distinction between 'significatio' and 'significatum', the two questions, what words signify (or what their significatum is), and what signification itself may be, lead in different directions. By leaving aside the former question, I shall concentrate on the latter.

    The question about meaning or signification is deemed, especially since the 'linguistic turn', to be one of the most fundamental questions, philosophy has to account for. Of course, it is by no means a recent question. And yet it is, in a

specific sense, not as old as one might suggest. It may be controversial, whether the problem of meaning ('Bedeutungsproblem'), as Weisbergerer (1930:17f) has stated, did not matter in classical Greek philosophy, or, as Cassirer (1925: 86) has claimed, already for Plato made up the "starting point of philosophy", whether Aristotle in the first chapter of his *Peri hermeneias* had offered "not even a sketch of a general theory of meaning" (Kretzmann 1974:5), or at least the "rudiments of a semantic theory" (Weidemann 1982). What has to be noticed, is, that the very term and concept of signification had not yet become a problem in classical Greek philosophy -- and could not even have been as such, due to the simple fact, that a concept of meaning or signification in a terminological sense did not exist. Indeed, the word or linguistic sign *(semainon)* was said to signify or mean something *(semainei ti)* and speech *(logos)* was characterised as significative *(semantikós).* But whereas in modern translations this is usually expressed in terms of words having meaning. there is, as far as I can see, at least in classical Greek no equivalent noun for 'meaning' or 'Bedeutung'. The history of terminology shows, that the corresponding Greek noun of the latin '*significatio'* was *semasia'*. But the earliest evidence for the use of *'semasia'* in the sense of meaning (of a word) seems to be a passage in the *De signis,* written by the Epicurean Philodemus of Gadara around the middle of the first century. In all earlier occurrences this term means 'sign' or 'signal' or an act of signalising (cf Ebert 1987:108sq.).

So it seems as if semantics is not necessarily in need of the concept of signification or meaning. Because for quite a long time philosophy did not even have a word for it. But once introduced, it could give rise to such problems, as, referring to the concept of meaning, Charles Morris (1971:95) has pointed out by noticing that " 'meaning' signifies any and all phases, of sign-processes (the status of being a sign, the interpretant, the fact of denoting, the significatum)".

By considering the meaning of 'significatio' in scholastic logic, I do not intend to give a comprehensive outline of the various theories of signification that have been worked out by that

tradition, but rather want to confine myself to the more modest purpose of giving an account of the use of that term in scholastic logic. So, even if the title of my paper seems to offend the Wittgenstein's prominent advice "don't ask for meaning, ask for use", I will observe it insofar, as I am going to *take a look at the concrete use of 'meaning' or rather 'signification' in scholastic logic, which however, as we shall see, not quite the same. By so doing, I do not intend to establish something like the* scholastic meaning of signification. For if we are told by Wittgenstein and many others, that "the meaning of a word is its use in language", we will be confronted here with the fact, that the usage of *'significatio'* -- and thus its 'meaning' -- is highly divergent in itself." (pp. 89-90)

15. ———. 2013. "The Hermeneutical Rehabilitation of Supposition Theory in Seventeenth-Century Protestant Logic." *Vivarium* no. 51:464-481.

Abstract: "The paper focuses on some aspects of the early modern aftermath of supposition theory within the framework of the protestant logical tradition. Due to the growing influence of Humanism, supposition theory from the third decade of the

sixteenth century was the object of general neglect and contempt. While in the late sixteenth-century a number of standard textbooks of post-Tridentine scholastic logic reintegrated this doctrine, although in a bowdlerized version, it remained for a century out of the scope of Protestant logic. The situation changed when the Strasburg Lutheran theologian J.C. Dannhauer, who in 1630 developed and propagated the program of a new discipline which he called ‘general hermeneutics’ (*hermeneutica generalis*), accentuating the importance of supposition theory as an indispensable device for the purpose of textual interpretation. Due to Dannhauer’s influence on later developments of hermeneutics, which in the seventeenth and early eighteenth centuries was regarded as a logical discipline, supposition theory is still present in several logical treatises of the eighteenth century. The explication of the underlying views on the notion of supposition and its logico-semantic function may give at least some clues as to how to answer the question of what supposition theory was all about."

16. Miller, Barry. 1973. "Proper Names and *suppositio personalis*." *Analysis* no. 33:133-137.

    "Proper names may be used so as to be self-referring, as in ' "Tom" is a three-lettered word' and ' "Tom" is a noun'. They may also be used to refer to their bearer, as in 'Tom is running'. And the point I want to discuss is whether 'Tom' may not be used in a third way, one in which it refers neither to itself nor to its bearer. What I have in mind may be illustrated from the case of common names. As a parallel to ' "Tom" is a three-lettered word' and ' "Tom" is a noun' we have ' "Man" is a three-lettered word' and ' "Man" is a noun' respectively.

    As a parallel to 'Tom is running' we have 'A man is running'. But, inaddition, we have 'Man is a species', in which 'man' clearly refers neither to itself nor to individual men. So the question I am raising is whether there is any use of 'Tom' that parallels this last use of 'man'.

    In the middle ages that same question was framed in terms of whether proper names did or did not have *suppositio*

personalis, with William of Sherwood saying they did and Peter of Spain saying they did not. I think that William was right. I will argue therefore that there is a use of 'Tom' that does parallel that of 'man' in 'Man is a species', and in which 'Tom' refers neither to itself nor to Tom. This, I suggest, is to be found in 'Tom is an individual'." (p. 133)

    Reprint Westport: Greenwood Press, 1976.

    "While these terminist logicians appear to have been familair with the *Prior Analytics, Topics*, and *Sophistical Refutations* of Aristotle, as well as with the traditional Boethian writings, their text books do not follow the order, nor cover the whole content, of Aristotle's *Organon*. The "traditional" sections treat only of the following subjects: (1) the proposition, both categorical and hypothetical; (2) the predicables; (3) the categories (omitted by Shyreswood); (4) the syllogism; (5) the topics or *loci communes*; and (6) the fallacies.

    What is new in these text books is a section treating of "the properties of terms", introducing the conception of the supposition of subject and predicate for a common undetermined subject, and using this notion in the analysis of quantification, temporal determinations of the copula or verb, adjectival determinations of subject or predicate, and logical functions of relative pronouns. A sharp distirrction is made between the property of "signification" and that of "supposition", such that the logical analysis of categorical propositions, and of their truth conditions, is carried out in a formal and extensional manner in terms of the property of "supposition"." (p. 4)

    (...)

    "These new branches of logical investigation, represented by the treatises on the supposition of terms and by those on the syncategorematic signs, were destined to receive an elaborate development during the century following on Shyeswood and Peter of Spain. The part played by Priscian's grammatical

syntax in the development of this approach to the logical analysis of language is strikingly evident from the constant citations of the Roman grammarian which occur in Shyreswood and the other terminist logicians.")p. 5)

    Introduction, pp. IX-CIV. § 4. Antecedents and Nature of the Logica Moderna: A. A Theory of Supposition, pp. XXXVIII-LVIII.

    "Three of the seven treatises which enter into the composition of the *De Proprietatibus Terminorum* are expressly dedicated to a categorizing treatment of supposition—the treatises on Suppositions, Amplifications and Restrictions.

    A fourth treatise, that on Relatives, is so integrally bound up with the conception of supposition that it is practically impossible to regard it as other than a further application of the conception. Indeed, it is from the conception of the supposition of relatives which is held by the grammarians that the logicians derived the concept of supposition in the first place.

    The first problem in connection with "suppositio" is the genesis of the term and the evolution, if any, of the conception.

    In classical Latin, “suppono” is commonly used in the sense of “substitute”. Cicero uses it in a very suggestive manner when he says “...non esset difficile alium in suppositi locum supponere.”(26) It is probably from the classical usage of the term “supponere” that “suppositio” originally stems. The conception of a term substituting for or standing for something other than itself occurs frequently in Priscian but it is always in relation to the pronoun(27)." (pp. xlv-xlvi)

    "It remains to examine one final analytical language; it is the most comprehensive of all in its applications: the *theory of suppositio* ofthe so-called *logica moderna*. This is not the place to pause for even the most compendious description of the theory or of the service it was to philosophy in general. This, together with considerable detail about what I would call its vocabulary and rules or algorithms, can be gleaned from other sources.(61)

    For our purposes it is enough to note that, as an analytical language, it was used to treat any philosophical problem. My past interest has been in its application to problems within natural philosophy, most notably those *de motu*. But is was similarly applied in theology as well. As part of logic, wherever is was brought to bear, it functioned metalinguistically. That is, its application amounted to an invocation of the procedural rule to adopt a second intentional point of view; one dealt not with individual entities, but with propositions and with terms within propositions(62) that stood for (*supponit pro*) such entities. Accordingly, the elucidation of the kind of supposition that was had by the terms in a given problematic proposition was one of the most common ways of resolving the problem carried by the proposition, especially when that problem had to do with the analysis of continuous processes or quantities, with the determination ofthe proper order of "parts" within those processes or quantities, or with the setting of limits for them." (pp. 285-286, a note omitted)

(62) Since suppositio is a significative relation had by terms only as they occur in propositions, this qualification is necessary.

20. Muré, Dafne. 2013. "Suppositum between Logic and Metaphysics: Simon of Faversham and his Contemporaries (1270-1290)." *Vivarium* no. 51:205-229.

    Abstract: "This article is the result of research on the occurrences of the terms *suppositio, supponere* and their linguistic derivations in the literature on fallacies (comments on the *Sophistical Refutations*) of the second half of the thirteenth century. The authors analysed are Albert the Great, Giles of Rome, Simon of Faversham, the so-called *Incerti Auctores* (Anonymous C and SF), the Anonymous of Prague (P) and John Duns Scotus.

    The central elements that emerge are the role played by the notion of *suppositum* and by the linguistic context (*adiuncta, determinatio*) to determine the denotation of an expression, and the importance of the metaphysical problem of the unity and identity of s*uppositum* in both the theory of predication and the theory of inference. Both subjects, obviously, are closely connected."

21. Normore, Calvin Gerard. 1997. "Material Supposition and the Mental Language of Ockham's *Summa Logicae*." *Topoi. An International Review of Philosophy* no. 16:27-33.

    "William Ockham begins his *Summa Logicae* by dividing language into three types, written, spoken and “conceived, having being only in the understanding”.(1) He goes on to argue that this conceived language or ‘mental’ (*mentalis*) language, as he frequently calls it, is in some ways the most basic type. It is composed of terms which are natural whereas spoken and written language are instituted *ad placitum*. Spoken and written terms have their signification because of their

subordination to the terms of mental language which play very much the roles Frege attributes to senses (*Sinne*).

Ockham's views about mental language seem to have developed considerably during the part of his life in which he wrote extensively about issues in the philosophy of language. I will be concerned here only with what might be thought his 'mature' view as this is presented in the (relatively) late *Summa Logicae*. In this work the terms of the mental language (concepts (*conceptus*) as he also calls them) are acts of the mind and the formation of a mental sentence is some kind of production of such acts." (p. 27)

(1) "Est autem sciendum quod sicut secundum Boethium, in *I Perihermenias* triplex est oratio, scilicet scripta, prolata, et concepta, tantum habens esse in intellectu, sic triplex est terminus, scilicet scriptus, prolatus et conceptus." Ockham *Summa Logicae* I, c. 1 *(Opera Philosophica* I, p. 7 , l. 13–16). Hereafter I will abbreviate *Summa Logicae* as S.L., *Opera Philosophica* as OP and will place simple citations of this work in the text.

Bologna: CLUEB.

23. Oesterle, John A. 1944. "Another Approach to the Problem of Meaning." *The Thomist* no. 7:233-263.

    "Thus John of St. Thomas, in defining *suppositio*(4) [*] is insisting that terms or words have *suppositio* only when they are in a proposition and hence that *suppositio* is a property only of propositional terms or words, not of terms or words simply*

    This understanding of *suppositio*, however, was strongly contested in his time, and some writers insisted that s*uppositio* was merely the employment of any name to signify the understanding of a thing. The consequence is, as John of St.

Thomas points out, a failure to distinguish *suppositio* from signification and the further consequence of assuming that any name must have s*uppositio* whether in a proposition or not. Note here, for the moment, the ultimate consequence which could be drawn from such a position: that if any name must have *suppositio*, and especially if *suppositio* is confused with signjfication, then it is an easy step to assume that a name has meaning only as it is in the context of a proposition, since it is only in the context of a proposition that there can be *suppositio* (i.e., standing as the logical subject or the logical predicate); and finally, how easy the step would be to assume also that every name must be verified, since *suppositio* requires verification.

It would be interesting to know whether the writers John of St. Thomas had in mind took these consequences; if so, the problem of meaning (or more likely, the problem of signification or *suppositio*) was being argued then." (p. 236)

(4) There is no exact English equivalent for *suppositio*. " Supposition " fails to carry the precision, and " supposes " is hopelessly inadequate. As John of St. Thomas' definition indicates, it is a certain kind of " standing for " within the proposition.

24. Panaccio, Claude. 1984. "Propositionalism and Atomism in Ockham's Semantics." *Franciscan Studies* no. 44:61-70.

"The term "propositionalism" has been proposed as a label for Ockham's theory of language by the Spanish scholar Teodoro de Andrés in his 1969 book, *El nominalismo de Guillermo de Ockham como filosofía del lenguaje*. For de Andrés' Ockham, the proposition rather than the term is "the primary complete linguistic unit" and the "primary reality" of knowledge.(1) On the other hand, the expression "semantical atomism" is used by Michael Loux in a 1979 paper to characterize the standard terminist tradition which, he claims, Ockham breaks with.

For Loux's Ockham, "the meaning of a general term is a function of the roles it plays in propositional contexts" and "it is impossible to isolate a non-propositional component in a speaker's linguistic knowledge."(2)

Andrés' and Loux's interpretations are remarkably similar to each other. I will call them "propositionalist interpretations of Ockham's semantics." (p. 61)

(...)

"I will here discuss the arguments in favor of the propositionalist interpretation and show that they cannot support the very strong claims that are supposed to rest on them. I will briefly consider two auxiliary arguments and, then, come to grips with the really central one." (pp. 62-63)

(...)

"I have tried to show elsewhere that, although Ockham's semantics does not show much theoretical interest in the demonstratives, it does systematically resort to them in practice to play a role very much like that of the logically proper names of Russell's logical atomism, that of providing a means for direct singular designation.(35) If that is true, we are now very far from the propositionalist interpretation of Ockham's semantics." (p. 70)

25. ———. 2013. "Ockham and Buridan on Simple Supposition." *Vivarium* no. 51:371-384.

Abstract: "What is at stake, philosophically, in the disagreement between Ockham and Buridan is whether there is

simple (or material) supposition in the mental language or not. The key difference is that Ockham's theory allows for the possibility of use/mention ambiguities within mental language, while Buridan's approach, whatever it is exactly, does not."

"On the whole—and this will be my provisional conclusion—, no second-order Buridanian theory, whether descriptional or intuitivistic, seems clearly superior to Ockham's straightforward acceptance of simple supposition in mental language. The key difference, in the end, is that Ockham's theory allows for the possibility of use/mention ambiguities within mental language, while Buridan's approach, whatever it is exactly, does not. My own feeling at this point is that a philosophical theory of human mental language should not rule out *a priori* the possibility of such confusions within our own minds."

26. Parsons, Terence. 1994. "Anaphoric Pronouns in Very Late Medieval Supposition Theory." *Linguistics and Philosophy* no. 17:429-445.

"This paper arose from an attempt to determine how the very late medieval (1) supposition theorists treated anaphoric pronouns, pronouns whose significance is derivative from their antecedents. Modern researches into pronouns were stimulated in part by the problem of "donkey sentences" discussed by Geach (1962) in a section explaining what is wrong with medieval supposition theory. So there is some interest in seeing exactly what the medieval account comes to, especially if it turns out, as I suspect, to work as well as contemporary ones. Besides, finding a good analysis of pronouns has proved to be very difficult, and so we might possibly find some insight in a historically different kind of approach.

I discuss a version of supposition theory that aims at producing *analyses* of sentences containing quantified terms, (2)' as articulated around 1400 by Paul of Venice, and as further developed by certain logicians such as de Soto and Celaya in the 1400's and early 1500's, (3) Much of what I will say also applies indirectly to earlier versions of supposition theory (before 1400)."

(1) I say very late medieval' because the period in question (1400-1600) would normally be classified as Renaissance. I am individuating the period by its themes, not solely by its dates.

(2) This was not obviously the intent of the great developers of supposition theory from 1250 to the late 1300's: Peter of Spain, William Sherwood. Roger flacon, William Ockham, Walter Burleigh, John Buridan. For them suppositional "descended forms" follow logically from the sentences under discussion, but they do not *analyze* those sentences because they are not generally equivalent to those sentences. (This is important in Geach's (1962) criticisms of supposition theory.) A burning issue in scholarship on supposition theory is: what was it is supposed to be *for*? One popular answer is that it is supposed to yield an analysis of quantification. This answer accords well with later accounts, but poorly with earlier ones, because the earlier "analyses" are often obviously not equivalent in truth value to the sentences being "analyzed." (See e.g. Matthews, 1964.) I assume equivalence in the theories under discussion.

(3) For details of the mature theory see Ashworth (1974).

27. ———. 1997. "Supposition as Quantification *versus* Supposition as Global Quantificational Effect." *Topoi. An International Review of Philosophy* no. 16:41-63.

Abstract "This paper follows up a suggestion by Paul Vincent Spade that there were two Medieval theories of the modes of personal supposition. I suggest that early work by Sherwood and others was a study of quantifiers: their semantics and the effects of context on inferences that can be made from quantified terms. Later, in the hands of Burley and others, it changed into a study of something else,

a study of what I call global *quantificational effect*. For example, although the quantifier in ~∀xPx' is universal, it can be seen globally as having an existential effect; this is because the formula containing it is equivalent to ∃x~Px'. The notion of global effect can be explained in terms of the modern theory of normal forms. I suggest that early authors were studying quantifiers, and the terminology of the theory of personal supposition is a classification of kinds of quantifiers. In this

theory, to say that a term has distributive supposition is to say, roughly, that it is quantified by a universal quantifying sign. Later authors turned this into a theory of global quantificational effect. In the later theory, to say that a term has distributive supposition is to say that the overall effect is as if the term were universally quantified with a quantifier taking (relatively) wide scope. The difference between these two approaches is illustrated by the fact that the term ‘man’ is classified as having distributive (“universal”) supposition in ‘Not every man is running’ in the earlier theory, whereas in the later theory that term does not have distributive supposition; it has determinate (“existential”) supposition. In the paper I explain these options, and I argue from several texts that the earlier and later medieval theories actually worked like this. In an appendix I make further efforts to clarify the obscure early accounts, as well as the nineteenth century “doctrine of distribution”. The last section of the paper discusses the “purpose(s)” of supposition theory."

28. ———. 1997. "Missing Modes of Supposition." *Canadian Journal of Philosophy* no. Supplemetary volume 23:1-24.

    "Supposition theory is a medieval account of the semantics of terms as they function in sentences. The word 'supposition' is probably interchangeable with our word 'reference,' but I'll leave it as 'supposition' so as to identify the medieval source of the theory I discuss here. Medieval writers had a great deal to say about supposition; this paper focuses on only one part of the theory, the study of what is now generally called the theory of *modes of common personal supposition*. The word 'common' is used here as in 'common term,' as opposed to 'singular term,' but in fact, the theory focuses on common terms along with the quantifiers

    that accompany them. The word 'personal' is a technical term indicating that the word in question is used in its normal way to refer to the things it is true of, as distinguished from occurrences in which it refers to itself (as in "Giraffe' is a noun') or refers to a particular thing intimately related to the things it is true of (as in 'Giraffe is a species'). So we might describe this

as a theory of the modes of reference of quantified common terms used normally

29. ———. 2006. "The Doctrine of Distribution." *History and Philosophy of Logic* no. 27:59-74.

    "Peter Geach describes the 'doctrine of distribution' as the view that a term is distributed if it refers to everything that it denotes, and undistributed if it refers to only some of the things that it denotes. He argues that the notion, so explained, is incoherent. He claims that the doctrine of distribution originates from a degenerate use of the notion of 'distributive supposition' in medieval supposition theory sometime in the 16th century. This paper proposes instead that the doctrine of distribution occurs at least as early as the 12th century, and that it originates from a study of Aristotle's notion of a term's being 'taken universally', and not from the much later theory of distributive supposition. A detailed version of the doctrine found in the Port Royal Logic is articulated, and compared with a slightly different modern version. Finally, Geach's arguments for the incoherence of the doctrine are discussed and rejected."

    "1. Introduction

    This paper is about the 'doctrine of distribution' as described and criticized by Peter Geach. My goal is to provide an alternative to Geach's account of the history of the doctrine and to defend the doctrine against his claims that it is incoherent. This paper discusses:

    (1) what the 'doctrine of distribution' is;

    (2) some of Peter Geach's criticisms of the doctrine;

    (3) Geach's story of the history of the doctrine;

    (4) an alternative account of the history of the doctrine;

    (5) the version of the doctrine as it occurs in the Port Royal Logic;

    (6) a defence of the coherence of the doctrine."

30. ———. 2008. "The Development of Supposition Theory in the Later 12th through 14th Centuries." In *Handbook of the*

History of Logic. Vol. 2: Mediaeval and Renaissance Logic, edited by Gabbay, Dov and Woods, John, 157-280. Amsterdam: Elsevier.

"Soon after the time of Anselm (1033–1109) and Peter Abelard (1079-1142), universities began to be founded. Logic was taught pretty much as it had been before the year 500; it consisted of work from Aristotle's *Categories* and *On Interpretation,* and material from the first few sections of his *Prior Analytics*. There was also material from the Stoics on propositional logic. In the early 1100's, western scholars acquired Latin versions of additional work by Aristotle, including his *Sophistical Refutations*, which dealt extensively with fallacies. This inspired original new work by medieval scholars. Sometime in the 12th century a number of original texts suddenly appeared containing a fairly extensive group of interrelated theories, usually employing the term 'supposition', which means pretty much what we mean by "reference" or "standing for". The texts were similar, expounding much the same doctrines, and often employing the same or closely similar examples. Clearly there was some common source, but the texts themselves contain no indication of the origin of the doctrines, and the early history of the topic is unknown. This essay is an account of some of the main theories of this tradition, often called Supposition Theory. For want of space, the commonest known themes will be treated, without extensive details of how the theories varied from author to author. The picturegiven here is then a kind of ideal framework of a large tradition." (p. 157)

31. ———. 2013. "The Expressive Power of Medieval Logic." *Vivarium* no. 51:511-521.

Abstract: "This paper is about the development of logic in the Aristotelian tradition, from Aristotle to the mid-fourteenth century.

I will compare four systems of logic with regard to their expressive power.

1. Aristotle's own logic, based mostly on chapters 1-2 and 4-7 of his *Prior Analytics*.

2. An expanded version of Aristotle's logic that one finds, e.g., in Sherwood's *Introduction to Logic* and Peter of Spain's *Tractatus* 3-5. Versions of the logic of later supposition theorists such as William Ockham,

John Buridan, and Paul of Venice. Version 4 is the logic without relatives (anaphoric pronouns); version 5 adds relatives.

I am ignoring modals, conditionals that are not *ut nunc*, infinitizing negation, exclusives and exceptives, all exponibles, all insolubles, and terms with simple or material supposition, ampliation and restriction, and many other things."

32. ———. 2014. *Articulating Medieval Logic*. New York: Oxford University Press.

Chapter 7: *Modes of Personal Supposition*, 184-226.

"This chapter has two parts. The firrst part, sections 7.1–7.7, explains an historical version of the theory of modes of personal supposition. The second part, sections 7.8–7.12, deals with a refined version of that theory.

7.1 Introduction to the medieval theory

A common term which is used personally(1) has what is called a mode of (common) personal supposition.(2) A mode of supposition is something like a kind of quantificational status. It is a status that a term has in a proposition based on where it occurs in the proposition and what quantifier word occurs with it and with other terms in the proposition. Three modes of common personal supposition are widely discussed:

• Determinate Supposition

• (Confused and) Distributive(3) Supposition

• Merely Confused Supposition" (p. 184)

(1) Medieval logicians held that expressions can be used in three ways. An expression can be used materially (with "material supposition") as in 'Man is a noun'; used in this way the expression supposits for itself or for a similar expression. An expression can be used simply (with "simple supposition") as in 'Man is a species'; used in this way the expression

supposits for a related form in the external world or for a mental concept. (Realists held the former; nominalists something like the latter.) Finally, an expression can be used personally (with “personal supposition”) as in ‘A man is an animal,’ to supposit for things that “fall under” the term. (Realists would say that in personal supposition a term supposits for things that fall under the form that the word supposits for when used with simple supposition; some nominalists would say that in personal supposition a term supposits for the things that its associated mental concept naturally signifi es.) The topic of this chapter concerns words used personally.

(2) Some authors (see Marsilius of Inghen 1 (57–9)) believe that terms used materially can also be assigned a mode of supposition, since they are common terms. (Dutilh Novaes 2007, 62 suggests that he was the first to hold this.) For example, in ‘Every donkey in that sentence is bisyllabic’ the word ‘donkey’ is a common term that stands for any word spelled d-o-n-k-e-y. On this analysis, ‘donkey’ has distributive material supposition in that sentence. According to some, even discrete terms used materially are common terms, and can have modes of supposition, as in ‘Every this uttered this morning was the subject of the sentence in which it occurred.’

Most authors either disagree with this view, or ignore it.

(3) Some authors use ‘distributed’ and some use ‘distributive’; I use these interchangeably. (The term ‘distributed’ may presuppose that a term cannot have that mode of supposition unless it has been distributed by some distributing sign; see section 7.4.)

33. Pérez-Ilzarbe, Paloma. 2004. "Complexio, Enunciatio, Assensus: The Role of Propositions in Knowledge according to John Buridan." In *Medieval Theories on Assertive and Non-*

Assertive Language, edited by Maierù, Alfonso and Valente, Luisa, 401-413. Firenze: Olschki.

"This paper is an attempt to rethink Buridan's ideas concerning knowledge (which are well known after the work of de Rijk and Zupko) from two perspectives: On the one hand, I explore Buridan's theory of knowledge in the hope that it will shed some light on the intuition that the structure· of propositions determines the justification of our beliefs on various different levels. On the other hand, I would like to contribute to demonstrating the consistency of Buridan's thought, which has been remarked by almost all scholars working on Buridan: in particular, I am interested in exploring the benefits of using supposition theory when applied to the theory of knowledge.

The aim of this paper, suggested in the subtitle: the role of propositions in knowledge, is therefore to explore the interweaving between Buridan's theory of propositions and some aspects of his theory of knowledge. I will start by examining Buridan's conception of *scientia* (as opposed to *error, opinio* and *fides*), from the perspective of two distinctions which are very important to Buridan's theory of the proposition: *complexio / enunciatio* and *enunciatio / assensus*. Then I will recall Buridan's analysis of prop··! tions (and his use of supposition to define truth conditions) to show ilui» consistency with this conception of knowledge." (pp. 401-402, two notes omitted)

Abstract: "For John Buridan, truth-bearers are assertions. This fact explains why the inference 'p is true, therefore p' may fail. On the one hand, the tense of the verb plus the time of utterance do not determine the time about which a sentence is intended to be true: the intention of the speaker is needed. On the other hand, since the meaning of vocal and written words is conventional, it may seem that they can be used with different meanings on each side of the inference. While the antecedent may talk about a situation different from the present one, this

doesn’t make it the actual situation of utterance, and the words have meanings only in the actual situation of use. Although such situations are different, in both of them we are asked to see the importance of identifying features of which the disquotational schema doesn’t keep track and that can only be specified in the context of use."

36. ———. 1971. "Approaches to Supposition Theory." *The New Scholasticism* no. 45:381-408.

    "The past 25 years have seen an increasing interest in later medieval logic and in the theory of supposition. A review of literature reveals, however, wide differences of interpretation of supposition-theory. Taking the theory in the widest sense as a contribution to semiotic or the theory of signs, this study shows how supposition has been variously treated as a syntactical, semantical and even pragmatical theory. The main views of P. Boehner, E. Moody, P. Geach, D. P. Henry, W. C. Kneale and L. M. De Rijk are examined, compared and appraised with respect to overall progress in the elucidation of supposition theory."

37. ———. 1986. "Supposition Theory: A New Approach." *The New Scholasticism* no. 60:213-231.

    "For the past three decades the theory of supposition (*suppositio*) has been a crux of scholarship in medieval logic. Although supposition was one of the banner doctrines of the logics modernorum, its nature and purpose have remained elusive to modern interpreters. Tn this paper I outline an alternative approach to supposition theory. The paper has three parts.

    Part I reviews a few of the difficulties which modern conceptions of supposition theory have encountered.

    Part IT offers an interpretation of supposition theory as a system of conceptual notation.

Part III develops some connections between supposition as conceptual notation and the medieval art of memory.

A conclusion will suggest some of the advantages of the present interpretation over earlier ones." (p. 213, notes omitted)

38. Piolata, Thomas. 2021. "The Significance of Supposition: Abelard and Bonaventure on the Question of God Begetting God." *Collectanea Franciscana* no. 91:27-49.

    Summary: "This article treats the way in which Peter Abelard and Bonaventure deal with the logic of the phrase *Deus genuit Deum*, that is, how to understand logically the idea – rooted in the *Creed* – that God generates God (“God from God”). As Augustine had affirmed, essence cannot generate itself. Consequently, this aspect of the faith poses a potential problem. To handle it, the logical theory of supposition is key. This theory concerns the reference of a given term in a phrase, and not its signification. Abelard did not have the privilege of supposition. By the time of Bonaventure, however, it had become a standard tool of logical analysis. The goal of this study is thus to articulate the logical treatment of this phrase in Abelard and Bonaventure, and thereby to highlight the importance of the theory of supposition."

39. Price, Robert. 1970. "William of Ockham and *Suppositio Personalis*." *Franciscan Studies* no. 30:131-140.

    "Many have suggested that Ockham's theory of *suppositio* is in some sense an anticipation of contemporary quantification theory; usually this is qualified by the suggestion that Ockham quantifies over terms or qualities rather than individuals.(1) There is also some discussion as to whether the theory is semantical or syntactical in character.(2) Both these matters are, I think, tied together. If we must force a later distinction

    on Ockham: what he did was to develop roughly the same semantical theory which was later used to interpret contemporary quantification theory. He did so, however, in order to interpret the simple categoricals which have a quite different syntax.

    (...)

In order to give a clear account of these matters I will first give in contemporary materials a theory which would serve Ockham's purposes.

What this amounts to is the presentation of a semantical interpretation for quantification over sorted individuals which emphasizes those features which are relevant to Ockham's account.(3) I will then present a rough outline of Ockham's theory as it appears in the first *Summa* in order to stress the parallels between it and the previously presented theory. I will then turn to a discussion of historical developments along the lines already indicated." (pp. 131-132)

40. Priest, Graham, and Read, Stephen. 1977. "The Formalization of Ockham's Theory of Supposition." *Mind* no. 86:109-113.

    "The point of the paper is to show that the medieval theory of personal supposition can be formalised using the standard tools of modern logic. A formal account of the modes of supposition is given and it is shown how these can be used to obtain the descensus in standard cases. The formalisation is used to show that Ockham's views on the supposition of the predicate in the "o" form are mistaken, and to refute the following claims: (a) the medievals omitted some modes of supposition; (b) they had too many modes of supposition; and, (c) their theory is incapable of handling multiple quantification."

41. ———. 1980. "Merely Confused Suppposition: a Theoretical Advance or a Mere Confusion?" *Franciscan Studies* no. 40:265-297.

"In this article we will discuss the notion of merely confused supposition as it arose in the mediaeval theory of *suppositio personalis*. The context of the analysis is our formalization of William of Ockham's theory of supposition sketched elsewhere.(1) The present paper is however, self-contained, although we assume a basic acquaintance with supposition theory. The detailed aims of the paper are: i) to look at the tasks that supposition theory took on itself and to use our formalization to relate them to more modern ideas; ii) to explain the notion of merely confused supposition and to defend it against certain criticisms; and iii) to discuss two issues closely related to the idea of merely confused supposition which we would not broach in a shorter article: the mode of supposition of terms in intensional contexts, and the possible existence of a fourth mode, often called *suppositio copulatim*.

Our account is essentially a theoretical one which attempts to explain and account for a number of features of mediaeval supposition theory and, as such, it is ultimately to be tested against source material. Hence, although much of the evidence we shall offer comes from Ockham's writings, our conclusions apply to the mediaeval theory of supposition, in terms of descent, as it is found in a number of authors. Our earlier article drew on three works of Ockham's: *Summa Totius Logicae* (henceforth STL), *Elementarium Logicae* (EL), and *Tractatus Logicae Minor* (TLM).(2) Since then we have become aware of Gàl's persuasive doubts concerning the authenticity of the last two works. His conclusion is that they cannot be taken as genuine texts of Ockham's until further research has been carried out.(3) We will find it possible here to draw most often on STL; however, the reader will note that our findings are consonant with both TLM and EL, and on occasions we will look there for support, and also to writings by later authors working in the same tradition."

42. ———. 1981. "Ockham's Rejection of Ampliation." *Mind* no. 90:274-279.

    "The standard mediaeval account of the truth-conditions of modal and tensed sentences used a notion of "ampliation", whereby the class of objects for which a term supposits could be extended beyond the class of things of which it could be truly predicated. Ockham did not use the notion in his account. We examine why this was, explain Ockham's account, and argue that it is preferable to the ampliative one. In particular, the authors show the ambiguities found in modal and tensed sentences to be, contrary to popular opinion, different, and support Ockham's contention that the ambiguity in the tensed case is not one of sense (signification) but of reference (supposition)."

43. Read, Stephen. 1991. "Thomas of Cleves and Collective Supposition." *Vivarium* no. 29:50-84.

    "The Modes of Supposition

    In an anonymous commentary on Marsilius of Inghen's treatise on supposition, it is asked: "are there only three kinds of common [personal] supposition?"(1) The question is posed within the medieval theory of properties of terms, according to which various kinds or modes of supposition are ascribed to subject and predicate terms in propositions. Abstracting from the particular doctrines of particular authors, one may define the three standard modes of common personal supposition attributed to general terms in their occurrence in propositions as follows:

    The mode of common personal supposition of an occurrence of a general term t in a proposition P is

i) *determinate* if P is equivalent to a disjunction of singulars with respect to t'

ii) *confused* if not, and

a) confused and distributive if P entails a conjunction of singulars with respect to t ;

b) merely confused if not but P entails the result of replacing t by a disjunct term."(p. 50)

(,,,)

"Conclusion

Towards the middle of the fourteenth century, it was realised that, simply on gronds of symmetry or duality, a fourth mode of descent to singulars was possible, conjunct descent or *descensus copulatim*. This finally led, arguably in the person of Thomas Zeghenans of Cleves, a Paris master of the early 1370s, to the identification of a fourth mode of common personal supposition, *suppositio copulatim*. Independently, it had long been realised that the subjects of universal propositions permit both a distributive, or divisive, interpretation, and a collective one. This in itself can be a ground for postulating an additional mode of supposition, and indeed, one which can be linked to the new conjunct mode of descent. Thus the fourth mode of common personal supposition can equally well be called "collective supposition.". (p. 82)

(2) Most of what I write in this paper concerns the theory of supposition as it developed in the second half of the fourteenth century. Little has been written on the theory at this date. A recent and instructive article on the theory before this date is P. V. Spade, *The Logic of the Categorical : the medieval theory of*

descent and ascent, in *Meaning and Inference in Medieval Philosophy*, ed. N. Kretzmann, Dordrecht 1988, pp. 187-224.

44. ———. 1999. "How is Material Supposition Possible?" *Medieval Philosophy and Theology* no. 8:1-20.

    "In the early fourteenth century, material supposition was characterized as nonsignificative, when a term supposits for itself or other terms contrary to its normal signification. But this characterization is in tension with the doctrine of signification, which picks out the concept uniting the things for which the term supposits. This tension was appreciated by Thomas Maulfelt and others so that by the end of the century, in John Dorp for example, a further concept was associated with each term, the concept of the term itself and its equiforms. Material supposition can then be subsumed under the theory of signification."

45. Rearden, Myles. 1982. "On teaching students logic." *Philosophy* no. 57:130-132.

    "Is Peter Geach right to dismiss the medieval theory of distribution? Arguably, the distinction between "suppositio distributiva et confusa" and "suppositio confusa tantum" is more durable than all the rest of supposition theory. There is still valid point about how general terms stand for individuals. "some man runs" and "every man runs" both stand for everyone. The difference is that the former does so disjunctively, the latter, conjunctively. That seems enough to salvage the essence of distribution theory. Geach's rejection of distribution stems from his view that it involves assimilating nouns to proper names as regards their manner of signification. Quite the contrary, medieval distribution theory accepted the difference between a name-like referring and a more general standing-for. Distribution theory continues to make sense, and so consequently does much of the logic of categorical propositions."

46. ———. 1984. "The distribution of terms." *The Modern Schoolman* no. 61:187-195.

"The traditional doctrine of distribution retains some validity, contrary to the view of Geach in reference and generality. The history of the doctrine is outlined. The medieval distinction between descensus copulativus and descensus disiunctivus is the core of distribution. The class interpretation of categoricals obscures the doctrine. Contemporary quantifier theory reveals it again. Geach's arguments against it are analysed and criticised."

Bibliography

Studies in English Ric - Z

1. Richards, Thomas J. 1971. "The Two Doctrines of Distribution." *Australasian Journal of Philosophy* no. 49:290-302.

   "Medieval logicians often defined a term T as distributed in a sentence f(T) iff there is a valid inference from f(T) to If(this T)]. Thus P is distributed in [Some S are not P]. Nineteenth-century traditional logicians presented an alternative definition of distribution of T in f(T) according to whether T refers to its whole extension. Thus S is not distributed in [Some S are not P]. This version is also medieval, and has been attacked, mainly by Geach, from the point of view of the incoherence of the theory of reference it *prima facie* presupposes. In this paper I shall make some remarks about the history of the two doctrines, then attempt to provide precise formulations of them.

   These formulations will then be compared; and then precise formulations of the two traditional distribution laws of inference will be offered. These two laws are, informally and traditionally: a term distributed in a conclusion must be distributed in a premiss (Law of Valid Process); and, the middle term of a syllogism must be distributed in a premiss (Law of

Distributed Middle). The latter is capable of generalisation to cases other than traditional syllogisms, otherwise it is trivial.

The tenor of the paper is that all these precise formulations are acceptable renderings of distribution theory generalised beyond simple S-P sentences.

Consequently the acceptability of these areas of traditional metatheory of traditional logic has as at least a necessary condition the proof of the two distribution laws and the demonstration of the equivalence of the two definitions of distribution. It will be shown that the two definitions are not equivalent, that the Law of Valid Process does not hold on one definition of distribution, and that neither law holds on the other definition." (p. 290)

(From the *Preface*)

3. ———. 1967. *Logica Modernorum. Vol 2. Part One: The Origin and Early Development of the Theory of Supposition*. Assen: Van Gorcum.

"In this work it will be attempted to show how the *Logica Modernorum* had its origin, long before the thirteenth century, in the logical and grammatica! theories current in the Western centres of studies: Paris, Oxford and presumably a school in Northern ltaly.

The First volume dealt with what was considered as one of the two roots of this development: the twelfth century theories of fallacy. The present volume discusses the other source: the development of Mediaeval grammar from an elementary discussionof (Latin) grammar to a linguistic-semantic theory of (Latin) language. It was the latter contribution that was of extreme importance for the origin of the theory of supposition, and generally speaking, of terminist logic.

The purpose of this volume is to trace the details of the origin of the theory of supposition, including appellation and copulation, and to discuss the theory of the properties of terms as found about 1200.

Besides, some historical evidence will be given for the origins of the tracts dealing with the properties of syncategorematic terms and those discussing the other specific elementa of the *Logica Modernorum*.

The author has thought it of some importance for further investigation in this field to edit in full the main treatises on which the present study is based.They will be found in the second part of this book. They have been arranged chronologically, except for the *Quaestiones Victorinae*, which are to be considered as an extra.

The *Index nominum,* the *Index locorum* and the *Index sophismatum* aim at completeness. The *Index verborum et rerum* is not exhaustive: it only tries to give a number of words and phrases considered as important for our understanding of the conceptual and doctrinal contents of the edited tracts, and to facilitate the reader's orientation in this study."    Reprinted as chapter X in: L. M. de Rijk, *Through Language to Reality. Studies in Medieval Semantics and Metaphysics*, edited by E. P. Bos, Northampton, Variorum reprints, 1989.

   "I - Status quaestionis.

   From the investigations in the first part of this article the conclusion was drawn that in the thirteenth century doctrine of

supposition natural (or habitual, or absolute) supposition was considered the natural capacity of a term to stand for something partaking in the essence (or: universal nature) signified by that term; accidental supposition was the term's actual being taken for something in virtue of the term's combination with some other term in either a phrase or a proposition, or of its having a special meaning in a special social context. Briefly stated : natural supposition was decidedly non-contextual, whereas all kinds of accidental supposition were of the contextual type.

Two characteristics of the thirteenth century doctrine of supposition are to be noticed

(a) accidental supposition, being contextual, does not always imply a propositional context

(b) natural supposition, being something midway significatio and suppositio (as opposed to significatio), seems to enervate the clear-cut

distinction all thirteenth century logicians made between suppositio and significatio.

ad a Thirteenth century logicians turn out to consider the proposition as just one of the possible contexts of a term, not as the only one required for a term's having supposition.

ad b The introduction of natural supposition was due to the peculiar fact that those logicians apparently held it to be indispensable to distinguish between a word's having signification (viz. its representing some universal nature) and its capacity to stand for individuals partaking in this universal nature (c.q. the universal nature participated, taken as such), which capacity was the direct, or natural, counterpart of its having signification. This natural capacity must be seen as a reference to a *possible* context, which supplies an adjunct to limit, or restrict, the term's original capacity (c.q. which causes its having an unrestricted exercise of its natural capacity). (...)

As is well known, when studying the problems of signification fourteenth century logicians showed an increasing interest in

the contextual approach to language. Their investigations were focussed on the *congruitas locutionis* and the *veritas propositionis* as the basic requirements *(exigentie)* for stating the actual meaning of terms. Their theories of supposition may be taken as an attempt to specify the truth conditions for (mostly affirmative) categorical propositions. Thus, the various kinds of supposition were characterized by fourteenth century logicians by means of implications *(consequentie)'*. Consequently, they were bound to lay the most explicit stress on the *proposition* as the only possible context in which a term could have supposition.

The most obvious conclusion from the theoretical point of view would be that natural supposition, being of the non-contextual type, had to disappear in fourteenth century logic. To my mind, it certainly had - as certainly as it never should have appeared. However, it *did* occur in those days, not only in the Realist tradition but with a logician as John Buridan as well.

It is the aim of this article to discuss the reinterpretation of natural supposition and the controversies it provoked, and is still provoking up to the present days." (pp. 43-44)

7. ———. 1982. "The origins of the theory of the properties of terms." In *The Cambridge History of Later Medieval Philosophy: From the Rediscovery of Aristotle to the Disintegration of Scholasticism*, edited by Kretzmann, Norman, Kenny, Anthony Patrick, Pinborg, Jan and Stump, Eleonore, 161-173. Cambridge: Cambridge University Press.

   "The first medieval scholars to have a professional interest in language as such were the grammarians. Their interest was focused on what we would call logico-semantical and syntactical questions; this is espedally true of the School of Chartres as early as the 1030s. No longer were words studied as separate units quite apart from their linguistic context; rather it was that context itself that attracted the most intense interest. I have labelled this concentration of attention the 'contextual approach' (De Rijk 1967, pp. 113-17; 123-5). The statement (*propositio*), not isolated words, was taken to be the fundamental unit of meaning. The meaning of a word in its

actual use in a propositional context was considered so important, indeed, as to lead to the introduction of a special terminology, centred around terms (i.e., words as parts of actual propositions) and their properties.

The development of the doctrine of the properties of terms was in fact nothing but the growing dominance of just one of the properties of terms, *suppositio*, i.e., actually 'standing for'. On the other hand, throughout that development, there remained some basic presuppositions which not only established the framework of the development but were, unfortunately, to determine later developments as well. Among them the most obstinate was the doctrine of *significatio*." (pp. 161-162)

8. ———. 2013. "Semantics and Ontology. An Assessment of Medieval Terminism." *Vivarium* no. 51:13-59.

Abstract: "This paper aims to assess medieval terminism, particularly supposition theory, in the development of Aristotelian thought in the Latin West. The focus is on what the present author considers the gist of Aristotle's strategy of argument, to wit conceptual focalization and categorization. This argumentative strategy is more interesting as it can be compared to the modern tool known as 'scope distinction'."

"A Summary

The following statements can summarize our findings:

[1] The medieval theories of the properties of terms, supposition in particular, and medieval terminism in general developed around 1100 from a doctrine concerning the unmasking of fallacious arguments through grammaticological analysis.

[2] Unlike fallacies, as a root of terminism, grammatico-logical analysis continued to play a prominent role in its later developments.

[3] Like any philosophical method, the methodology of terminism had everything to do with a philosopher's basic attitude towards reality, and, accordingly, its diverse developmental directions mirrored diverse philosophical positions, varying from realism to nominalism/conceptualism, to each of which it was equally hospitable.

[4] The basic ancient and medieval philosophical positions were all governed by the paradigm of the parallellism (supposedly existing) between Reality and our cognitive faculties (for Aristotle and the Medievals, particularly the scheme of the ten categories).

[5] There are, consequently, unmistakable parallells between the Aristotelian and the medieval strategies of argument, which, however different they sometimes seemed, both served much the same philosophical positions.

[6] The nucleus of the Aristotelian strategy of argument, which consists in focalization and correct categorization, is also found in terminism, both of which are based on the conviction that any proper discussion requires highlighting the object's (whether essential or coincidental) ontic features that are suited to the investigation or discussion at hand.

[7] Taking advantage of the ambivalent semantic area of the key focal terms of the discussion is one of the main characteristics of terminism.

[8] The medieval debates on metaphysical issues and on intentionality, as well as sophisticated disputes about the significative force of words occurring in special contexts, gave rise to many semantic refinements, such as the issues of semantic stratification and time connotation.

[9] The entire development of terminism can also be assessed in the broader context of the post-medieval rise of empiricism, including an ongoing critical attitude towards rational

speculation. As far as the Middle Ages are concerned, this attitude came to the fore in reducing the number of the categories regarded as ontologically representative (with Ockham among others), or even in giving up the idea of ontological representativeness altogether (with Crathorn)." 13. ———. 1973. "On Refuting and Defending Supposition Theory." *The New Scholasticism* no. 47:84-87.

    Summary: "P. T. Geach's critique of medieval supposition theory has generated much controversy. Supposition theory is neither as guilty as Geach claims, nor as innocent as Scott, one of Geach's critics, claims. Geach takes a medieval account of supposition, the "Ockham-Buridan" account, and attempts to show that it provides us with unacceptable semantic analyses of

certain propositions. According to him, supposition theory treats applicatives as associating with common nouns to form referring expressions. However, there is no way to render intelligible the referents of expressions like 'some dancers' and 'all dancers'. Geach sees this semantic foul-up as a consequence of supposition theory's failure to assign applicatival expressions to the proper grammatical category. T. K. Scott counters that the medieval treatment of applicatives parallels modern logic's treatment of quantifiers."

In *Formal Approaches and Natural Language in Medieval Logic*, edited by Cesalli, Laurent, Goubier, Frédéric and Libera, Alain de, 303-324. Barcelona - Roma: Fédération Internationale des Instituts d'Études Médiévales.

    "In recent years, a number of important studies in medieval philosophy have convincingly shown that those we would call pragmatic considerations according to today's trends in philosophy of language and linguistics, were also at the core of the concerns in medieval logic and semantics. The works of Irène Rosier-Catach(1), only to mention one remarkable example, have shown that medieval theories of language, far from being limited to strictly syntactic or semantic analyses, crucially involved elements of what we could call speech act theory as well as a notion of meaning which resorted to the identification of the intentions lying behind a speaker's utterance." (p. 303)

    (...)

    "In the same spirit of the cited works, in the present paper I will argue in favour of the analogy between Ockham's supposition theory and one very specific and peculiar approach in post-Gricean Pragmatics, that of so-called Default Semantics(6) (DS).

    The purpose of this work will be very limited. I will restrict myself to a little portion of Ockham's theory of supposition, i.e. his theory of supposition proper, and will leave aside the much more complex theory of the modes of personal supposition.

Also, I will pursue my analogy only with respect to the treatment that DS proposes with respect to one important distinction in contemporary theories of reference, i.e. Donnellan's distinction between referential and attributive uses of definite descriptions(7).

My aim is to show that the general strategy advocated in DS to cope with this kind of semantic issue comes very close to Ockham's strategy to distinguish the readings of a proposition by the possible modes of supposition of its terms. My hope is that such an analogy could eventually be illuminating with respect to the general question of what medieval theories of supposition were aimed at." (pp. 304-305)

15. Schaeffer, Frans. 1987. "Syntax and Semantics in Supposition Theory." In *Ockham and Ockhamists*, edited by Bos, Egbert Peter and Krop, H. A., 63-69. Nijmegen: Ingenium Publishers.

"Introduction

Of the many topics discussed by Ockham in his writings on logic, in recent rimes most attention has been paid to his theory of supposition. This is not surprising, since the theory of supposition is widely recognized to be the most original medieval contribution to logic, and in Ockham' s hands the theory became a strong weapon in the fight about the status of universals.

What is surprising, perhaps, is that this attention has been focused almost completely on personal supposition, to the exclusion of material and simple supposition. This can be explained in part by the fact that the notions of material and simple supposition can only be understood against the background of a comprehensive (medieval) philosophy of

language, whereas personal supposition can be approached more directly from a modem logical point of view.

Indeed, it is clear that techniques and notions drawn from modem logical theory can play an important role in helping to understand personal supposition. But we must be careful not to divorce persona! supposition from the larger framework of which it is, after all, only a part." (p. 63)

16. Schoot, Henk J.M. 1993. "Aquinas and Supposition: the Possibilities and Limitations of Logic *In Divinis*." *Vivarium* no. 31:193-225.

)"Medieval theory of supposition, being a part of medieval theory of meaning, has been and remains a subject of particular interest of present-day philosophers. Ever since it was discovered that there are peculiar parallels between modern and medieval theory of meaning, considerable effort has been made to describe its origins and develop- ment. The parallel, in short, is a similar distinction between the signification of a word and its actuad meaning in use. Frege' s conceptual pair of Sinn (sense) and Bedeutung (reference), like Carnap' s pair of Intension and Extension (Connotation and Denotation), were discovered to echo the medieval distinctions between Significatio and Appellatio (around 1100), and between Significatio and Suppositio (end 12th and 13th century)." (p-193)

(...)

"The first paragraph will elaborate the link between divine simplicity, mystérium and the (in)adequacy of talk about God, in order to make intelligible that in Aquinas all analysis of the human way of speaking provides both possibilities and limitations. In the second paragraph I will investigate Aquinas' use of the term modus significandi and show that it is linked with supposition. The third paragraph proceeds with a study of the distinction of supposition and signification, a study of the various *modi supponendi* that Aquinas distinguishes and with a comparison of it to three logical tracts from the thirteenth century (Peter of Spain, William of Sherwood and Lambert of Auxerre). Both paragraphs mention the word naturalis and so a

fourth paragraph will be needed to explain the influence of modes of signification upon modes of supposition, and the double meaning of the term supponere naturaliter in Aquinas." (p. 197)

17. Scott, Theodore Kermit. 1966. "Geach on Supposition Theory." *Mind* no. 75:586-588.

    "Ib his recent book, *Reference and Generality*,(1) P. T. Geach has made explicit some of his objections to a portion of Ockham's supposition theory, although there was some mention of its shortcomings in his earlier article on the doctrine of distribution.(2) I want to argue that most of Geach's objections are based on a misinterpretation of the doctrine. He criticizes in particular those types of supposition that are divisions of personal supposition and that constitute the portion of the theory having to do with the effect of quantifiers on propositions. It is important to recognise that the reference of terms falling under these types is already fixed by stating that they have personal supposition, meaning that they stand for their logical inferiors. And their reference is not altered by including them under these further types. There is just no mention of reference at all in connection with this portion of the theory. The sole reason for placing a term under one of these types is that the quantified proposition in which it occurs is equivalent to another proposition of a certain form.(3) For example, the term ' man ' in the proposition ' Every man is an animal ' is said to have *suppositio confusa et distributiva*, because that proposition is equivalent to the conjunctive proposition' This man is an animal and that man is an animal and ... and that man is an animal ', indicating each man in turn (*Summa Logicae*, i. 70). And the same term has suppositio determinata in the proposition ' Some man is an animal', because that proposition is equivalent to the disjunctive ' This man is an animal or that man is an animal or . . . or that man is an animal' (*Summa Logicae*, i. 71). Hence, this part of the theory has nothing to do with the reference of terms, but only with the role of quantifying words." (p. 586)

    (1) *Reference and Generality,* Cornell University Press, 1962.

(2) [The doctrine of distribution,] *Mind*, 1956, pp. 67-74.

(3) In discussing these types (*Summa Logicae*, i. 70-74), Ockham actually says that it is " suitable to descend " (contingit descendere) from the original pro- position to the second one. However, I take every such pair to be equivalent, since in every case, ht says that either of the two may be inferred from the other.

18. Sirridge, Mary. 2013. "Supposition and the Fallacy of Figure of Speech in the *Abstractiones*." *Vivarium* no. 51:147-168.

    Abstract: "I undertake to examine the practice of Richard, Master of Abstractions,[*] with respect to supposition in his dealing with the fallacy of figure of speech. His practice turns out to support the ‘single theory’ account of the theory of personal supposition, as does his treatment of a functional equivalent of simple supposition, but his practice of proposing additional solutions points to changing attitudes with respect to species as separate entities. Questions having to do with material supposition and the like are completely absent, even in discussions where we might expect to find them."

20. Sørensen, Holger Steen. 1961. "An analysis of linguistic signs occurring in suppositio materialis or the meaning of quotation marks and their phonetic equivalents." *Lingua* no. 10:174-189.

    Abstract: "n this paper I propose to discuss the time-honoured problem of linguistic signs occurring in suppositio materialis, a problem which has recently been given some attention. The problem may be stated as follows: What is the subject in a sentence like “Happily was spelt incorrectly”? And to what

word-class does it belong? I shall show that the ordinary view of the suppositio materialis employment of signs — that e.g. ‘happily’ is a noun in this employment — is seriously fallacious. The notions of subject and subject of discourse have not been kept distinct. (The subject (= grammatical subject) in ‘Anderson smokes cigars’ is ‘Anderson’, whereas the subject of discourse is Anderson) In other words, signs and what signs are signs for have not been kept distinct. This is a mistake the linguist often accuses the layman of committing. But unfortunately he often commits it himself. In connexion with my analysis I shall call attention to an important distinctive feature of the language (metalanguage) the linguist uses in describing languages."

    Reprinted as Chapter IX in P. V. Spade, *Lies, Language and Logic in the Late Middle Ages,* New York: Routledge 1988.

    "In his thirteenth-century I ntroductiones in logicam, William of Sherwood enunciates the following principle: "Subjects are of such sorts as their predicates may have allowed."(1) That is, the kind of supposition(2) or referencs a term has in a given sentence depends at least in part on what kind of a term the predicate is. This principle I shall call the "rule of supposition". Thus, in 'A man is running' the subject 'man' has personal supposition, while in 'Man is a species' it has simple and in 'Man is a name' it has material.(3)" (p. 63)

    (...)

    "Ockham thus gives a complete version of the rule of supposition which we first saw in rudimentary form in William of Sherwood.

    Nevertheless, I shall argue in sections II and III, below, that Ockham does not really want the rule he gives. It conflicts with the main body of his doctrine in two ways; there are pressures from two directions

    to revise his version of the rule. In section IV. I shall examine how some later formulations of the rule relieved these

pressures." (p. 67)

22. ———. 1975. "Some Epistemological Implications of the Burley-Ockham Dispute." *Franciscan Studies* no. 35:212-222.

Reprinted as Chapter X in *Lies, Language and Logic in the Late Middle Ages*.

"The dispute between Walter Burley and William of Ockham over supposition and signification has been discussed often in the literature. For the most part, the philosophical - as distinguished from the textual - side of this discussion has centered on those aspects of the dispute which are based on the metaphysical disagreements between the two men. From this point of view, the main question in the debate is "For what does a common term stand when it stands in simple supposition?" Burley, the realist, maintained that such a term stands for what it signifies, namely, a common nature outside the mind. On the other hand, Ockham the conceptualist could not accept such a position; in his ontology there were simply no common natures outside the mind. For him, therefore, a common term in simple supposition stands for the universal concept in the mind.

This much of the dispute then is based on the metaphysical disagreement over whether there exist common natures outside themind. It is this metaphysical side of the dispute that is usually brought out in recent discussions.

But there is quite another question too at issue between Burley and Ockham, one the answer to which is restricted but not totally fixed by their respective metaphysical views. It is: "Disregarding the question what we are to posit at the one end of the relation of simple supposition, which kind of supposition is it in which a term stands for what it signifies?" For Burley it is simple supposition, for Ockham personal. As will be seen, this issue has epistemological implications.

It is this side of the dispute that I want to explore here." (pp. 213-214, notes omitted)

23. ———. 1975. "Ockham's Distinctions Between Absolute and Connotative Terms." *Vivarium* no. 13:55-76.

    Reprinted as Chapter XI in Spade, *Lies, Language and Logic in the Late Middle Ages,* New York: Routledge 1988.

    "This paper is intended as an introduction to the theory of "connotation" as developed by William of Ockham, especially as in his *Summa logicae*. It is only an introduction to that theory, because it focusses on only the most rudimentary part of it, namely, the distinction between absolute and connotative terms. The paper does two things. First, it tries to clarify several crucial but obscure notions that arise in connection with this distinction, notions such as "signify the same things in the same way", "secondary signification", and "express the quid nominis". Second, the paper argues for the claim that connotation-theory, or at least that part of it presented here, requires no new primitive notions beyond those already required for the theory of absolute terms." (p. 55, a note omitted)

24. ———. 1976. "Priority of Analysis and the Predicates of O-form Sentences." *Franciscan Studies* no. 36:263-270.

    Reprinted as Chapter XII in *Lies, Language and Logic in the Late Middle Ages*.

"In 1970, John J. Swiniarski observed in this journal that there is something peculiar about Ockham's doctrine that the predicates of O-form sentences have confused and distributive supposition.(1)In 1973, Gareth Matthews made a similar point. (2) In brief, the problem is this: Ockham defines confused and distributive supposition in such a way that a given term in a sentence has confused and distributive supposition if and only if a descent to singulars under that term is possible by a conjunctive sentence, and the original sentence cannot be inferred from any one conjunct." (p. 263)

(...)

"I find neither of these views compelling. While Matthews is certainly right in saying that Ockham never claims equivalence explicitly, I for one find it hard to imagine that he means anything else. For if equivalence fails, the elaborate distinction of the various kinds of personal supposition cannot be used in an account of truth-conditions.

What then is the distinction for? Is it simply an idle decoration in the theory of supposition?

On the other hand, while Swiniarski's suggested "priority of analysis" rule would avoid the problem with the O-form sentences, it would not, as he claims it does, do away with the need for merely confused supposition entirely. Ockham, after all, uses merely confused supposition not only in his account of A-form sentences, but also in his account of such problem-sentences as •I promise you a horse.'

A "priority of analysis" rule would eliminate the need for merely confused supposition in the case of A-form sentences, but not in the other cases." (p. 265, a note omitted)

25. ———. 1982. "The Semantic of Terms." In *The Cambridge History of Later Medieval Philosophy*, edited by Kretzmann, Norman, Kenny, Anthony Patrick and Pinborg, Jan, 188-196. Cambridge: Cambridge University Press.

"Two senses of'term'

Medieval philosophers and logicians used the word 'term' (*terminus*) in several senses, two of which are especially pertinent to this discussion.

Strictly speaking, a term is what is subjected to the predicate or predicated of the subject in an ordinary categorical proposition - the subject term or the predicate term, the two ends (termini) of the proposition. In this sense whole phrases may be terms, but only certain sorts of words - nouns, adjectives, and verbs - can serve by themselves as terms. Less strictly, and in the later Middle Ages more prevalently, a term is any word at all, regardless of propositional context. In this discussion 'term' will be used in the less strict sense unless otherwise noted.

Signijication as a psychological and causal property of terms

There are two basic properties for the medieval semantics of terms: signification and supposition. Signification is a psychologico-causal property of terms - a fact responsible for many disagreements and tensions in medieval semantics. The main source for the notion of signification was Boethius' translation of *De interpretatione* 3, 16b 19: '[Verbs] spoken in isolation are names and signify something." (p. 188)

(...)

"Supposition-theory is best viewed as two theories: the theory of supposition proper and the theory of'descent to singulars'. (29)" (p. 192)

(...)

"The second main part of supposition theory is the theory of descent to singulars or 'modes of personal supposition'. The standard modes are: 'discrete', 'confused and distributive', 'determinate', and 'merely confused'.

Discrete supposition is the supposition of proper names, demonstratives, and demonstrative phrases. There was wide divergence regarding the definitions of the other modes." (p. 194)

(29) See Scott's introduction to Buridan 1966, [(1966). *Sophisms on Meaning and Trut*h, tr. T. K. Scott, Appleton-Century-Crofts] pp. 29-42

26. ———. 1984. "A Defense of a Burlean Dilemma." *Franciscan Studies* no. 44:193-196.

"Professor Fitzgerald's interesting paper "An Interpretative Dilemma in Burlean Semantics" argues against certain claims made in my "Some Epistemological Implications of the Burley-Ockham Dispute"."

(...)

"Fitzgerald and I remain in disagreement about the correct interpretation of Burley's semantics. I hold (1) that for Burley a common term (discrete terms are another matter(1) signifies a species or common nature, not individuals, and (2) that for Burley it is only in simple supposition that a common term supposits for its significate. Since (3) a term signifies just what it makes one think of, I conclude (4) that it is only when a common term is used in simple supposition for species or common natures that we are made to think of what the term supposits for, and so what we are talking about.

If I understand him correctly, Fitzgerald and I disagree about (4) because we disagree about both (1) and (2)." (pp- 193-194)

(...)

"The reader will have to decide for himself whether the texts really do provide sufficient evidence for my claims (1) and (2), and so whether the very interesting passages Fitzgerald quotes concerning direct intellectual cognition of particulars should be counted against my interpretation or, on the contrary, only aggravate the difficulties I see in Burley's theory." (p. 196)

(1) Burley's denial of any difference between simple and personal supposition for simple discrete terms may be taken as

implying a denial of a distinction between individuals and their individual natures, between for example Socrates and his Socrateity.

27. ———. 1988. "The Logic of the Categorical: The Medieval Theory of Descent and Ascent." In *Meaning and Inference in Medieval Philosophy: Studies in Memory of Jan Pinborg*, edited by Kretzmann, Norman, 187-224. Dordrecht: Kluwer.

    "The fact is, therefore, that we hear comparatively little about supposition-theory from either side of the English Channel during roughly the last quarter of the thirteenth century. This perhaps suspicious coincidence is all the more intriguing once it is realized that the theory of supposition, as it emerges from the shadows again in the early fourteenth century, is in important respects different from what it was earlier. These differences have not been sufficiently noticed or studied in the literature. I propose to examine some of them here.

    The differences I have in mind all pertain to that well known part of supposition-theory called the doctrine of "descent to singulars", together with the correlative but perhaps not so well known notion of "ascent" (from singulars). This doctrine has been widely discussed in the secondary literature, mostly from the point of view of Ockham's presentation of it. Recently there has been some dispute over just what the doctrine of "descent to singulars" was intended to accomplish and over whether it does in fact accomplish it,u Another goal of this paper will be to shed some light on that dispute.

    Section I below distinguishes two main parts of the theory of supposition. Section II gives a preliminary description of the part that is the main focus of this paper. Section III introduces some notions and notation. Section IV defines various "modes" of common personal supposition. Section V restricts our consideration to the kinds of sentences to which the theory was primarily intended to apply. Section VI proves three theorems. Section VII makes some observations based on the theorems. Section VIII considers two views about the purpose of this theory. Finally, in Section IX, I offer my own tentative suggestions." (p. 188)

28. ———. 1997. "Walter Burley on the Simple Supposition of Singular Terms." *Topoi. An International Review of Philosophy* no. 16:7-13.

    Abstract: "This paper argues that Burley's theory of simple supposition is not as it has usually been presented. The prevailing view is that Burley and other authors agreed that simple supposition was in every case supposition for a universal, and that the disagreement over simple supposition between, say, Ockham and Burley was merely a disagreement over what a universal was (a piece of the ontology? a concept?), combined with a separate disagreement over what terms signify (the speaker's thoughts? the objects the thoughts are about?).

    In fact, however, Burley explicitly allows that some instances of simple supposition are for an individual, and that in certain cases personal supposition and simple supposition coincide. The present paper explores Burley's theory on this topic, and proposes a way of thinking about the metaphysics and the semantics that makes sense of what he says."

29. ———. 1999. "Walter Burley on the Kinds of Simple Supposition." *Vivarium* no. 37:41-59.

    "By the early-fourteenth century at the latest, the mediaeval theory of supposition could be divided in most authors into two main branches, which in recent literature have come to be called the theory of “supposition proper” and the theory of “modes of personal supposition,” respectively. While the relation between these two branches remains obscure, we can say to a first approximation that the theory of supposition proper was a theory of “reference,” designed to answer the question what entity or entities a term refers to or “supposits” for in a given occurrence in a given proposition, whereas the theory of modes of personal supposition, whatever its ultimate purpose, was the part of the theory that included the much discussed accounts of “descent to singulars” and “ascent from singulars”."(p.41, notes omitted)

    (...)

"In the present paper, therefore, I shall explore in at least a preliminary way Burley's account of the divisions and subdivisions of simple supposition, investigate how that account changed over time, and inquire into the motivation behind this part of his doctrine. The main texts I shall be concerned with are Burley's early treatise *De suppositionibus* (dated 1302)(12) and his later *De puritate artis logicae tractatus longior* (before 1327).(13) I shall occasionally mention Burley's late *Expositio super artem veterem* (1337), although the theory of simple supposition in that work remains to be studied more fully.(14)" (p. 43)

(12) Edited in Stephen F. Brown, *Walter Burleigh's Treatise De suppositionibus and Its Influence on William of Ockham*, in: Franciscan Studies, 32 (1972), 15-64. On the date, see ibid., 16.

(13) Edited in Walter Burley (= Burleigh), *De puritate artis logicae tractatus longior, With a Revised Edition of the Tractatus brevior*, ed. Philotheus Boehner, St. Bonaventure, NY 1955. In the introduction to his edition (p. viii), Boehner dates this work 1325-1328. But Rega Wood, in an unpublished paper *Walter Burley: Life and Works*, suggests a slightly earlier date.

(14) Walter Burley, *Burlei super artem veterem Porphirii et Aristotelis*, Venice: Otinus [de Luna] Papiensis, 11 May 1497 (Copy in the Lilly Library at Indiana University). On the date, see the explicit quoted in James A. Weisheipl, *Repertorium Mertonense*, in: Mediaeval Studies, 31 (1969), 174-224, at p. 189.

30. Sweeney, Eileen C. 1995. "Supposition, Signification, and Universals: Metaphysical and Linguistic Complexity in Aquinas." *Freiburger Zeitschrift für Philosophie und Theologie* no. 42:267-290.

"This essay places Aquinas's use of supposition theory in its metaphysical and linguistic contexts, showing, first, how Aquinas's use of supposition in the problems surrounding terms said of God illustrates Aquinas's theological and metaphysical commitments. Second, I argue that Aquinas's supposition theory organizes but does not dissolve the

ambiguities and complexities of language, taking the multiplicity of meanings and references as intrinsic rather than curable aspects of language. These complexities are, for Aquinas, reflections of our imperfect imitation of the immediate and complete understanding of the divine intellect, and the composite and fragmented metaphysics of created being."

31. Swiniarski, John J. 1970. "A New Presentation of Ockham's Theory of Supposition with an Evaluation of Some Contemporary Criticisms." *Franciscan Studies* no. 30:181-217.

    "This is a critical evaluation of Ockham's theories of meaning and reference based on extensive primary source materials and especially concerned with Ockham's procedures for the extensional analysis of general propositions. The Kneales' contention that absurd conclusions follow from the application of Ockham's procedures is shown to be ill-founded. Geach's claim, that Ockham's notion of purely confused supposition is unnecessary, is supported. Some of Moody's views on supposition are upheld."

32. ———. 1971. *Theories of Supposition in Medieval Logic: Their Origin and their Development from Abelard to Ockham*.

    Available at ProQuest Dissertation Express. Order number: 7107229.

    "All of the systematic treatises concerning supposition which we shall consider in this chapter date from about the middle of the thirteenth century. All of them appear as tracts in handbooks composed for the teaching of logic in the medieval universities. Four logicians whom we can name composed such texts: William of Sherwood, Peter of Spain, Roger Bacon, and Lambert of Auxerre. William's work is important because it appears to be the earliest of the four.

    Peter of Spain's text is significant because it came to be the most popular of all the medieval handbooks on logic.

    Bacon's work is important because it contains certain tendencies and insights not found in the works of either of his immediate predecessors.

Lambert's work is less significant than that of the others because it appears to be primarily an expansion upon and an explanation of the work of Peter of Spain, rather than an independent work in its own right." (Chaptet Two: Thirteeenth theories of supposition, p. 111)

33. Theron, Stephen. 1999. "The supposition of the predicate." *The Modern Schoolman* no. 77:73-78.

    "Supposition theory (chiefly that of Aquinas) is contrasted with theories of reference. It is argued that the predicate "stands for" (supponit pro) what the subject stands for. It has the same supposition, that is, but according to its predicative mode. Supposition can be varied "ad placitum." The role of the copula is crucial, as is the principle that "only wholes can be predicated of wholes" (Aquinas: De ente et essentia). The context is a discussion of writings by Peter Geach."

35. Trentman, John Allen. 1964. *Simple Supposition and Ontology: A Study in Fourtenth-Century Logical Theory*, University of Minnesota.

    Available at ProQuest Dissertation Express. Order number: 6500162.

36. Uckelman, Sara L. 2013. "A Quantified Temporal Logic for Ampliation and Restriction." *Vivarium* no. 51:485-510.

    Abstract: "Temporal logic as a modern discipline is separate from classical logic; it is seen as an addition or expansion of the more basic propositional and predicate logics. This approach is in contrast with logic in the Middle Ages, which was primarily intended as a tool for the analysis of natural language. Because all natural language sentences have tensed verbs, medieval logic is inherently a temporal logic. This fact is most clearly exemplified in medieval theories of supposition. As a case study, we look at the supposition theory of Lambert of Lagny (Auxerre), extracting from it a temporal logic and providing a formalization of that logic."

37. Valente, Luisa. 2011. "Praedicaturi supponimus. Is Gilbert of Poitiers' approach to the problem of linguistic reference a pragmatic one?" *Vivarium* no. 49:50-74.

    Abstract: "The article investigates how the problem of (linguistic) reference is treated in Gilbert of Poitiers' Commentaries on Boethius' *Opuscula sacra*. In this text the terms *supponere, suppositus,-a,-um*, and *suppositio* mainly concern the act of a speaker (or of the author of a written text) that consists of referring—by choosing a name as subject term in a proposition—to one or more subsistent things as what the speech act (or the written text) is about. Supposition is for Gilbert an action performed by a speaker, not a property of terms, and his 'contextual approach' has a pragmatic touch: "we do not predicate in order to supposit as much as we supposit in order to predicate". Language is considered by Gilbert as a system for communication between human beings, key notions are the 'sense in the author's mind' (*sensus mentis eius qui loquitur*) and the 'interpreter's understanding' (*intelligentia lectoris*). The phenomenon of 'disciplinal' discourse ("man is a species of individuals") is treated by means of these hermeneutic notions and not by means of a special kind of supposition."

38. ———. 2013. "Supposition Theory and Porretan Theology: *Summa Zwettlensis* and *Dialogus Ratii et Everardi*." *Vivarium* no. 51:119-145.

    Abstract: "The article investigates how the problem of (linguistic) reference is treated in the theology of two pupils of Gilbert of Poitiers by means of *suppo** terms (*supponere; suppositus,-a,-um; suppositio*). Supposition is for Gilbert an action performed by a speaker, not a property of terms, and he considers language as a system for communication between human beings: key notions are the 'sense in the author's mind' and the 'interpreter's understanding'. In contrast, the two Porretans tend to objectify language as a formal system of terms. *Suppositio* becomes in the Summa Zwettlensis the name itself as subject term in a proposition, and is divided into many kinds; formal rules are described which govern the influence of

the predicate on the subject term's denotation. In Everard of Ypres' *Dialogus Ratii et Everardi*, supponere is a function (*officium*) of the name, and 'human is a species of individuals' is, as in some logical treatises and differently from Gilbert, a case of rhetorical transfer."

39. Wagner, Michael F. 1981. "Supposition Theory and the Problem of Universals." *Franciscan Studies* no. 41:385-414.

    "I examine Burleigh's and Ockham's positions on universals through explaining their theories of signification and supposition. I argue for a representational analysis of these theories, which i distinguish from prevailing interpretations of these theories; and i argue, in particular, that when Burleigh's theory of the signification and supposition of general terms is properly understood, he is not an extreme realist (at least as this view is normally understood) and his disagreement with Ockham over universals is much more subtle than it is normally conceived by historians of philosophy."

40. Ward, Thomas M. 2018. "Logic and Ontological Commitment: Vincent Ferrer's Theory of Natural Supposition." In *Modern Views of Medieval Logic*, edited by Kann, Christoph, Loewe, Benedikt, Rode, Christian and Uckelman, Sara L., 233-244. Leuven: Peeters.

    "This paper draws attention to one way in which Vincent Ferrer (1350–1419) developed a theory of supposition which was supposed to be amenable to certain metaphysical commitments of his fellow Dominican, Thomas Aquinas. Specifically, Ferrer held that from a proposition in which the subject term supposits naturally – for example, "Man is risible" – one can descend copulatively to everything falling under the subject term – every human – even when there is not universal quantification – for example, "Some man is risible". And when there is nothing falling under the naturally suppositing subject term – supposing, for example, that there have been no humans, are no humans, and never will be any humans – a proposition like "Man is risible" is not only truth evaluable but true. While the bulk of this paper is concerned with explaining Ferrer's theory of natural supposition, I close the paper by

exploring some of the metaphysical issues that arise on Ferrer's view that propositions with naturally suppositing subject terms can be true when there are no instances. I argue that Ferrer's position actually commits him to a kind of realism about natures that is probably not Thomistic – despite Ferrer's expressed loyalty to the Angelic Doctor.

I will proceed in the following way. After describing the way in which certain comments of Thomas Aquinas were influential on Ferrer with respect to his division of the kinds of supposition, I will give an account of Ferrer's theory of natural supposition, focusing on the four 'rules' he lays down and drawing out some of the odd inferences one can make by following these rules. I will then discuss some of the metaphysical problems arising from Ferrer's theory." (p. 233)

41. Wciórka, Wojciech. 2019. "Stephen Langton on common supposition." *Przegląd Tomistyczny* no. 25:319-367.

    Summary: "This paper argues that the notion of the "common" supposition employed by Stephen Langton (fl. ca 1200, † 1228) does not involve ambiguity (*duplicitas, multiplicitas*) but should be explained in terms of generalized or disjunctive truth conditions. This means that a sentence such as "deus generat" ("God begets") is true even if just one of the referents of the subject term has the property attributed by the predicate. The common supposition of "deus" in this context encompasses both the divine being (*essentia*) and a person, whereas the distinctive property attached by "generat" inheres only in the Father. And yet we are in no position to claim that on Langton's model "deus generat" is true with regard to a divine person but false with regard to the divine being. The sentence "deus generat" is simply true, just because one of the elements of the common supposition happens to satisfy the predicate and make the sentence true. Some aspects of Langton's views were developed by his student Geoffrey of Poitiers, whose unedited Summa 'Ego novissimus' sheds light on several tricky points, including the analogy between "deus generat" and the semantic statement "homo supponitur," which is said to involve both simple and personal supposition."

42. Weidemann, Hermann. 1979. "William of Ockham on Particular Negative Propositions." *Mind* no. 88:270-275.

    "In their recent attempt to formalize Ockham's theory of *suppositio personalis* in standard modern logic G. Priest and S. Read ('The Formalization of Ockham's Theory of Supposition', Mind lxxxvi [1977] 109-113)

    have tried

    '(a) to establish that Ockham was mistaken in his analysis of the *suppositio* of the predicate in the O form, and to put him right; and

    (b) to correct the following claims that have recently been made about the theory: (i) that Ockham and the medieval logicians in general omitted some modes of suppositio; (ii) that Ockham lists too many modes [. . .]' (p. 109).

    My aim in this paper is to show that the views of Priest and Read on these three points themselves need some correction.(1) Commenting on points (a) and (b)(i), which are focused on Ockham's treatment of particular negative propositions, I shall not follow the way Priest and Read have chosen to formalize Ockham's supposition theory. Instead I shall use, following R. Price, a 'sorted calculus of individuals with identity as its only predicate'.(2)" (p. 270)

    (1) There is a fourth point (b)(iii), on which I don't need to comment, because the authors have indeed succeeded in rejecting the claim 'that supposition theory is incapable of dealing with multiple quantification' (p. 112).

    (2) R. Price, 'William of Ockham and *Suppositio Personalis'*, *Franciscan Studies*, xxx (1970), PP. 131-14°; cf. pp. 132 f., 138 f.

43. Yrjönsuuri, Mikko. 1997. "Supposition and Truth in Ockham's Mental Language." *Topoi. An International Review of Philosophy* no. 16:15-25.

    Abstract: "In this paper, Ockham's theory of an ideal language of thought is used to illuminate problems of interpretation of his theory of truth. The twentieth century idea of logical form is

used for finding out what kinds of atomic sentences there are in Ockham's mental language. It turns out that not only the theory of modes of supposition, but also the theory of supposition in general is insufficient as a full theory of truth. Rather, the theory of supposition is a theory of reference, which can help in the determination of truth values within the scope of simple predications. Outside this area, there are interesting types of sentences, whose truth does not depend on whether the terms supposit for the same things or not for the same things."

44. Zheng, Yiwei. 1998. "Metaphysical simplicity and semantical complexity of connotative terms in Ockham's mental language." *The Modern Schoolman* no. 75:253-264.

    "In this paper I offer a formal presentation of Ockham's connotation theory, based upon a distinction between metaphysical simplicity and semantical complexity of connotative terms, that I argue render consistent Paul Spade's claim (1975) that Ockham needs and adopted a recursive semantics for his ontological elimination and Claude Panaccio's observation (1990) that there is no simple connotative term in Ockham's mental language."

Bibliography of the Medieval Theories of Supposition: Fifth part

Bibliography

Études en Français

1. Bazán, Bernardo Carlos. 1979. "La signification des termes communs et la doctrine de la supposition chez Maitre Siger de Brabant." *Revue Philosophique de Louvain* no. 35:345-372.

   Résumé : "Ayant comme objectif principal l'étude des propositions énonciatives de structure prédicative, Siger établit que la signification du terme commun peut être stable parce qu'il se rapporte aux choses changeantes signifiées par l'intermédiaire du concept consignifié. L'unité intelligible de l'essence saisie dans le concept est la base de l'unité de signification face à la diversité existentielle des choses.

   L'analyse de la signification s'avère insuffisante dès que l'on prend en considération la fonction symbolique concrète du terme à l'intérieur d'une proposition donnée. C'est ici qu'intervient la doctrine de la suppositio, dont l'essentiel revient à distinguer la fonction significative du terme et sa fonction de suppléance par rapport à la diversité des prédicats."

2. Beuchot, Mauricio. 1991. "Albert de Saxe: la supposition sémantique et les noms vides." In *Itinéraires d'Albert de Saxe, Paris-Vienne au XIV Siécle*, edited by Biard, Joël, 111-124. Paris: Vrin.

3. Biard, Joël. 1989. *Logique et théorie du signe au XIVe siècle*. Paris: Vrin.

   Chapitre III : *Supposition et signification selon Guillaume d'Ockham*, pp. 74-96.

   "La présentation ockhamiste des signes, tout en reprenant bon nombre d'idées présentes chez Roger Bacon, a la particularité d'introduire la supposition dans la définition du signe, du moins pour ce qui est des signes logico-linguistiques, c'est-à-dire des termes écrits, parlés ou mentaux. Il faut donc d'abord indiquer ce que Guillaume d'Ockham entend à travers cette notion de supposition, puis se demander si la signification est effectivement redéfinie à partir d'elle, dans quelle mesure et de quelle manière." (p. 74)

   (...)

   "Qu'est ce que Guillaume d'Ockham entend par *supposition*? Je n'ai pas l'intention d'exposer dans toutes ses ramifications la théorie ockhamiste de la supposition; mais il est indispensable de percevoir le sens général et la portée de ce concept.

   Une difficulté surgit immédiatement : la *Somme de logique* ne contient pas vraiment de définition de la supposition. Il en va certes différemment dans les traités d'inspiration ockhamiste que sont le *Tractatus minor* et les *Elementarium logicae* (1). Mais, comme le fait remarquer Léon Baudry dans son *Lexique philosophique de Guillaume d'Ockham*, la supposition est « un terme technique que Guillaume ne définit pas et qui n'est pas facile à définir" »(2). La *Somme de logique* propose bien un énoncé jouant le rôle d'un définition, mais celle-ci est tempérée par un *quasi*. En fait, il semble que tout acte de langage présuppose la supposition.

   Elle est un terme primitif qui permet de définir les autres, y compris ceux qui jouent un rôle fondamental comme celui de signe. Toutefois, ce que veut dire effectivement supposer peut et doit s'expliciter dans les analyses logico-linguistiques qui forment la S*omme de logique*. Il est donc possible de la cerner et de la caractériser à partir de son usage effectif, ce que tente Guillaume dans le chapitre 63 de la première partie." (p. 75)

(1) 1. Ces deux traités ont été admis comme oeuvres authentiques par Ph. Boehner dans « Three Sums of Logic Attributed to William Ockham », in *Collected Articles,* pp. 70-96, et par E. M. Buytaert qui les a édités : « The Tractatus logicae minor of Ockham », in *Franciscan Studies,* 24 (1964), pp. 34-100, et « The Elementarium logicae of Ockham », in *Franciscan Studies*, 25 (1965), pp. 151-276, et 26 (1976), pp. 66-173. Mais, dans leur « Introduction » à l'édition critique de la *Summa logicae,* G. Gäl et St. Brown montrent que ni les arguments externes ni la teneur interne de ces textes ne permettent d'assurer leur authenticité.

Qu'ils aient été conçus dans l'esprit de la logique ockhamiste, voire compilés à l'aide d'ouvrages du *Venerabilis Inceptor*, cela n'est pas douteux, de sorte qu'ils peuvent éclairer certains aspects de sa doctrine. Mais des nuances existent néanmoins sur certains points, et rien ne permet d'affirmer qu'ils sont de la main de Guillaume d'Ockham : cf. *loc. cit.,* « Introduction », c. VI, pp. 62*-66*.

(2) L. Baudry, *Lexique philosophique de Guillaume d'Ockham,* Paris, 1958, p. 258.

4. Ducrot, Oswald. 1976. "Quelques implications linguistiques de la théorie médiévale de la supposition." In *History of Linguistic Thought and Contemporary Linguistics*, edited by Parret, Herman, 189-227. Berlin New York: Walter de Gruyter.

   "Pendant trois siècles environ, du début du 12ème à la fin du 14ème, la notion de supposition (souvent considérée comme une création d'Abélard) a joué un rôle central dans la pensée logique et, dans une bonne mesure aussi, théologique, du moyen-äge. Nous voudrions, à la fois, la présenter en elle-même, et montrer certaines réflexions qu'elle peut suggérer à un linguiste.

   Il est malheureusement impossible, vu les nombreuses variantes et transformations que la notion a subies au cours de son histoire, de donner une définition liminaire de la supposition." (p. 189)

   (...)

"Mais, indépendamment méme de ses applications théologiques, la logique a besoin de cette distinction pour résoudre ses problémes les plus courants, tous ceux, notamment, où sont enveloppés les rapports de l'extension et de la compréhension. Car il est clair que l'ensemble des «suppôts» d'un nom commun constituent son extension, et que la «forme» n'est pas très éloignée de ce que nous appelons la compréhension d'une notion. Des problèmes de supposition vont donc se poser chaque fois qu'on se demande si les conditions de vérité d'une proposition sont déterminées par l'extension ou par la compréhension des mots qui y interviennent. Si, par exemple, je dis «Certains hommes sont menteurs», la vérité ou la fausseté de l'énoncé tient à ce qu'on trouve ou ne trouve pas, parmi les «suppôts» de homme, quelqu'un qui vérifie le prédicat «être menteur». En revanche, pour reprendre un exemple médiéval mille fois discuté, si je vous annonce «Un cheval vous a été promis», on cherchera en vain dans n'importe quel cheval particulier une propriété qui rende vrai ou faux l'énoncé: la valeur de vérité de la phrase semble tout à fait indépendante, ici, des «suppôts» du mot qui en est le sujet. Et de même — autre exemple que nous retrouverons plusieurs fois —, pour l'énoncé «L'homme est la plus digne des créatures»: la considération des êtres particuliers n'est suffisante, semble-t-il, ni pour la démentir ni pour la confirmer. Car la proposition ne dit pas que tous les hommes particuliers, ni même tel ou tel homme particulier, soient les plus dignes des créatures. Pour l'examen logique de ces énoncés, il faut prendre en consdération les rapports de la forme et des «suppôts», chercher quand, et dans quelle mesure, c'est le suppôt ou la forme qui est concerné par l'énoncé." (p. 191)

5. Galonnier, Alain. 1987. "Le *De grammatico* et l'origine de la théorie des propriétés des termes." In *Gilbert de Poitiers et ses contemporains. Aux origines de la "Logica Modernorun"*, edited by Jolivet, Jean and Libera, Alain de, 353-375. Napoli: Bibliopolis.

6. Goubier, Frédéric. 2014. "Dire et *vouloir dire* dans la logique médiévale: Quelques jalons pour situer une frontière."

Methodos. Savoirs et textes no. 14:1-28.

Résumé : "La philosophie médiévale du langage présente deux séries d'affinités remarquables avec les approches contemporaines. L'une se situe du côté des sémantiques formelles et, plus généralement, des analyses logiques des conditions de vérité des énoncés. L'autre relève plutôt de la pragmatique, notamment des perspectives contextuelles sur les actes de langage. Les logiciens, grammairiens et théologiens du Moyen Âge étaient, de fait, pleinement conscients qu'ils avaient à leur disposition deux types d'approche des énoncés, selon qu'ils prenaient en compte les seules propriétés sémantiques de leurs composants ou qu'ils intégraient des considérations extralinguistiques allant de l'intention des auteurs / locuteurs à leur statut, en passant par le contexte d'énonciation. Chacune de ces perspectives a bénéficié d'un certain nombre d'études récentes ; la question que je voudrais aborder est plutôt celle de leur frontière en logique, de son emplacement, ses déplacements, sa porosité éventuelle. La complexité des matériaux en jeu ne permettra pas de proposer plus que quelques points de repères, qui peuvent toutefois aider à évaluer l'hypothèse d'un « projet formel » en sémantique médiévale."

7. Karger, Elizabeth. 1978. "Conséquences et inconséquences de la supposition vide dans la logique d'Ockham." *Vivarium* no. 16:46-55.

   "Ockham peut-il faire figure de précurseur de la théorie de la quantification ?" (p. 46)

   (...)

   "Cependant cette thèse a été vivement contestée par Matthews [2].

   Nous pensons que ses arguments sont bien fondés, mais qu'il n'en a pas dégagé la véritable portée. Nous montrerons que les conclusions qu'impose un réexamen minutieux des textes sont différentes: ce à quoi il

   faut renoncer n'est pas à l'analogie entre applicatifs et quantificateurs, mais à trouver chez Ockham une logique une et

homogène. Nous verrons que deux logiques sont nécessaires pour justifier toutes les inférences tenues pour valides par Ockham." (p. 47)

(...)

"Nous conclurons par quelques réflexions sur la supposition vide dans son rapport avec la théorie des modes de la supposition personnelle. Il apparaît à la lumière de notre étude que le concept de supposition vide est étranger à la doctrine de la supposition personnelle dans son ensemble. En effet la supposition personnelle d'un terme general se subdivise en trois modes principaux, identifiés justement par diverses formes de " descentes". Mais non seulement ces descentes ne sont définies que pour des termes non vides, ce qui est évident à la seule lecture des textes (*SL* i, 70), mais encore les termes vides appartiennent à d'autres formes propositionnelles et à une autre logique. Il aurait donc été impossible à Ockham d'assouplir la théorie de ces modes de façon à y inclure la possibilité de la supposition vide et c'est aller à l'encontre de sa logique que de chercher à le faire.(18) On comprend que dans les chapitres consacrés à la supposition personnelle, Ockham ne mentionne qu'une fois la supposition vide, et ceci seulement dans une réponse à une objection.(19)" (p. 55)

8. ———. 1982. "La supposition matérielle comme supposition significative: Paul de Venise, Paul de Pergola." In *English Logic in Italy in the 14th and 15th Centuries. Acts of the 5th European Symposium on Medieval Logic and Semantics, Rome, 10-14 november 1980*, edited by Maierù, Alfonso, 331-341. Napoli: Bibliopolis.

"Dans une première partie, préambule à notre propos principal, nous exposerons une théorie de la référence aux expressions qui présente l'avantage d'être compatible, au prix d'accommodements de dé tail, non seulement avec la théorie propre d'Ockham, mais encore avec celles de logiciens « post-ockhamistes »(3). Elle représente ainsi une sorte de norme permettant d'apprécier les quelques déviations. Nous en puisons les éléments dans le *Traité des Suppositions* de Paul de Venise.(4)

Dans une seconde partie, nous montrerons en quoi la théorie précédente a paru à certains inacceptable du moment qu'elle est placée dans le cadre de la sémantique due à Ockham. Aussi ces logicien· avaient-ils le choix entre le rejet de cette théorie et la modification de cette sémantique. De ces deux options, d'ailleurs non-exclusive, nous nous attarderons à la seconde à partir de l'ouvrage mentionné de Paul de Venise mais surtout du traité des Suppositions contenu dan· la Logica(5) de Paul de Pergula." (p. 352)

9. ———. 1991. "Une définition de la supposition par Guillaume d'Ockham et sa reprise par Albert de Saxe." In *Itinéraires d'Albert de Saxe, Paris-Vienne au XIV Siécle*, edited by Biard, Joël, 51-69. Paris: Vrin.

"Dans le chapitre de la première partie de la *Summa logicae* servant d'introduction à la doctrine de la supposition, Guillaume d'Ockham propose non pas une mais deux définitions de cette notion(1). La première s'avère déficiente dans la mesure où elle caractérise en fait non la supposition en général mais seulement l'une de ses formes, la supposition significative(2). C'est pourquoi Ockham lui substitue une autre définition, au demeurant beaucoup plus complexe, mais qui, selon lui, caractérise effectivement la supposition en général,

significative ou non-significative. C'est cette définition, plutôt que la définition initialement donnée, qui est reprise — non sans modification — par Albert de Saxe dans les premières lignes du second traité de sa Logica(3)

Le présent travail est consacré en premier lieu à l'examen, chez Ockham, de cette définition de la supposition, mon propos étant d'en élucider le contenu et d'en évaluer la validité. Aussi la majeure partie de cet essai consiste-t-elle en une analyse du texte pertinent de la *Summa logicae* (dorénavant *SL*). Sur la base de compréhension qu'à l'issue de cette analyse on aura acquise de la définition ockhamiste, on examinera ensuite la pertinence des modifications que lui apporte Albert." (p. 51)

(1) Dans son excellent article « What does Ockham mean by "supposition" ? », *Notre Dame Journal of Formai Logic,* July 1976, pp. 375-391, Marilyn Adams ne tient compte que de la première de ces deux définitions.

(2) La distinction entre supposition significative (ou personnelle) et non significative (ou non personnelle) est définie plus loin.

(3) En reprenant à son compte cette seconde définition ockhamiste de la supposition, Albert semble faire figure d'exception parmi les logiciens nominalistes postérieurs à Ockham. La plupart d'entre eux en effet adoptent de cette notion une définition essentiellement identique à la première définition ockhamiste, certains, tel Marsile d'Inghen, réussissant malgré tout, à force d'ingéniosité, à définir ainsi une notion commune à la supposition personnelle et non personnelle, tandis que d'autres, tel Buridan, semblent peu se soucier de n'embrasser dans leur définition que la supposition personnelle.

10. Libera, Alain de. 1981. "Supposition naturelle et appellation: aspects de la sémantique parisienne au XIII siècle." *Histoire, Épistémologie, Langage* no. 3 (1):63-77.

"On admet généralement(1) que la supposition naturelle présente un ou plusieurs des caractères suivants : (a) c'est une supposition virtuelle, (b) c'est une supposition non-

contextuelle, (c) c'est une supposition non déterminée contextuellement.

Cette présentation est correcte dans l'ensemble. On constate cependant que, sur certains points, elle est imprécise ou incomplète. C'est ainsi que le premier caractère distingué ne tient pas compte du fait que cc qui est virtuel dans la supposition naturelle, ce n'est pas la supposition elle·même, mais uniquement une partie des *supposita*. En effet, la supposition naturelle n'est pas une propriété virtuelle des termes : ce n'est pas la prédicabilité du terme mais son *acceptio* pour tout ce dont il est prédicable, c'est donc une relation sémantique actuelle entre un terme et des objets dont une partie est composée d'entités virtuelles (*preterita, futura*).

De même, le second caractère laisse de côté le fait que plusieurs auteurs médiévaux admettent qu'un terme soit pris en supposition naturelle tout en étant sujet d'une proposition. Ce même fait rend également problématique le troisième caractère, dans la mesure où il semble que seul le contexte puisse faire qu'un terme suppose naturellement tout en exerçant une fonction à l'intérieur d'une proposition déterminée.

Afin d'échapper à ces con~radictions, nous proposons de distinguer entre la définition de la supposition naturelle et son emploi effectif dans la théorie logique." (pp. 63-64, unenote omise)

    "La notion de supposition naturelle, qui, sous une forme ou sous une autre, figure chez presque tous les logiciens du XlIIe siècle, a donné bien du fil à retordre aux commentateurs modernes.

    (...)

    "Il ne s'agit pas là d'une technicalité de détail. C'est l'interprétation globale de la sémantique médiévale qui est en cause dans ce point précis. Je voudrais ici le montrer par une discussion critique de la position claire et provocante originalement défendue par de Rijk, que je résumerai succinctement dans les quatre thèses suivantes:

    (Tl) la supposition naturelle des logiciens du XIIIe siècle est une propriété non-contextuelle (de Rijk 1971);(1)

    (T2) cette notion a été introduite pour des raisons externes à la théorie logique proprement dite, elle n'y joue aucun rôle direct et elle en contredit même l'inspiration fondamentale, T'approche contextuelle' (de Rijk 1967a:577-78, 597);

(T3) en tant que propriété non-contextuelle, elle disparaît entièrement (et à juste titre) de la logique terministe du XIVe siècle à partir d'Occam et de Burleigh (de Rijk 1973);

(T4) si l'expression 'supposition naturelle' réapparaît chez Buridan et quelques autres logiciens du XIVe siècle, c'est pour y désigner une nouvelle propriété qui, elle, est bel et bien contextuelle: la fonction référentielle d'un terme général dans une proposition scientifique omnitemporelle, ou atemporelle comme chez Vincent Ferrer (de Rijk 1973:51ss).

Pour ma part, je souscris sans réserve à Tl, que de Rijk me semble avoir démontrée de façon convaincante, et je n'y reviendrai que brièvement pour mieux situer le débat qui va suivre et pour conjurer du même coup certains soupçons encore exprimés par des interprètes récents (section 1 ci-dessous).

T2, au contraire, me paraît entièrement erronée et T3 passablement trompeuse. J'essaierai de montrer que la supposition naturelle est indispensable à la théorie sémantique du XlIIe siècle (section 2) et qu'elle ne

disparaît pas vraiment chez Occam, mais qu'elle y change simplement de nom pour s'appeler dorénavant 'signification' (section 3). Je retrouverai de la sorte l'image générale proposée — à partir surtout d'un examen de la théorie sémantique des modistes — par Jan Pinborg (1976). Quant à T4, elle est aujourd'hui communément admise et je n'en traiterai pas ici." (pp. 255-256)

(1) Il faut noter cependant que de Rijk (1982:169-70) semble revenir à l'interprétation de Boehner pour ce qui est du texte de Pierre d'Espagne (cf. infra note 6).

(6) Il est étonnant par conséquent que de Rijk ait récemment fait marche arrière pour revenir sans argumentation nouvelle à une interprétation contextuelle de la supposition naturelle chez Pierre d'Espagne: "... in natural supposition the capacity of standing for all particulars involved [...] is completely exploited [...] by leaving aside the actual context in which the term occurs. But natural supposition is unlike signification in that

there is a context, an actual linguistic framework, which is left out of account for a moment" (de Rijk 1982:169-70; les italiques sont de l'auteur).

17. ———. 2004. "Tarski et la *suppositio materialis*." *Philosophiques* no. 31:295-309.

"In his 1944 paper *The Semantic Conception of Truth and the Foundations of Semantics*, Alfred Tarski refers in so many words to the medieval idea of "suppositio materialis". The interpretation he suggests for it, however, is historically misleading, and this historical inaccuracy yields in this case what can be taken to be an unfortunate philosophical mistake. In " 'snow is white' is true ", Tarski sees the phrase "snow is white" (between quotation marks) as the name of a certain sentence, while the medieval philosophers would have seen it

rather as an occurrence of that very sentence, but taken in a special use, the suppositio materialis . The paper shows how these two approaches differ exactly and argues that the medieval theory is philosophically preferable in that (1) it is descriptively more adequate with respect to natural languages, (2) it is more appropriate even for artificial languages, which it renders both more effective and more intelligible, and (3) it rests upon the identification of an important phenomenon, the generality of which is missed by the Tarskian type semantics, namely the duality of principle between the extension of a term in itself and the extension it receives within a given propositional context."

18. Panaccio, Claude, and Perini-Santos, Ernesto. 2004. "Guillaume d'Ockham et la *suppositio materialis*." *Vivarium* no. 42:202-224.

    "L'idée de base de la théorie médiévale de la *suppositio* est qu'il y a, pour chaque terme d'un langage quelconque, deux sortes de propriétés sémantiques: celles qu'il possède en lui-même, avant toute insertion propositionnelle, dont la significatio est l'exemple paradigmatique; et celles qu'il acquiert dans le cadre d'une phrase lorsqu'il y est employé comme sujet ou comme prédicat, c'est la *suppositio* sous ses diverses variantes. Selon les théories et selon les contextes, l'écart entre les unes et les autres peut être plus ou moins grand. Pour les sémanticiens réalistes, un terme comme «cheval» signifie en lui-même la nature chevaline et—dans son usage normal— suppose en contexte pour certains chevaux singuliers.(1) Pour le nominaliste Guillaume d'Ockham—qui nous intéressera ici—, le même terme «cheval» signifie (au sens large) tous les chevaux singuliers possibles(2) et— dans son usage normal, la *suppositio personalis*—suppose en contexte phrastique pour certains d'entre eux, ceux, par exemple, qui existent au moment de l'énonciation si le verbe principal est au présent.(3) La théorie, de façon générale, essaie de thématiser dans un jeu complexe de distinctions et de règles les variations de la fonction référentielle d'un terme pris en contexte, par rapport à ce que l'on appellerait aujourd'hui son «extension» totale, c'est-à-dire l'ensemble de toutes les choses présentes, passées,

futures ou même seulement possibles auxquelles le terme s'applique."

5. Goubier, Frédéric. 2009. "La teoria della supposizione e le sue cronologie semantiche." *Rivista di Filosofia Neo-Scolastica* no. 101:501-532.

"Ritengo infatti che ci sia un aspetto originale e cruciale della teoria della supposizione che, benché non sia passato inosservato, merita più attenzione. Il riferimento va alla “temporalizzazione” – o “cronologizzazione” – della semantica estensionale, introdotta per determinare le condizioni di verità delle proposizioni. Prestarle la dovuta attenzione può arricchire la comprensione della teoria e della nozione stessa di supposizione.

È con questo scopo che il presente lavoro esamina la formalizzazione, operata dalla teoria della supposizione, della capacità del linguaggio di evocare esistente e non-esistente, attuale e possibile, reale e fittizio, contingente e necessario. Principalmente si cercherà di mostrare che si può comprendere questa dimensione della teoria nei termini dell’articolazione di

tre cronologie semantiche: una corrispondente al soggetto della proposizione, un'altra corrispondente al predicato e una terza riservata alla proposizione stessa. Lo scritto farà del suo meglio per convincere il lettore di due cose. Cogliere quest'aspetto significa accedere al cuore della teoria.

Esprimerlo in termini di cronologie semantiche è darsi la possibilità di comprendere meglio il genere di strumento in cui consiste la *suppositio*, individuando alcuni presupposti semantici alla base della teoria." (p. 502)

   "Girolamo Saccheri (1667-1733) fornisce le definizioni di *suppositio* nel primo capitolo (de terminis, eorumque proprietatibus) della Logica demonstrativa e ne fornisce le *regulae* nel capitolo terzo. Le dottrine legateall'uso della nozione sono pertanto collocate al di fuori della sezione propriamente "analitico-assiomatica" della Logica. Ciò implica in primo luogo che, dal punto di vista della dottrina logica saccheriana, la maggior parte degli enunciati relativi alle *proprietates terminorum* corrispondono a definizioni

nominali: ovvero, come si chiarirà in seguito con più precisione, la cui “realtà” non è accertabile attraverso i soli strumenti della logica.

In secondo luogo, la “teoria” della suppositio, quale corpo articolato di nozioni riguardanti le proprietà dei termini all’interno della proposizione, non è svincolabile dal concetto saccheriano di “analisi” e, perciò, dalla concezione epistemologica e filosofica del gesuita. Al contempo, l’uso della nozione di *suppositio* ha un ruolo centrale nell’opera del Saccheri, sia all’interno della teoria della definizione che nei trattati teologici. È quanto intende mostrare il nostro contributo.

L’articolo non fornisce, perciò, una trattazione esauriente della dottrina della suppositio nell’opera logica e teologica del gesuita, ma presenta elementi essenziali utili per i necessari approfondimenti storico-dottrinali.

Tuttavia, speriamo apparirà chiaro dal nostro contributo che tali studi dovranno tenere presente l’intera opera teologica del gesuita e le sue posizioni filosofiche generali." (pp. 281-283, note omesse)

   "La tradición lògica medieval hizo uso de la noción de proposición *de modo loquendi inconsueto* en diverses contextes;(1) pero sólo atenderé a una de las especies de proposiciones comprendidas bajo esa dénomination: aquellas en las que se hace uso de signos extranos a la lengua latina, intro ducidos con propósitos técnicos especifîcos. Asimismo hizo uso en diverses contextes de la noción de suppostilo mixta·,(2) pero sólo atenderé a la noción de suppostilo mixta en cuanto forma especifica de suppostilo personalis que puede convenir a un termino simple." (p. 537)

   (:::)

   "Mi contribución constarà de tres partes. En la primera, presentare los datos que he podido recoger hasta el presente en relación con la historia de està especie de proposiciones *de modo loquendi inconsueto*, en la segunda, me ocuparé de

algunas cuestiones lógicas bàsicas, imprescindibles para la recta comprensión de las cuestiones suscitadas a propòsito de estas proposi ciones; por ùltimo, en la tercera parte, intentaré dar respuesta a esas dos cuestiones suscitadas por Ashworth." (p. 539)

(1) La noción de proposición *de modo loquendi inconsueto* fue utilizada por la tradición lógica medieval para referirse a cualquier tipo de proposición que, por una u otra razón, atentaba contra la forma usuai, consueta, de las proposiciones, ya en razón de su peculiar naturaleza fisica, ya en razón de su peculiar estructura gramatical, extrana al uso ordinario de la lengua latina. Bajo esta noción quedaron comprendidas proposiciones constituidas por piedras, en lugar de palabras o signos escritos; o en parte por signos orales y en parte por signos escritos; o proferidas o escritas en momentos o lugares muy distantes, o en parte por un sujeto y en parte por otro, de manera que quedaba oculta su unidad; o cualesquiera otras proposiciones que presentaban cualquier otro tipo de anomalia semejante. Pero también quedaron comprendidas bajo esta noción diverses tipos de proposiciones, constituidas por palabras comunes pero sujetas a convenciones extranas al uso ordinario de la lengua latina, establecidas con propósitos estrictamente técnicos, y que atentaban contra las réglas ordinarias de la concertación gramatical (termines de genero comûn determina dos por sincategoremas de gènero masculine o femenino), o la libertad del orden de las palabras Las cuestiones relativas al valor lògico asignado al orden de las palabras, y a su importancia corne instrumente para el anâlisis de los problemas relatives a la cuantifîcación multiple y el desarrollo de una lògica de relaciones, han recibido ya una considerable atención. Me he ocupado de esas cuestiones en mi trabajo: A d'Ors, *Hominis asinus/Asinus hominis*, en S. Read ed., *Sophisms in Medieval Logic and Grammar,* Dordrecht-Boston-London, Kluwer Academic Publishers, 1993, pp. 382-397. Mas recientemente, E. Karger se ha ocupado de nuevo de algunas de estas cuestiones: I. Karger, *The 15th and Early 16th Century Logicians on the Quantification of Categorical Sentences,* «Topoi», XVI, 1997, pp. 65-76.

(2) La tradición terminista atribuyó una suppositio mixta a términos complejos cuyas partes tenian, una, *suppositio materialis*, otra, *suppositio personalis·*, o una, *suppositio distributiva*, otra, *suppositio determinata* o *confusa tantum*, o cualesquiera otras combinaciones semejantes.

8. Freitas, Antonio de. 1999. "La teoria de la suposición en Pedro Hispano." *Revista Venezolana de Filosofia* (23-38).

   Resumen: "Queremos presentar algunos elementos de la lógica medieval y, en particular, una breve exposición sobre la teoría medieval de la suposición en el *Tractatus* VI, (*De Suppositionibus*), de las *Summulae Logicales*, de Pedro Hispano. La teoría medieval de la suposición se basa en que el significado de una palabra en un caso particular puede ser reducido a su significado fundamental *(significatio*), lo cual corresponde a la propiedad natural constitutiva de la palabra, su esencia, en virtud de la cual estará presente en la raíz de cualquier significado particular de la palabra.

   Esta teoría sirvió de hilo conductor a los estudios lógicos. Se pretendía explicar la relación existente entre el pensamiento, el lenguaje y la realidad. Actualmente son temas que interesan a la filosofía del

   lenguaje y a los estudios fundacionales de la Inteligencia Artificial."

9. Garcia Cuadrado, José Angel. 1991. "La teoría de la suposición en los tratados filosóficos de San Vicente Ferrer." In *Excerpta e Dissertationibus in Philosophia*, 325-349. Servicio de Publicaciones de la Universidad de Navarra.

   Extracto de la Tesis Doctoral presentada en la Facultad Eclesiástica de Filosofía de la Universidad de Navarra.

   "Además, el interés del estudio de la teoría de la suposición no se restringe de modo exclusivo al ámbito lógico-formal; en la base de las diferentes propuestas se encuentran a menudo

importantes cuestiones gnoseológicas, epistemológicas y metafísicas, repropuestas de una manera u otra por la filosofía moderna, tal como ha puesto de relieve Vignaux(4) . Ya en su tiempo la teoría de la suposición era el campo de discusión y estudio de problemas no sólo estrictamente lógicos sino también gnoseológicos, metafísicos y, en última instancia, teológicos. Es también el punto de arranque de una epistemología y teoría de la ciencia moderna(5).

Dentro de este contexto de investigación los tratados lógicos de San Vicente Ferrer han abierto un interesante campo de estudio.

Frente a la teoría de la suposición instaurada por Ockham y el nominalismo del XIV se abre paso la doctrina de Vicente Ferrer basada en unos presupuestos filosóficos realistas con los que intenta hacer frente a las soluciones nominalistas. En los últimos años se ha comenzado a prestar una mayor atención a estas obras del dominico valenciano; fruto de dicho interés es la publicación de la primera edición crítica del *Tractatus de Suppositionibus* llevada a cabo en 1977. A dicha edición crítica hay que sumar la reciente traducción castellana de las dos obras lógicas que se conservan de Vicente Ferrer, y los numerosos artículos y estudios centrados en algunos aspectos parciales de la doctrina contenida en dichos tratados."     "The comparison between "suppositio naturalis" by Pedro Hispano and Vincent Ferrer, clearly shows us the gnoseological differences underlining the theory of one supposition from the other. Vincent Ferrer speaks of a "moderate realism" as seen by Thomas Aquinas; Ferrer proposes a new notion and classification of the "suppositio naturalis" which helps to solve some of the logical-semantic problems raised by the theory of supposition by Pedro Hispano."

    Resumo: "Es esta la primera parte de un estudio sobre el problema de la "suppositio", según la interpretación de la "Lógica" de Juan de Santo Tomás; el problema -surgido de Aristóteles- de la palabra como intención objetiva, razón o posibilidad de ser y de conocer Vista la insuficiencia de las soluciones nominalista y conceptualista, pasa el autor a analizar la solución del conceptualismo moderado tomista, la cual "reconoce la necesidad de elevarse al orden de la significación y la de concretar el sentido, para alcanzar su ultimación positiva sin perder su universalidad.

    La palabra sustituye a la cosa en dos momentos en cuanto se da la re presentación ("significatio"), y en cuanto se da el ser ("suppositio") La actualidad trascendente del ser da a la sustitución supositiva concreción y universalidad. Ella es la raíz de la culminación positiva del sentido y la base que "verifica" la comunicación de un sentido y el mutuo entendimiento entre los hombres."

Continuación." *Convivium (Barcelona)* no. 19-20:47-72.

"Conclusión.

La teoría de la suppositio que hemos desarrollado parte de un hecho: la existencia de expresiones u oraciones *de subjecto non supponente*. Esto implica que el orden del ser, en que los supuestos se dan, se encuentra más allá de cualquier término subjetivo, arbitrario o convencional, del sentido de la expresión. Sólo así puede acontecer que el supuesto de la expresión *non inveniatur*, no se dé según las exigencias del verbo que expresa la actualidad del ser y sus modos o concreciones y, de esta forma, la ultimación del proceso intencional y significativo sea negativa o fallida.

Este hecho supone también que la ultimación del sentido se venfique gracias a una participación -- que como tal siempre es un acto y no un hábito o potencia, sea primera o segunda -- en la plenitud actual del ser.

Ahora bien, una manera de negar esa plenitud es desligar o sacar la expresión o su interpretación de la circunstancia humana en que se produce, del momento existencial, que es el contexto natural de toda expresión, por el que adquiere plenitud de sentido. Tal sucede cuando se habla o se interpreta una locución desde supuestos abstractos o convencionales, sin descender a ese momento de plenitud significativa; p. e., en ese hablar de memoria o por tópicos, sin hacerse cargo de la actualidad existencial que, según Cayetano, llena de sentido las categorías mentales, los géneros y las diferencias.

De aquí que la suppositio sea definida por los escolásticos, como lo hace el P. Urrabarutu, como una propiedad del término *potissimum oralis* (1 19), porque fuera del momento en que se habla, con signos orales o gráficos, etc., la expresión decae de la estricta actualidad significativa.

"De todo lo cual resulta, podemos concIuir con Ortega y Gasset que el sentido real de una palabra no es el que tiene en el Diccionario, sino el que tiene en el instante" (120). Pero un instante que no anule, sino que de plenitud al sentids, representa un presente en la trascendencia actual del ser.

"La más valedera, la más profunda de las comprensiones de un vocablo, dice E. D'Ord, será aquella que penetre el secreto de su sentido" (121), secreto escondido en esa aventura insoslayable por la que el hombre llega a ser un ente metafisico." (pp. 71-72)

Translated in Spanish by Th. G. Sinnige.

"En este modesto articulo me propongo hablar de la teoria de la suposición de Pedro Hispano en la forma en que esta expuesta en el Tratado No. VI (*de suppositionibus)*. A menudo encontramos la opinion de que la teoria terminística de la suposición en todos los casos haya tenido una base de Indole nominalista. Esta opinion está decididamente equivocada. Basta señalar a un autor como Gualterus Burlaeus para porter en claro que la teoría de la suposición podia muy bien ser interpretada en un sentido realista. Por otra parte se puede comprobar que la teoría de la suposición ya en sus orígenes iba vinculada estrechamente con la teoría de la significación. La evolución de la teoria de la suposición por consiguiente está mezclada Intimamente con las fluctuaciones que se producen en la teoría de la significacion.

En lo que signe me propongo analizar:

1) lo esencial de la teoría de la suposición, teoría que en su origen no era otra cosa sino una teoría sobre la interpretabilidad de un término dentro de la proposición; 2)el estrecho vfnculo que existe entre la teoria de la suposición y la teoria de la significación. Como consecuencia de esto, a principios del siglo XIII et concepto de suposición tiende a extenderse hasta incluir también términos usados fuera del contexto de la proposición (*)" (pp. 226-227)

    "Based on Ockham's "Summa Logicae", this article is intended to present the terms classification related to individual entities and inserted in propositions. Essence of signs is discussed, the same as reference to the world. Ockham states that sign is that which supposes a thing making it comprehensible. Supposition is made clear only in a sentence as a whole, for it is the smallest signification unit (and not the separated terms). It presents, too, conceptions of significativity and truth as qualities of sentences, composed by terms which suppose for an individualized reality."

2. Coxito, Amândio. 1981. *Lógica, semântica e conhecimento na Escolastica Peninsular pré-Renascentista*. Coimbra: Biblioteca Geral da Universidade.

    Capítulo VI. *A teoria da "suppositio",* pp. 201-241.

    Sinopse: "«Este trabalho foi inicialmente apresentado, em dáctilo-composição, à Faculdade de Letras da Universidade de Coimbra, como dissertação de doutoramento em História da Filosofia e da Cultura Portuguesas. Na presente edição, o texto primitivo foi mantido no essencial, tendo-se apenas introduzido algumas alterações de pormenor.

    A ideia que levou à realização deste trabalho teve a sua origem na convicção de que não seria possível compreender

adequadamente o movimento filosófico português e peninsular do século XVI (e nomeadamente a Segunda Escolástica) sem primeiro investigar o período crítico que o antecedeu, isto é, a chamada «Escolástica decadente», com referência à problemática lógica, semântica e gnosiológica.» "

3. ———. 2001. "Pedro da Fonseca. A teoria da suposição e o seu contexto excolástico." *Revista Filosofica de Coimbra* no. 10:285-311.

   Resumo: "Fonseca não se dedica longamente ao estudo da teoria da suposição, apartando-se assim da atitude característica dos lógicos da chamada "escolástica decadente", que sobre ela desenvolveram amplas discussões, em geral áridas e formalistas. De qualquer modo, estuda as principais espécies de suposição que tinham sido consideradas pelos seus antecessores, nomeadamente a pessoal (e suas subdivisões), a própria e a imprópria, a simples e a absoluta. É em relação a estas duas últimas que se verifica em Fonseca a interferência do realismo dos géneros e das espécies na problemática lógica, em oposição ao nominalismo."

4. Morujão, Carlos. 2005. "A *Logica Modernorum*: lógica e filosofia da linguagem na Escolástica dos séculos XIII e XIV." *Revista Filosofica de Coimbra* no. 14:301-322.

   Abstrac:t: "This essay approaches two of the main contributions of medieval logic to the history of logic and the philosophy of language: the doctrine of *suppositio* and that of *consequentiae*. The aim here is to demonstrate that although medieval logic depended on the syntactical structure of Latin, authors managed to reach a high level of understanding regarding strictly logical problems, not only anticipating some theories from modern semantics, but also predicate calculus and sentential calculus. This research, especially after the 13th century, developed in complete isolation from Aristotelian logic, particularly its doctrines of syllogism and declarative sentence. It also revealed enormous originality and creativity regardless of the contribution that stoic logic known from the works of Cicero and Boethius may have had."

   "The present volume is a detailed and original study of the traditional, doctrine of terms. It can be regarded as an attempt to tackle the question:,How would the scholastic philosophers have conceived and defended their doctrine bad they bad at their disposal the methods and techniques of contemporary logic and semantics? The answer provided, a systematic

reconstruction of a number of important ideas in the history of logic, is both formally illuminating and entirely faithful to the relevant text.

The work begins with a general exposition of the doctrine of terns oriented around the basic semantic opposition between *significatio* and *suppositio*, analogues of the more familiar notions of sense and reference.

As a means of providing a precise and coherent reconstruction of the doctrine the author does not simply provide the predictable translation of the more amenable passages into the language of predicate logic. Rather he develops, on the basis of a careful systematization of the texts themselves, a formalization of his own, incorporating an ontology of substance and accident. The advantages of this approach are revealed in its capacity to provide both a simple reconstruction of syllogistic logic by means of a sequent-calculus and a natural extension of this logic to a theory of supposition.

Taking into consideration the categories of substance and accident in place of the more usual apparatus of set and element allows the author to develop a formalized theory of objects in which the two categories are allowed to yield composite objects of various sorts. This makes possible an illuminating application of the theory of concreta and abstracta (square of permutations) both to the theory of ampliatio and appellatio and to modal syllogistics.

The work concludes with a sketch of possible further developments and an attempted demonstration of the philosophical relevance of the theory in the light of a critical consideration of the relevant secondary literature."

Semantics and Ontology in the Philosophical Works of Abelard

Introduction

"Abelard composed four works on logic:

1) *Introductiones Parvulorum*, which consists of short glosses on Porphyry *Eisagoge* and Aristotle *Categories* and *De Interpretatione*;

2) *Logica Ingredientibus* (so called because *ingredientibus* is the first word of its text), which consists of longer glosses on the texts covered by the previous work together with Boethius' *De Differentiis Topicis* and was probably written while Abelard was teaching in Paris before 1120;

3) *Logica Nostrorum Petitioni* (so called because *nostrorum petitioni* are the first words of its text), which consists of longer glosses on the *Eisagoge* and may date from the time of his teaching at the hermitage of the Paraclete;

4) *Dialectica*, which has the form of an independent work about the subjects covered by Boethius' logical writings and Victorinus' treatise *De Definitionibus* and seems to contain materials from different periods of Abelard's life but probably did not reach its final form until a late date, perhaps the time of his stay at Cluny shortly before his death. Of these the second and the fourth are the most valuable.

The *Dialectica* indeed, though based, like that of Garland, chiefly on the works of Boethius and written with the prolixity which was all too common among medieval authors, is an original composition of great importance for the development of logic. Abelard's mind was the keenest (though not in all respects the most admirable) that had

been devoted to the subject for more than a thousand years, and he approached his task with the belief that it was still possible to make discoveries: '*Non enim tanta fuit antiquorum scriptorum perfectio ut non et nostro doctrina indigeat studio, nec tantum in nobis mortalibus scientia potest crescere ut non ultra possit augmentum recipere*.' (1) The *Dialectica* survives in a single manuscript which lacks the opening sections. Excerpts from it were published by Victor Cousin in 1836 in his *Ouvrages inédits d' Abelard*. But unfortunately the text was not printed in full until 1956, and before that date it was therefore not possible to appreciate the magnitude of Abelard's contribution to the doctrines we regard as characteristically medieval. (...).

The text is divided into five *tractatus* which correspond to groups of Boethius' writings and are called respectively: I *Liber Partium,* II *De Categoricis,* III *Topica,* IV *De Hypotheticis,* and V *De Divisionibus et Definitionibus*. Of these the first is subdivided into three *volumina* dealing with the *antepraedicamenta* (or *quinque voces* of Porphyry), the *praedicamenta* (or categories of Aristotle), and the *postpraedicamenta* (or questions about meaning raised in the De Interpretatione). (2) But our sole surviving manuscript lacks the whole of the first volume and the opening of the second. This is unfortunate, since the missing part probably contained Abelard's last thoughts about universals. We can be reasonably sure also that it contained an account of the distinction between words of first and words of second imposition, since this was mentioned by Boethius in his commentary on the Categories and is taken for granted later by Abelard." (pp. 203-204, some notes omitted)

Notes

(1) *Dialectica* p. 535.

(2) In later times the name *antepraedicamenta* was used (more naturally) for the subjects treated by Aristotle in his *Categories*, 1-3 (i.e. equivocal and univocal naming, simple and complex expressions, etc.), and the name *postpraedicamenta* for the subjects treated by Aristotle in his Categories, 10-15 i.e. kinds of opposites, kinds of priority, etc.).

(3) *Dialectica* p. 122.

From: William & Marta Kneale, *The Development of Logic*, Oxford: Clarendon Press 1962.

The modern rediscovery of Abelardian logic

"Geyer's editions [...] gave the first decisive stimulus to the study of the Palatine Master's philosophical writings.

Up to 1919 (the year of Geyer's first edition) the known Abelardian writings were limited to those edited by Cousin (7): this French scholar attached the most importance to the comments on Porphyrius, the *Categorie* and the *Topici* of Boetius and the passages of the *Dialectica*. On the whole the material was fragmentary, uncritically sifted and confused with fragments of non-Abelardian comments, which Cousin nonetheless considered were his. De Rémusat's incomplete paraphrase in French of a comment on the *Isagoge* was then added to these texts.

In 1919 Geyer began publishing *Ingredientibus* (8): under this name he has edited a comment on the *Isagoge*, a second on the *Categorie*, and a third on *De Interpretatione*. A prologue (from the beginning of which Geyer took the name *Ingredientibus*) presents these comments as a unit which has a certain compactness; this is confirmed by other observations which are intrinsic to the work, such as the internal cross-references from comment to comment, the persistence of a similar attitude and of an identical -- terminologically as well -- solution when confronted by the problem of universals in all the comments (9), the 'dictum' theory present in the three comments. (10) From internal cross-references that Abelard makes to an essay *De Hypotheticis* (11), Geyer concludes that the work must have included other comments as well as these. From hints dropped by Abelard in *De Interpretatione*, it seems highly likely to me that a comment on *De Categoricis* also belonged to *Ingredientibus*. (12) Dal Pra has shown that the comment on *De differentiis topicis*, edited by him, is clearly distinct from the literal comments, and concluded that this is a comment that comes within the framework of *Ingredientibus*. (13) We thus have four of the seven comments on the usual 'septem codices' (14) that Abelard considered fundamental.

Also part of the *Philosophische Schriften* edited by Geyer is a comment on the *Isagoge* of which Rémusat had edited an incomplete paraphrase in French. In the prologue Geyer singled it out as part of an organic work, called *Nostrorum* (15) by him from the words at the beginning: here too Abelard proposed an entire treatment of the logical corpus usually used by him. Today we still have only the comment on the Porphyrian *quinque voces*.

In 1954 Geyer's edition was joined by the edition of the literal comments edited by M. Dal Pra. In this edition the comments are arranged in the order which Abelard himself indicates at the end of the logical treatise and to which he also holds in *Dialectica*. The comments on the *Categorie* and on *De Interpretatione* thus come after the comment on the *Isagoge*. The presence of a comment on the Boetian *De Divisionibus* indicates that Abelard used the 'seven codes' from the outset and leads one reasonably to suppose that he had worked on other comments of the same type as *De Syllogismis categoricis*, *De Syllogismis Hypotheticis*, and *De Differentiis topicis* which we do not have now. This seems to me to be confirmed by certain references of *Dialectica*, which are remade in the comments on *De Differentiis topici*s and *De hypotheticis* in the *Introductiones parvulorum* (16), identified by Geyer with the literal notes. We have already seen how the comment on *De Differentiis topici*s edited by Dal Pra in the *Scritti Filosofici* must be assimilated, on the contrary, to the corpus of notes in *Ingredientibus*.

In 1956 De Rijk published an edition of *Dialectica* which enhances the picture of the Palatine Master's logical work. *Dialectica* is not a comment but an organic treatise based nonetheless on the 'septem codices'. The most serious gap, by extension and importance, is that which deprives us of the treatise on the Porphyrian *quinque voces* which was certainly included in the work, because Abelard hints at it. Two passages in this work show us Abelard's concept of it (17): the Palatine Master here presented himself as an auctor in line with Aristotle, Porphyrius and Boetius, whose works he would perfect, as he proudly declares.

In *Abaelardiana inedita* edited by Minio Paluello (18), two texts are edited, the first contained in a manuscript now in Berlin, and the second belonging to a manuscript in the monastery of Fleury, both

from the 12th century. The existence of these two manuscripts was not unknown to us. (19) The text of the Berlin manuscript, a commentary on *De Interpretatione*, is three-quarters identical to the Ambrosian manuscript edited by Geyer as a section of *Ingredientibus* and the part that differs is without any doubt more coherent with the preceding part than the Ambrosian manuscript which contained a noteworthy break. The contribution of this new edition consists in a rigour and a greater accuracy in the reading of the Abelardian text: it does not, however, appear that in this last part of the commentary there are motives that complete or at least modify the weight and the general meaning of the commentary itself.

The text of the Fleury manuscript is more interesting, even if, with regard to the attribution, it is more uncertain. This concerns the analysis of a paralogism and of five sophisms that emerge from a nominalistic interpretation of the concept of *totum*." (pp. 2-4)

The ancient logical works known at the time of Abelard

"...of whose seven books everyone in this art with an education in Latin should be armed. Only two of Aristotle's books are still known to the use of the Latins, namely the *Categories* and the *De Interpretatione*. One book is Porphyry's: that is the one written about the five 'predicables' (genus, species, difference, property and accident) [the *Isagoge*]; this is an Introduction preparatory to the *Categories*. We usually treat Boethius as four books: that is the *De Divisione*, the *De Topicis*, the *De Syllogismo Categorico* and the *De Syllogismo Hypothetico*. The text of my *Dialectica* will include a very full summary of all of these, and it will see the light -- so that readers can use it -- provided the Creator of our life grants us a little time and Envy relaxes her grip on our works."

From: Petrus Abaelardus, *Dialectica. First complete edition of the Parisian manuscript with an Introduction by L.M. de Rijk*, Assen: Van Gorcum, 1970 (second edition), p. 146, lines 10-20 (cited from M. T. Clanchy, *Abelard. A Medieval Life*, Malden: Blackwell, 1997, p. 98).

"*The Aristotelian texts available to Abaelard.*

The *Introductiones parvulorum* contain short glosses on Porphyry's *Isagoge*; Aristotle's *Categories* and the *Peri Heraineias*; and Boethius' *De topicis differentiis* and the *De divisionisbus et definitionibus*. The *Ingredientibus* contains longer glosses on the texts of Porphry and Aristotle. The *Nostrorum petitione sociorum* elaborates on Prophyry alone. Additional texts available to Abaelard were Boethius's *Introductio ad categoricos syllogismos*, the *De syllogismis categoricis*, the *De syllogismis hypotheticis* and Cicero's *Topics*. Abelard was surely using the extended, newer Boethian translation of the *Isagoge* (secunda editio) rather than the older translation based on Marius Victorinus. The glosses of the

Categories relied on a copy of the *editio composita* of Minio-Palüello (Aristóteles Latinus I) — probably the close redaction, Ms. Chartres 497. Both Minio-Paluello and de Rijk find similarities between Abaelard's and Thierry of Chartres' use of Ms. Chartres 297 , in part, a Boethian translation of the Peri Hermeneias.(1) With respect to the *nova*-texts available to Abaelard, it is certain that he had some acquaintance with both the *Prior Analytics*, cited in the *Dialectica*, and the *De sophistici elenchi*, cited in the *Ingredientibus*. As his acquaintance with the *Prior Analytics* is certainly not from indirect sources, he most likely used the *recensio Carnutensis* Boethian translation found in Ms. Chartres 497 which also contained the *Categories*. A translation of Aristotle's *Topics* is also found in the same codex. While the text is not quoted in any of Abelard's extant writings, it seems probable that he reviewed the text. The *De sophistici elenchi* is found in Ms. Chartres 498. While Abaelard states that he did not always have access to the work (*Ingred.* 400,33-4), it is evident that he knew the text-- probably from this manuscript. While there was an anonymous translation of the *Posterior Analytics* circulating in Abaelard's day, it is highly unlikely that he had ever seen the work. It is not quoted in any of the extant writings. He was certainly unacquainted with the *nova* translations of James of Venice which started to circulate sometime after 1130. Unfortunately, James' translations of the *De anima* and the *Metaphysics* first appeared a few years after Abaelard's death (and, in fact, they had few readers at the time). Aristotle's *Ethics* was not translated until early in the thirteenth century.

Dialectic at the time of Abelard

"When the medievals dealt with dialectics, they meant logic as such, and dialectic in the historic Greek sense of the term that was at issue from the Sophists through Aristotle largely fell by the wayside. For the medievals, then, dialectics was logic at large, the science of demonstration through which rational inquiry sought *veritatis seu falsitatis discretio*.(16) And as such dialectic constituted a key part of the institutional *trivium* of grammar, rhetoric and dialectic (i.e., logic). Thus while the medieval treatment of "dialectic" forms an

important chapter in the history of logic, it can be left aside in the context of the history of dialectic as traditionally understood in its relation to philosophical methodology.(17) However, insofar as dialectic is a feature of the actual practice of academic disputation, it continued to play an important role in higher education throughout the middle ages.(18)" (p. 137)

Notes

(16) Abelard, *Dialectica,* p. 435. For an English translation of a typical medieval treatise on dialectic see John Buridan, *Summulae de dialectica* tr. by Gyula Klima (New Haven, Conn: Yale University Press, 2001). A look at the elaborate table of its Contents shows that with regard to topics that the treatise remains well within the boundaries of Aristotle's logical organon. Not until the Renaissance did Petrus Remus reconstitute the idea of dialectic as the art of disputation (*doctrina dispusandi*. See his *Dialecticae Constitutiones* (1543).

(17) Over and above the standard histories of logic, the following treatments of medieval dialectic are highly instructive: T. J. Holopainen, *Dialectic and Theology in the Eleventh Century* (London: Brill, 1996); J. A. Endres, "Die Dialektik and ihre Gegner im 11. Jahrhundcrt," *Philosophisches Jahrbuch*, vol. 19 (1906), pp. 20-33; N. J. Green-Pedersen, T*he Tradition of the Topics in the Middle Ages* (Munich, Philosophia Verlag, I984); and above all, Eleanore Stump, *Dialectic and its Place in the Development of Medieval Logic* (Ithaca, NY: Cornell University Press, 1989).

(18) On medieval academic disputation see A. G. Little and F. Pelster, *Word Theology and Theologians* (Oxford: Clarendon Press, 1934), pp. 29-56. A vivid account of scholastic disputation is given in Thomas Gilby, O. P., *Barbara, Celarent. A Description of Scholastic Dialectics* (London, New York: Longmans, Green, 1949), see especially Chapter XXXII on "Found Dialectic," pp. 282-93; and see also Bromley Smith, "Extracurricular Disputation: 1400-1650," *Quarterly Journal of Speech*, vol. 34 (1948), pp. 473-96. The semiotics of Abelard

"3. The linguistic theory of Abelard is centred around the correlaion or correspondence between the "word" and the "thing" or the *signifiant* and the *signifié* as we would have them today. According to Abelard, if a word or a sound signifies, it is because something is added to its physical being, *essentia*; this something is the significative function,*officium significandi*. The sound, just like the thing that it represents in a give language, remains the same from one community of speakers to another, it belongs to the sphere of things, which is natural; the significance, on the other hand, changes due to the diversity of languages, it depends upon institution, upon a human convention, *positio hominum, voluntas hominum*.(1) We have already the distinction between the sphere of significance and the sphere of things. The sound or the physically pronounced utterance is of the order of nature while significance is created when "something" is added to its being, and, this "something" is due to human intervention in a human, social institution. For Abelard, words give birth to or "generate" intellection which then correspond to things. Thus, argues Abelard, threre is a double series of correspondence between words and intellections, and between intellections and things, and consequently, between words and things. These are three distinct but related spheres.(2)

In *Peri Hermeneias*, Abelard insists that first of all the words signify "intellections" and only by implication and consequently, the things, otherwise there would be no logic. At the level of utterance, we deal with ideas which are "abstracted" from things but which are not found in any one thing. The reference to things is always indirect, intellective.(3)

Words are imposed upon things by human convention and they do not carry the same significance from one language to another, hence they are "arbitrary", but as they signify "intellection" of a given thing, they operate within the sphere of logic. Words constitute intellections, or what are called "analyses" in the eighteenth century by Condillac and his followers, they represent logical propositions on

the object under study. They do not correspond to the physical, empirical reality of the thing (object) but to its intellective reality. Hence, the move from one word (utterance) to another is in fact a move from one intellection to another. This is why, for Abelard, to say that a word signifies is to say that it manifests an intellection of the one who pronounces it, and that it generates a similar intellection for the one who hears it. To signify is to constitute intellection but the act of communication requires a speaker and a hearer where there must be a similarity of intellection.(4) Abelard continues the argument in *Super Peri* [*Hermeneias*] and explains that linguistic communication is an affair between two thinking beings. (5)

Language thus is not only a matter of forming logical propositions on the perceived reality of things, it is an institution where two thinking beings, beings who reflect upon the nature of things, exchange their intellections or analyses. But the so-called perfect exchange can take place if the same intellection is generated between two persons.

There are three degrees of knowledge, argues Abelard in *Peri Hermeneias*: sensation, *sensus*, imagination, *imaginatio*, intellection, *intellectus*. One can feel without imagination, imagine without thinking but imagination presupposes sensation and, there can be no intellection without image.

Our words turn our attention towards the resemblance of a thing so that it may be applied, not to this resemblance, but to the thing that it represents. This is the role of the image. One may compare it with a statue of Socrates. We apprehend it not as a thing but as a resemblance. Our intellection is not concerned with it, it only represents Socrates. When our sensation perceives it, it orients it towards the real Socrates. Image is thus situated within the mental operation which leads to knowledge. It serves as a substitute for the thing that is absent. An image alone can also be the object of thought, but in that case, it is not really an image, it has to be considered as an object in itself without another image serving as an intermediate. In any case, we see that feeling or sensation, in itself or across an image, serves as the basis of our intellection. But neither sensation nor image is sufficient for our knowledge; in the first case, we remain at the surface, manifest level, in the second, there is confusion. It is

through the application of our esprit that we pass on to intellection. It leads us to the knowledge of the nature and the properties of things which are imperceptible to senses or to imagination.

Our reason leads our esprit to intellection, without it we remain in the domain of confusion which is the characteristic of imagination.

To think is not to subject a given thing (object) to our intellection, but a nature or a property of that thing.

In its simplest form, an image presents only a resemblance of a thing perceived, it is confused, and like sensation, it does not allow us to distinguish the various properties of the thing. It is only a material to work on, to apply our intellection. Moreoever, the validity or invalidity of an intellection has nothing to do with the specific characteristics of an image. These images serve only as signs. Two persons may think of a non-sensible object, like rationality, across two different images, and both of them may formulate valid propositions. What matters is what is aimed at across these images, *attentio rerum per imagines*, and not the arrangement or the aspects of these images, *dispositio imaginum vel forma*.

Intellections may be simple or complex. A simple intellection corresponds to a noun (name), its object is composed of matter and form but it is apprehended in one unique perception, it is thus without any parts. A complex intellection corresponds to *oratio* as animal, rational, mortal; it groups several intellectual acts. The second division refers to an intellection of related or divided things, *intellectio conjunctorum vel divisorum*, on the one hand, and on the other, the intellection that relates or divides, *intellectus conjungens vel dividens*. The former refers to a reunion or a separation already made within the language. It is thus a simple idea, it corresponds to a definite or an indefinite noun as the things are related or divided. The intellection that relates or divides is, on the other hand, a composed or complex intellection; to a term already thought (analysed), it relates another. Such an intellection corresponds to animal + rational + mortal. Furthermore, there is the intellection that divides and the other that abstracts. The former separates one characteristics from the other but considers both in conjunction or disjunction. The latter considers only one term at a time, neglecting the other.

As the primary interest of Abelard is the interpretation of old sacred texts, he argues that as the ancient texts represent specific intellections of the authors, their true understanding would lead us to the understanding of the texts or the intellections, which are different from those of ours, but they would not shed light on the real nature of things, of the objects they refer to, of the mysteries of the Church. Before Abelard, Isidore had taught in the seventh century that once you know the etymology of a word, you know the "reality" of the thing. For Abelard, etymology informs us only of the intellection of the previous author. That intellection is no more related to the reality of the thing than our intellections are today. The etymological analysis gives only a "partial" view of what is really the thing. The etymology, says Abelard, sheds light more on the composition of the word than on the substance of the thing.(6) No wonder, he was excommunicated. For the logician Abelard, there is absolutely no confusion. For him, the science of logic is concerned only with the enunciative propositions and hence finds its precise object at the level of language, and not, at the level of the impression of things. The sphere of ideas is clearly distinct from the sphere of things.(7) It is interesting to note that following this reasoning, Abelard comments upon the ten categories of Aristotle and states that they are due to "human initiative", and hence due to the nature of language, otherwise such a homogeneity between the categories of language and that of the things of the world could not be envisaged. (8) Eight hundred years later, in a now celebrated article, Emile Benveniste makes the same point with the help of the modem Saussurian linguistics.(9) Abelard insists that the formation of words must be understood as a resultant of a certain mental activity and not as a perfectly adequate translation of the nature of things.(10) Furthermore, as the logical proposition is not a transposition of the natural rapports between things, we cannot talk simply of the differentiation between language and logic. Language regulated by simple grammar at the complex but spontaneous level of the construction of words does neither correspond to the logical structures, nor to the nature of things.(11) This three-way interrelation becomes even more complex when we realise that at times, the reference to a thing may be composed of several intellections and as such the utterance that describes this grouping may have a multiple signification. This multiplicity of reference is the

crux of the problem of signification, not sufficiently emphasized in modem semiotics.

A proposition is both simple and multiple. It should therefore lead us, across several terms, to something that is unique, that is numerically one. It expresses something with the help of several words, but this something is not a thing. A proposition is materially composed of a noun and a verb; similarly, the corresponding intellection is constituted with the relations of the intellections of its parts. But what corresponds, in reality, with a proposition, not having any thing as its basis, is not composed of what corresponds, in reality, with the words, *res autem propositionis, cum nullam habeat rem subjectam, ex rebus vocabulorum non constat*. (12) In the sphere of intellection (analysis) of a thing, Abelard insists that it is "nothing", *nil omnino*, "absolutely nothing", *nullam omnino rem*, it is not an existing thing.(13) But what does not exist intellectively is the corporality of the thing. Intellection deals with what is called, the state of things, something like the *sachverhalt* [state of affairs] of phenomenology which corresponds well with the proposition of Abelard: *quidam rerum modus habendi se*.(16)

All experimentation in modem art in the sphere of the correspondence,between form and content point to what Abelard emphasized that there is no such thing as absolute reality, every thing, every object, is under some impact, physical or psychological, whether it is the impact of light for the impressionists or the impact of psychic turbulations for the cubists or surrealists, or economic or social impact for the Marxists. Abelard had realised in the early years of the twelfth century that the object of study is not already given, it has to be defined, it has to be constituted within a specific universe of discourse, and, all intellection and comprehension of this object has to be in the sphere of ideas, in the sphere of the logical propositions of reality. This is what he tried to do with Holy Trinity and he got into trouble with the Church. For Abelard, at the level of things, Father, Son and the Holy Spirit are three different things because there is no such thing as a universal thing. It is only at the level of intellection, at the abstractive level where a certain unity is envisaged in terms of certain definitions of a perceived characteristics that the Trinity becomes *metaphorically* one. It is only in the *enunciative* field of the Christian discourse that the metonymic sequence of

Father and Son is obliterated. The move from individuality to universality is a move in the realm of intellection and not in the realm of empirical realism which the Church wanted to impose purely on the basis of Faith. For Abelard it is a problem of language, which is a problem of intellection par excellence. In fact, it is only in the realm of semiotics that the Unity of the Holy Trinity could be established as indeed did Abelard, but unfortunately he was too advanced for his times.

4. In his *Logica*, Abelard discusses the intellection of the universals and individuals.(15) When intellection acquires a universal term, argues Abelard, we have a common and confused image formed from several realities. On the other hand, when there is an individual term, we have before us a form of one and unique being, a form that has a rapport with only one individual; when we hear the word, man, a certain representation emerges whose rapport with each of the men is such that it is common to all but specific to none. When we hear the word, Socrates, a certain form emerges which expresses a similitude with a given being. This vocable, Socrates, gives birth to a form of a being who is unique, it is a real thing which is certified and determined. For the vocable, man, on the contrary, the implied community leads us to confusion and we do not know which man is in question. In fact, the word, man, signifies neither Socrates nor any other man, it does not refer to any man even though it denominates all.

A real thing abstracted by intellection may signify either a veritable substance of a thing, when for example intellection is based on a sensible perception, or a mental conception of form corresponding a given thing, which, in the absence of such a thing, may correspond to a common or a specific form. By common form is meant a form which has the common similitude of a multiplicity of beings, but which, in itself, is considered as a unique thing.

As for the mental or conceptual forms, Abelard makes a distinction between the divine forms and human forms. He compares God with artisan who conceive mentally the form of the work that they are going to realise later in a specific body. But there is a difference, says Abelard, it is God who creates man, soul or stone, while man creates a house, a statue or a sword. Neither statue nor sword are natural

works, the names which designate them are not based on substance but on accidents, they do not correspond to genres or species. Thus one can say that the Divine thought conceives by abstraction, the natural realities of universal character, while men know things only through senses. Abelard thus rules out the innate faculty of man in the realm of conceptualisation as proposed later by Descartes and further developed in the Port Royal School.(16) In this respect he is the precursor of the empirical school of Condillac in the eighteenth century(17), and consequently, of the basic hypothesis of modem social sciences where all creation is due to bricolage or due to establishing new relationships within the material culture which is already present. Apart from the works of Claude Levi-Strauss, we see this most clearly in the writings of A.G. Haudricourt where he demonstrates a relationship between the methods of plantation and cosmological conceptualisation in New Caledonia.(18)

Our intellection is based on two distinct operations: attraction and synthesis. Form and matter, argues Abelard, do not exist in isolation from each other but our "esprit" has the faculty to consider one or the other at a time or even together in a certain relationship. We abstract a certain element of a synthesis and examine it in its proper nature. When we re-establish a certain specific relation, we operate a synthesis. For example, we may consider the substance of a man, it may be body, animal, man, rationality etc. When we pay attention to any one of these in its material essence excluding all other forms, this operation is abstractive. Inversely, if we pay attention to only the corporality which we relate with the substance, the operation is synthetic.

These abstractive operations could be considered false, for here we perceive things not as they exist in reality; no abstracted element can exist in isolation. However, it is not so, for it is a question of intellection, of paying attention at a time to a specific element. The isolation of an element, substance or form is only intellective and not in its subsistence. It is a matter of considering a certain quality or characteristics separately and not as separated. For example, if we have a statue made of half gold and half silver, we can consider separately either gold or silver even though within this statue they do not have separate existence. The same is true of all complex realities whose comprehension is possible only if at times, we consider their

constituents in their abstracted forms, and at others, by operating certain specific syntheses.

The same principle operates in the prevision of the artisan who conceives forms in advance of their realisation. This prevision is of the order of senses as it is based on establishing intellective relationships within the elements of things already present. These so-called pre-conceived forms of the artist are thus not based on nothing. It is simply an affair of the mental application of the operations of abstraction and synthesis. The creative process or the prevision of the artist involves the establishment of metaphoric relations, the relations which bypass the sequential relations of time and space in a metonymic, sequential or syntactic realisation within a given enunciative field." (pp. 4-12)

Notes

Abelard's modes of signification

"For Abelard there are primarily six modes of signification.

1. *By imposition*. The word, man, signifies mortal rational animal, for this signification is imposed on the word, man. The signification is thus due to human or cultural fact.
2. *By determination*. Rational or man referring to the substances whose predicates they are, also determine the characteristics of rationality. This is why Aristotle states in his *Categories* that the genre and species determine a quality with reference to a substance, a substance on which their names are imposed because of a given quality.
3. *By generation*. The intellection constituted in the word pronounced generates a similar intellection for the one who

hears it.

4. *By negation*. A thing designated by a definite noun is in a way signified by an indefinite word. The word, non-man, attributed to an object because it is not a man, signifies in a way also the notion of man. It may signify many other things not covered by the word, man.
5. *By adjunction*. The name Socrates, signifies also a number of his accidental characteristics. The barking of a dog refers to its anger.
6. *By consecution*. When I say that I am his father, it is understood that he is my son. The signification is created within a relational space of reciprocity and simultaneity (*)

It is in the discussion of the nature of universals that we follow the development of Abelardian theory of signification. The problematic revolves around the relation between the signifier and the signified, the word and the thing, and its numerous implications for the general theory of semiotics (9). To signify or to designate is the function of words, to be signified is that of the things. A universal is that which by nature can serve as a predicate of several subjects, a singular, which cannot. It seems that both words and things can be considered as universals, one has to see how the definition of universal can be applied to things. Abelard states that some thinkers attribute universality to things by arguing that there is essentially the same substance in things which are different on in form. If we take away the forms, there would be no difference in things. The difference lies in form or accidents and not in essence. There is the same substance of man which becomes here Plato, there, Socrates, due to their respective accidents.

Abelard argues that this theory does not stand the test of "physics". Suppose that there is in fact a being essentially the same, even though it appears in different forms, exists in different subjects. It must follow that the thing that is within this form be the same in another form. For example, an animal inhabited by rationality be also the animal inhabited by irrationality, thus the rational animal is at the same time, the irrational animal; is such the two contraries exist in the same subject. Moreover, they will not really be contrary as they would co-exist in the same absolutely identical essence. In

fact, the contraries cannot be together in the same subject, even under different rapports, as it is the case with relational and other attributes.

These contraries are presented by some thinkers under different perspective by stating that one should not formulate the proposition as "rational animal is irrational animal". A being can be rational from a certain point of view and irrational from another, the forms which correspond to he same subject are no more opposing forms. And, one does criticize propositions such as "rational and mortal animal" or "white animal and animal that walks", for man is not mortal inasmuch as he is rational or he is white inasmuch as he walks. The one and the same animal can have two properties under different rapports.

Then we come to the Aristotelian theory of ten essences or ten most general genres, for in each case we find the same essence diversified only due to different forms. Thus substances are absolutely the same beings, he same is true of all qualities and all quantities. The realities signified by Socrates and Plato are absolutely the same for essentially they are no more different than the substances to which they are attached as the quality of Socrates and the quality of Plato, for both are qualities. They do not differ from each other in the nature of their qualities or the nature of their substances as the essence of their substance is the same.

Abelard refutes this theory. First of all, why should one restrict only to ten essences. There can be more or less. And, how can we perceive a numerical multiplicity in substances if only the forms are different? We do not consider Socrates as numerically multiple just because he may have multiple forms. Another affirmation that does not stand the test of verity is he statement that the individuals are made by their proper accidents. If the individuals derive their being from their accidents, the accidents should precede them. If man differs from other species because of the difference n form, the individual named, Socrates, is distinguished by his accidents. Socrates thus cannot exist without his accidents nor man without his differences. Socrates is not the substratum of his accidents. If the accidents are not in the individual substances, they are not in the universal substances also.

The theory that states that an absolutely identical essence is found simultaneously in different beings is illogical, asserts Abelard.

There are others who have a slightly better theory of universality when they state that the individuals do not differ from each other only due to their forms, they are also individually distinct in their very essence. Matter and form are both different in every individual. Even if the forms are suppressed, their individual distinctions stay because of the diversity of essences. But there is an impasse, for the theory of universality is not abandoned in this case. It is argued that the distinct beings are the same thing, not by essence but by non-difference. Thus the individual men are distinct from each other but they have the same being in man. They do not differ in the nature of humanity. This universality is due to this non-difference.

Abelard continues to present the divergent views within this doctrine of non-difference. There are some thinkers, he says, who perceive this universal element in the collection constituted of several elements. For them, Socrates and Plato by themselves do not represent a species, but all men taken together constitute the species, man, and all animals together form a genre. A certain unity is attributed to this collectivity, for without this one cannot have a predicate of several individuals. A universal thing will not have multiple subjects and the universals will not be as numerous as the singulars. As such, Socrates inasmuch as he is a man is dissociated from himself as Socrates. He cannot be his own genre or his own species if he is not in one way or the other different from himself, for the relative terms must oppose each other.

Abelard thus refutes this theory of collection. How can a collection of men taken together as one species be a predicate of several subjects and thus be universal while taken in its totality we do not attribute it to subjects taken one by one. If we accept that there is a predicate of different subjects according to its parts, it has nothing to do with the community of the universals, which according to Boethius, should entirely be in each subject. It is this that distinguishes it from the common base, which following its parts, is like a field whose different parts belong to different masters. We could then attribute the predicate, Socrates, to several subjects which would be his different parts, and he would himself be universal. Moreover, we will

have to consider a universal any plurality of men put together. Similarly, we will make a unique universal substance from any collection of bodies and souls, and in that case the entire collection of substances will be one of the most general genres. In fact, argues Abelard, if one of the substances is subtracted, the remaining collection is not the most general genre while it is a universal substance. It must be a species of the genre of substance and should have a species which corresponds to it under the 1 same genre. A part is not identical with the whole but the species is always identical with the genre. How can then the entire collection of men be equivalent to an ensemble of animals?

Finally, Abelard presents the theory of those who consider individuals as universals inasmuch as they correspond with others, and accept that they are predicates of several subjects not because they are essentially multiple but because these multiple subjects correspond with them. But argues Abelard, if to be predicated of multiple subjects is equivalent to corresponding with these multiple, how can we say that the predicate individual is accorded to another that is isolated? How the fact of being predicate of several subjects distinguishes the universal from the singular? For, man, inasmuch as he is a man, corresponds with several subjects, but neither man, inasmuch as he is Socrates, nor Socrates inasmuch as he is Socrates, corresponds with others.

Man in Socrates and Socrates himself do not differ from each other. Nothing can be different from itself. This is why Socrates as white and Socrates as grammarian, even though with two different characteristics, is not different from himself, for he is not a grammarian in a way that he is not himself, nor when he is considered white. When they say that Socrates and Plato correspond with each other in "man", how can we believe this, for it is certain that all men are different from each other in matter and in form.

It is obvious that the things, whether they are taken one be one or together, cannot be considered universals, i.e., predicates of several subjects. Thus we must attribute this universality, argues Abelard, to words alone. The grammarians consider some nouns as "appelative", others, "proper". Similarly, for the dialecticians, some simple terms are "universals", others, "particulars", or "singulars". The universal is

a vocable that is instituted to serve as a predicate of several subjects taken separately, as the noun, man, that one can join with specific men due to the nature of the real subjects to whom it is attributed. The singular is that which can be a predicate of any one subject, like Socrates." (pp. 38-41)

(...)

"Abelard's theory of signification is further crystallized in *Logica Nostrorum* where he makes a distinction between *vox* and *sermo*. The universals are neither things nor sounds, votes, they are due to *sermones* which may be singular or universal. A noun or a term is due to human institution but a thing or a sound is due to nature. The signifying act is thus a human fact, a cultural fact, as opposed to the physical aspect of the word that is purely natural. Abelard compares this phenomenon with the creative act. A stone and a statue are one and the same "thing" but they are derived from different sources. The stone is the work of God (nature) while the statue is the work of man (culture). The *sermones* are universal because they are created by man, they are predicates of several subjects. The sounds and things are not at all universal even if in physical reality votes and *sermones* are not different. Abelard's theory of signification is presented in an important article by L. M. De Rijk (**) where he distinguishes between Abelard's views on the signification of words and propositions. To signify, *significare*, with words, *dictiones*, is to generate an intellection in the soul of the hearer. The same is applicable to the denotation of external things, and in this case, the verb is synonymous with *appellare, nominare, demonstare, designare*. To signify with complete sentences, *propositiones,* is to generate an intellection which is constituted with the liaison of the intellections with its parts, *dictiones*. For Abelard the words first signify intellections, then the things which correspond them. The words generate intellections and with these we arrive at the knowledge of things. Intellections thus play an intermediary role. We have now to enquire about the exact status of things. For Abelard, the race, *cursus*, and he runs, *currit,* refer to the same things as it is considered in *essentia*, the race, and in *adiacentia*, he runs. Jean Jolivet believes that this linguistic approach is more concerned with the mental activity than with the exact nature of things. This is true if we think only of the external aspect of things. In this case,

Abelardian theory is different from that of Aristotle. Aristotle's emphasis is on the external things and Abelard is primarily interested in the domain of the spirit or the domain of intellections. As such, we can say that the things signified by words are things as thought of or as produced by intellection. This difference with Aristotle is manifest most clearly in Abelardian theory of the proposition, *propositio*. Even though for Abelard the signification of a proposition is definite, its signified, *significatum*, is not a thing, it is a sort of a half-thing, quasi-res. It depends upon three aspects of the proposition. One may consider it as a verbal phrase, as an intellection expressed by words, or as a thing that is the object of the verbal phrase or the intellection. Abelard states that our expressions have a *consignificatum* rather than a signification so-called, and the task of the proposition is to present a mode of conception, modus *concipiendi*. It does not have a specific content, *in istis nulla imagine nititur intellectus*, but it is derived from it.

The signification of a proposition is further explained by means of the logic of implication, *si rosa est, flos est*. The logic of this necessity lies in the fact that what is stated by the antecedent, *rosa est*, cannot be stated without what is stated by the consequent, *flos est*. If the antecedent is taken either as a grammatical construct or as an act of intellection, it can be without the consequent which can be taken separately as a grammatical or an intellective construct. On the contrary, the antecedent taken as a fact of logic implies the logical existence of the consequent. This necessity is purely relational, *quidam rerum modus habendi se* and it does not concern the relation between the external aspect of things, nor between intellections taken as psychological or rational acts. It is a relation between the contents of intellections. In other words, these relations are purely logical or formal. The dictum of Abelard is neither an external thing, res, nor a mental act as such, but the objectivated content of this act, which being neither a thing nor an act, is called half-thing, quasi-res." (pp. 43-44)

The signification of thoughts and the signification of things

"Although Abelard draws the material for his studies on logic from such traditional sources as Boethius in the field of dialectic and Priscian in the field of grammar, many of his reflections are so fresh and original that in the history of the problems concerning the bearers of truth and falsity he belongs among the few pioneers who really broke new ground and contributed insights which were a lasting source of inspiration for later generations. The following survey is based upon his glosses on Porphyry's Introduction to the *Categories* and Aristotle's *Categories* and *De interpretatione,* which are found in the so-called *Logica ingredientibus* (1) *,* and upon his systematic treatise *Dialectica (*2).

Abelard defines a word *(dictio) as* a sound significant by convention none of whose parts is significant in separation *(D* 147, 21). Some words, namely nouns and verbs, have a definite signification by themselves; other words, namely conjunctions and prepositions, have an indefinite signification by themselves *(D* 117, 26). The definite signification of nouns and verbs, which for certain purposes include also pronouns, adverbs, conventional interjections, and participles *(D* 121, 8, 18; *G* 334, 23), is twofold: they signify thoughts *(intellectus)* and they signify things *(res)*. Thoughts are the affections of the soul or the *noemata* of which Aristotle speaks in the first chapter of *De interpretatione;* Abelard interprets *an intellectus as an* act of attending to the nature or a property of a thing which is either present to the senses or put before the mind by means of a mental image *(G* 20, 30; *G* 312, 36; *G* 328, 18). In connection with a thought the verb *significare* either has the same meaning *as exprimere* or*manifestare intellectum* -- the speaker or the word he

uses expresses the speaker's act of thinking -- or, more often, it has the same meaning *as constituere3* or *generare intellectum:* the speaker or the word he uses produces a certain act of thinking in the hearer's mind *(G* 307, 30). For this meaning of *significare* I shall commonly use the phrase 'to produce a thought'. Further, nouns and verbs signify things; for this kind of signifying Abelard uses, apart from *significare,* such verbs *as appellare, demon-ware, denotare, designare,* and *nominare.* For this meaning of *significare* I shall employ the phrase 'to denote a thing'. Although for several reasons Abelard regards the signification of thoughts as more important, in the context of his reflections on *De interpretatione,* than the signification of things *(G* 308, 19), there is some difference between his conception of the signification of nouns and verbs and Aristotle's. For the latter nouns and verbs primarily signify thoughts; they can only be said to signify things because of the fact that the thoughts which they signify are the likenesses of things. In Abelard, on the other hand, this difference between the directness of the signification of thoughts and the indirect character of the signification of things is less prominent; both significations are treated, so to speak, on the same level.

That conjunctions and prepositions have an indefinite signification is the view defended by Abelard in his *Dialectica* (118-120). When, for instance, the preposition *de* and the conjunction *et* are uttered in isolation, they have a signification which is vague and undetermined: the hearer's mind is kept in suspense about that to which they are to be attached. Only when the open places by which they are accompanied have been filled is their imperfect and indefinite signification rendered precise and definite. In the *me* of *homo et lapis,* for example, the general signification of *et,* namely that things are conjoined, has been made specific by the meanings of the two nouns: we now know that we are dealing with the conjunction of a man and a stone. In the glosses on *De interpretatione,* however, Abelard objects that this view makes it impossible to draw a clear distinction between, on the one hand, conjunctions and prepositions and, on the other hand, nouns and verbs; for the latter, too, can be said to have a signification which is not precise until they are combined with other words*(G* 337, 41). He therefore prefers to say that conjunctions and prepositions when uttered by themselves have

no signification at all; they signify only in combination with other words *(consignificant),* but in that case they contribute a clearly distinguishable part to the meaning of the whole. It is necessary to hold that they have a signification of their own when they are used in combination with other words, since otherwise they cannot be differentiated from letters and syllables.

Whichever of the two views one adopts, there is a problem about the *intellectus* and the *res* which are produced and denoted by conjunctions and prepositions. If those words have a signification, either in isolation or only in combination with other words, they must produce some thought; and they can produce a thought only if there is a thing or a mental image of a thing to which the thought is directed *(G* 338, 41). According to Abelard some authors held that words with an indefinite signification produce a thought but do not denote a thing, in the same way as *propositiones (D 119,* 3). But it is hard to see how they could produce a thought if there is nothing to which the thought is related. Some grammarians tried to solve this difficulty by suggesting that prepositions denote the thing which is denoted by the noun to which the preposition is attached; but in that case the denotation of the noun would be superfluous. Abelard's own view is that conjunctions and prepositions denote a certain characteristic *(proprietas)* with regard to the thing that is denoted by the adjoining nouns or verbs. In the combination *in domo,* for instance, the preposition *in* denotes the characteristic of the house that consists in its containing something; and the conjunction *ergo,* placed between statements, denotes the characteristic that consists in the circumstance that the premisses prove the conclusion and the conclusion is proved by the pre-misses. Abelard finds it difficult, however, to state clearly the thought which belongs to each preposition and conjunction; it is as hard, he says, as stating explicitly the thought that belongs to utterances that are not used for the purpose of making a statement, such as 'Come to me' *(D* 118, 29).

The copulas *est* and *non est* get a separate treatment. They neither produce a thought nor denote anything, but they contribute to the affirmative or negative import of *a propositio (ad vim affirmationis* or *ad vim negationis proficit)* by causing the mind to combine or separate the things thought of (the *intellecta* or *intellectae res;* cf. *D* 154, 25-27). In understanding a *propositio* the mind performs three

acts: it thinks of each of the two parts, the subject and the predicate, and it combines or separates the things thought of. Although the act of combining or separating the things thought of is not itself an *intellectus*, it nevertheless is part of the thought produced by the whole*propositio* (G 339, 20). Similarly, the conjunctions *si* and *non si* have no signification, but they unite or separate significant sounds by inclining the mind to a certain mode of conceiving (*animum inclinant ad quendam concipiendi modum*; cf. also G 329, 29).

The same expression *modus concipiendi* is used in connection with the difference between a finite verb such as *currit* and a noun such as *cursus*. The verb and the noun denote the same thing, running, but the different mode of conceiving it causes a difference in the thought produced (*diversus modus concipiendi variat intellectum*). The distinction between parts of speech pertains to a difference in thought produced rather than to a difference of denotation (*G* 308, 25).

In D 124, 11, a distinction is made between the principal signification of a noun and its accidental significations, which have to do with the modes of signifying. The difference between singular and plural is said to be a difference of accidental signification. Differences in case and gender, on the other hand, are not related to any difference in signification, but only to the position which nouns can occupy in constructions (Cf. G 364, 2). Similarly, such pairs as *comedere/vesci* ('to eat') and *carere/non habere* ('to lack') have the same signification but they play different roles in constructions (D 125, .33; G 369, 27). The same is true of such forms as *curro, curris, currit, curritur*. They all have the same signification but the ways in which they are completed into a full *propositio* by the addition of such pronouns as *ego, tu, tile, a me, a te, ab illo* are different. In other words, differences in person are not connected with any difference in signification, whereas differences in number, tense, and mood are differences in (accidental) signification (G 138, 31)." (pp. 139-142)

Theories of the Copula in the Logical Works of Abelard

The use of copula in Abelard's logic

"With Abelard, the term 'copula' enters into western thought. In fact, although widely attested, the use of the term 'copula' in reference to Aristotle's work is totally anachronistic. (16)

What led to this term? In his *Dialectica*, Abelard was mainly concerned with the way syllogisms can be construed. The interest of the copula was in fact derivative from this main concern. As Kneale and Kneale (*The Development of Logic*, 1962: 206) put it, 'it is clear that for his [Aristotle's] theory of syllogism he assumes in every general proposition two terms of the same kind, that is to say, each capable of being a subject and each capable of being a predicate'. Thus, since the only linguistic entities that can play these two roles are nouns (in modern terms, noun phrases), it is easy to understand why the copula became central. Abelard pursued the Aristotelian theory by emphasizing the role of be as the element that can turn a noun into a predicate in a syllogism rather than as the element that provides the sentence with a time specification (see *Dialectica* 161).

It is this conceptual shift that underlies the invention of the term 'copula', which is cast on the Latin *copulare* meaning 'to link'. For example, in sentences like *a man* is a mammal and *Socrates is a man* the copula allows the noun phrase *a man* to play the role of the subject, in the first, and that of the predicate, in the second.

Clearly, in such a framework the assumption that the copula can be interpreted as a predicate meaning 'existence' cannot be maintained (...). We have an explicit argument by Abelard to overcome this

problem. Let us reproduce it synthetically as follows. A sentence like *Socrates est* (Socrates is), where *est* (is) just occurs with a subject, potentially undermines the theory of the 'copula' as link between a predicate and a subject like in *Socrates est homo* (Socrates is man). To avoid this inconsistency, Abelard appeals to a typical *reductio ad absurdum* (*Dialectica* 137, 162)."

We interpret *Socrates est* as meaning *Socrates est ens* (Socrates is existing, where *ens* is (the Nominative, singular form of) the present participle of *esse*, be). Suppose that *est* means *est ens*, that is, *est* is a predicate meaning existence. Then nothing would prevent a sentence like Socrates *est ens* from being interpreted as *Socrates est ens ens*, and that from being interpreted as Socrates *est ens ens ens*, etc., ad infinitum without reaching a stable meaning.(17)

Thus, Abelard concludes, in the sentence Socrates est, the predicate of existence is just not expressed.(18)

Notes

(16) See for example J. L. Ackrill's comment on *De Interpretatione* (Ackrill 1963). Aristotle always avoids employment of a special name for the copula: rather he refers to actual instances of εἶναι (be). Not all translators seem to be aware of this fact. In the *De Interpretatione* (*De Int*. 3, 16b, 25), for example, Aristotle says that εἰναι προσσημαίνει δε` σὐνθεσὶν τινα. Ackrill's translation says "but it additionally signifies some combination" (Ackrill 1963: 45). Cooke, instead, renders it as "but imply a copulation [sic] or synthesis" (Cooke 1938: 121).(...)

(17) For a discussion on this matter see Kneale and Kneale (*The Development of Logic*, 1962) and Pinborg (*Logik und Semantik im Mittelalter*, 1972).

(18) Correspondingly, the common use of *to be* (or *being*) as a shortened form of *to be* (or *being*) *existent* is to be treated in the same way. The following passage pointed out to me by Giulio Lepschy illustrates the point: *Dixit Deus ad Moysen: ego sum qui sum. Ait: sic dices filiis Israel: qui est, misit me ad vos* (*Exodus*, III 14). From a linguistic point of view, however, this should not be surprising. A similar case is that of to do (or doing) as a shortened form of to do (or doing) something. Interestingly, the term 'existence'

is not etymologically related to the copula *essere* / εἶναι but to a locative predicate *sisto* and a locative particle *ek*-.

From: Andrea Moro, *The Raising of Predicates. Predicative Noun Phrases and the Theory of Clause Structure,* (Appendix: *A Brief History of the Copula*, pp. 248-261), Cambridge: Cambridge University Press, 1997.

"Before embarking on a discussion of Abelard's views on sentential predication and the role of the copula, it seems useful to summarize our author's basic views on the noun and verb.

1) 'Nomen' (noun, name) is defined (in the Aristotelian-Boethian tradition) as 'a spoken sound having a signification by convention, without the notion of time, of which no parts are meaningful in separation' (*Dialectica* 121,28-9; cf. 129,4-5 and *Glosses in Peri hermeneias* 334,18ff.). It should be borne in mind that like the Ancients the Medievals too, were in the constant habit of not sharply distinguishing between a noun's (or verb's or any other significative expression's) significate and the 'thing' (whether substantial or accidental) signified in the outside world. (1)

2) Verbum ('verb') is defined (*Dialectica* 129,11-3) as: 'a spoken sound, having a signification by convention, which, in its finite forms, is designative of the present time, of which no part have meaning in separation'.

3) As a logician Abelard is quite explicit throughout his works about the semantic difference between categorematic words (nouns and verbs) and syncategorematic ones (prepositions, conjunctions etc.). As to the differences between the noun and verb his opinions are less stable, it seems. So much seems to be certain, on the semantic level Abelard recognizes a close affinity between the noun and verb as, in his opinion, they are just various tools to convey identical sememes [so e.g. 'cursus' ('course') and 'currere' ('to run')], whereas they only differ by the different ways in which they convey the common sememe ('*modus significandi*').

4) Both nouns and verbs have the job of naming and determining, whereby the difference between 'naming' and 'determining' is only of a syntactic nature, it seems. On the level of naming and determining

(onomazein-level), the noun and verb convey, each in their own ways (nominally or verbally, respectively), some semantic content ('sememe'). By this, they constitute some 'idea' ('*conceptio', 'conceptus', 'intellectus'*) in somebody's mind (the speaker's or the hearer's that is), but still without conveying any complete thought or sense.

5) Contrariwise, on the level of 'statement-making' (*legein* level) the (finite) verb when actually used (2) comes to be really 'statement making', to the extent indeed that it performs this job together with some noun(s) but nonetheless being itself the statement-maker, properly speaking." (pp. 98-99)

Notes

(1) For this phenomenon, see e.g. De Rijk, *Plato's Sophist. A Philosophical Commentary,* Amsterdam, North-Holland, 1986, Index, s.v. *Name*. For Peter Abelard, see e.g. *Glosses in Peri hermeneias* 126,35-127,13; *Dialectica* 564,6-9 and all the passages in which he explains the *significatio rerum* (vs. *intellectuum*). The distinction always concerns the opposition of *res significata* to *intellectus significans res*, rather than the *intellectus* as such.

(2) For this condition, see N. Kretzmann, *The Culmination of the Old Logic in Peter Abelard*, p. 495, n. 33, cf. De Rijk *Plato's Sophist. A Philosophical Commentary,* 15.23. 15.32 and 16.4 and below p. 101

From: L. M. de Rijk, "Peter Abelard's Semantics and His Doctrine of Being", *Vivarium*, 24, 1986, pp. 85-127.

"The distinction of nouns or names (a category that includes adjectives) from verbs was as much argued over in Abelard's day as in ancient times, and it provided Abelard with an entry to matters that lie at the heart of his philosophy. He rejects Aristotle's view that verbs differ from nouns in having a consignification of time, for he sees no reason not to ascribe a similar consignification to nouns:

For just as 'run' or 'running' indicate running in connection with a person as presently inhering in him. so 'white' determines whiteness in connection with a substance as presently inhering, for it is called white only because of present whiteness. (1)

Abelard is equally unhappy with the idea that verbs, as distinct from other parts of speech, signify only actions and passions, or what might better be called 'receptions' (*passiones*, i.e. the passive correlates of actions). This view runs afoul of the copula which although accepted as a verb can he used to 'join' (*copulare*) to its subject any sort of entity whatsoever.'(2)What distinguishes verbs, in Abelard's view, is that they provide the 'completeness of sense' (*sensus perfectio*) characteristic of whole sentences (*orationes perfectae*) as distinct from mere phrases (*orationes imperfectae*). What is the difference, he asks, between 'A man runs' and 'a running man'? Of constructions such as the latter he remarks:

But a completeness of sense has not yet been brought about in them; for when this expression has been uttered the mind of the hearer is suspended and desires to hear more in order to arrive at completeness of sense, for example. 'is' or some other acceptable verb. For without a verb there is no completeness of sense.' (3)

Verbs can perform this function because they propose the inherence of what they signify in the subject.

Thus we see that this completeness of sense depends mainly on verbs, since only by them is inherence of something in something indicated in a manner expressive of different mental states; without this inherence there is no completeness of sense. When I say 'Come to me' or 'If only you would come to me', in a way I propound the inherence of coming to me in a manner expressive of my order or my desire; in the one case I order that coming should belong to him, in the other I have a desire, namely, that he come.' (4)

The talk of 'inherence', however, must be treated delicately, for it is not Abelard's view that any verb, even the copula, signifies some relational property of inherence. Rather verbs generally signify that which 'inheres', while the copula, according to one of Abelard's accounts of it, signifies nothing at all. If any verb were to signify 'inherence', then it would be unable to perform the 'linking' function, i.e., the function of the copula, which is to 'link' what the predicate signifies to the subject. 'Runs' signifies running and 'links' it as well. The copula 'is' really expresses just this linking function implicit in all verbs; if it were to signify anything on its own it could no more

take a predicate noun or adjective and link its significate to a subject than can 'runs'. (5)

This view is taken still further when Abelard separates 'to be' used as a copula from 'to be' used to mean 'to exist'. If the separation is not made we have problems with sentences such as 'Homer is a poet' and 'A chimera is conceivable', where the subjects are non-existent or even impossible. Abelard's solution is to treat the whole phrase consisting of copula plus predicate noun or adjective as a single verb-phrase and in this way eliminate any idea that 'to be' on its own is predicated of the subject.

Thus it seems to me if I may dare to speak freely, that it would be more rational and satisfying to reason that ... we understand as a single verb 'to be a man' or 'to be white' or 'to be conceivable'. Aristotle indeed says that in 'Homer is a poet-to be' is predicated *per accidens*, i.e., 'to be' is predicated accidentally of Homer in that the poem belongs to him, but it is not predicated per se of Homer that he is. But since 'to be', as was said, is not a verbal unit, to be predicated *per accidens* is not to be predicated; rather 'to be' is part of the predicate."

Abelard in effect wants us to treat the copula as what a modem grammarian would call an auxiliary, and indeed Abelard draws support for his view from the implausibility of dividing up '*erit sedens*' (will be sitting) into two parts, because of the conflict of tenses between auxiliary and participle."

The copula, then, turns out to be a verb-phrase-maker, taking as complements nouns, participles, and whole clauses and turning them into verb phrases. But the process should not be thought to leave the complement with the same meaning it has in isolation, for this leads to logical absurdities. As we have seen, the noun following the copula has in isolation a tense of its own (generally the present), and this can conflict with the tense of the copula. For example, 'This old man was a boy' will be necessarily false if we treat 'boy' as retaining its signification of present time, for then the sentence is equivalent to 'This old man was one of those who is presently a boy." What we must do, Abelard says, is treat the whole copula plus predicate noun as a single verb having the tense of the copula. He shows how only in this way can the rules of conversion and syllogistic inference be made

to apply to sentences with verbs in tenses other than the present.' (6)" (pp. 144-146, Latin text in the notes omitted)

The diffusion of Abelard writings

"The surviving manuscript books containing works by Abelard and by his students and disciples have a history and reveal much about the activities of the anonymous students of Abelard's thought. They were produced, exported, copied and read at great labour and for particular reasons. In their character, in the markings which they bear, in the frequency with which they are encountered in libraries, in the relationship of the copies to each other, can be found indications of the kinds of interests which were aroused by Abelard's teachings and of the uses to which they were put. This is as true of copies of Abelard's own works as of those of his disciples. The study of the diffusion of these manuscripts is complex but it is also the study of the geography of twelfth-century thought and learning; it assists our appreciation of the widespread interest in Abelard's writings and by implication in those of other masters. Our main concern is with manuscripts produced before 1500 and containing the major doctrinal works of Abelard and of his disciples. The poems, the personal correspondence with Héloise, the smaller occasional

letters and pieces are less instructive in this respect than the logical writings, the biblical commentaries, the *Theologia* and *Sic et Non* in their many versions, the *Ethica* and the *Dialogu*s. Manuscripts produced after the twelfth century are less relevant, but are none the less valuable because they presuppose earlier exemplars and because they witness to the history of the copying of particular works.

Several of Abelard's writings are wholly lost. The glosses on Ezechiel which Abelard delivered at Laon and then finished at Paris were transcribed and circulated but do not now survive.(1) The letter in which Abelard attacked Roscelin of Compiegne is only known through Roscelin's reply(2) and from a reference in a letter which Abelard wrote to the bishop of Paris. His *Grammatica* is lost,(3) as is the *Exhortatio* which he delivered to the monks of St Denis.(4) Heloise received from him a *Psalterium* which consisted perhaps of a series of collects to follow the recitation of the Psalms.(5) It is even possible that Abelard wrote both an Anthropologia (the counterpart in his teaching about man of the *Theologia* which concerns God and the Trinity) (6) and a *Rhetorica*.(7) He may also have written glosses on the *De syllogismo categorico* and *De syllogismo hypothetico* in his *Introductiones parvulorum*,(8) a commentary on the *De syllogismo hypothetico* in his *Logica Ingredientibus* (9) and further commentaries in the *Logica Nostrorum*. Even of Abelard's surviving works the varying versions and revisions are not fully available. Analysts of Abelard's texts have posited the existence of two versions preceding the surviving version of the Dialectica (10) as well as of other versions of his Logica.(11) Fr Buytaert believes that the earliest version of the *Sic et Non* is lost. (12) Moreover, among the extant versions completeness is all too infrequently found. Losses have occurred too among the writings of Abelard's followers. The authors of the *Sententie Hermanni*(13) and of the *Sententie Parisienses I* (14) may have composed commentaries on St Paul's *Epistle to the Romans*, while a *Liber Sententiarum*, containing opinions which appeared to be derived from Abelard's teaching, crossed the path of Bernard of Clairvaux in the period before the council of Sens.(15)

The surviving copies of Abelardian works are, however, numerous enough to permit a consideration of the extent and the manner of their diffusion and appeal. Of Abelard's own major works the *Theologia* is found in eighteen manuscripts, the *Sic et Non* in ten, the

*Ethic*a in five, the *Dialogus* in three, the commentary on the *Hexaemeron* in four and that on *Romans* in three. A single manuscript contains a fragment of the *Apologia* and there are single copies of Abelard's logical works.(16)" (pp. 60-62, notes renumbered)

(16) The commentary on the *De interpretatione* in the *Logica 'Ingredientibus'* is an exception; two copies are known, see below, p. 89.

From: David E. Luscombe, *The School of Peter Abelard. The Influence of Abelard's Thought in the Early Scholastic Period,* Cambridge,: Cambridge University Press 1969.

"The very important cod. Milan, Ambrosiana M. 63 sup. which contains on ff. 1r-72r a large part of the *Logica 'Ingredientibus'* in a copy of the late twelfth or early thirteenth century has been in the Ambrosian Library since its foundation in the early seventeenth century; (1) it was received by Cardinal Federigo Borromeo as a gift from Camillo Bossi of Modena in 1605, but its earlier history is not known.(...) The last part of the commentary on Aristotle's *De interpretatione* contained in this manuscript has been shown by Dr Minio-Paluello(3) to have issued from a circle in which were debated problems similar to those discussed by Abelard, and the same manuscript also contains on ff. 72v-81v a commentary on Porphyry's *Isagoge* composed by a disciple of Abelard.(4) Dr. Minio-Paluello believes that the authentic and complete version of Abelard's commentary on the *De interpretatione* in the *corpus* of his *Logica 'Ingredientibus'* is found in a copy made by an Italian scribe of the late twelfth century in cod. Berlin, Deutsche Staatsbibliothek lat. fol.

624, ff. 97r-146r. This manuscript belonged to St Victor in Paris in the later middle ages.(5)" (pp. 88-89)

Notes

(5) The commentary was discovered by M. Grabmann, 'Kommentare', pp. 203-5, and the latter part of it is ed. by Minio-Paluello, op. cit., pp. 1-108. For descriptions of the manuscript see Grabmann, 'Kommentare', especially pp. 185-6, and Minio-Paluello, op. cit., pp. XII-XVI.

From: David E. Luscombe, *The School of Peter Abelard. The Influence of Abelard's Thought in the Early Scholastic Period,* Cambridge,: Cambridge University Press 1969.

"The evidence of all these manuscripts contributes to an understanding of the nature of the appeal of Abelard's writings and of those of his followers to twelfth-century scholars. Manuscripts containing Abelard's logical writings are relatively few in number. Although, as John of Salisbury shows in his Metalogicon and Abelard in his Historia Calamitatum, logic was the subject of passionate disputes arousing widespread interest, documents presenting these debates are not abundant.(2)

Of Abelard's logical writings some are lost and only one (the commentary on the *De interpretatione* in the *Logica Ingredientibus)* survives in more than a single copy. Yet in comparison with the works of contemporaries, those of Abelard survive extremely well for the logical writings of Roscelin, William of Champeaux, Master

Alberic, Jocelyn of Soissons, Bernard of Chartres and Robert of Melun are entirely lacking while from Adam of the Petit Pont we have only two copies of the *Ars disserendi*.(3) The habit of publishing one's logical teaching may have been under-developed among the logicians and quite possibly manuscripts of logic have had a poorer chance of surviving through the centuries. Those of Abelard are for the most part exceptional in bearing clear, contemporary indications of their author. The evidence collected suggests that the logical teaching of Abelard and of other masters was discussed not only in Paris but also in several other centres, at Fleury on the Loire, in the circle of Robert of Torigny, in some of the religious houses of Germany and possibly too in Italy. Copying, however, appears to have ceased in the thirteenth century and it is then that a new period begins in the history of logic characterized by the work of such masters as Lambert of Auxerre, William of Shyreswood and Peter of Spain and by the absorption of further translations of Aristotle's logical writings." (pp. 93-94)

Notes

(2) To say this is not to ignore the series of discoveries made by the late M. Grabmann in several of his more recent articles.

Selected Bibliography on Abelard's Logic and Ontology. First Part A - Gui

Bibliography

1. Arlig, Andrew W. 2005. *A Study in Early Medieval Mereology: Boethius, Abelard, and Pseudo-Joscelin*, Ohio State University.

   Available at ProQuest Dissertation Express. Order number: 3161106.

   Contents: 1. Introduction 1; 2. Introduction to mereology and the metaphysics of mereology 12; 3. Boethius and the early mereological tradition 62; 4. Abelard's mereology and its role in metaphysics 141; 5. Pseudo-Joscelin and the Moderate critique of Abelard 243; 6. Conclusion 304; List of references 316-338.

   Abstract: "The study of parts and wholes, or mereology, occupies two of the best philosophical minds of twelfth-century Europe, Abelard and Pseudo-Joscelin. But the contributions of Abelard and Pseudo-Joscelin cannot be adequately assessed until we come to terms with the mereological doctrines of the sixth century philosopher Boethius. Apart from providing the general mereological background for the period, Boethius influences Abelard and Pseudo-Joscelin in two crucial respects. First, Boethius all but omits mention of the classical Aristotelian concept of form. Second, Boethius repeatedly highlights a rule which says that if a part is removed, the whole is removed as well. Abelard makes many improvements upon Boethius. His theory of static identity accounts for the relations of sameness and difference that hold between a thing and its part. His theory of identity also provides a solution to the problem of material constitution. With respect to the problem of persistence, Abelard assimilates Boethius' rule and proposes that the loss of any part entails the annihilation of the whole. More precisely, Abelard thinks that the matter of things suffers annihilation upon the gain or loss of even one part. He also

holds that many structured wholes, namely artifacts, are strictly dependent upon their parts. Yet Abelard insists that human beings survive a variety of mereological changes. Abelard is silent about objects which are neither artifacts nor persons. I argue that Abelard has the theoretical resources to provide an account of the persistence of these types of object, so long as some forms are ontologically robust. Pseudo-Joscelin rejects the thesis that the removal of any part entails the destruction of the whole. The annihilation of a whole follows only from the removal of essential parts. Pseudo-Joscelin employs two basic principles in his theory of persistence. First, forms and the functions encoded in them play a primary role in identity and persistence. He also makes use of a genetic criterion. Pseudo-Joscelin expands both principles and employs them when he vigorously defends the thesis that a universal is a concrete whole composed of particulars from Abelard's criticisms."

2. ———. 2007. "Abelard's Assault on Everyday Objects." *American Catholic Philosophical Quarterly* no. 81:209–227.

   Abstract: "Abelard repeatedly claims that no thing can survive the gain or loss of parts. I outline Abelard's reasons for holding this controversial position. First, a change of parts compromises the matter of the object. Secondly, a change in matter compromises the form of the object. Given that both elements of an object are compromised by any gain or loss of a part, the object itself is compromised by any such change. An object that appears to survive change is really a series of related, but non-identical, objects. I argue that, for Abelard, this series of objects is not itself an object. Finally, I examine an apparent exception to Abelard's claim that no thing can survive a gain or loss of parts, and I show that this specific case does not undermine his general thesis."

3. ———. 2012. "Peter Abelard on Material Constitution." *Archiv für Geschichte der Philosophie* no. 94:119–146.

   Abstract: "Some scholars have suggested that Peter Abelard has a solution to Allan Gibbard’s [*] famous puzzle concerning a lump of clay and the statue that the clay composes.

Although Abelard does not explicitly address an analogue of this puzzle, I claim that an Abelardian solution can be constructed based on principles drawn from his discussions of sameness and difference in his later theological writings. In this study, I first summarize the puzzle and several standard solutions to it. I then present and analyze Abelard's account of sameness and difference, with special emphasis on his description of the ways in which the matter of a statue is both the same as and different from the statue. I then show how we can reconstruct an Abelardian solution to the problem from these remarks. Finally, I consider whether this Abelardian solution is coherent and plausible. In doing so, I show how the Abelardian solution reveals an underlying tension in Abelard's later ontology."

[*] Gibbard, A. 1975. "Contingent Identity", *Journal of Philosophical Logic* 4, 187–221. Reprinted in *Material Constitution: A Reader*. Edited by Michael Rea, Lanham, MD: Rowman & Littlefield, 1997, pp. 93–125.

4. ———. 2012. "Parts, Wholes, and Identity." In *The Oxford Handbook of Medieval Philosophy*, edited by Marenbon, John, 445–467. New York Oxford University Press.

"Abelard's ingenious solution to the problem of whether a whole is numerically the same as its part is to ground numerical sameness and difference in the more basic relations of sameness and difference in *essentia*. In this part of Abelard's works, a thing's *essentia* should not be thought of as that thing's quiddity, but rather its concrete being. (12) Thus, in Abelard's view, my *essentia* just is the composite of all my

material bits and some forms. Given that my *essentia* is a composite, Abelard insists that we must keep track of these parts when we are determining whether some things are the same or different in *essentia*. Specifically, according to Abelard, A is the same in *essentia* as B if and only if the *essentia* of A coincides with the *essentia* of B. (13) Discrete things, such as Socrates and Plato, clearly fail to coincide mereologically, and hence, they are different in *essentia*. Yet, given that mereological coincidence is necessary for essential sameness, A

and B can differ in *essentia* even if some parts are shared. For example, Socrates's hand is different in *essentia* from Socrates.

This is true because, while Socrates's hand is included along with the other parts 'in the quantity of the whole', the quantity of Socrates's hand's *essentia* does not exhaust the quantity of Socrates's *essentia*." (p. 448)

(12) In Abelard's works 'essentia' has a number of meanings. See De Rijk (1981, 19–24).

5. ———. 2013. "Some Twelfth-Century Reflections on Mereological Essentialism." *Oxford Studies in Medieval Philosophy* no. 1:83–112.

Abstract: "Peter Abelard held two views that imply a form of Mereological Essentialism: first, a thing is nothing other than all its parts taken together and second, no thing has more parts at one time than it does at another. This paper situates Abelard's theses within their historical context. The paper first examines Boethius's suggestive remarks about the dependence of the whole upon its parts and it highlights several of the choices that were open to twelfth-century students of Boethius's mereology. Then there is a brief survey of Abelard's understanding of Mereological Essentialism. Finally, the paper examines some of the more interesting challenges to Mereological Essentialism that were posed by Abelard's contemporaries. The paper focuses in particular on a set of

fragments that have been attributed to the school of Joscelin of Soissons."

6. Astroh, Michael. 2001. "Petrus Abaelardus on Modalities *De re* and *De dicto*." In *Potentialität und Possibilität. Modalaussagen in der Geschichte der Metaphysik*, edited by Buchheim, Thomas, Kneepkens, Corneille Henri and Lorenz, Kuno, 79–95. Stuttgart: Frommann-Holzboog.

   "The distinction between modalities *de re* and *de dicto* Abaelard discusses in his *Glossae super Peri hermeneias* (1) presents itself as a topic of traditional predication theory. The two varieties of alethic modality are bound to opposite forms of predication. In spite of their uniform linguistic appearance their basic structures are different. Modal propositions de dicto are semantically, not just grammatically, impersonal whereas modal propositions *de re* are truly personal constructions.(2) Nevertheless Abaelard explains the meaning, scope and purpose of according modal operators in so uniform a manner that he can set forth rules of inference between modal propositions *de re* and their logical correspondents *de dicto*.

   A systematic presentation of Abaelard's theory pertains to all constitutive features of predication. The grammatical, but even more so the semantical, impersonality or personality of a categorical proposition, its quality and if appropriate its quantity, and finally its temporality and existential presupposition -- each of these features predetermines the manner in which modalities *de re* or *de dicto* contribute to a proposition's meaning and validity. These basic aspects of Abaelard's account of predication do not obstruct his intuitive conception of alethic modality as determining either *de re* or *de dicto* a predicate's inherence or remotion.(3)" (p. 79)

   (1) The text of the relevant treatise will be quoted according to its critical edition by Klaus Jacobi and Christian Strub: Petrus Abaelardus, *Glossae super Peri Hermeneias,* Turnhout: Brepols (Corpus Christianorum. Continuatio mediaevalis), forthcoming [2010]. As this new edition presents the text with reference to the edition by L. Minio-Paluello: *Twelfth Century Logic. Texts and Studies. Vol.* 2: *Abaelardiana Inedita, 1.*

Glosse Magistri Petri Abaelardi super Periermeneias Rome 1958, quotations will refer to the latter one (abbreviated with: G).

(2) For Abaelard's account of semantical impersonality cf. Klaus Jacobi, "Diskussionen über unpersonliche Aussagen in Peter Abaelards Kommentar zu Peri Hermeneias", in: E. P. Bos (ed.), *Mediaeval Semantics and Metaphysics. Studies dedicated to L. M. De Rijk on the occasion of his 60th Birthday*, Nijmegen 1985, 1-63.

(3) The usage of this distinction draws on Abaelard's terminology in *Dialectica*, cf. for example 191,6. The text of *Dialectica* is quoted with reference to the De Rijk edition: Petrus Abaelardus, *Dialectica*, ed. L. M. de Rijk, Assen 1970 (abbreviated with: D).

   Contents: Premise V; Foreword to the Second Edition VII; Introduction 1; I. What Abelard Means by Logic 13; II. The Problem of Meaning 28; III. The Meaning of Universal Nouns 42; IV. The Meaning of the Proposition 71; V. The 'Argumentatio' 80; Appendix: *Abaelardiana Inedita* 90; Bibliography 100; Index of Names 101.

   "The purely 'philosophical' importance of logical Abelardian research has been emphasized by Mario Dal Pra in his introduction to the edition of the *Glosse Letterali*. In this volume it seems important in my eyes to illustrate not only the interest of Abelardian dialectic techniques (which are at times penetrated by positions which are still realistic), but also, and above all, the importance of his total attitude towards the 'scientia scientiarum', stated in advance by a freer and braver mentality that is later to use this instrument for its rigorous definition of philosophical research.

When studying Abelardian dialectic I have preferred to follow the line of development of his inquiry, from meaning to syllogistic calculation. This line does not, however, coincide perfectly with the expositive progress of the various commentaries, from the *Isagoge* to the Boethian texts; the trail has thus been marked out for me by some of the Palatine Master's statements rather than by the order of the comments.

The perspective of this research is, generally speaking, given from the viewpoint of contemporary formal logic, a viewpoint that is nevertheless implicit, even, I think, if it is at work in inquiry. In fact, in an attempt to have a clearer picture of the historical importance of the author and his meaning in a dialogue which is mediaeval, I have tried, as far as possible, to keep the language constantly in the tone of those times, and I have tried to avoid certain equations - unprecise and sterile in my opinion - between Abelardian logical formulae and contemporary logical formulae. I hope that what will be of interest from a modern viewpoint is Abelard's total attitude." (Premise, p. V).

8. Binini, Irene. 2018. "'My Future Son is Possibly Alive'. Existential Presupposition and Empty Terms in Abelard's Modal Logic." *History and Philosophy of Logic* no. 39:341–356.

   Abstract: "The aim of this paper is to investigate the problem of existential import in Abelard's modal logic, and to ask whether the system of logical relationships that he proposes for modal propositions maintains its validity when some of the terms included in these propositions are empty. In the following, I first argue that, just as in the case of non-modal propositions, Abelard interprets modal propositions as having existential import, so that it is a necessary condition for the truth of propositions like 'It is possible for my son to be alive' or 'it is necessary that all men are animals' that their subjects' referents exist. Then, I present the schemata of inferences that Abelard proposes to describe the logical behaviour of de rebus modal propositions. I argue that these systems of relations are valid only as long as all the terms contained in the formulas have an existing referent. I also claim that Abelard was aware of this

difficulty (at least in the *Logica Ingredientibus*), and, accordingly, he explicitly decided to restrict the validity of his modal system to propositions that do not contain empty terms."

9. ———. 2020. "Abelard's Treatment of Logical Determinism in Its Twelfth-Century Context." *Vivarium* no. 58:1–28.

   Abstract: "This article investigates Abelard's defence of the compatibility between universal bivalence and the existence of future contingent events. It first considers the standard strategy put forward by twelfth-century commentators to solve Aristotle's dilemma in *De Interpretatione* 9, which fundamentally relies on Boethius' distinction between *definite* and *indefinite* truth values. Abelard's own position on the dilemma is then introduced, focusing on a specific deterministic argument considered in his logical works that aims to demonstrate that, given the determinacy of present-tense propositions such as '"that Socrates will eat tomorrow" is true', future contingent events such as that Socrates will eat tomorrow are determinate in advance. In addition to presenting Abelard's reply to the argument, the article offers an analysis of his notions of *contingency*, *determinacy,* and *future events*, and a comparison between Abelard's position and other twelfth-century discussions on future contingents."

11. ———. 2021. "Some Further Remarks on Abelard's Notion of Nature." In *Women's Perspectives on Ancient and Medieval Philosophy*, edited by Chouinard, Isabelle, McConaughey, Zoe, Ramos, Aline Medeiros and Noël, Roxane, 239–251. Cham (Switzerland): Springer Verlag.

    Abstract: "The notion of nature is central not only to Abelard's theory of cognition and to his treatment of universals, but also to Abelard's modal logic, to his discussion of future contingents and to his theory of conditionals. In this essay, I emphasize how

the notion of nature—despite its pervasiveness in Abelard's philosophy and despite the attention that has been paid to it—still raises puzzling questions to interpreters. One of these puzzles has to do with Abelard's idea that different individuals may be "of a same nature (*eiusdem naturae*)," a claim that according to some is hardly compatible with the nominalist position he endorsed. Another interpretative issue is raised by Abelard's claims in *De Intellectibus* that substances have more than one nature, and that we might consider things as being of a different nature depending on which of their properties we pay attention to. Given Abelard's essentialist framework, his assertions on the multiplicity of natures associable to a single individual may sound perplexing. Other issues that I take into account are Abelard's attribution of natures to non-existent things such as chimaeras or horned men, and his remarks concerning the accessibility of natures to our knowledge."

Conclusion 308; Bibliography 311; Index 324-326.

"Part I of this book aims to present the logical and grammatical context in which Abelard's modal theories originated, considering the debates on modalities that are put forward in published and unpublished treatises and commentaries of his time. I shall start by taking into consideration the sources on which Abelard and his contemporaries relied for construing their modal thought." (p 14)

(...)

"Having investigated Abelard's and his contemporaries' definitions of modes and their analysis of the syntactic structure of modal propositions in Part I, in the second part of this book I focus on Abelard's modal theory by taking into consideration its logical core, namely, the system of relations of opposition and equipollence that he establishes among propositions about possibility, impossibility, and necessity." (p. 118)

(...)

"The last part of this book is dedicated to Abelard's theory on the nature of modalities, and to the questions he raises concerning how we may come to know that something is possible or necessary." (p. 200)

13. ———. 2022. "The *De Re–De Dicto* Distinction. A Twelfth-Century Logical Discovery." *Vivarium* no. 60:162–191.

Abstract: "The identification of two possible readings – de re and de dicto – of modal claims is considered one of the greatest achievements of Abelard's logic. In the Dialectica and the *Logica "Ingredientibus,"* Abelard uses this distinction as a basis for his modal semantics and theory of modalities. Rather than focusing on Abelard's own theory, the aim of this article is to pay attention to a number of sources that – like Abelard's logical works – are datable to the first decades of the twelfth century, to investigate whether the d*e re–de dicto* distinction was already adopted and debated in them. It argues that, even if there is no systematic theorization of the distinction in these sources, Abelard's contemporaries put forward a number of

questions concerning the syntax and the signification of modal claims that contributed to set the stage for the distinction's identification and later development."

14. Bird, Otto. 1960. "The Logical Interest of the *Topics* as Seen in Abelard." *The Modern Schoolman* no. 37:53–57.

    "Father Ong in his *Ramus* describes Peter of Spain as giving "short shrift" to the doctrine of places and explains this by saying: "The notion of the places is not scientific in any precise logical or psychological sense, since the exact application of the local analogy in play here is very difficult, if not impossible to determine." (1) Leaving aside the analogy, the question may be raised whether there is any "precise logical" interest in the doctrine of places, or of "topics," as I prefer to call them. There may be little in the Renaissance logics which are the main object of Father Ong's study. But it is quite a different matter for medieval logic, as is evident from a consideration of perhaps the first great figure in the development of a specifically medieval logic. I refer to Peter Abelard, whose main work on the topics is now available in the recent, edition of the *Dialectica* by L. M. De Rijk, where it takes up 160 of the 548 pages of text. (2)?

    What I propose to do here is to show from Abelard's analysis that there is a precise logical interest in the topics and incidentally to indicate how at least some of the matters of traditional topical concern fall within the scope of modern logic.

    Abelard begins his consideration of the topics (De Loci.s) immediately after that of the syllogism, as does Peter of Spain in his Siunmulae, which became the classical text in elementary logic from the thirteenth century on. In it he is still concerned with inference, the great object of the logician's interest. Rut in turning from the syllogism to the topics, he passes from what ho calls perfect to imperfect inference." (p. 53)

15. Blackwell, Daniel F. 1988. *Non-Ontological Constructs: The Effects of Abaelard's Logical and Ethical Theories on His Theology: A study in Meaning and Verification*. Bern: Peter Lang.

    Contents: Abbreviations III; Introduction V-XII; I. The Works and their Problems 1; II. The Logic of Affairs and Causes 72; III. Revelation, Verification, and Meaning in the Continuum 180; Appendix I: The Aristotelian texts available to Abaelard 309; Appendix II: Abelard and contemporary literature 311; Bibliography 317-327.

    "In the *Ingredientibus* and the *Dialectica* Abaelard sees himself following in the tradition of Aristotle. Throughout the three *Theologies* he shows a marked respect for Platonic and neoPlatonic philosophy. While the origin of much of his thought lies in both traditions, significant is the use which he makes of his sources. For example, the content of much of the grammatical and logical texts is based on Aristotle. Yet, by rejecting just one fundamental Aristotelian logical principle--namely, the logical significance of the notion that qualities 'inhere in' subjects qua substances— his grammatico-logical methodological presuppositions become so at odds with those of the *Organon* that he can be called an Aristotelian only in the broadest sense of the term.

    (...)

    The problem in which Abaelard was involving himself was that of sense and reference. Maintaining the position that the subjects of meaningful statements needn't refer to things, he had to find a verification principle for propositional statements which did not depend on an ontological inherence theory. Turning his attention to impersonal constructs, he notes that all statements of this type contain *dicta,* or descriptive assertions of facts about things.

(...)

Near the end of the *Ingredientibus* Abaelard notes that modal propositions (e.g. *Possible est*...) are also impersonal grammatical constructions. In fact, all existential statements imply a tacit '*verum est*....' It is here that the grammatical origins of the logic become apparent: All existential statements may be transformed into impersonal constructions which contain *dicta*. 'That which is true' is the meaning described by the *dictum*. Truth is not concerned with the existence or non-existence of some substance, but with meaningful descriptions about some state of affairs in the world which happens to occur or not occur. Hence, it is the meaning of a statement which is its principle of verification.

Unlike existential statements, general statements of necessary truth cannot be verified by dicta because they do not describe individual states of affairs. The general or universal terms contained in conditional statements do not refer to things.

(...)

While much of Abaelard's theology in the TSB [*Theologia Summi Boni*] is concerned with definitions, he also stresses the importance of similies and analogical descriptions of divine Realities. Insofar as analogies are descriptive, they parallel propositional dicta. Although they do not describe worldly states of affairs, like dicta, the truth of analogical statements is closely associated with their meaning." (pp. V-IX)

"In one of the most sustained recent studies of Abelard’s thought, *Non-ontological constructs. The effects of Abaelard's logical and ethical theories on his theology: a study in meaning and verification* (Berne/Frankfurt/New York/Paris, 1988) (Basler und Berner studien zur historischen und systematischen Theologie 56), Daniel Blackwell gives an account of Abelard’s logic which gives pride of place to his theory of non-things and relates his approach to theology to it. Interesting though many of his observations are, the investigations of the preceding chapters would suggest that he has distorted the balance of Abelard’s thought; and his

reconstruction of Abelard’s intellectual progress relies on a dating of the works which few scholars would now find acceptable." (John Marenbon, *The Philosophy of Peter Abelard*, Cambridge: Cambridge University Press 1999, p. 209, n. 15)

16. Boler, John F. 1963. "Abailard and the Problem of Universals." *Journal of the History of Philosophy* no. 1:37–52.

    "The effect of Abailard's analysis on the later Middle Ages is considerable.

    Nearly all writers after Abailard make use of the distinctions of two-fold signification, first and second imposition, word and term--in one form or another. But in some of these later writers, one finds what seems to be a return to the pre-Abailardian concern with things rather than terms. It is no surprise, really, for one wonders, even upon reading Abailard, whether he has been fair in his evaluations of his predecessors.

    Coming, as it does, after a criticism of the earlier positions on universals, Abailard's remark that universality pertains to terms and not to things might lead us to believe that he intends to solve the problem of universals by speaking only of terms. It is true that, from the time of Porphyry, the problem of universals had been cast in the language of genus and species; but Abailard's proposal to take genus and species as second imposition -- laudable enough in itself--does not seem adequate to the problem which these men had, however imprecisely, suggested. Even through Abailard's presentation of their positions, one can see that they were concerned with the question of what it is for Peter and Paul to be the same as men; and neither second imposition nor "significatio de intellectibus" meets this problem head on.

    (...)

    What I have tried to suggest in the present paper is that, behind the "clear idea" that universality pertains to terms and not to things, there lies a proposal which, if it is not metaphysics, is also not logic: namely, that the understanding achieves a peculiar transformation in the process of arriving at the

"status," where what is known is something different from the individual thing as individual. Abailard may be correct in holding this, but I do not find either a clear analysis or adequate justification for it in his writings. (34) Without such analysis, the statement that universality pertains to terms and not to things cannot serve as sufficient evidence of the character of Abailard's position on the problem of universals." (pp. 50-51)

(34) The lacuna which I find in Abailard's theory is, according to Geyer, more than adequately filled by Abailard's theory of abstraction. (See the articles cited in note 10, above. ["Die Stellung Abaelards in der Universalienfrage," *Beiträge* . . . . Suppl. I (1913), pp. 101-127]) I cannot help but feel, however, that Geyer is (at best) reading a thirteenth-century interpretation into Abailard.

And his insistence that the analysis of abstraction shows what a sharp psychologist Abailard was only serves to further disaffect me. A shift to psychology at this point in the problem would seem to me more unfortunate than laudable.

17. Brower, Jeffrey E. 1996. *Medieval Theories of Relations before Aquinas: 'Categories' Commentaries, A.D. 510--1250 (Aristotle, Boethius, Peter Abelard, Saint Albertus Magnus)*, University of Iowa.

    Available at ProQuest Dissertation Express. Order number: 9715116.

    Table of Contents: Vol. I: List of Abbreviations X; I. Introduction 1; II. Aristotelian Background 49; III. Boethius's Commentary on *Categories* 100; IV. Abelard's Two *Categories* Commentaries 226; V. Albert's Commentary on *Categories 7* 176; Vol. II: Appendix A. Preface to translations 221; B. Boethius's Translation of *Categories 7* 228; C. Composite edition of *Categories 7* 246; D. Boethius *in Categorias Aristotelis* 264; E. Abelard's *Logica Ingredientibus* 346; F. Abelard's *Dialectica* 418; G. Albert's *Liber de Praedicamentis* 446; Bibliography 533-544.

From the Abstract: "In the dissertation I focus on the texts of three medieval philosophers writing before Aquinas: Boethius (480-524), Abelard (1079-1142), and Albert the Great (1200-1280).

These texts are all commentaries on Aristotle's short treatise, the *Categories*. In the *Categories* Aristotle identifies relations (or relatives, *pros ti*) as one of the ten irreducible kinds of beings (*onta*), and he devotes an entire chapter the seventh chapter of his treatise to

analyzing their nature and ontological status. I take Categories 1 as a starting point for my dissertation, and devote its first chapter to outlining Aristotle's discussion and identifying the important philosophical and interpretive questions to which it gives rise. In the remainder of the dissertation, however, I examine the medieval commentary tradition that grew up around the *Categories* during the years 510-1250 A.D.

(...)

None of the texts I consider in the dissertation has ever been translated into a modern language. As an aid to their recovery, I include (as appendices) English translations of all the following: (1) Boethius's Latin translation of *Categories* 7, (2) chapter 7 of the early medieval composite edition of the *Categories* (the so-cailed *Editio Composita*), and (3) all the relevant portions of Boethius's, Abelard's, and Albert's *Categories* commentaries." (Abstract, pp. V-VII)

Texts of Abelard translated:

[Latin Text: *Logica ingredientibus* in *Peter Abaelards Philosophische Schriften*, Beitrage zur Geschichte der Philosophie des Mittelalters, Band XXI, 1-3, ed. Bernhard Geyer (Munich, 1919-1927), 200-223.], pp. 346-417.

[Latin Text: *Dialectica*, ed. L.M. de Rijk, 2nd ed. (Assen, 1956), 83-92.], pp. 418-445.

18. ———. 1998. "Abelard's Theory of Relations: Reductionism and the Aristotelian Tradition." *The Review of Metaphysics* no. 51:605–631.

"In what follows I focus on the work of Peter Abelard (1079-1142), an influential medieval logician who developed his theory of relations in the course of commenting on *Categories* 7.(4) Like other Aristotelians, Abelard accepts the view that relations are reducible to the monadic properties of related things. On his theory, however, the relation between Simmias and Socrates is not to be explained by a set of peculiar monadic properties--say, being-taller-than-Socrates and being-shorter-than-Simmias. Rather it is to be explained by a pair of ordinary heights--say, being-six-feet-tall in the case of Simmias and being-five-feet-ten in the case of Socrates. Indeed, according to Abelard, the relation between Simmias and Socrates is nothing over and above the possession by these individuals of their respective heights.

Although Abelard commits himself to a form of reductionism about relations, we shall see that his theory is perfectly compatible with the advances made by twentieth-century logicians. Abelard is careful to distinguish questions about ontology from questions about logic, and to commit himself to reducing relations only at the level of ontology. Thus, he argues that Simmias's being taller than Socrates is nothing but Simmias, Socrates, and their respective heights. Nonetheless, he denies that relational statements of the form "Simmias is taller than Socrates" can be reduced to complex non-relational statements of the form "Simmias is six-feet-tall and Socrates is five-feet-ten."

The rest of the paper is divided into three parts. As will emerge, there is an important distinction to be drawn between Abelard's theory of relations and his account of relatives. hi the first part of the paper (sections I-II), I present and explain the account of relatives. Here I focus on one of Abelard's most important logical works, his Logica 'ingredientibus,' but since the relevant portion of this work follows the subject matter and arrangement of *Categories* 7, I begin with a brief sketch of Aristotle's text. In the second part of the paper (sections III-V), I indicate what Abelard's account of relatives tells us about his own theory of relations. Although, this requires some reconstruction on my part, it is possible to determine with

some accuracy to what sort of theory he committed himself. In the third and final part of the paper (sections VI-VII), I turn to the defense of Abelard's theory. My purpose in this last part is to begin the project of rehabilitating a much denigrated tradition in the history of philosophy." (pp. 605-606)

19. Cameron, Margaret. 2007. "Abelard (and Heloise?) On Intention." *American Catholic Philosophical Quarterly* no. 81:323–338.

    Abstract: "For Abelard, the notion of “intention” (*intentio, attentio*) plays a central and important role in his cognitive and ethical theories. Is there any philosophical connection between its uses in these contexts? In recent publications, Constant Mews has argued that the cognitive and ethical senses of “intention” are related (namely, the cognitive sense evolves into the ethical sense), and that Abelard is repeatedly led to focus on intentions throughout his career due to the influence of Heloise. Here I evaluate Mews’s arguments by examining and comparing the cognitive and ethical senses of the term. Although the basis for Mews’s claim seems to be false, I argue that there is nonetheless an important philosophical relationship between cognitive and ethical *intentiones* in Abelard’s thought, the recognition of which leads to a new and more precise understanding of his ethical theory of intention."

20. ———. 2011. "Abelard's Early Glosses: Some Questions." In *Arts du langage et théologie aux confins des XIe et XIIe siècles*, edited by Rosier-Catach, Irène, 647–662. Turnhout: Brepols.

    "Peter Abelard’s first known glosses on *Isagoge, Categories, On interpretation* and *On division* – variously referred to as the « Editiones », the « Introductiones parvulorum », or literal commentaries – were supposedly written very early in his career, probably around 1102-1104 when he was in his early twenties.

    (,,,)

    The *editiones* are commonly considered to be Abelard’s « vocalist », or *in voce,* commentaries, thought to display more than anything else the influence of his former teacher, Roscelin

of Compiègne, who has been long characterized by historians of philosophy as a nominalist, and more recently as a « vocalist ». These works are supposed to reflect the kind of teaching that Abelard would have received under Roscelin. Despite their important role in the narrative of Abelard's career and of early medieval logic more broadly, the early glosses have not been examined in close detail.

Although they have been attributed to Abelard and treated as a set, serious questions need to be raised regarding the evidence used to defend these claims. The evidence is fivefold. First, the editiones were written in the same, twelfth century hand and are found in one manuscript. Second, the *Isagoge, On interpretation* and *On division* glosses bear titles that attribute the works to Abelard. Third, elsewhere in his corpus Abelard himself refers to « introductiones parvulorum » that he has written. Fourth, versions of the *Isagoge and On interpretation* glosses are found in another manuscript, manuscript Munich, Bayerische Staatsbibliothek, clm 14779, where there appear to be self-referential examples using the name « Petrus » given.

Finally, it has been argued that the *Categories* gloss, despite being untitled, bears strong similarities (namely, linguistic and doctrinal parallels) to Abelard's commentary on *Categories* found in the *Logica* « Ingredientibus » collection.

Possibly none of the questions raised in this article on its own is sufficient to overturn the attribution, but taken together they raise serious difficulties for anyone who wishes to continue to defend that the *editiones* were written by Abelard. There do, however, seem to be extremely good reasons to break up the set of the editiones by excluding the gloss on *Categories* from the rest: unlike the others, it is an anonymous fragment, different in style and has required a special defence for its inclusion in the set. In what follows, I will examine each of the five pieces of evidence. I will argue that there are insufficient reasons to continue to attribute these works to Abelard or to consider that they form a set (1)." (pp. 647-648)

(1) In « A note on the Attribution of the Literal Glosses in Paris, BnF, lat. 13368 », Christopher Martin will examine the

doctrinal content of the *Isagoge, On interpretation* and *On division* glosses and compare it with views Abelard is known to espouse elsewhere in his writings.

21. ———. 2011. "When does a word signify? Debates from Peter Abelard's milieu and the early thirteenth century." *Archives d'Histoire Doctrinale et Littéraire du Moyen Age* no. 78:179–194.

    Abstract: "The shift of focus from spoken to mental language in medieval philosophy is well known.

    What has not been noticed is the role played by the recognition of various paradoxes and problems of signification due to the physical character of spoken utterances.

    This essay examines these paradoxes and their solutions in the work of Peter Abelard, his contemporaries, and some authors in the early thirteenth century."

    "As is well-known, Abelard eventually shifted his attention away from consideration of the physicality of utterances towards their cognitive status.

    Abelard concedes that the material nature (*essentia*) of utterances (*voces*) and significant words (*sermones*) is virtually the same, but they differ in origin (34): spoken utterances (*voces*), like the things signified by words, are due to nature, whereas significant utterances *(sermones*) are products of human institution. In his latest works, it is clear that Abelard has shifted altogether away from the analysis of utterances considered as physical, natural items and towards words considered as significant as a product of human institution, connected most closely with human understanding." (pp. 18-189)

    (34) (34) Abelard, *Logica nostrorum petitioni sociorum*, ed. P. Geyer, *Peter Abaelards philosophische Schriften*. II. Die Logica « Nostrorum Petitioni Sociorum » : Die Glossen zu Porphyrius, Münster 1933, p. 522.17-22: « Quid enim aliud est nativitas sermonum sive nominum quam hominum institutio ? Hoc enim quod est nomen sive sermo ex hominum institutione contrahit. Vocis vero sive rei nativitas quid aliud est quam

naturae creatio, cum proprium esse rei sive vocis sola operatione naturae consistat ? Itaque nativitatis vocis et sermonis diversitas, etsi penitus in essentia identitas ».

22. ———. 2011. "The Development of Early Twelfth Century Logic: a Reconsideration." In *Arts du langage et théologie aux confins des XIe et XIIe siècles: textes, maîtres, débats*, edited by Rosier-Catach, Irène, 677–694. Turnhout: Brepols.

    "It is important to evaluate the most recent account of the development of early twelfth century logic put forward, in separate works, but by way of mutual influence, by Y. Iwakuma and J. Marenbon. I will call their version « The Current Story ». According to it, Abelard developed a philosophical position called « Vocalism » upon aving argued with his former teacher William of Champeaux over universals. Prior to this confrontation, the young Abelard (and others associated with his teacher Roscelin of Compiègne) practiced what Marenbon has called « *in voce* exegesis» and what Iwakuma calls «proto-vocalism ». The inspiration for their account came in part from a series of arguments concerning the chronology of Abelard writings given by C. Mews (1985).

    (...)

    "In the end, I hope to show that the Current Story is wrong. To do so, I will first summarize it as it has been told by Marenbon and Iwakuma. I will try to sort out a basic confusion about the meaning of ontological neutrality upon which it relies. The evidence supporting the Current Story crucially depends on the dating and characterization of Abelard's so-called earliest glosses, the «*Introductiones parvulorum*» (referred to as the «editiones» below). Elsewhere (see my article in this volume) I have argued that there is insufficient evidence to attribute these *editiones* to Abelard. Furthermore, as I will show, regardless of their supposed connection to Abelard, the *editiones* has been mischaracterized. I argue that there is a much more plausible and defensible way to understand the character and purpose of these early glosses and others like them. By altering our understanding of these glosses, however, we are forced to abandon the Current Story altogether." (pp. 677-679)

23. ———. 2012. "Meaning: Foundational and Semantic Theories." In *The Oxford Handbook of Medieval Philosophy*, edited by Marenbon, John, 342–362. New York Oxford University Press.

"What follows is a very brief overview of some of the major developments in semantic and hermeneutic theory, focusing especially on the issue of using names other than as they were imposed to signify.

One of the first efforts to account for this phenomenon can be seen in the early twelfth century during Peter Abelard’s milieu, during which they refined a notion of linguistic translation (*translatio*). As Rosier-Catach (1997, 1999) has shown in detail, signification by way of translation or semantic transference (not from one language into another, but from one sense into another) was introduced in order to handle

cases of metaphorical language.

(...)

As Abelard notes, there is only a conflict of meaning (*oppositio vocis*) if the expression is interpreted according to the way the terms were originally imposed, but not according to the way it is accepted in a given context of use (1927, 478, 28–479, 2). The doctrine of semantic transference was of great use for hermeneutics, specifically for the interpretation of theological language: given that imposition is a human act, names were ‘instituted in order to designate the creatures that humans were able to conceive’ (Abelard, 1983 , II § 70–78). Accordingly, when human words are used to talk about God and God’s nature, they ‘necessarily exceed their proper institution (or imposition)’ (ibid.)" (p. 353, a note omitted)

"A novel kind of meaning shows up, apparently independently, in the philosophy of the Stoics and of Peter Abelard (1079–1142). For the Stoics it is the *lekton*, or ‘sayable’ (or, more precisely, the *axioma*, or ‘assertible’, which is one type of *lekton*), and for Abelard it is the *dictum*. The extent of similarity between their doctrines is surprising, especially because there is no evidence of a historical connection between them: as far as we know, Abelard did not have access to any Stoic writings, or reports of Stoic views, on the topic of linguistic content. (1) The similarity is more surprising still, given that Abelard was working within the context of Aristotle’s logic, which contains no comparable doctrine. Historians of philosophy have noticed this similarity.(2) When the comparison is drawn it is with reference to the fact of their shared recognition of this new type of content—propositional content. But there are other remarkable points of similarity in their views. First, both seem to have been motivated, at least in part, by the need to disambiguate the notion of predication in the ancient philosophical tradition. Second, both the Stoics (at least beginning with Chrysippus, the third head of the school) and Abelard were driven by a commitment to anti-realism, and by the need to present an anti-realist, or at least deflationary, metaphysics. After a brief outline of each of their doctrines, I will compare their views on the points mentioned here." (p. 55)

(...)

"Conclusion. In conclusion, what happens to this new type of linguistic content after Abelard? Theories of propositional content emerge, disappear, and re-emerge throughout the medieval and scholastic periods. The interest is preserved in the continuation of the logical tradition, still rooted in Aristotelian logic, beginning in the twelfth century. Some theorists seemed to have been entirely unconcerned with the ontological implications and underpinnings of these sorts of linguistic content. For example, the author(s) of a thirteenth-century logical textbook called the *Ars Burana* explain(s) that it is best considered to be an extrapredicamental thing (that is, not countenanced in what exists in an Aristotelian ontology of substances and accidents): Note that whether it is called a *dictum propositionis* or the *significatum propositionis* or the *enuntiabile*, it is the same. The enuntiable is that which is signified by the proposition . . . If you inquire what kind of thing it is, whether it is a substance or an accident, it must be said regarding the enuntiable, just as regarding the predicable, that it is neither a substance nor an accident nor is it of any other category. For it has its own per se mode of existing. And it is called 'extrapredicamental', not for the reason that it does not belong to any category, but because it does not belong to any of the ten categories that Aristotle distinguished. It is therefore of a certain category which can be called the 'enuntiable category'. (53) Later, some philosophers attempted to defend a view that took the opposite tack— that is, to defend a view of propositional realism, only to encounter some of the same sorts of anti-realist challenges.(54)" (p. 71)

(1) While Augustine's *De dialectica* contains some version of the Stoic doctrine, his treatise does not appear to have circulated until the thirteenth century. Another possible source might have been Cicero, but I know of no evidence to support such a transmission.

(2) Martin (2004), who cites Nuchelmans (1973) and Schenkeveld (1984). See also Jacobi (1983) and Lenz (2005). But see Nuchelmans (1973: 152): it is hardly necessary to add

that the Abelardian term *dictum* has nothing to do with the Stoic term *lekton*.'

25. ———. 2015. "The Logic of Dead Humans: Abelard and the transformation of the Porphyrian Tree." *Oxford Studies in*

Medieval Philosophy no. 3:32–63.

"Is a dead human still a human? Is it the same human, or even the same body? What is the correct meaning of the sentence, “Humans die”? These sorts of problems, which are being actively debated today, were also recognized in the early twelfth century in Paris by Peter Abelard and others who adhered to the classical definition of man, or human, as ‘rational mortal animal.’ Their concerns were not, as far as I know, ethical, although they were likely to an extent theological.(1)

Instead, they recognized a problem with the logic of living and dead humans based on the doctrine of substance found in Aristotle’s Categories and in the division of substance, as outlined by Porphyry to exemplify the logic of genus and species relations in the *Isagoge*. Abelard (1079–1142) held the view that there is no such thing as a dead human, and this provoked an intense response from his contemporaries.

(...)

I will first outline the reasons for Abelard’s claim that there are no dead humans, as well as his theory of what a human being is. There is plenty of evidence that Abelard’s view was faced with criticism, and in section 1 I will run through some of those criticisms. This period is best known for the debates over the status of universals, which were presented to us by Abelard himself in his commentary on *Isagoge*, and as it turns out, the debates over the implications of Abelard’s view that there are no dead humans were tightly bound up with the debates over the status of universals. The debates found in the anonymous commentaries have to do with how to understand the so-called Porphyrian tree, which was regarded as a fixed and inviolable structure of the category of substance. Specifically, the anonymous commentators try to defend the view known as Material Essence Realism (or MERealism), or at least a version of realism very similar to it, against Abelard’s criticisms of it. By tracking the problems generated by Abelard’s view that there are no dead humans we acquire greater insight into these early twelfth-century debates over the status of genera and species,

especially those prompted by the difficulty of trying to make sense of the logic of dead humans." (pp. 33-34)

(1) The theological implications of the substantial status of human beings are, obviously, far reaching. In addition to debates over the Trinity, there are also implications for the real presence of Christ in the Eucharist and the endurance of Christ's body in the tomb.

The History of the Philosophy of Mind, Volume 2.

"My primary interest in this chapter is to identify the ancient sources that inspired Abelard's own theory, and more narrowly to investigate the language of mental perception that lies at its foundation. Abelard turned to three well-known ancient writings available to him in the early twelfth century:

Boethius' *Commentary on Porphyry's Isagoge* and his *Consolation of Philosophy*, as well as Augustine's *On the Trinity*. King (1982) first emphasized the importance of acts of attention in Abelard's philosophy. The explicit link with Augustine's theory was elaborated by Rosier-Catach (2004). Their interpretations of Abelard on attention differ considerably from one another, and my own differs from both of theirs. Without access to Aristotle's *De Anima*, which was first translated into Latin in the late twelfth century (and even then it took a number of years before it began to be seriously studied), Abelard is left to come up with a theory of mind, ultimately rooted in sense experience, that can account for our true understanding of things that have no correlates or denotata in the reality that we presently sense." (p. 19)

27. ———. 2020. "The Constraints of Nature(s): Abelard on Modality, Understanding and Linguistic Meaning." In *The Origin and Nature of Language and Logic: Perspectives in Medieval Islamic, Jewish, and Christian Thought*, edited by Germann, Nadja and Harvey, Steven, 369–386. Turnhout: Brepols.

"According to Peter Abelard (1079-1142), the nature of things *(natura rerum*) imposes strict constraints on what is possible, impossible and necessary: the possible is what nature allows, the impossible what is contrary to nature, and the necessary what nature demands.(1) Species, which are natural kinds, have natures; for example, humans by nature are rational, mortal animals. These natures constrain modal parameters for individuals of those species by determining those individuals' capacities and incapacities. What is possible, impossible or necessary for individuals is thereby broadly determined by their species-level capacities.

This aspect of Abelard's modal theory has been acknowledged by recent scholars. What has not been noticed is the remarkable extent to which Abelard's views on the constraints of nature for modality are consistent with his views on the ways nature constrains both understanding and linguistic meaning. In other words, Abelard's modal theory is complemented by a psychological theory about how we come to know these modalities as well as by a theory of linguistic meaning that explains how names come to be. In what follows I will outline how nature constrains modality, understanding and linguistic meaning according to Abelard. To appreciate the consistency of his views, we will need to investigate what Abelard means by "nature", and how it is able to effect the constraints at each level: reality, understanding and linguistic meaning. As a result, it will become perfectly clear, contrary to some earlier interpretations of Abelard's philosophy (see below, section II of this paper), that while Abelard is a non-realist about many

things (e.g., universals, causes), he is a realist about natural kinds and is committed to a one-world theory of modality, rendering any possible-worlds-style interpretation of his philosophy inappropriate." (pp. 369-370, notes omitted)

28. Courtenay, William J. 1991. "*Nominales* and Nominalism in the Twelfth Century." In *Lectionum Varietates. Hommage à Paul Vignaux*, edited by Jolivet, Jean, Kaluza, Zénon and Libera, Alain de, 11–48. Paris: Vrin.

    Reprinted as Chapter Four in: W. J. Courtenay, *Ockham and Ockhamism: Studies in the Dissemination and Impact of His Thought*, Leiden: Brill, 2008, pp. 39-80.

    "Since the *Nominales* are first mentioned as active in Abelard's last years or shortly after his death and the application of the theory of the nomen to the problem of the object of faith does not appear before Abelard, it seems plausible that his teaching was, at the very least, influential in the development of the positions of that group. At the same time it must be noted that (1) Abelard made use of a theory of nouns and *enuntiabilia* that was already in circulation and that the label *Nominales* was first and foremost tied to a theory of the *nomen* that Abelard shared with many others; that (2) it is unclear how many of these positions were original or unique to Abelard; and that (3) several of the positions attributed to the *Nominales* were attributed variously to several other groups or schools as well, such as the *Parvipontani, Melidunenses, Montani*, and *Cappauces*. Abelard had considerable sympathy for a theory of *nomina* and a technique of problem solving that his colleague, Alberic, found objectionable. This is another illustration of the Platonic current within Abelard's thought that has not received sufficient attention.

    Alberic could well have included Abelard among the *secta Nominalium*, but the latter is probably a larger category and not identical with Abelard or his disciples. If the first major twist in this problem requires us to acknowledge the Platonic background of the nominalist theory, the second major twist is that Abelard was a Nominalist or proto-Nominalist, but on a far different set of issues and viewpoints than previously imagined.

And if we include Abelard among the *Nominales*, then we should include Peter Lombard and his closest followers.

On the basis of our present knowledge, however, it might be more accurate simply to describe Abelard as a major source and Lombard as heavily influenced by nominalist theory." (pp. 78-79 of the reprint)

29. ———. 1993. "*Nominales* and Rules of Inference." In *Argumentationstheorie. Scholastische Forschungen zu den logischen und semantischen Regeln korrekte Folgerns*, edited by Jacobi, Klaus, 153–160. Leiden: Brill.

    Reprinted as Chapter Five in: W. J. Courtenay, *Ockham and Ockhamism. Studies in the Dissemination and Impact of His Thought*, Leiden: Brill, 2008, pp. 81-87.

    "Among the positions attributed to the *Nominales* in the twelfth and thirteenth centuries are several that can be categorized as rules of inference or are related to theories of entailment. A list of these along with other nominalist opinions was recently assembled by Calvin Normore in a very stimulating and perceptive article(1) Although the entire list of positions attributed to the Nominales seemed initially to Normore to be quite disparate and unrelated, he concluded that the positions had two things in common. First, that they were all positions held by Peter Abelard who, on the basis of this and other long-known evidence, was credited with the establishment of the Nominalist school. And second, that the principal issue that linked most of the nominalist theses was not the issue of universals but rather the question: what makes propositions true?" (p, 81 of the reprint)

30. Cranz, Edward F. 2006. "Boethius and Abelard." In *Reorientations of Western Thought from Antiquity to the Renaissance*, edited by Struever, Nancy, 1–20. Aldershot: Ashgate.

"Let me conclude with two brief general addenda. First, I have tried to outline the main development of Abelard's logic and the one most dependent upon Boethius. What we have seen may be summarized by saying that, where Boethius closely connects, sometimes even identifies, intellections, universals and propositions with *'res*' or beings, Abelard shifts all these relationships to a new context and then denies them all: intellections, universals and propositions are not *'res*" as physical things. To repeat a phrase; he desubstantializes them all.

But Abelard never stops thinking. Sometimes his conclusions are more new questions than new answers, and his second treatment of a problem is sometimes very different from his first. Some scholars have described the last stage of his thought as a 'return to Platonism': but I think he is more creative and original. He has changed Boethius' res into 'physical things,' and he has denied that intellections or meanings were 'physical things' and turned them into 'nothings.' But there are hints, and there is no time to analyze them here, that at the end he began to move to another new solution in which meanings from having been nothings turn into the ultimate realities. If I had to suggest parallels to his last stage, Petrarch, Lorenzo Valla and Nicholas of Cusa come to mind. So if I have tried to describe Abelard's transformation of Boethius, what was left, and I don't believe it was ever completed, might be called Abelard's transformation of Abelard.

Second, while Abelard's writings had no wide dispersion and while he was not followed by any school or even by very many pupils, I believe his diffuse influence was greater than one might expect. The reorientations of thought one finds in his logic and elsewhere often spread more widely in his own time than did his specific ideas; they were not destroyed by the reception of Aristotle and in some ways provided a context within which Aristotle was received. So in concluding I cannot resist noting that, while I have characterized what happened as a transformation of Boethius, let us not in this group forget that it was a transformation of Boethius." (p. 20)

31. Donato, Enrico. 2022. "Abelard on Eternal Truths." *Vivarium* no. 60:226–247.

    Abstract: "This article reconstructs Abelard's account of eternal truths as it is presented in the *Dialectica,* in the so-called *Sententiae Parisiense*s, and in the *Theologia "Scholarium."*

    It first shows how in the *Dialectica* Abelard had to transform the traditional account of topical inferences in order to make sense of the idea that true conditional propositions express eternal truths. It clarifies Abelard's claim that eternal truths are grounded on the "nature of things" and explains why Abelard thought that these truths hold even when there are no things. The article then considers Abelard's reply to an objection according to which eternal truths have in fact been false in the past. It examines Abelard's mature views on eternal truths as we find them in the *Sententiae Parisiense*s and *Theologia "Scholarium."* Here, Abelard grants the status of eternal truth also to what is expressed by contingently true categorical propositions. These truths are grounded on the "events of things" that exist eternally as the proposition-like objects of God's will and foreknowledge."

32. ———. 2025. "Alberic the Logician." *Journal of the History of Philosophy* no. 63:357–377.

    Abstract: "Alberic of Paris (fl. 1130s) was one of the most prominent philosophers of the twelfth century, and Peter Abelard's main rival. In this paper, I argue that the aim of Alberic's logical program was to propound a realist conception of logic. That is, Alberic rejected the nominalistic theorem according to which logic deals only with names, and argued that logic also deals with things, both particular and universal. In this regard, Alberic's logic hinges on a clear commitment to the existence of universals.

    To show this, I examine the core elements of Alberic's logic and contrast them with their nominalistic counterparts. My analysis shows that Alberic, unlike Abelard and the Nominales, systematically construed logical relations and operations with reference to things and their universal natures. Moreover, I

demonstrate that Alberic's realism was in many ways an attempt to recover the original spirit of Boethius's logic from the unorthodox and profound transformations that had been introduced by Abelard in the 1110s."

    Section IV. *Abelard*, pp. 7-9.

    "It has been remarked that in Abelard the logical terminology is not definitely assested and that he frequently uses the same terms in an equivocal sense. Nevertheless Abelard is the first author in which the distinction between the intensional and the extensional aspects of semantics is substantially (if not always terminologically) posited with a great care. It is true that he speaks indifferently of "significado de rebus" and "significatio de intellectibus," but it is equally true that for him the primary sense of "significatio" is an intensional one, on the Augustinián line of thought- where "significare" is "constituere" or "generare" a concept of the mind." (p. 7)

35. Fredborg, Karin Margareta. 2003. "Abelard on Rhetoric." In *Rhetoric and Renewal in the Latin West 1100-1540: Essays in Honour of John O. Ward*, edited by Mews, Constant J., Nederman, Cary J. and Thomson, Rodney M., 55–80. Turnhout: Brepols.

    "The only time we hear about the famous dialectician and theologian Peter Abelard being engaged in studying rhetoric is when he resumed his studies with William of Champeaux some time between 1108 and 1113 in Paris. As in other situations, Abelard started an argument and came out victorious:(1)

    (...)

Why a dispute about the universals should come up during a disputation in a course of rhetoric, we are never told. Early twelfth-century French rhetorical commentaries, however, including those by William of Champeaux, do deal with philosophical matters. Three times in his commentaries we find phrases like ‘res universalis’ or ‘invincible reasons for saying genus est res’(3) which could have sparked off such a dispute over the universals. Unfortunately, no extant Ciceronian commentary or traces of Abelard’s own teaching on, for instance, the *De inventione* or the *Rhetorica ad Herennium* exist today, but we know that Abelard was interested in Cicero. (4(We also possess an interesting twelve-page digression on rhetorical argumentation in his glosses to Boethius’ *De differentiis topicis* which I intend to re-edit here.[*]" (pp. 55-56, two notes oitted)

36. Freddoso, Alfred J. 1978. "Abailard on Collective Realism." *Journal of Philosophy* no. 75:527–538.

Comments by Eileen Serene, pp. 539-540.

Abstract: "In the "Logica ingredientibus" Abailard attacks the theory according to which universals are collections of individuals. I argue that Abailard's principal objection to this 'collective realism', viz, that it conflates universals with integral wholes, is actually quite strong, though it is generally overlooked by recent commentators. For implicit in this objection is the claim that the collective realist cannot provide a satisfactory account of predication. The reason for this is that

integral wholes are not uniquely decomposable. In support of my thesis I first explicate the medieval distinction between integral and subjective parts and then discuss its application to collective realism."

37. Gill, Harjeet Singh. 1989. "The Abelardian Semiotics." In *Abelardian Semiotics and Other Essays*, 1–29. New Dehli: Bahri Publications.

    "The linguistic theory of Abelard is centred around the correlation or correspondence between the "word" and the "thing" or the *signifiant* and the *signifié* as we would have them today. According to Abelard, if a word or a sound signifies, it is because something is added to its physical being. *essentia;* this something is the significative function, *officium significandi.* The sound, just like the thing that it represents in a give language, remains the same from one community of speakers to another, it belongs to the sphere of things, which is natural; the significance, on the other hand, changes due to the diversity of languages, it depends upon institution, upon a human convention, *positio hominum, voluntas hominum*.(1) We have already the distinction between the sphere of significance and the sphere of things. The sound or the physically pronounced utterance is of the order of nature while significance is created when "something" is added to its being, and, this "something" is due to human intervention in a human, social institution. For Abelard, words give birth to or "generate" intellection which then correspond to things. Thus, argues Abelard, there is a double series of correspondence between words and intellections, and between intellections and things, and consequently, between words and things. These are three distinct but related spheres.(2)" (pp. 4-5).

38. ———. 1996. *The Semiotics of Conceptual Structures*. New Delhi: Bahri Publications.

Second edition Jawaharlal Nehru University 2016.

First part: Abelardian Discourse: Pierre Abélard 19; Abélardian Theory of Mental Images 37; Abélardian Discourse 46; Abéelardian Tradition 55-71.

"We can summarise Abélardian reflections on the nature and function of language as a human institution where the words are imposed on things by human will, by human convention. At this stage they may be considered arbitrary but in the evolutionary process, the words not only refer to things, but also, and at times primarily, to their concepts, hence, they are not so ·arbitrary. Their semantic ranges are extended on the basis of analysis and analogy. These analogies are based on our perception of similarities as "soft" in soft wood, soft iron, soft cotton, soft drink, soft colour etc. We always begin from a physical sensuous experience which is then reorganised, rearranged in the domain of imagination. It is this imaginatively reconstituted concept of the thing (experience) that is the object of our intellection. Our expressions have three levels of articulation: the *physical*, the *grammatical* and the *conceptual*. We first proceed from the physical to the conceptual as we call "mother" Ganges on the basis of a certain perception of our own mother, then reciprocally, our mother acquires the characteristics of mother Ganges.

Furthermore, all conceptual relations are *reciprocal* as father and son derive their "fatherhood" and "son-hood" from each other, or metonymic and metaphoric relations, where chronological, syntagmatic, sequential and non-sequential, metaphorical concepts play a major role. Finally, language is a vehicle of communication between *thinking* beings where the interlocutors exchange words or expressions which are the resultants of their mental *activity*. They represent conceptual realities which are different from both Platonic universal realism and Aristotelian individual nominalism. (pp. 54-55)

Second edition. First edition with the title *Mental Images and Pure Forms: Study in Abelardian Theory* New Delhi: Bahri Publications 1991.

"4.3. The controversy over universals or mental images common to a number of individuals in the Middle Ages presents two opposing propositions. The realists, following Plato, believed that these universals like rationality and mortality have an intrinsic existence outside our bodies. They have a separate, real existence. The nominalists, following Aristotle, insisted that the universals subsist always in the sensible. It is a question of substance in act. This nature of animal that is designated by a universal word, which due to a certain transfer, is called universal, is found nowhere other than within a sensible body. For the realists, this universal conserves its being even outside all sensible substance.

Abélard says that we have to assign to these universal terms a third signification, other than the one which is based on the real thing and the one that is based on its intellection. This reality that Abélard assigns to these universals is a conceptual reality. It has neither the Platonic independent existence nor the Aristotelian reality confined only to the individual, sensible beings.

4.4. Abélard then explains the process of abstraction. Matter and form do not exist in isolation from each other but our esprit has the faculty to consider either one or the other in itself, paying attention, at times, to form only, at others, to matter, and even if it so desires, to consider them both in a certain combination. In the first two cases, it is an affair of an abstractive operation, an act with which our esprit abstracts an element from a synthesis to consider it in its own nature. In the third case, it is an operation of synthesis. For example, we have the substance of man. It is body, animal, man, it is covered with indefinite number of forms. When we pay attention to this substance in its material essence avoiding all forms, this operation is abstractive. Inversely, when we pay attention only

to the corporeality that we relate with the substance, our operation of comprehension is synthetic with rapport to the one that consists of considering only the nature of the substance, but it is at the same time, abstractive with rapport to other forms of corporeality like animation, sensibility, rationality etc., to which now we do not pay any attention. These abstractive intellections could be considered false and empty for they conceive things in a manner other than they really are. Paying attention to either form or matter in isolation when neither form nor matter subsists in isolation, we conceive things different from the way they really are, and consequently, they are completely false." (pp. 54-55)

41. Gracia, Jorge J. E. 1984. *Introduction to the Problem of Individuation in the Early Middle Ages*. München: Philosophia Verlag.

    Chapter IV. *The Tradition Based on Boethius' Logical Works: Peter Abailard and John of Salisbury*, pp. 196-254.

    I. Peter Abailard 196. A. The Accidental Theory of Substantial Individuation 196; 1. Abailard's Criticism 198; B. The Essential Theory of Individuation 210; 1. Abailard's Response 212; C. The Formalist Theory of Individuality and Its Criticism 212; D. Word View of Individuality 215; E. Numerical Diversity in the *Theologia christiana* 227; II. John of Salisbury 236; Notes 241-254.

    "Abailard, like most medieval writers before the thirteenth century, does not give separate consideration to the problem of individuality. He raises it in the context of his treatment of universals, contenting himself with only occasional and always incidental comments; the notion of individuality comes up when it can be used to shed light on the more controversial notion of universality. Moreover, the impact of his comments is mainly negative, given their critical character. The positive view of individuality he proposes is largely restricted to a logical dimension of the problem of individuality, as we shall see, and even then it is rather brief and cursory. In spite of this, and owning in particular to the sharp criticism of his opponents he presents, Abailard's discussion of individuality is in some ways

more subtle and interesting than much of what had been done before him.

There are only two works in which individuality is discussed to any serious degree.(6) The most developed view is contained in the *Logica ingredientibus*, a logical treatise written for beginners. A less complete account is given in the *Logica nostrorum*, of later date. Both works consist of commentaries on Porphyry and, as it should be expected, make extensive use of Boethius' Commentary on the "Isagoge". (p. 196, a note omitted)

(6) The existing books of the *Dialectica* contain very little of interest about individuality. In the lost books, however, most likely Abailard dealt with this issue, particularly in the book on *genus* and *species*, where he certainly must have raised the question of universality.

Moreover, there are other works of Abailard which are now lost and which may have contained matter relevant to the problem of individuality. See A. Van den Eynde, "Les ecrits perdus d'Abelard", *Antonianum* 14 (1975), 263-272 and N. M Häring, "Abailard Yesterday and Today", in *Pierre Abelard-Pierre le Vénérable* (Paris: CNRS, 1975), pp. 341-403. One of these reputed lost works was called *De universalibus et singularibus ad Oliviarum filium suum tractatus*, listed in *Histoire litteraire de France*, vol. 12 (Pans, 1763), p. 130.

42. ———. 1999. "Metaphysical, epistemological and linguistic approaches to universals: Porphyry, Boethius, and Abailard." In *Medieval Masters: Essays in Memory of Msgr. E. A. Synan*, edited by Houser, Rollen Edward, 1–24. Notre Dame: Notre Dame University Press.

43. Greene, Virginie. 2014. *Logical Fictions in Medieval Literature and Philosophy*. Cambridge: Cambridge University Press.

    Chapter 1: *Abelard's donkey: the nonexistent particular*, pp. 13-32.

    "In this chapter I will examine Abelard's thoughts about imagination and the status of its products in the soul. This will be a little dry for a while, but the appearance of Browny the

Donkey in Abelard's commentary of Porphyry's *Isagoge* will bring comic relief while introducing my own theory about fiction as a mental process of creating imaginary particulars. I will then return to the *Roman de Renart* and a chivalric romance involving animals: Chrétien de Troyes's *Yvain or The Knight with the Lion*, in order to underscore their way of imagining particulars. I will also use Bernard de Clairvaux's astute criticism of chivalric fictions to compare his understanding of imagination with Abelard's theory and Chrétien's practice." (p. 14)

44. Guilfoy, Kevin. 1999. *Abelard's Theory of the Proposition*, University of Washington.

    Available at ProQuest Dissertation Express. Order number: 9936410.

    Abstract: "In Peter Abelard's writings, the *dictum* performs the role a twentieth-century philosopher would assign to a proposition. A *dictum* is what is said or asserted by a sentence. We are able to call a sentence "true" or "false", "possible" or "necessary", if the *dictum* asserted by the sentence is true, false, possible, or necessary. It is clear that the *dictum* is the central element in Abelard's theory of the proposition. Nonetheless, that the *dictum* performs an important role, is perhaps the only claim about Abelard's theory of the proposition to which there is general agreement among current thinkers. There is a good deal of dispute and confusion with regard to the proper interpretation of Abelard's theory of the proposition. Much of this dispute centers on the fundamental question: What is the *dictum*? This dissertation is an extended attempt to answer this question. There are three parts to the dissertation. In part one the dissertation disputes the common assumption that *dicta* are composed of status. This discussion serves to separate Abelard's theory of the proposition from his theory of universals. The second part of the dissertation argues that Abelard, at different times, advanced two distinct theories of the proposition, one in his *Dialectica* the other in his *Logica Ingredientibus*. The dissertation contends that Abelard's more mature view is found in his *Logica lngredientibus*. The

remainder of the dissertation is an account of Abelard's theory of the proposition as it is found in the *Logica Ingredientibus*."

45. ———. 2002. "Abelard's Rejection of the Tarski Biconditional." *Logical Analysis and History of Philosophy* no. 5:143–158.

    Abstract: "In a fairly opaque passage in his commentary on Aristotle's Categories Peter Abelard denies both directions of a biconditional sentence very much like a Tarski biconditional: "A man exists" is true iff a man exists. "A man exists" is taken to be a sentence token and the right hand element is taken to be the existence of a man. Neither Abelard's argument nor his reason for making the argument is clear. It at first appears that Abelard may be claiming that each of the corresponding conditionals is false. Such a claim could amount to a rejection of the correspondence theory of truth and would naturally have serious repercussions for the study of Abelard's logic. In this paper I argue that Abelard does not deny the truth of the biconditional only its necessity. Abelard makes this argument in response to Boethius and certain twelfth-century masters (I suggest Thierry of Chartres), who argue that there is a logically necessary connection between words and things, and hence between sentence tokens and what is the case in the world. Abelard is not expressing any serious reservations about the correspondence theory of truth. He is demonstrating the logical importance of the conventionality of language. Arguing against authorities, and twelfth-century peers, he shows that there is no logically necessary connection between words and things, hence the Tarski biconditional is not necessarily true."

47. ———. 2004. "Mind and Cognition." In *The Cambridge Companion to Abelard*, edited by Brower, Jeffrey E. and Guilfoy, Kevin, 200–222. Cambridge: Cambridge University Press.

    "In this chapter I provide a systematic introduction to the central elements of Abelard’s account of cognition and

philosophy of mind.

I begin with a brief assessment of Abelard's place in the Aristotelian tradition (§ i). Following this, I discuss Abelard's account of sensation, imagination, and understanding (§ ii); it is in this section that I develop Abelard's account of cognition. I turn next to a discussion of abstraction and universal understandings (§ iii). Finally, I conclude with a brief discussion of opinion, knowledge, and intelligence – the epistemic issues involved in Abelard's account of mind (§ iv)." (p. 201)

48. ———. 2006. "Imagination and Cognition of Insensibles in Peter Abelard." In *Intellect et imagination dans la philosophie médiévale / Intellect and imagination in medieval philosophy / Intelecto e imaginação na filosofia medieval / Actes du XIe Congrès international de philosophie médiévale de la Société internationale pour l'Étude de la philosophie médiévale (S.I.E.P.M.): Porto, du 26 au 31 août 2002*, edited by Pacheco, Maria Cândida and Meirinhos, José F., 895–902. Turnhout: Brepols.

"Cognition, especially the cognition of insensibles is a key element in Abelard's semantics: words signify items by generating understandings of these items. If we could not form an act of understanding an item we could not use a word to signify the item. Each of Abelard's discussions of the semantics of universal terms are accompanied by an account of the cognition of insensibles. In brief, the cognition of a particular insensible nature or property is a necessary intermediate step to the formation of a universal understanding. We must understand the particular insensible nature, this-humanity, before having the pure universal act of understanding humanity. To use Abelard's own terms an understanding must be *sola* and *nuda* before it can be *pura*. Abelard made at least two attempts to explain the initial cognition of particular insensibles. But, ultimately he was not content with either. His final pronouncement on the topic is to claim that, whatever the cognitive process, our cognition of insensibles is sufficient to provide a semantics for universal terms. Abelard expresses little confidence in this claim and even this slight confidence

may be unwarranted. Abelard is committed to 3 theses, which I will explain below and that present a seemingly insurmountable obstacle to the initial cognition of particular insensibles." (p. 895)

49. Guilfoy, Kevin Stephen. 1999. *Peter Abelard's Theory of the Proposition*, University of Washington.

    Abstract: "In Peter Abelard's writings, the dictum performs the role a twentieth-century philosopher would assign to a proposition. A dictum is what is said or asserted by a sentence. We are able to call a sentence "true" or "false", "possible" or "necessary", if the dictum asserted by the sentence is true, false, possible, or necessary. It is clear that the dictum is the central element in Abelard's theory of the proposition. Nonetheless, that the dictum performs an important role, is perhaps the only claim about Abelard's theory of the proposition to which there is general agreement among current thinkers. There is a good deal of dispute and confusion with regard to the proper interpretation of Abelard's theory of the proposition. Much of this dispute centers on the fundamental question: What is the dictum? This dissertation is an extended attempt to answer this question. ;There are three parts to the dissertation. In part one the dissertation disputes the common assumption that dicta are composed of status. This discussion serves to separate Abelard's theory of the proposition from his theory of universals. The second part of the dissertation argues that Abelard, at different times, advanced two distinct theories of the proposition, one in his Dialectica the other in his Logica Ingredientibus. The dissertation contends that Abelard's more mature view is found in his Logica lngredientibus. The remainder of the dissertation is an account of Abelard's theory of the proposition as it is found in the *Logica Ingredientibus*."

Selected Bibliography on Abelard's Logic and Ontology. Second Part Ham - Mar

Bibliography

1. Hamelin, Guy, and Maia, Danilo Luiz Silva. 2015. "Nominalism and Semantics in Abelard and Ockham." *Logica Universalis* no. 9:155–190.

   Abstract: "Peter Abelard and William of Ockham represent the two main figures of the nominalism of the Middle Ages. Both share the fundamental thesis of that doctrine, according to which only individual entities exist.

   The repercussions of nominalism are quite evident in relation to the question of universals, which constitutes a subject that, until now, won the attention of the majority of contemporary studies on the two most important logicians of their time. Nevertheless the nominalism of each of these two protagonists apparently diverges in a significant manner, especially in respect to the role exercised by the mind in the semantic process. Ockham seems to distance himself definitely from his predecessors, including Abelard, when he transfers grammar and semantic functions of conventional language to the level of mental language. In the present article, the chief intention is to expound the theory of sign and signification of each of the authors under consideration. The ultimate objective is to compare their respective semantic positions and indicate the principal points of agreement and disagreement, keeping in mind the hypothesis according to which these two medieval nominalists should have more theoretical elements in common than not."

2. Hansen, Heine. 2024. "Abelard’s Ontology of Forms: Some New Evidence from the Nominales and the Albricani." *Open Philosophy* no. 7:1–13.

Abstract: "This article concerns existents as a contentious issue in contemporary Abelardian scholarship.

More precisely, it concerns the ontological standing of forms in Abelard's metaphysics. Take, for example, the apple on my desk. What ontological standing does its redness have? Is it an actual entity over and above the apple or is it in some sense "reducible" to it? Abelard, famously, was a nominalist, so the question is not about some purported universal redness. Rather, it is about the particular redness of the particular apple on my desk. The issue is contentious in that the best current accounts of Abelard's metaphysics disagree strongly about how to answer this question. Here, rather than focusing on Abelard's own writings – which so far have yielded no definitive answer – I will consider some anonymously transmitted and mainly unedited logical texts from the twelfth century and show how his contemporaries understood Abelard's view and how the followers of his philosophical nemesis, Alberic of Paris, reacted to it."

3. Hellemans, Babette. 2010. "The 'Whole Abelard' and the Availability of Language." In *How the West Was Won. Essays on Literary Imagination, the Canon and the Christian Middle Ages for Burcht Pranger*, edited by Otten, Willemien, Vanderjagt, Arjo and de Vries, Hent, 349–376. Leiden: Brill.

   "In what follows I want to point out the 'philosophical' implications that a distinctively Abelardian 'questioning' of the status of language and its provision might involve. This singular type of inquiry in order to understand the human condition is what I mean by Abelard's 'epistemological project.' My hopes are modest, since the topic is extremely complex. So when I speak of 'Abelard', the topic is selected with the intent of demonstrating his skeptical method of understanding language within a specific historical context.(8) Such an investigation cannot be based upon some consenting or dissenting reference to Abelard in some of his works, or on the status of his work as it was shaped by the nature of his 'profession' (master, logician, philosopher, theologian, lover and so forth). Thus, to get a grip on Abelard's epistemological project, I will refrain, as far as possible, from applying external categories to his work. Instead,

the hermeneutical problem which underlies the (in)accessibility of ‘Abelard’, in his works as well as in the factual information concerning his historical persona, is my approach of understanding his epistemological project." (pp. 351-362)

(8) I use the term ‘skeptic’ and ‘skepticism’ with the caveat that we do not mean quite the same thing when we speak of skepticism as conceived by a thinker conditioned by a Christian *Weltanschauung* as when we speak of skepticism as a philosophical enterprise.

In the case of Abelard, his skeptical method of questioning can be illustrated by his famous aphorism in the prologue of Sic et Non: “By doubting we come to examine, and by examining we reach the truth.”

4. Hennig, Boris. 2015. "Instance Is the Converse of Aspect." *Australasian Journal of Philosophy* no. 93:3–20.

   Abstract: "According to the aspect theory of instantiation, a particular A instantiates a universal B if and only if an aspect of A is cross-count identical with an aspect of B. This involves the assumption that both particulars and universals have aspects, and that aspects can mediate between different ways of counting things. I will ask what is new about this account of instantiation and, more importantly, whether it is an improvement on its older relatives. It will turn out that the part of it that is new is the notion of cross-count identity among aspects. As I will show, this notion is both dubious and unnecessary. I will end by presenting a simplified aspect theory of instantiation that does not involve cross-count identity."

5. Henry, Desmond Paul. 1985. "Abelard's mereological terminology." In *Mediaeval Semantics and Metaphysics: Studies Dedicated to L. M. de Rijk, Ph. D. on the Occasion of His 60th Birthday*, edited by Bos, Egbert P., 65–92. Nijmegen: Ingenium Publishers.

6. ———. 1990. "Master Peter's Mereology." In *De Ortu Grammaticae: Studies in Medieval Grammar and Linguistic Theory in Memory of Jan Pinborg*, edited by Bursill-Hall,

Geoffrey L., Ebbesen, Sten and Koerner, Konrad, 99–115. Amsterdam: John Benjamin.

"The paradox of the *Sententie*, at least in relation to the question of Abelardian authorship, is that the objections to which the piece is mainly engaged in replying evince a higher degree of generality than do the replies.

Again, the objections are for the most part coherent with well-known, if not notorious, Abelardian theses. At the same time those misdirected replies are not lacking in their own sort of mereological acumen. The fact that the objections are attributed to the partisans of *voces* (utterances) could suggest that the piece is an early one, dating from near to the time when Abelard was hearing the 'insane' arguments of his master Roscelin. It can be suggested that such arguments are intended to call attention to quite valid points in the mereological area (cf. HMT). The later, and more general Abelard could then have taken over the marrow of those points, thus explicating the known Abelardian nature of some of the objections themselves.

Thus in the end it may well be possible, given a progressive sharpening of our appreciation of the significance of the discussions contained in the Sententie, to hypothesise more definitively as to whether Abelard was indeed the author of the piece. One might even emit conjectures as to the point in the chronology of his works at which it could feasibly be situated.

For this, however, a more comprehensive perspective of the mereological aspects of his work is required, and this, for the moment, is lacking." (p. 114)

Chapter 2: *Abelard and His Contemporaries*, pp. 64-217.

"0.1 Mereology, Ancient and Contemporary

0.11 Mereology is, strictly speaking, the theory of the part in its concrete (as opposed to abstract) sense; it may hence, by implication, deal with wholes also, although this need not necessarily be so. Systematic work on these topics was produced in 1916 by the Polish philosopher S. Lesniewski; his paper on the general theory of sets was in that year published in Moscow (cf. SLM, LF). My own acquaintance with his mereology is due to the teaching of Czeslaw Lejewski, who studied under Lesniewski."

(,,,)

"0.2 Medieval Mereology and Metaphysics

0.21 Nevertheless, the mereology covered by the present work remains within the confines of the medieval Latin West, but without in any way claiming that it was an exclusive property of that West. The temporal scope will range forward from the time of that precursor Boethius whom we may sometimes call 'the Roman' (470 - 525 A.D.) in order to distinguish him from another Boethius, namely Boethius of Dacia (flourished 1270 - 80), a Danish philosopher to whom we are to be indebted hereunder for his excellently clear elucidations. The main final figure will be Paul of Venice (c. 1369 - 1429) whose monumental embodiment of what for him was all possible logic, the *Logica Magna*, contains sections expressly devoted to mereology (section 8 below). The later John of St. Thomas has also been incidentally included, given his prologations of certain of Aquinas' theses (section 3.75)." (pp. 2-3)

(...)

"0.7 Summary

In brief, it has been contended above that the medieval section of the history of mereology may be recounted, understood, and appreciated in the light of an introductory exploitation

of the present-day form of the discipline, as axiomatised by S. Lesniewski and his successors. The medieval philosopher, Boethius of Dacia, has been shown to explain the theoretical location of mereology in relation to metaphysics in a way which

is compatible with and corresponds to contemporary axiomatised bodies of knowledge, of the sort outlined in the Presuppositional Explicitation (section 10 below). Further, a likewise elementary version of a contemporary form of logical grammar, ultimately overlapping in its aims with the speculative grammar established by Boethius of Dacia (i.e. the resolution of grammatical ambiguity by recourse to quasi-universal grammar) has already inaugurated the task of keeping under control the logical-grammatical situation of material with which a history of medieval mereology is going to have to deal. Although by this present point applications of such grammar have been excessively elementary, it and the categorial language constituted by Lesniewski's ontology on which it is based are quite essential for any thorough understanding and appreciation of texts in which quidditative-level terms mingle with collective-class discourse (e.g. in the work of the ps-Joscelin of Soissons, or in the commentaries of Gilbert of Poitiers: cf. 2.7). It should be clear, of course, that the importation of Boethius of Dacia has not been for the purpose of using him as some sort of authority, but chiefly in order to bear witness to the continuity of the medieval and present-day disciplines, as well as to illustrate the sympathy between the two. In some respects such was also the intention of Lesniewski himself, as LSE reminds us." (pp. 30-31)

8. ———. 1991. "Abelard and Medieval Mereology." In *Peter Geach: Philosophical Encounters*, edited by Lewis, Harry A., 49–64. Dordrecht: Kluwer.

"It is a pity that the stock story of early medieval thought tends to concentrate on something called the 'universals controversy' and does so in a way which inappropriately subsumes the twists and turns of a highly complex situation under somewhat ill-fitting headings. Although a start has now been made on a saner account of the matter both in general (1) and insofar as it affects Abelard, (2) nevertheless the usual connotations of a term such as 'realism' when applied to the topic of universals render somewhat startling the realisation that one such theory attacked by Abelard was the polar opposite of any otherworldly Platonic-style theory, namely the '*collectio'* theory. It is yet a greater pity that in his attack on this theory (3) Abelard by no means does justice either to it or to his own wide-ranging account of part/ whole relations. At the time of his attack his maturer thoughts (in the *Dialectica)* were still to come, yet some of the essentials of that later work are already to be found in his gloss on Boethius' *De Divisione,* a gloss dated as belonging to the end of his first teaching phase. (4)

In II below is presented a brief and inadequate characterisation of some of Abelard's theories and themes; in III these are applied to contemporary discussions which have a bearing on his own sad fate and on that of a certain cat to whom we have been genially introduced by Professor Geach."

9. ———. 1999. "Signification, Superfluity, and Indeterminacy in Abelard and other Medievals." In *Signs and Signification. Vol. I*, edited by Gill, Harjeet Singh and Manetti, Giovanni, 69–83. New Delhi: Bahri Publications.

   "1.1. For Boethius and the medievals, signification is primarily linked with *definition* and *understanding* (intellectus). Abelard maintains these links as also does Aquinas, for example.

   1.2. *Definition* canonically so-called is of nominal terms and is effectuated by means of genus, species, and differentia, at least where substance-names are concerned. Paronyms, or denominative names, involve incompletenesses which both Anselm of Canterbury and Abelard characterise most competently according to frameworks other than the strictly canonical. Non-canonical characterisations in general were said to be *descriptions*. The process of definition *stricto sensu* would accordingly comprise or entail sentences such as '*Man* is a species', '*Animal* is a genus', and so on. It was in his commentary on Aristotle's *Categoriae* that Boethius noted how such sentences embodied the threat of fallacious arguments such as the following: 'Man is a species; but Socrates is a man; therefore Socrates is a species'. One solution, he suggested, would be to reconstrue the 'species' of 'Man is a species' as one of the *names of names* (*nominum nomina*), the named name being in his case 'man'. Thus the middle teen of the inference becomes ambiguous, and the illation fails. At the same time, we witness the foundation of the description 'nominalism' upon this intra-linguistic analysis of propositions such as the one now in question, which superficially concern the 'universal' *man*, and so forth. (Ockham and Hobbes are two thinkers often characterised as nominalists, and who quite consciously and overtly preserve this *nominum nomina* terminology, in the same sort of context).

   1.3. But although definition in the strict medieval sense thus appears to be of isolated terms, taken out of context, in practice contextual presuppositions did intervene, and this in various ways. It became common to work on the *significatio* of whole propositions, thus directing attention to the sense or

significatio of the whole within which the defined terms were embedded. The propositions, in their turn, were taken to occur within at least three generally specifiable non-exclusive anticipated contexts, namely either that of the theoretical (or 'quidditative'), wherein definitional propositions are basic, or within that of the syllogistic (largely, the four canonical A, E, I, and O forms) or within that of *usus loquendi*, the context of usage, whence the classical grammarians took their starting point, and which was recognised by medieval investigators of *significatio* as an area distinguishable (because of its contingent irregularities) from that of special technical usages. This latter distinction is already highly marked in the work of St. Anselm (1033 - 1109). These possible varieties of presupposed context will be taken account of in my own remarks, and attention called to them when the occasion arises." pp. 69-70 (notes omitted).

10. Iwakuma, Yukio. 1992. "*Vocales*, or Early Nominalists." *Traditio* no. 47:37–111.

    "In Section I of the present essay I present evidence that in the early twelfth-century nominalists were called *vocales*, a name that only later was replaced by *nominales*. In Section 2 I argue that 'vocalism' arose about 1080, one generation of scholars before Roscelin. Since Garlandus' vocalistic *Dialectica* could be thought to provide evidence of an even earlier origin of the theory, Section 3 will deal with the date of this work, which has wrongly been assigned to the mid-eleventh century or earlier. Sections 4-6 will present a number of unpublished texts by vocalist authors, and the Appendix will supply editions of vocalist texts commenting on or otherwise discussing Porphyry's *Isagoge*." (p. 37(

    Appendix (pp. 65-133): Edition of Vocalist texts commenting or discussing Porphyry's *Isagoge*: I. (Petri Abaelardi (?) *Positio Vocum Sententia* (pp. 66-73); II. Roscelini Compendiensis (?) *Disputata Porphyrii* pp. 74-102); III.1 *Excerpta Pommersfeldensia I* pp. 103-107; III.2 *Excerpta Pommersfeldensia II* pp. 108-110; III.3 *Excerpta Pommersfeldensia III* pp. 110-111.

11. ———. 1992. "Twelfth-Century Nominales. The Posthumous School of Peter Abelard." *Vivarium* no. 30:97–109.

    "Otto [of Freising] says that Abelard held the 'sententia vocum seu nominum' in natural philosophy and introduced it into theology, and Walter Map says that he was 'princeps' among the Nominales. We know that Abelard was a charismatic and popular teacher, and we have no evidence at all of his followers (who must have been many) being called by any other name. We must conclude, then, that either he did not found a distinctive school or that the Nominales are that school. On the other hand I know of no text which both identifies itself as from the Nominales and calls Abelard 'our master' and no text which attributes views identified in the text as Abelard' s to the Nominales. The identification of the Nominales as Abelard's followers would, then, have to rest squarely on finding them characterized by distinctive theses which we have independent reasons to think of as in some way peculiar to Abelard.(9)" (p. 82)

    (9) The need to find *distinctive* theses and not merely theses which Abelard and the Nominales both held is emphasized in Courtenay [1992a.

14. ———. 2004. "Influence." In *The Cambridge Companion to Abelard*, edited by Brower, Jeffrey E. and Guilfoy, Kevin, 305–340. Cambridge: Cambridge University Press.

    "In this chapter, I attempt to provide some indication of Abelard's overall historical influence. I shall focus, however, on the influence he had on his contemporaries, taking up three areas of twelfth century logic to which contributed – areas that we would nowadays think of falling within the domain of metaphysics, philosophy of language, and logic, respectively – and then examining his contemporaries' reactions to them. Along the way, however, I will also have something to say about the school of the Nominales and some of their distinctive theories." (p. 305)

15. ———. 2009. "*Vocales* Revisited." In *The Word in Medieval Logic, Theology and Psychology: Acts of the XIIIth International Colloquium of the Société Internationale pour l'Étude de la Philosophie Médiévale, Kyoto, 27 September - 1 October 2005*, edited by Shimizu, Tetsuro and Burnett, Charles, 81–172. Turnhout: Brepols.

    "The aim of this study is to show the struggles between the master [William of Champeaux] and his student [Peter Abelard] concerning Aristotle's *Categories* before their conflict over universals. The young Abelard first brought into Paris a new wave of logic, which I shall call "proto-vocalism", to challenge William to examine it seriously. William tried to harmonize the new logic with his basically Boethian logic.

Abelard pitted himself against William, sharpening his “proto-vocalism”; but the struggles with his master finally transformed Abelard into an original logician, into becoming a “vocalist”, so to speak.

I shall divide this study into three parts. In Part I, I shall discuss some preliminary issues—my general answer to John Marenbon’s comments to my loose understanding of “vocalism”—and introduce two texts so far little known, which I focus on in this essay. In Part II, I shall show William’s attempts to harmonize the new logic, which Abelard had brought into Paris, with his basically Boethian logic. In Part III, I shall discuss an issue in which the struggles between the master and the student came to its culmination, which resulted in the renewal of Abelard’s logic." (pp. 81-82)

16. ———. 2011. "Alberic of Paris on Mont Ste Geneviève against Peter Abelard." In *Logic and Language in the Middle Ages: A Volume in Honour of Sten Ebbesen*, edited by Fink, Jakob Leth, Hansen, Heine and Mora-Márquez, Ana María 27–47. Leiden: Brill.

"Sten Ebbesen and I have composed a list of sources which refer to the logico-theological schools of the twelfth century.(1) As a supplement to it, I have composed another list, this time covering references by name to masters in logical texts written ca. 1130–1200. In the present paper, I shall give some introductory remarks on this second list, which mainly concern the controversies between Alberic of Paris and Peter Abelard on Mont Ste Geneviève." (p. 27)

(...)

"Conclusion and Further Perspectives

I have so far discussed, in a preparatory way, major disputed issues between Abelard and Alberic, mainly from sources by the Albricani. Some opinions ascribed to Abelard are actually found in his writings, some are not. There are many other texts in my list not touched upon in the present paper. More detailed study of the list should shed new light on Abelard's teachings on Mont Ste Geneviève in his last years—a period from which we have none of his own writings.

But I have yet another purpose in composing this new list. Our texts are always full of anonymous references to other philosophers' theories, such as *quidam dicunt,* etc. My list, together with the list in 'Logico-theological Schools', makes it easier for us to identify those *quidam*, and perhaps also the provenance of anonymous texts, along the lines of what I have just shown above: B13 (not in the list of sources) is a work of an Albricanus, B14 of a Meludinensis, and B15 (not in the list of sources) of a Porretanus.

Such future studies would provide a better understanding of twelfth-century logic." (p. 43)

(1) Y. Iwakuma and S. Ebbesen, 'Logico-theological schools from the second half of the 12th century: A list of sources', *Vivarium* 30 (1992), 173–210.

17. Iwakuma, Yukio, and Ebbesen, Sten. 1992. "Logico-Theological Schools from the Second-Half of the 12th Century: A List of Sources." *Vivarium* no. 30:173–210.

"Several logico-theological schools are known to have been active in the second half of the 12th century. This is an exhaustive collection of the sources we know in which any of those schools are referred to by name. We have only omitted the Helistae , who appear solely in Glossa Promisimus (see texts in Hunt 1940/43, pp. 52-54). For the two early 12th-century schools known, *Waldicelli/Waldilli* and *vocales*, see sources in De Rijk 1966, p. 4 and Iwakuma 1992b, § 1, respectively. Our collection does not include passages in which the adjective for a school-name is attached to the name of the school-founder (e.g. Parvipontanus attached to Adam." (p. 173)

"Frege was not familiar with Abelard or any of the other scholastics. There is no historical connection between the two philosophers, be it direct or indirect. When I speak on Abelard and Frege here, the theme is selected with different intentions from those for a paper on say Freqe and Leibniz. I intend to conduct a comparison in systematic perspective. This comparison cannot be based on the demonstration of an influence of Abelard on Frege undiscovered until now or upon some agreeing or dissenting reference to Abelard in Freqe's works. Thus I would like to provide you with a brief explanation of what motivated me to the comparison.

First, I wish to make clear that in selecting this theme I do not intend to open a debate on progress or regression in philosophy or the field of logic. I am not going to have the two philosophers compete with each other. I am not going to measure the one against the other. Thus no attempt will be made here to demonstrate that Abelard "anticipated" later insights of Frege or that Frege "rediscovered" earlier insights which Abelard had reached." (pp. 81-82)

19. ———. 1985. "Peter Abelard's Investigations into the Meaning and Functions of the Speech Sign *Est*." In *The Logic of Being*, edited by Knuuttila , Simo and Hintikka, Jaakko, 1–15. Dordrecht: Reidel.

    "Although Peter Abelard was the most distinguished teacher of logic of his time, a logic understood to be the science of argumentative discourse, he was not destined to found a new philosophical tradition. The historical situation offers at Least a partial explanation -- the pace of philosophical and theological research was so brisk in the twelfth century that many of the established schools enjoyed life spans of at most two or three generations of teachers. The restlessness of the times is embodied to a special degree in Abelard.(1) His writings include commentaries, in many cases several to a work, on the logical works of Aristotle and Porphyry then available, handed down in the form of Boethius' translations, and on Boethius' own logical works. Abelard has to take a number of positions into consideration here: several commentaries on Aristotle by ancient scholars, by Boethius, and by Abelard's own predecessors and teachers, and furthermore the grammatical theories of Priscian and those deriving from Abelard's contemporaries. He discovers with distinctive acumen that the tradition he is examining is disunited and full of tensions on basic questions. It is in the analysis and discussion of these tensions that he finds the field of his own philosophical research. He expects to reach solutions by intensifying the controversies, not by seeking harmony. Thus he traces argument and counter-argument in great thoroughness of detail and from a dizzying succession of points of view, abandoning theses and offering countertheses. What his students could learn from him was not so much a particular theory as his method of formulating and discussing problems.

    The situation is much the same for us. If we turn to Abelard in our inquiry into the logic and semantics of the speech sign 'est', we must discover anew the questions which concerned him. In the first Part of this Paper, I will sketch some of the discussions conducted by Abelard in order to make clear in what contexts he found himself confronting questions on the variations of

meaning, function, or use of the expression 'est'. In the second part, I will group various theses which Abelard deals with appropriately. It is my intention to plot out the full range of the theories discussed and to mark points of conflict. In the third and final part, I will make some cautious comments on the deeper current of unity to be observed in Abelard's reflections, a current perhaps more easily discernible to the modern eye then it was to Abelard himself." (pp. 145-146)

(1) Cf. Jolivet (1969), Chapter IV; de Rijk (1980). Also compare Häring (1975), who explains the meager transmission of Abelard's works as at least partially attributable to Abelard's style of thinking and writing. His philosophical "works" were not written as books intended to be recopied and handed down but as records of his own thinking to be used in teaching. A thesis which he adheres to with conviction at one point in his writings may reappear later or even in a reworking of the first source as being subject lo doubt or in need of revision.

20. ———. 2004. "Philosophy of Language." In *The Cambridge Companion to Abelard*, edited by Brower, Jeffrey E. and Guilfoy, Kevin, 126–157. Cambridge: Cambridge University Press.

"My discussion in what follows is divided into two main parts. In the first part (§ i), I provide some general orientation to those texts and issues that are most important for understanding Abelard’s views

in philosophy of language. As we shall see, these particular texts and issues lead Abelard to place questions of semantics at the very center of his logical studies.(8) In this respect Abelard’s approach to

logic differs from that of contemporary logicians, for whom questions of possible semantic interpretations are typically secondary to the syntactic construction of a calculus. In the second, and longer part of the chapter (§§ ii–v), I turn to those aspects of Abelard’s philosophy of language that constitute his most enduring legacy, namely, his views about the semantics of terms and propositions. In the course of examining these views, we shall see that Abelard’s distinctive approach in logic is

determined in large part by “metaphysical issues such as the status of universals as well as psychological topics such as the role of images in thought.”(9)" (p, 128)

(8) Cf. de Rijk 1981b, 19: “Whoever . . . speaks of semantics cannot ignore the questions of ontology and metaphysics.” Tweedale 1998, 8: “The objective grounds for logical relationships lie in what these xpressions signify.”

"In his Commentary on Aristotle's "Peri hermeneias, " (1) Abelard distinguishes the form of an expression(2) {*oratio*) from what it says, that is, its content. The content of an expression is its understanding {*intellectus*). This distinction is surely the most well-known and central idea in Abelard's commentary. It provides him with the opportunity to distinguish statements {*enuntiationes*) from other kinds of expressions without implying a difference in their content, since the ability of a statement to signify something true or false {*verum vel falsum*) cannot be found in its content. More precisely, Abelard distinguishes statements both from complete expressions *(orationes perfectae*) that are not statements but rather questions, requests, commands, etc. and from incomplete expressions, that is, mere word strings {*orationes imperfectae*), such as *homo albus*. These kinds of expressions,

according to Abelard, do not differ in the understanding they present but in the way they present it."

(1) The text of Abelard's *Commentary on Aristotle's " Perì hermeneias "* was published from the Milan manuscript in Geyer [1927]. Minio-Paluello [1958] 125-8 published some additions and corrections to Geyer's edition based on the Berlin manuscript. We are preparing a new and complete edition of the full text for the *Corpus chrislianorum* series, to appear shortly; we give references to the page and line number of Geyer [1927], but we supply our own version of Abelard's text, which differs in some cases from Geyer.(...)

(2) We use "expression" to pick out strings of more than one word which are in grammatical agreement. A single word is not an *oratio* but a *dictio* - in our terminology, not an expression but merely a word.

(3) That a statement is an expression signifying something true or false is implied by Aristotle, who said that "not every expression is a statement, but only those in which there is truth or falsity" (*Peri hermeneias* 1 7a2-3), and stated explicidy in Boethius, *De topicis diffrrentii*s 1174B (*oratio significare verum falsumve*). See also 375.29-32.

Reprinted in C. H. Kahn, *Essays on Being*, New York: Oxford University Press, 2009, pp. 41-61.

"I am concerned here not with the pairing of the terms *copula* and *existentia* in the eighteenth or nineteenth century but with their separate history in the earlier period. Both Latin terms are fixed in their standard uses in medieval philosophy. The term *copula* occurs in Abelard and almost every later writer on logic. The technical sense of *existentia* (specifying the use of *esse* which contrasts with *essentia*, together with a connotation of actuality as opposed to potency) is perhaps not clearly attested before the *esse existentiae* of Duns Scotus. In both cases there are obvious roots for the medieval usage in classical Greek philosophy.

Yet in both cases the connection between the ancient and medieval terminology is more problematic than one might suppose." (p 42 of the reprint)

"Prantl tells us that Abelard is the first extant Latin author to use *copula* as a technical term for est in the categorical proposition *homo est mortalis*.(3) The Kneales give this as the usual view, but suggest that the term may have appeared in earlier medieval discussions of the role of *est* in such propositions.(4) I do not venture any guesses about the terminology of unrecorded or unpublished discussions but, as we shall see, Abelard's early usage of the word suggests that copula was not yet a fixed term. If that is so, Abelard must be personally responsible for the classical terminology. It is clear that (as Prantl noted) the noun does not occur in the corresponding sense either in Boethius, who is Abelard's chief authority, or in the latter's translation of Aristotle. Boethius does use the verb *copulare* and its abstract noun *copulatio* to describe the function of est, following Aristotle's use of the terms and It is easy enough to see how Abelard's use of the term *copula* develops in a natural way out of Boethius' language. But the impression remains that both the term *copula* and, in part, the theory it is designed to convey are Abelard's own." (pp. 42-43)

24. Kaldramova, Elitza. 2019. "Peter Abelard's Conceptualism and Its Influence." *Archive for Medieval Philosophy and Culture* no. 25:71–81.

    Abstract: "The problem of the universals is associated with the universals' existence and reasons for classifying objects as one species or genus. It inquires what notions and their features are. The problem's importance is related to the detailed study of dialectics and the notion. The latter is the link between sensible objects and the mind and is essential for building sentences and propositions. Abelard's conceptualism is moderate position considering universals as notions and focusing on the linguistic and logical aspects of the problem. The ontological aspect is not excluded which is evident due to the notion of status. The influence of Abelard's conceptualism in modern times is associated with the theory of direct reference for nouns, the account of formal validity and the theory of propositional content. Common features between Abelard's conceptualism and Rand's objectivism are also discussed such as the abstraction, the important role of reason, the individual and the subjective element."

26. ———. 2004. "Metaphysics." In *The Cambridge Companion to Abelard*, edited by Brower, Jeffrey E. and Guilfoy, Kevin, 65–125. Cambridge: Cambridge University Press.

    "Abelard's philosophy is the first example in the Western tradition of the cast of mind that is now called *nominalism*. Although his view that universals are mere words (*nomina*) is

typically thought to justify the label, Abelard's nominalism - or better, his *irrealism* - is in fact the hallmark of his metaphysics. He is an irrealist not only about universals, but also about propositions, events, times other than the present, natural kinds, relations, wholes, absolute space, hylomorphic composites, and the like. Instead, Abelard holds that the concrete individual, in all its richness and variety, is more than enough to populate the world."

(...)

"I'll begin with Abelard's antirealism about universals (§ i), since it is the key to his irrealism. It provides the foundation for his conviction that only individuals exist, a thesis that calls for further analysis of the nature of individuals (§ ii). Most individuals are a kind of integral whole, namely, a hylomorphic compound of form and matter, belonging to natural kinds. Abelard clarifies how the elements of such complex individuals are related to one another with his theory of identity (§ iii), and he develops a theory of how individuals interact to make up the world, using far less by way of ontological resources than other philosophers (§ iv). The result is a subtle and sophisticated irrealist metaphysics, one of the most interesting and original in the history of philosophy." (pp. 65-66, a note omitted)

27. ———. 2007. "Abelard on Mental Language." *American Catholic Philosophical Quarterly* no. 81:169–187.

Abstract: "I argue that Abelard was the author of the first theory of mental language in the Middle Ages, devising a "language of thought" to provide the semantics for ordinary languages, based on the idea that thoughts have linguistic character. I examine Abelard's semantic framework with special attention to his principle of compositionality (the meaning of a whole is a function of the meanings of the parts); the results are then applied to Abelard's distinction between complete and incomplete expressions, as well as the distinction between sentences and the statements which the sentences are used to make. Abelard's theory of mental language is shown to be subtle and sophisticated, the forerunner of the great theories of the fourteenth century."

28. ———. 2007. "Abelard's Answers to Porphyry." *Documenti e Studi sulla Tradizione Filosofica Medievale* no. 18:249–270.

    "Abelard inherited a tradition that began philosophical investigation with the initial questions of Porphyry's *Isagoge*, a tradition putting metaphysics, and in particular the problem of universals, at the centre of philosophy. In Abelard's version of Boethius's Latin translation, Porphyry's questions are as follows: (1)

    [Latin text omiited]

    As regards genera and species, for the present I shall refuse to say whether they subsist or are postulated in understandings that are alone and bare and pure; or whether, if they subsist, they are corporeal or

    incorporeal; and whether they are separated from sensibles or are postulated in sensibles and things going along with them." (p. 249)

    "The focus here is on what Abelard understands to be involved in Porphyry's questions and what they entail, not on the details of his critique of realist theories of universals, or even the details of his own positive account of universal words; these aren't needed to understand Abelard's claims about Porphyry. Section 1 focuses on Abelard's claim that Porphyry's questions do not have a special status. Section 2 considers Abelard's twofold way of construing of Porphyry's final phrase "and things going along with them." Section 3 takes up Abelard's strategy for dealing with the traditional reading of Porphyry's questions. Section 4 describes Abelard's many answers to Porphyry. I conclude by reflecting on whether Abelard's strategy is successful." (p. 250)

29. ———. 2023. "Abelard on Existential Inference." In *Metaphysics Through Semantics: The Philosophical Recovery of the Medieval Mind. Essays in Honor of Gyula Klima*, edited by Hochschild, Joshua P., Nevitt, Turner C., Adam Wood,

Adam and Borbély, Gábor, 21–38. Cham (Switzerland): Springer.

"On closer inspection it turns out that Abelard's views surrounding existential import are complex. For while Abelard does talk about empty terms, and about subalternation and quantification and related matters, his discussion addresses many subtle nuances of the "problem" of existential import—or, as I shall call it to highlight its perhaps unproblematic nature and Abelard's more general interest in it, *existential inference*.

The best way to begin, I think, is to take a step back from the texts and the contemporary discussion to see what is involved in existential inference of the sort at issue (§1), and then to see what Abelard has to say about it from the ground up: the distinction of the logical and grammatical parts of the simple categorical sentence (§2), his views about the nature of existential commitment (§3), and the role of quantifiers (§4). In the end, things are rather messy, and a good deal the more interesting for it." (pp. 22-23)

30. Knuuttila, Simo. 1993. *Modalities in Medieval Philosophy*. New York: Routledge.

See Chapter 2: *Philosophical and Theological Modalities in Early Medieval Thought*: Boethius' Modal Conceptions 45, New Theological Modalities: from Augustine to Anselm of Canterbury 62; Gilbert of Poitiers, Peter Abelard and Thierry of Chartres 75-98.

"The basic conceptions of Abelard's modal theory are to be found in a survey serving as an introduction to Chapters XII-XIII of his long commentary on *De interpretatione* (*Super Periermenias*, edited by L. Minio-Paluello, 3-47). A rather different and possibly earlier account occurs in the section on modality in the *Dialectica* (191.1-210.19).

According to Abelard, modal terms in the most proper sense of the word are adverbs expressing the way in which the determinant predicated of a subject inheres in it. Terms like 'necessarily', 'well' or 'rapidly' are used in this manner; some other adverbs like 'possibly' and 'falsely' are also called modals,

but this is due to their position in sentences rather than to their meaning; their task does not consist in modifying actual inherences. When nominal modes (*casuales*), for example, 'it is necessary that' or 'it is possible that', are understood in an adverbial manner, they are in the same way divided into proper and improper modes. Abelard thinks that the reason why Aristotle treated mainly nominal modes in *De interpretatione* 12-13 was that they involve more problems than simple adverbial modes." (p. 83)

31. ———. 2008. "Medieval Modal Theories and Modal Logic." In *Handbook of the History of Logic, Vol. 2: Mediaeval and Renaissance Logic*, edited by Gabbay, Dov and Woods, John, 505–578. Amsterdam: Elsevier.

    "According to Abelard, the possibilities and necessities belonging to the individuals of a species are determined by their shared nature. What nature demands or allows and what is repugnant to it is the same for all members of a species, and what is possible is seen in what has taken place in the representatives of the species.(47) One could regard these essentialist possibilities as abstract Philonian possibilities, many of which never become or even can become actual in an individual.(48) This is one aspect of Abelard's modal views, but there are others. He assumes that what is actual is temporally necessary at a certain point of time as no longer avoidable, but he also argues that unrealized alternatives are possible at the same time in the sense that they could have happened at that time. Some of the alternatives of a singular being are real counterfactual alternatives. These are unrealizable because of some previous changes in the conditions of the subject.

    There are also merely imaginable alternatives, such as Socrates' being a bishop, which never had a real basis in things.(49)" (p. 521)

    (47) *Dialectica* 193.36-194.3; 385.1-8.

    (48) Philo's definitions of modal concepts are described in Boethius's commentary on *De interpretatione* (II, 234.10-21). One of his examples was that it is possible for a piece of wood at the bottom of the sea to be burnt, in virtue of the fitness of the

subject. See also Alexander of Aphrodisias, *In Aristotelis Analyticorum priorum librum I commentarium*, ed. M. Wallies, *Commentaria in Aristotelem Graeca* 2.1 (Berlin: Reimer, 1883), 184.6-12; John Philoponus, *In Aristotelis Analytica Priora commentaria*, ed. M. Wallies, *Commentaria in Aristotelem Graeca* 13.2 (Berlin: Reimer, 1905), 169.19-20.

(49) See the discussion of Logica 'Ingredientibus', 272.39-273.19, and some other texts in C.J. Martin, 'An Amputee is Biped. The Role of the Categories in the Development of Abelard's

Theory of Possibility' in J. Biard and I. Catach-Rosier (eds.), *La Tradition médiévale des Categories (XIIe-XIVe siècles),* Philosophes médiévaux 45 (Louvain-la-Neuve: ´Editions de l'Institut Supérieur de Philosophie, Louvain and Paris: Peeters, 2003), 225-42.

32. ———. 2010. "Medieval Commentators on Future Contingents in *De Interpretatione* 9." *Vivarium* no. 48:79–95.

Abstract: "This article considers three medieval approaches to the problem of future contingent propositions in chapter 9 of Aristotle's *De Interpretatione*. While Boethius assumed that God's atemporal knowledge infallibly pertains to historical events, he was inclined to believe that Aristotle correctly taught that future contingent propositions are not antecedently true or false, even though they may be characterized as true-or-false. Aquinas also tried to combine the allegedly Aristotelian view of the disjunctive truth-value of future contingent propositions with the conception of all things being timelessly present to God's knowledge. The second approach was formulated by Peter Abelard who argued that in Aristotle's view future contingent propositions are true or false, not merely true-or-false, and that the antecedent truth of future propositions does not necessitate things in the world. After Duns Scotus, many late medieval thinkers thought like Abelard, particularly because of their new interpretation of contingency, but they did not believe, with the exception of John Buridan, that this was an Aristotelian view."

33. ———. 2012. "A history of modal traditions." In *Handbook of the History of Logic, Vol. 11: Logic: A History of His Central Concepts*, edited by Gabbay, Dov, Pelletier, Francis Jeffry and Woods, John, 309–339. Amsterdam: Elsevier.

    "My aim is to shed light on long-lived assumptions in Western modal conceptions as well as some clashes between them. In the first section, I shall deal with those trends in ancient and medieval modal thought which were inclined to codify the meaning of modal notions in frequency terms. The second section concentrates on the emergence of a different paradigm in which the analysis of necessity and possibility is separated from a one world model, and which considerably modified late medieval modal logic. The third section is about the interplay of these traditions in the early modern period and their influence up to the nineteenth century." (p. 309)

    "Abelard thought that what was actual was temporally necessary as being no longer avoidable, but he argued that mutually exclusive alternatives are possible at the same time in the sense that one or another of them could have happened at that time.(25) As distinct from Boethius's diachronic modalities, Abelard also operates with simultaneous alternatives of the present."

    (...)

    "Abelard argued that future contingent statements are either true or false although they are not determinately true or determinately false, by which he means that their truth or falsity does not imply that the things which make them true or false are determinate.(28)" (p. 318)

    (25) Logica 'Ingredientibus', 273.39–274.19; see [Martin, 2003, pp. 238–9].

    (28) See [Lewis, 1987]. Later medieval authors usually regarded future contingent statements as either true or false. While Abelard ascribed this view to Aristotle as well, the majority of later writers believed that Aristotle gave up bivalence with respect to these statements; see [Knuuttila, 2010a].

34. ———. 2012. "Modality." In *The Oxford Handbook of Medieval Philosophy*, edited by Marenbon, John, 312–341. New York Oxford University Press.

"Before the intensional modal semantics of John Duns Scotus, various new modal ideas were developed in the twelfth century. According to Abelard, what nature demands or allows and what is repugnant to it is the same for all members of a species, and what is possible in this sense for one member of a species can be derived from what is actualised in other members of the same species (Abelard 1956, *Dialectica* , 193:36–194:3; 385:1–8). Th is is in agreement with the traditional ideaof partial potencies, but Abelard also developed some aspects of the model of simultaneous alternatives." (p. 322)

35. Kretzmann, Norman. 1982. "The Culmination of the Old Logic in Peter Abelard." In *Renaissance and Renewal in the Twelfth Century*, edited by Benson, Robert L. and Constable, Giles, 488–511. Oxford: Clarendon Press.

"Concentrating on Abelard, whom Haskins rightly calls "one of the first philosophical minds of the whole Middle Ages" (351), needs no justification; if Anselm is assigned to the eleventh century, Abelard is the philosopher of the twelfth century. But why focus on the Old Logic, which had been the main secular source of intellectual sustenance since the earliest Middle Ages and which therefore scarcely qualifies as the stuff of a renaissance? Because the Old Logic is all that Abelard had,(10)

and because in many respects Abelard's philosophical accomplishments are a worthy culmination of the half-millennium of the Old Logic. Abelard's contribution to the twelfth-century renaissance, the single most important philosophical contribution, is not that of a sower nor that of a reviver, but the contribution of a harvester. Some of the glory of the twelfth century is not vernal but autumnal." (pp. 490-491)

(10) Abelard was evidently at least acquainted with some treatises of the New Logic (de Rijk ed., *Dialectica*, Introduction, xvi- xviii), but his surviving work is in no important way influenced by the recovery of Aristotle, still far from complete when Abelard died in 1142.

36. Kunitz-Dick, Alisa. 2014. "Peter Abelard's Various Conceptions of Place (*locus*): from Attributes of Substances to Collections." *Medioevo. Rivista di Storia della Filosofia Medievale* no. 39:31–36.

    Abstract: "This article traces the development of Peter Abelard's innovative conceptions of place, from the *Dialectica* to his theological writings. It proposes that there were a number of shifts in his models, the most important of which was the reduction of place, both substantial and quantitative, which had been classified as accidental or semi-accidental, to his ultimate view in which place is a collection of things which are contained in some way. Other variations, such as the relationships between God and place or incorporeals and place, differed less regularly between his works, and there are even occasional internal discrepancies within them. In the conclusion, I summarise this article's findings and discuss possible reasons for Abelard's shifting models."

37. Lenz, Martin. 2005. "Peculiar Perfection: Peter Abelard on Propositional Attitudes." *Journal of the History of Philosophy* no. 43:377–386.

    "Peter Abelard is one of the first and few authors in the tradition of mediaeval logic who drew a distinction not only between propositional content and assertive force but also between propositional content and propositional attitude. The latter kind of distinction does not only involve the

consideration of statements but of sentences in general, including expressions of wishes, orders, questions and such like. He thereby departs from the Aristotelian way of analysing sentences in terms of predication, and propounds a structural model that allows for a more coherent account both of the units of language and of how they relate to the mind.

(...)

So the modest aim of my paper is to raise the question whether this distinction might have been underestimated in the history of the mediaeval philosophy of language. A thorough study of this distinction might eventually provide an answer to the more general question of how we came to think of the sentence as a complete or peculiarly perfect unit of language."

38. ———. 2007. "Are Thoughts and Sentences Compositional? A Controversy between Abelard and a Pupil of Alberic on the Reconciliation of Ancient Theses on Mind and Language." *Vivarium* no. 45:169–188.

    Abstract: "This paper reconstructs a controversy between a pupil of Alberic of Paris and Peter Abelard which illustrates two competing ways of reconciling different ancient traditions. I shall argue that their accounts of the relation between sentences and thoughts are incompatible with one another, although they rely on the same set of sources. The key to understanding their different views on assertive and non-assertive sentences lies in their disparate views about the structure of thoughts: whereas Abelard takes thoughts to be compositional, the opponent's arguments seem to rely on the premise that the mental states which correspond to sentences cannot be compositional in the way that Abelard suggested. Although, at a first glance, Abelard's position appears to be more coherent, it turns out that his opponent convincingly argues against weaknesses in Abelard's semantic theory by proposing a pragmatic approach."

39. Lenzen, Wolfgang. 2022. "Rewriting the History of Connexive Logic." *Journal of Philosophical Logic* no. 51:525–553.

Abstract: "The “official” history of connexive logic was written in 2012 by Storrs McCall who argued that connexive logic was founded by ancient logicians like Aristotle, Chrysippus, and Boethius; that it was further developed by medieval logicians like Abelard, Kilwardby, and Paul of Venice; and that it was rediscovered in the 19th and twentieth century by Lewis Carroll, Hugh MacColl, Frank P. Ramsey, and Everett J. Nelson. From 1960 onwards, connexive logic was finally transformed into nonclassical calculi which partly concur with systems of relevance logic and paraconsistent logic. In this paper it will be argued that McCall’s historical analysis is fundamentally mistaken since it doesn’t take into account two versions of connexivism. While “humble” connexivism maintains that connexive properties (like the condition that no proposition implies its own negation) only apply to “normal” (e.g., self-consistent) antecedents, “hardcore” connexivism insists that they also hold for “abnormal” propositions.

It is shown that the overwhelming majority of the forerunners of connexive logic were only “humble” connexivists. Their ideas concerning (“humbly”) connexive implication don’t give rise, however, to anything like a non-classical logic."

41. Lewis, Neil T. 1987. "Determinate Truth in Abelard." *Vivarium* no. 25:81–109.

"I wish to show in this paper that when read in this broader context we can see (i) that Abelard does not adopt different views in LI [*Logca Ingredientibus*] [*] and D [*Dialectica*] , in that the same solution is offered in each to this line of

argument; (ii) that Abelard in these passages does not rely on the claim that valid inference preserves determinancy.

(...)

"Before we consider these issues in detail it will prove useful to set out some more general points pertaining to the concept of deter- minancy, an important but little studied notion in Abelard. I shall not try here to iron out all of the considerable difficulties Abelard's texts pose, but rather I shall outline some general themes useful for the more detailed discussion in section III on." (pp. 81-82)

[*] LI, p. 424.36-40. The longer discussion of concern to us occupies pp. 421.16- 422.40. The text of this passage in Geyer's edition contains a number of incorrect readings and the apparatus contains some errors and omissions. The reedited text may be found in the appendix to this paper (pp. 106-108).

42. MacFarlane, John. 2016. "Abelard's Argument for Formality." In *Formal Approaches and Natural Language in Medieval Logic: Proceedings of the Xixth European Symposium of Medieval Logic and Semantics, Geneva, 12-16 June 2012*, edited by Cesalli, Laurent, Goubier, Frédéric and Libera, Alain de, 41–57. Turnhout: Brepols.

"Generalizing, we might say that formally valid inferences are inferences whose validity is not grounded in any fact about the world. Of course, the claim that there *are* such inferences is a substantive one. Let us call it the Formality Thesis:

There are inferences whose validity is entirely grounded in their forms, and does not depend on any fact about the world(5)" (p 42)

"Abelard interests me because, unlike later medieval logicians, he offers an argument for the Formality Thesis –a thesis his predecessors seem to have rejected. This argument motivates his distinction between formal and material consequence –or, in his terminology, perfect and imperfect entailment (inferentia(6). He does not slide from «good in all matter» to «good in virtue of form»; indeed, he recognizes inferences that are good in all matter but depend for their validity on facts

about the world. He gives a much subtler argument –and it is a good argument, in its philosophical context. But it is not an argument that can give us a good reason to accept the Formality Thesis."(pp. 43-44)

(5) As stated, the Formality Thesis is ambiguous between a metaphysical thesis (there are inferences that are valid solely in virtue of their forms, and not at all in virtue of any facts about the world) and an epistemological thesis (there are inferences that we can know to be valid solely on the basis of knowledge of their forms, and independently of any knowledge of facts about the world).

(6) translating inferentia as «entailment», I follow C. Martin «Logic», in J. E. Brower, K. Guilfoy (eds.), *The Cambridge Companion to Abelard*, Cambridge University Press, Cambridge 2004, pp. 158-199.

43. Malcolm, John. 1979. "A Reconsideration of the Identity and Inherence Theories of the Copula." *Journal of the History of Philosophy* no. 17:383–400.

"Scholars concerned with medieval logic have recently made much of a distinction between two alleged theories as to the logical function of the copula: the identity theory and the inherence theory."

(...)

"My thesis will be that the identity-inherence dichotomy has been applied much too broadly and uncritically, for it does not hold for cases of accidental predication. I shall first try to get an adequate formulation of the two theories and shall then contrast them with what I shall call the normal theory of accidental predication. I then turn to Abelard and maintain that he does not go from an inherence theory in the L*ogica lngredientibus* (5) to an identity theory in the *Dialectica* but, rather, holds to the normal theory in both works. After this I shall examine Ockham and his followers and shall conclude that they are not, as is usually supposed, identity theorists.

The question remains whether there are any *bona fide* inherence theorists. I shall suggest that the attempts to

consider Aquinas and Ferrer to be such are inconclusive, but I shall not, in contrast with the alleged identity theorists, give a conclusive rebuttal of this possibility. Finally, I shall indicate that the true scope of the controversy between identity and inherence should be limited to essential predication." (pp. 383-384 a note omitted)

44. Maloney, Christopher J. 1982. "Abailard's Theory of Universals." *Notre Dame Journal of Formal Logic* no. 23:27–38.

    "Abailard like Porphyry asks, but unlike Porphyry answers, three questions of the semantics and ontology of universals:

    (1) What is the common cause by which the universal word, a predicate, is correctly imposed or predicated?

    (2) What kind of concept of commonality is understood in an intelligent act of predication?

    (3) Is a predicate called common because of the common cause of imposition, the concept understood in predication or both?

    Abailard's responses to these questions are notorious and raise as many issues as they resolve. It is my primary purpose to reconstruct Abailard's answers in such a way that his nominalism and conceptualism are intelligible.

    This requires an analysis of what he calls the common cause of the imposition of a predicate as well as his view of abstract concepts. To assess his theory, it is first necessary to survey briefly his objections to William and Joscelin. We shall find that Abailard's own theory is subject to much the same criticism he levies against his rivals. Indeed, far from the nominalism he hopes to defend, Abailard's theory runs off toward Platonic realism." (pp. 27.28, a note omitted)

45. Marenbon, John. 1991. "Abelard's Concept of Possibility." In *Historia Philosophiae Medii Aevi. Studien zur Geschichte der Philosophie des Mittelalters. Festschrift für Kurt Flasch zu seinem 60. Geburtstag. (vol. II)*, edited by Mojsisch, Burkhard and Pluta, Olaf, 595–609. Amsterdam: B. R. Grüner.

Reprinted as Essay X in: John Marenbon, *Aristotelian Logic, Platonism, and the Context of Early Medieval Philosophy in the West*.

"In the following pages, I will argue that Abelard's view of possibility is more unusual and more complex than these scholars [*] have allowed. Strange though it may seem, Abelard accepted the notion of genuine

counterfactuality and set out to analyze it, and yet he rejected the idea of alternative possible worlds on which modern logicians found their analysis of counterfactuality. The reasons why he did so go to the very heart of his philosophy and theology.

The main works of Abelard's which will be used in this discussion are his *Dialectica* — a textbook of logic; the glosses to Aristotle's *Categories* and *De interpretatione* from his *Logica ingredientibus;* his *Theologia christiana* and his *Theologia scholarium*. Both the *Dialectica* and the glosses probably date from between 1117 and 1121: neither work as a whole seems to be earlier than the other, although in individual sections one or the other appears to be more developed.(7) Both of the theological works, however, are later: the *Theologia christiana*, in its various recensions, dates from c. 1121-6, and the *Theologia scholarium* from 1133-40.(8)" (p. 596, a note omitted)

Marenbon, J., Medieval latin commentaries and glosses on aristotelian logical texts before ca. 1150 A.D., in: *Glosses and Commentaries on Aristotelian Logical Texts: The Syriac, Arabic and Medieval Latin Traditions;* , ed. C. Burnett. London, 1993.

47. ———. 1992. "Abelard, *Ens* and Unity." *Topoi* no. 11:149–158.

Abstract: "Although Abelard arrived at a view of "ens" nearer to Aristotle's than his sources would suggest, unlike Thirteenth-century thinkers he did not work out a view of transcendentals in terms of "ens", its attributes and their convertibility. He did, however, regard unity (though not goodness or truth) as an attribute of everything. At first, Abelard suggested that unity, being inseparable, could not be an accident according to Porphyry's definition (' that which can come and leave a subject without the subject being corrupted') either it is some type of form not classified by Porphyry, or not a form at all. In his later logical work, Abelard argued differently. Unity, he said, is an accidental form, but Porphyry's definition of an accident must

be understood negatively, not as asserting something about what could happen in reality (since the form of unity could never leave its subject) but rather something about an absence of connection: were it, per impossible, to occur, the loss by a subject of its form of unity would not lead to the loss of its specific or generic status."

48. ———. 1997. "The Platonisms of Peter Abelard." In *Néoplatonisme et philosophie médiévale*, edited by Benakis, Linos G., 109–129. Turnhout: Brepols.

    Reprinted as Essay XII in: John Marenbon, *Aristotelian Logic, Platonism, and the Context of Early Medieval Philosophy in the West*.

    "When, in 1966, Father Chenu published *Les platonismes au XII siècle,* twelfth-century Platonism had already been a topic of scholarly interest for nearly a century. (1) Chenu's novelty lay in his plural: not «Platonism» but «Platonisms». He distinguished a strand going back to Augustine, another deriving from the *Timaeus* and Boethius, one linked to pseudo-Dionysius and another to Arab writers. Chenu's is a useful analytical method which allows the scholar to avoid broad, oversimplifying labels whilst continuing to see the history of medieval philosophy in the neat terms of interrelated and interacting traditions. No doubt it could be fruitfully applied to Abelard -- but that is not my intention here. The Platonisms I shall be discussing are not those of the historian, but Abelard' s own: some of the diverse ways in which he used a notion of Plato and Platonic teaching to formulate, structure and convey his own thought (2). At the end of this paper, I shall return to the question of method, and ask what my procedure has to offer by contrast with other ways of discussing Platon- or any other -ism."

    (1) In M.-D. Chenu, *La théologie au douzième siècle* (Études de philosophie médiévale, 45). Paris, 1966, pp. 108-141. For a sketch of the historiography of twelfth-century Platonism, see J. Marenbon, "Platonismus im zwólften Jahrhundert: alte und neue Zugangsweisen" (translation by A. Snell & O. Summerell), in T. Kobusch and B. Moisisch (eds.), *Platon in der*

abendländischen Geistesgeschichte, neue Forschungen zum Plaumismus, Darmstadt, forthcoming. [Darmstadt, Wissenschaftliche Buchgesellschaft, 1997 pp. 101-119]

(2) In my general presentation of Abelard's use of Plato and attitude to him, I summarize arguments put forward in various places and different contexts in my *The Philosophy of Peter Abelard*. Cambridge, 1997. But in my longer and more detailed discussions here -- of Plato universals, the *Timaeus* and optimism, and «the Platonism of the *Republic*» -- I develop and extend what I have written in the book.

49. ———. 1997. *The Philosophy of Peter Abelard*. Cambridge: Cambridge University Press.

Paperback edition, with corrections and bibliographical note, 1999.

"Outside quite technical matters of logic, it is implied, Abelard must be seen as important only in matters of detail and method - an attitude strengthened by an idea which has been taken up by more recent historians but goes back at least to the fifteenth-century historian Trithemius: that Abelard's theology is characterized by its application of the methods of logic to discussing Christian doctrine.(3)

The aim of this book is to show that this view of Abelard as a mainly critical thinker is inaccurate and unjust. His was more than a fleeting, superficial brilliance. He was a constructive and, at times, systematic philosopher; and, although it is certainly true that he (like many of his contemporaries) used the methods of logic in treating Christian doctrine, his theology is remarkable for much more than its method. Abelard's writings do not, however, form a single, coherent system. Abelard's interests and achievements fall into two roughly chronological phases. As a logician, he worked within the structure provided by the ancient texts which made up the logical curriculum. He provided cogent and often original answer to the philosophical questions which this study raised, but he did not pursue them systematically. He developed a sophisticated account of the semantics of universal words, but he did not resolve an underlying tension which runs through

his ontology. As a writer on Christian doctrine, by contrast, Abelard strove to create his own theological system. Although he used methods and concepts he had developed within his logic, they were incidental to his main suppositions and aims. The bearing of Abelard's theological system was predominantly ethical: in the course of developing it, he elaborated a coherent, systematic and wide-ranging moral theory.

(...)

"The plan is simple. Part I gives a general account of Abelard as a whole: his life, his writings and teaching and the overall shape and growth of his thought. Part II looks at the mainly coherent, but unsystematic philosophy which he developed in close connection with his study of logic. Part III examines the ethical system which binds together his theology. (pp. 2-3)

50. ———. 1998. "The Twelfth Century." In *Routledge History of Philosophy. Volume III: Medieval Philosophy*, edited by Marenbon, John, 150–187. New York: Routledge.

On Abelard see pp. 155-166.

"The following pages can give only an impression of some of the most philosophically interesting aspects of a thinker whose originality and breadth of vision would entitle him to much more space in a History of Philosophy had it not been his misfortune to live in the Middle Ages. First, his ideas on two areas connected with the more formal side of logic will be sketched: his treatment of conditionals, and his analysis of modal statements. (Many other of his more formal developments are also of great interest: for instance, his treatment of 'impersonal statements', such as 'It is good that you are here', and his discussion of the copula.(9) Second, after a glance at his basic metaphysics, Abelard's approach to the problem of universals will be examined. Third, his account of a central area in ethics, the ethical act, will be discussed and set in context." (pp. 156-157)

(9) On impersonal statements, see Jacobi [7.53]; on the copula, see de Rijk [7.76] (acute discussion and full bibliography on the

question).

51. ———. 2004. ""Dicta", Assertion and Speech Acts: Abelard and Some Modern Interpreters." In *Medieval Theories on Assertive and Non-Assertive Language*, edited by Maierù, Alfonso and Valente, Luisa, 59–80. Firenze: Olschki.

"The *dictum* is one of Abelard's most striking philosophical inventions, and one of the most controversial for his modern interpreters.(1) A *dictum* - as the Latin word indicates - is what is said by a *propositio* {a propositional sentence (2)." (p. 59)

(...)

"Too much remains hypothetical to speak of conclusions_ in the proper sense but this train of argument, stimulated by the speculations of Jacobi, Strub and King has led me to assert what twelfth-century logicians might have called a series of *positiones* (perhaps, the critic might say, no less paradoxical than some of theirs!). First, although Abelard is absolutely clear in seeing propositional sentences as assertive language, he does *not* use his concept of *dicta* to elaborate a theory of speech acts, which would distinguish between utterances with same content but different sorts of force - assertive, interrogative, exhortatory, desiderative. Second, there is no reason to suppose that Abelard introduced his theory of *dicta* in the first place so as to clarify the distinction between assertive and non-assertive language.

Rather Abelard needed the notion of *dicta* as an integral part of the metaphysics which he worked out in the course of his logical teaching. Third, it is extremely improbable that Abelard added the excursuses discussing *dicta* to his *Logica*

commentary on *De interpretatione* only after he had written the literal commentary and some of the other excursuses. Indeed, i! is altogether unlikely that Abelard added excursuses at a later stage to literal commentaries he had already written. Fourth Abelard may well have given up his theory of dicta in his last years of teaching, unable perhaps to resolve the problems It posed and wanting to concentrate on his ethical and theological project.

It is !he last, and most tentative, of these conclusions which is the most far-reachmg, and not Just for how it bears out a view of Abelard's career I have urged elsewhere, in which he moves away from elaborating a metaphysical theory that ultimately failed to cohere to concentrating on providing a rational account of Christian belief, organized around ethical doctrine. (35) It also contains the implication that Abelard himself found his views about *dicta* unsatisfactory, and, although, such an argument from silence can never be conclusive, his and his followers' failure to use the notion of *dicta* to discuss the object of faith is remarkable.

(1) Irene Rosier-Catach gives an up-to-date list of the main modern discussions in n. 1 of *Les discussions sur le signifié des propositions chez Abelard et ses contemporains* in this volume. I am very grateful to her for allowing me to use the text of her article and for discussing my views with me, and to her and Martin Lenz for reading through and commenting on this paper.

(2) The usual translation of *propositio* by 'proposition' is particularly confusing in this context.

By a *propositio*, Abelard means a token affirming or denying sentence: I shall therefore use the rather clumsy 'propositional sentence' as an English equivalent of the Latin *propositio*.

(35) See Marenbon, *The Philosophy of Peter Abelard,* esp. p. 208-215.

52. ———. 2006. "The Rediscovery of Peter Abelard's Philosophy." *Journal of the History of Philosophy* no. 44:331–351.

    Abstract: "My article surveys philosophical discussions of Abelard over the last twenty years. Although Abelard has been a well-known figure for centuries, his most important logical works were published only in the twentieth century and, so I argue, the rediscovery of him as an important philosopher is recent and continuing. I concentrate especially on work that shows Abelard as the re-discoverer of propositional logic (Chris Martin); as a subtle explorer of problems about modality (Simo Knuuttila, Herbert Weidemann) and semantics (Klaus Jacobi); as a metaphysician before the reception of Aristotle's Metaphysics (Peter King); and as an ethical thinker who echoes the Stoics (Calvin Normore) and anticipates Kant (Peter King)."

53. ———. 2007. "Abelard's Changing Thoughts on Sameness and Difference in Logic and Theology." *American Catholic Philosophical Quarterly* no. 81:229–250.

    Abstract: "The discussion of sameness and difference in the three versions of the Theologia has been analyzed by a number of recent writers (for example, Ian Wilks, Jeff Brower, and Peter King). Despite some disagreements, they concur that Abelard's views are best expressed in the *Theologia christiana* and that he is putting forward a theory that-perhaps adapted-can help philosophers now in considering the material constitution of objects. By contrast, I argue that his views, which should be seen as developing and reaching their final form in the *Theologia "scholarium,"* are much more closely linked than these scholars have thought to the particular theological problems involved in discussing the Trinity."

Peter Abelard, pp. 135-148.

"The system of logic Abelard devised was – so it has recently been shown (Martin, 1987, 1991, 2004) – a propositional logic. As logicians since Alcuin had done, he accepted Aristotelian syllogistic, though he saw the problems in, and adjusted, the modal syllogistic. As well as Aristotelian predicate logic,there had been in the ancient world a propositional logic – that of the Stoics.

But by late antiquity it was no longer understood, and so Boethius's usefulness as an intermediary was limited (Chapter 3, section 1). None the less, Abelard seems, partly through a perspicacious reading through Boethius's work on hypothetical syllogisms, partly through his own imagination, to have reinvented a fully propositional system. A precondition for this discovery, to which his tendency to analyse and disambiguate sentences may have disposed him, was his grasp of propositionality. Abelard, by striking contrast with Boethius, understood the idea of propositional content and propositional operations (such as negation and consequence) on it; so, for example, he was fully aware of how negating 'If p, then q' is not a matter of negating the antecedent or the consequent (let alone any of the terms which constitute them), but of denying that q is entailed by p." (p. 137)

Selected Bibliography on Abelard's Logic and Ontology. Third Part Mar - Pot

Bibliography

1. Marenbon, John. 2008. "Was Abelard a Trope Theorist?" In *Compléments de Substance. Études sur les propriétés accidentelles offertes à Alain de Libera*, edited by Erismann, Christophe and Schniewind, Alexandrine, 85–101. Paris: Vrin.

   "It was Christopher Martin who, in 1992, first made the link between Abelard's views on accidents and *differentiae* and what are usually called, in contemporary analytical ontology, `tropes'. Myself apart, Alain de Libera is the only writer I know who has taken serious notice of this idea, discussing it both on its own, and in the wider context of truth-makers and empty reference.(1) De Libera does not think that Abelard can illuminatingly be described as a trope-theorist. I still disagree, and although our disagreement is based on matters of detail, it may illustrate, as I suggest in the conclusion, a wider difference in approach." (p. 85)

Marenbon, *The Philosophy of Peter Abelard,* Cambridge; CUP, 1997, 119-30; A. de Libera, 'Des accidents aux tropes. Pierre Abélard', *Revue de métaphysique et de morale* 4 (2002) 509-30; *La Référence vide. Théories de la proposition,* Paris; PUF, 2002, 122-6, 269-97.

2. ———. 2008. "Abelard on «Differentiae»: How Consistent is His Nominalism?" *Documenti e Studi sulla Tradizione Filosofica Medievale* no. 19:179–190.

   "Abelard develops this nominalist theory in his discussions of Porphyry’s Questions in the *Logica Ingredientibus (LI)* commentary on the *Isagoge* (c.1119) and in his later *Logica Nostrorum Petitioni Sociorum* or *Glossulae (LNPS)* to the

Isagoge (c. 1125-6)(1). In both places he establishes his theory elaborately, both by reducing to absurdity the various versions of the realist position, and by explaining how the semantics of universal terms can be very satisfactorily explained without positing the existence of any universal things. But does he stick to it? There is a passage a little later on in the *LNPS* in the section on *differentiae*, an excursus at the end of the section, which has been interpreted — by myself(2) — to show that he did not. I argue that at least on one, plausible reading of the passage, Abelard will « have abandoned the

nominalist position he always explicitly holds on universals » and substituted for it a sophisticated realism, reminiscent of Duns Scotus.

Both the Excursus itself, and my interpretation of it, have been generally ignored(3) . This is a pity, for two reasons. First, the Excursus, though horribly obscure in some places, is a fascinating example of Abelard's thinking and, especially, of the analytical tools he had developed by the mid-1120s. Second, my interpretation is wrong and needs to be corrected — and putting it right offers a quite important general lesson about interpreting Abelard." (pp. 179-180)

3. ———. 2008. "Logic at the Turn of the Twelfth Century " In *Handbook of the History of Logic. Vol. 2. Mediaeval and Renaissance Logic*, edited by Gabbay, Dov M. and Woods, John, 65–81. Amsterdam: Elsevier.

   "This chapter is not, like the others in the book, a survey of the logical doctrines of a period, because I at least (and perhaps other scholars too) am not yet in a position to write such a survey. It is simply a guide to the material, to the technical problems it presents and some of the theories historians have elaborated about it, along with an indication of a few of the philosophical themes which are waiting to be explored. 'The turn of the twelfth century' is a deliberately vague title, designed to indicate the hole between where the previous chapter finished and Abelard's work, the subject of the following chapter. But plugging this gap—even as here, with a sponge and a nailbrush — is not a straightforwardly chronological matter. Abelard's *Dialectica*, the main subject of the next chapter, may have been being written as early as 1110: a good deal of what is discussed here was probably written no earlier, and some of the texts may in fact date from the 1120s or 1130s.

   But the writings and writers discussed here have at least traditionally been seen as providing the prelude to Abelard's work. They form a separate group in their methods and concerns from the writings of Abelard's contemporaries and the later twelfth-century schools considered in the final section of the next chapter." (p. 65, a note omitted)

4. ———. 2011. "Logic at the Turn of the Twelfth Century: a synthesis(1)." In *Arts du langage et théologie aux confins des*

XIe et XIIe siècles: textes, maîtres, débats, edited by Rosier-Catach, Irène, 181–218. Turnhout: Brepols.

"«Progress report» might be a more appropriate title. Despite the magnificent work of, in particular, one scholar, Yukio Iwakuma, who ha devoted a still continuing career to discovering, transcribing and editing twelfth-century logical texts, the material is still too sparsely published, too little read, too poorly understood for any proper synthesis to be possible. Yet the whiggish overtones of «progress report» may also deceive. There *has* been progress in the field: new material has been found and errors have been put right. But it has altogether been progress of a meandering sort; what with great learning one study constructs, the next as eruditely dismantles.

Moreover there is as I shall suggest, a danger of remaining trapped in an old historiographical framework and so moving in circles within a narrow compass, rather than reaching a broader and more exact understanding of logic in this period. That will be at the very end of the following pages (VI). Before then, I shall begin with what is uncontroversial: the settings in which logic was studied, the logical curriculum of the time, and the forms of writing on logic (I). Then I shall set ot the views about the development of logic c. 1100 as they have beeb developed over the last decades (II), and the important recent critiques of the them (some in this very volume) (III). In the following sections I re-examine the evidence and the critical arguments, and I attempt to state what we can believe with reasonable certainty (IV-V)." (p. 181)

(1) This chapter bears only a slight resemblance to the « Synthesis » which I wrote for the conference website. Catach very kindly allowed me to use material from that for a chapter I was rerqured Io submit al the last moment to the *Handbook of the History of Logic* (Marenbon 2008b), That chapter now complements this one.

   "*Abelard in Four Dimension*s can be read from various different perspectives and addresses itself to at least three different sorts of readers.

   Although it is not a general book on Abelard and his thought (I have written one already), it is written so as to be comprehensible to readers who are approaching him for the first time. Chapter 1 begins with a brief account of his life and writings which, along with the detailed list of editions of Abelard's works in the bibliography, provides an introductory framework. The body of the book discusses some of Abelard's most striking and characteristic ideas, through a wide range of his thought: his sophisticated semantics (chapter 5), his theories about the metaphysical structure of concrete things and about identity and difference (chapter 6), the place of intention in his moral psychology (chapter 3) and his conception of God and divine omnipotence (chapters 2 and 4)." (pp. 3-4)

6. ———. 2015. "Abelard's Theory of Universals." In *Nominalism about Properties: New Essays*, edited by Guigon, Ghislain and Rodriguez-Pereyra, Gonzalo, 39–62. New York: Routledge.

   "These pages began as an attempt to look at Abelard's theory of universals in connection with contemporary discussions. But it soon became apparent that there is little consensus about what this theory is and, despite the extensive literature on the subject, no place where readers, including those without any prior knowledge of the medieval background, can find a straightforward account of what Abelard said, what are the main questions of interpretation and how, or whether, they can be answered. (1) This chapter is intended to fill that gap. The first section presents the main lines of Abelard's theory, and the second looks in more detail at some of its problematic areas." (p. 38)

(1) The most important extended, general recent discussions of Abelard's own theory of universals are: Jolivet (1975); Tweedale (1976); de Rijk (1980); King (1982); Jolivet (1992, 128–41); Shimizu (1995); de Libera (1999, 281–498).

I discuss the topic in Marenbon (1997a, 174–201), but I have approached thesubject afresh here; I note where I reject my earlier interpretations.

7. ———. 2018. "Relations in Earlier Medieval Latin Philosophy: Against the Standard Account." *Enrahonar. An International*

Journal of Theoretical and Practical Reason no. 61:41–58.

Abstract: "Medieval philosophers before Ockham are usually said to have treated relations as real, monadic accidents. This “Standard Account” does not, however, fit in with most discussions of relations in the Latin tradition from Augustine to the end of the 12th century.

Early medieval thinkers minimized or denied the ontological standing of relations, and some, such as John Scottus Eriugena, recognized them as polyadic. They were especially influenced by Boethius’s discussion in his *De trinitate*, where relations are treated as prime examples of accidents that do not affect their substances. This paper examines non-standard accounts in the period up to c. 1100."

"There is a Standard Account of relations in medieval philosophy, which is the basis for most work on the area in the Anglophone tradition. It is presented in its clearest form in Jeffrey Brower’s article on the topic in the authoritative Stanford Encyclopedia of Philosophy (Brower, 2015). Its main features are, however, already found in the earliest survey of the field by a historian of philosophy with analytic training, Julius Weinberg’s 1965 essay on the history of relation (Weinberg, 1965). It informs Henninger’s important monograph on *Relations. Medieval Theories 1250-1325* (Henninger, 1989), and it shapes even the writing of the occasional historians who search for exceptions (for example, Ebbesen, 1995; Hansen, 2013)."

   "Among twelfth-century books, logical manuscripts constitute a coherent field of investigation.(1), (2) Logic was studied in the schools attached to cathedrals and, especially, in the many schools that grew up in Paris after about 1120.(3) The course in logic was fairly narrowly set, based on a small number of logical texts and commentaries from the ancient world.

   Twelfth-century authors wrote their own commentaries on these texts and independent logical works; in both will be found some of the most important philosophical thinking of the century.

   The first section of this chapter sets out the ancient and late antique texts used by logicians. There follow studies of the twelfth-century manuscripts containing this material (Section 2), of commentaries by twelfth-century logicians (Section 3), and of independent logical treatises from the period (Section 4)." (p. 115)

(1) John Marenbon is the author of Sections 1, 2, 4, and the Appendix, Caterina Tarlazzi of Section 3.

(2) Often twelfth-century authors call the subject dialectica, but sometimes this word is used to refer specifically to topical inferences. For this reason, and because of the various contemporary connotations of ‘dialectic’, ‘logic’ is a better term to use.

    William of Soissons and Abelard's theories of Entailment.

    "John of Salisbury's *Metalogicon* is well known as a source for the discussion of universals in the twelfth century, but has rarely been considered for what it can tell us about the developmrnt of theories of entailment. This is unfortunate because John has many interesting things to say." (pp. 564-565)

    (...)

    "According to William and Martha Kneale, it has been thought that William's invention was a physical device perhaps anticipating Stanley Jevon's logical machine.(2) Ther Kneales propose, however, that

    it was an argument to the effect that any impossibility may be derived from a single impossibility, but offer no suggestion as to what that argument might be. I will show here that most probably the machine was a version of what we know as C. I. Lewis's proof that anything follows from a contradiction."

(...)

"Such an argument has long been known from the fourteenth century, but its appearance in the twelfth has gone unnoticed. By show ing how the argument came about I want to reveal a turning point in the history of logic and lay to rest the claim that there is no history to the demand that relevance is required for entailment.(3) Many twelfth-century discussions are very sophisticated and, as accounts of argument and of the conditional in natural language, have much to offer to contemporary theorists. They have been neglected and mis understood by historians of philosophy.

With their recovery should come a better understanding of the treatment of philosophical and theological problems in the Middle Ages. I will concentrate on Abaelard's work, but what follows is only a very simplified account of a very complex theory.(4)" (p. 565)

11. ———. 1987. "Something Amazing about the Peripatetic of Pallet: Abelard's Development of Boethius' Account of Conditional Propositions." *Argumentation* no. 1:419–436.

    Abstract: "Mediaeval logicians inherited from Boethius an account of conditional propositions and the syllogisms which may be constructed using them. In the following paper it is shown that there are considerable difficulties with Boethius' account which arise from his failure to understand the nature of

compound propositions and in particular to provide for their negation. Boethius suggests that there are two different conditions which may be imposed for the truth of a conditional proposition but he really gives no adequate account of how such propositions may be obtained. The true greatness of Peter Abaelard as a philosophical logician is revealed in what he is able to do with the material which he found in Boethius. It is shown that he developed a precise theory of conditionals giving an account of how true conditionals may be obtained and principles which may be used to reject others as false. Unlike Boethius Abaelard properly appreciates that conjunctions must be treated as logical units. Even he, however, falls victim to difficulties which arise when this connective is brought into contact with negation and the conditions which he lays down for the truth of a conditional."

13. ———. 1992. "The Logic of the "Nominales", or the Rise and Fall of Impossible Positio." *Vivarium* no. 30:110–126.

    "The twelfth century *Nominales* were without doubt the followers of Peter Abaelard and they were probably so called on account of their theory of universals." (p. 110)

    (...)

    "Just like today's anti-realists Abaelard derived conclusions about entailment and argument from ontology and philosophical semantics. Where today's anti-realists are intuitionists, however, Abaelard and the *Nominales* were connexivists. Connexive logic has as its leading idea that 'no proposition should imply or be implied by its own negation'. Since half of this principle is found in the *Prior Analytics* and is reported in de *Syllogismo Hypothetico*, it was bound to be acknowledged in some form by all dialecticians. Abaelard held that the most peculiarly proper principle of Nominalist logic

followed from the basic connexive principle. This is the claim that conditionals whose antecedent and consequent differ in quality are false. To understand the character of Nominalist logic it is thus necessary to understand the nature of Abaelard' s support for connexivism and in particular why he advocates this account of the conditional. Abaelard' s connexivism ultimately rests upon an ontology of individual forms and I so will begin with a very brief survey of this and its relationship to his theory of language. The main part of the paper explores Abaelard' s theory of logical relations and its application by the *Nominales*. In particular I propose that they were probably the inventors of *positio* and that they rediscovered the Liar. I conclude with a discussion of two paradoxical claims made by his followers but not by Abaelard and some suggestions about the later history of the logic of the *Nominales*." (p. 111)

14. ———. 1999. *Theories of Inference and Entailment in the Middle Ages (Boethius, Philoponus, Peter Abelard, John Duns Scotus, William of Ockham)*, Princeton University.

    Available at ProQuest Dissertation Express. Order number: 9948627.

    Abstract: "The origins of mediaeval theories of inference and entailment are shown first to lie in the work of Boethius and an account is proposed of the theory of the hypothetical syllogism that he offers in *de Hypotheticis Syllogismis*. Boethius is also shown to have provided some hints which led twelfth century philosophers to develop the theory of *positio impossibilis* for the construction of thought experiments with hypotheses acknowledged to be impossible. The ancient sources of Boethius's ideas on such hypotheses are investigated and in particular the use of them by Philoponus in arguing against Aristotle's rejection of the notion of space as three dimensional extension. Peter Abaelard is shown to be the crucial figure in the development of theories of the truth of the conditional and the validity of argument in the twelfth century and this aspect of his philosophy is explored in some detail.

    Abaelard's followers the *Nominales* were characterised especially by their acceptance of his connexive principles for

the logic of the conditional and by their application of them in developing a theory of impossible hypotheses. It is argued here the *Nominales*' commitment to Abaelardian logic helps to explain their advocacy of the striking thesis that nothing grows and perhaps also reveals them to be discoverers of the Liar paradox in the middle ages. Finally it is argued that the distinctions made by Abaelard between two kinds of conditional, and the different logical principles governing them, are employed at least up to the time of William of Ockham and especially in the work of John Duns Scotus. Ockham's theory of the conditional is shown to make a fundamental break with the hyperintensional logical theory employed by Scotus in arguing for the central importance of the formal distinction in metaphysics."

15. ———. 2001. "Abaelard on Modality: Some Possibilities and Some Puzzles." In *Potentialität und Possibilität. Modalaussagen in der Geschichte der Metaphysik*, edited by Buchheim, Thomas, Kneepkens, Corneille Henri and Lorenz, Kuno, 97–125. Stuttgart: Frommann-Holzboog.

    "In his monumental study of William of Sherwood's modal theory Klaus Jacobi (2) surveys the treatment of modality by philosophers in the preceding century and shows that their concern was for the most part to calculate the logical relations between the various forms of modal proposition which they recognised. Although theology demanded that they take an interest in the nature of divine power, without the *Physics* and *Metaphysics,* to prompt them, twelfth century philosophers generally had little to say on the relationship of modal propositions and their structures to the various sources of modal claims, to claims, for example, about the nature of potentiality, physical causation, or action.(3) Some progress was made, however, and in the present paper I will consider the contribution of Peter Abaelard to the development of theories of modality and the curious attitude of one of his followers to his work on modal logic.

    Although Abaelard had no access to the *Physics* or *Metaphysics* and precious little, if any, to the *Prior Analytics,*(4) he did find in the *Categories* and *De Interpretatione* texts which posed

interpretive problems whose solution demanded that he discuss the nature of possibility and necessity. What follows is for the most part an examination of certain points made by Abaelard in his discussion of these problems. It is divided into two parts.

In the first part of the paper I propose an account of Abaelard's theory of possibility and its application both to creatures and to God.(5) Abaelard's claims about divine power are rather well known and I mention them only very briefly at the end. His treatment of creaturely potentiality in commenting on various claims made by Aristotle in the *Categories* has, on the other hand, barely been noticed and my concern in the first part of the paper is to thus set them out in some detail.

The failure to take into account the full range of Abaelard's thinking about potentiality has led to some very misleading claims about his views on possibility. What my investigation shows is that Abaelard employs three different but related notions of potentiality. The first is the potentiality that an individual has for future action and it is constrained by its species nature, its particular constitution, and its present circumstances. The second and third are both introduced to explain how we may legitimately say, as authority requires, that an amputee is bipedal. They are different but both reduce all unqualified possibility to potentiality and all potentiality to compatibility with species nature. The unqualified possibilities open for an individual creature of a given natural kind are thus for anything which is not incompatible with its species nature.

In the second part of the paper I first examine the account of modal propositions that Abaelard insists upon in discussing chapter 12 of *De Interpretatione*. I show that this account of the semantics of such propositions is completely in agreement with his treatment of the source of modal properties in natures. In his treatment of modal propositions Abaelard famously distinguishes between two different interpretations of propositions such as *'S* is possibly *P'*. A personal, or '*de re'* reading, in which *S* is said to possess a power to be *P,* and an impersonal, or *'de sensu'* reading in which *'S's being P'* is claimed to be possible where the nominal phrase is held to refer

to a proposition, propositional content, or some other kind of entity. Abaelard argues that only the *de re* reading yields a modal claim and that nominal modes are to be resolved into the corresponding adverbial modes. The truth conditions of modal propositions are thus always, according to Abaelard, ultimately to be given in terms of what is compatible and what is not with the specific nature of the subject of the *de re* reading of them.

Information about the fate of Abaelard's theories and the views of his followers is unfortunately very limited and it is pleasant to be able to add here to our knowledge. The texts that we have on divine and creaturely power agree with Abaelard's teaching in reducing unqualified potentiality to compatibility with species nature. In the concluding part of my paper, however, I show that the author of the *Summa Dialectice Artis* attributed to William of Lucca, otherwise an extremely devoted follower of Abaelard in logic, explicitly rejects his master's *de re* account of modality in favour of the alternative *de sensu* reading which Abaelard had gone to great lengths to refute. The *Summa* thus leaves us with a considerable puzzle about the commitment of Abaelard's followers in logic to his theory of modality. As compensation for this, we will see that the *Summa* also provides us with a solution to a small puzzle raised by Jacobi and Knuuttila concerning Abaelard's views on the logical relations between quantified modal propositions." (pp. 97-99)

(2) Klaus Jacobi, *Die Modalbegriffe in den logischen Schriften des Wilhelm von Shyreswood,* Leiden 1980.

(3) The outstanding exception is St. Anselm's discussion of the logic of action sentences in the Lambeth Fragments printed in R. W. Southern and F. S. Schmitt, *Memorials of St. Anselm*, London 1969, 333-354.

(4) Cf. *Dialectica,* Introduction,XIII-XIX. The evidence that Abaelard had direct access to the *Prior Analytics is* extremely slight. The *Dialectica* contains what appear to be two quotations from the *Prior Analytics,* the definition of the syllogism from *An. Pr.* I 1, 24b 18-22 at *Dialectica,* 232.5-8 and the distinction between perfect and imperfect syllogisms from *An. Pr.* I 1, 24b 22-25 at *Dialectica,* 233.36-234.3. In the

discussion following the definition of the syllogism, however, Abaelard refers not to the definition which he apparently quotes from Aristotle but rather to the definition given by Boethius in *De Syllogismo Categorico* II (PL 64, 821A 7 - 822C 12).

(5) Hermann Weidemann, 'Zur Semantik der Modalbegriffe bei Peter Abaelard', in: *Medioevo* 7 (1981), 1-40, argues that Abaelard thinks of possibility in this way but he does so very much the hard way by attempting to show that Abaelard's remarks on temporally determined modal sentences commit him to it. Here I take the very much easier course of pointing out Abaelard's explicit statement of the theory of synchronous possibility in terms of alternative world histories.

16. ———. 2003. "An Amputee is Bipedal! The Categories and the Development of Abaelard's Theory of Possibility." In *La tradition médiévale des catégories, XIIe - XVe siècles: Actes de XIII Symposium européen de logique et de sémantique médiévales, Avignon, 6 - 10 juin 2000*, edited by Biard, Joël and Rosier-Catach, Irène, 225–242. Louvain: Peeters.

"The task of explicating scriptural authority required twelfth century philosophers to take an interest in the nature of divine power and the task of explicating the *De interpretatione* required them to discuss the the logic of modal claims. Without Aristotle to prompt them, however, these philosophers generally had little to say on the relationship of modal propositions and their structures to the various sources of modal claims, to claims, for example, about the nature of potentiality, physical causation, or action. Nevertheless, some progress was made and in the present paper I will consider the contribution of Peter Abaelard to the development of theories of possibility. Abaelard had no access to the *Physics* or *Metaphysics* and precious little, if any, to the *Prior Analytics*, but he did find in the *Categories* and Porphyry's *lsagoge* texts posing interpretative problems whose solution demanded that he discuss the nature of possibility and necessity.

Abaelard's claims about divine power are rather well known and I will mention them only very briefly at the end of my

paper. His treatment of creaturely potentiality in commenting on various claims made by Aristotle in the *Categories* has, on the other hand, barely been noticed and my task here will be to examine it in some detail.

The failure to take into account the full range of Abaelard's thinking about potentiality has led to some very misleading claims about his views on possibility. What my investigation shows is that Abaelard employs three different but related notions of potentiality. The first is the potentiality that an individual has for future action and it is constrained by its species nature, its particular constitution, and its present circumstances.

The second and third are both introduced to explain how we may legitimately say, as authority requires, that an amputee is bipedal.

They are different but both reduce all unqualified possibility to potentiality and all potentiality to compatibility with species nature. The unqualified possibilities open for an individual creature of a given natural kind are thus for anything which is not incompatible with its species nature." (pp. 225-226, notes omitted)

17. ———. 2004. "Logic." In *The Cambridge Companion to Abelard*, edited by Brower, Jeffrey E. and Guilfoy, Kevin, 158–199. Cambridge: Cambridge University Press.

"A great deal of Peter Abelard's writing is concerned with what he regarded as logic, but which we would now classify as ontology or philosophical semantics. Following Cicero and Boethius, Abelard holds that properly speaking the study of logic has to do with the discovery and evaluation of arguments (*LI Isag*. 3.10). A necessary preliminary for this is an examination of the issues dealt with by Porphyry in the *Isagoge* and by Aristotle in the *Categories*, and *De interpretatione* (*LI Cat*. 113.26-114.30). In the present chapter, however, I will ignore most of this material and concentrate on the central issue of logical theory both for Abelard and for us, that is, on the nature of the relation of consequence, or following. Even with this limitation there is a great deal of ground to cover.

Abelard sets out his theory of entailment and argument in two very extended and dense discussions both of which have suffered considerable textual corruption. The treatment of topics and hypothetical syllogisms in the *Dialectica*, is apparently the earlier. The other is the surviving fragment of Abelard's commentary on Boethius's *De topicis differentiis*, *Glossae super De topicis differentiis*, which seems to belong with his other commentaries on the works of the *logica vetus* published as the *Logica "ingredientibus."* The two expositions disagree on some crucial questions, but here I will restrict myself almost entirely to the discussion in the *Dialectica*.". (p. 158)

18. ———. 2007. "Denying Conditionals: Abaelard and the Failure of Boethius' Account of the Hypothetical Syllogism." In *The Many Roots of Medieval Logic: The Aristotelian and the Non-Aristotelian Traditions*, edited by Marenbon, John, 153–168. Leiden: Brill.

    Abstract: "Boethius' treatise *De Hypotheticis Syllogismis* provided twelfth-century philosophers with an introduction to the logic of conditional and disjunctive sentences but this work is the only part of the *logica vetus* which is no longer studied in the twelfth century. In this paper I investigate why interest in Boethius acount of hypothetical syllogisms fell off so quickly. I argue that Boethius' account of compound sentences is not an account of propositions and once a proper notion of propositionality is available the argument forms accepted by Boethius are seen to be incoherent. It was Peter Abaelard who first understood the nature of propositionality and propositional connectives and used this to criticise Boethius' claims in *De Hypothetics Syllogismis*. In place Boethius' confusion Abaelard offered a simple and correct account of the hypothetical syllogism."

19. ———. 2009. "Imposition and Essence: What's New in Abaelard' Theory of Meaning?" In *The Word in Medieval Logic, Theology and Psychology. Acts of the XIIIth International Colloquium of the Société Internationale pour l'Étude de la Philosophie Médiévale, Kyoto, 27 September - 1 October 2005*,

edited by Shimizu, Tetsuro and Burnett, Charles, 173–212. Turnhout: Brepols.

"The proponents of the “New” or “Causal” theory of reference, and most famously Kripke, Putnam, Donellan and Kaplan,(4) argue that the Description Theory of names is manifestly false. They insist in particular that the reference of a term is semantically entirely unrelated to the ideas which happen to be present in the minds of the speaker and listeners when it is uttered." (pp. 173-174)

(...)

"According to Putnam ancient and mediaeval philosophers thus maintained versions of the mistaken theory that the sense of a word is a mental description. Against this he famously remarked that “Cut the pie anyway you like, ‘meanings’ just ain’t in the head.”(10)

In the face of the enormous success of the New Theory, it is not surprising that contemporary students of mediaeval philosophy trained in the analytic tradition should have tried to show that Putnam is wrong by finding anticipations of it in their favourite authors and in particular in the work of Peter Abaelard.

In this essay I shall investigate this question further and show that it is certainly a mistake to characterise Abaelard as a twelfth-century Putnam, just as much a mistake as dismissing him as a twelfth-century description theorist. Abaelard’s views on meaning are implacably psychologistic. He is an “essentialist,” of course, and his essentialism explains the apparent anticipation of the New Theory. The order of explanation connecting metaphysics to semantics is, however, quite the opposite in Abaelard to that on which the New Theory relies. For Abaelard “essentialism” does not follow from rigidity but rather guarantees it." (pp. 175-176)

20. ———. 2009. "The Development of Abaelard’s Theory of Topical Inference." In *Les lieux de l'argumentation. Histoire du syllogisme topique d'Aristotle à Leibniz*, edited by Biard, Joël and Mariani Zini, Fosca, 249–270. Turnhout: Brepols.

"What I will try to do here is to locate the relevant differences between Abaelard’s two works on the topics and show how the theory of the maximal proposition which he presents in his *Glosses* marks a significant development in his thinking about logic in comparison with that which he proposes in the *Dialectica*.

There is no doubt at all that both of the works are by Abaelard and no doubt either that the Glosses on *De differentiis topicis* are later than the Treatise on Topics in the *Dialectica*. What I think there should be considerable doubt about is just how much later they are. Mew’s proposed dating ol Abaelard’s works has the *Dialectica*, *Glosses*, and indeed the great bulk ol Abaelard’s logical writings, all produced within the four or five year, immediately following his castration in about 1117 (1). This seems to me rather difficult to accept, not least because of the significant theoretical development that we find in these works. My own view is that the *Dialectica* could and probably does, date from the beginning of the second decade ol the eleventh century and might well contain the novelties which we are told Abaelard propounded on Mont-Ste-Genevieve around 1110, or perhaps even earlier, and which led to the confrontation with Goswin recorded in the life of the Saint (2). Such a dating would then allow ten years for Abaelard to develop the new theory of propositionality which seems to account for the major differences between the *Dialectica* and the *Glosses*." (pp. 249-250)

(...)

"Conclusion

In the *Glosses* Abaelard offers an account of topical inference which, it seems to me, marks a very considerable advance over that presented in the Dialectica. It is rather odd that he does not acknowledge that the theory he is rejecting is one which he himself once held since he is not in general shy of saying « meminimus ». What is clear, however, is that in Abaelard's work reflection on the nature of topical inference achieved a degree of sophistication which is not found at any other time in the history of the subject. We can only hope that it will not be another fifty years before this is fully recognised." (p. 270)

21. ———. 2010. "The Development of Logic in the Twelfth Century." In *The Cambridge History of Medieval Philosophy. Vol I*, edited by Pasnau, Robert and Dyke, Christina van, 129–145. Cambridge: Cambridge University Press.

"The twelfth century was one of the most important and exciting periods in the history of logic. At the start of the century, the production of elementary glosses on ancient texts gave way to a sophisticated commentary literature in which writers developed and debated their own theories concerning what we would now classify as ontology and philosophical logic. Most famous today are the disputes over the status of universals; the present chapter, however, focuses on the less well-known – but, I believe, more important – work done on theories of meaning, modality, and the relation of logical consequence. Many of the works that have survived from the twelfth century are anonymous, but fortunately at least some of those by Peter Abaelard do bear his name: in particular his survey of logic, the *Dialectica* (probably written around 1112) and a set of commentaries on the books of the *logica vetus* known as the Logica "Ingredientibus" (probably written between 1115 and 1120). Abaelard is the outstanding logician of this period and is, indeed, one of the greatest of all logicians.(1) His work in these areas fundamentally shaped later development in logic; what follows is essentially an account of his views and of the problems to which they gave rise." (p. 129)

(1) For a more extensive discussion of Abaelard's revolution in logic, see Christopher J. Martin, "Logic," in J. Brower and K. Guilfoy (eds.) T*he Cambridge Companion to Abelard* (Cambridge: Cambridge University Press, 2004) 158–99.

22. ———. 2011. ""What An Ugly Child": Abelard on Translation, Figurative Language, and Logic." *Vivarium* no. 49:26–49.

    Abstract: "An examination the development of Peter Abaelard's views on translation and figurative meaning. Mediaeval philosophers curiously do not connect the theory of translation implied by Aristotelian semantics with the multiplicity of tongues consequent upon the fall of Babel and do not seem to have much to offer to help in solving the problems of scriptural interpretation noted by Augustine. Indeed, on the Aristotelian account of meaning such problems do not arise. This paper shows that Abaelard is like others in this respect in not in general finding translation problematic. Two particular cases, oppositio in adiecto and accidental predication, however, present problems for him and the paper examines and tries to explain the differences between the account given in the Dialectica and that given in the Logica 'Ingredientibus'."

23. ———. 2011. "A Note on the Attribution of the Literal Glosses in Paris, BnF, lat. 13368 to Peter Abaelard." In *Arts du langage et théologie aux confins des XIe et XIIe siècles: textes, maîtres, débats*, edited by Rosier-Catach, Irène. Turnhout: Brepols.

    "I could go on to give more examples of the way in with the *Literal Glosses* fail to agree and fail to offer any trace of the phllosophical positions set out by Abaelard in his *Dialectic* and his *Logics* but at this point I think that have shown enough to at least raise considerable doubt about the authorship of these texts. I was convinced as soon as I began to read the *Literal Glosses* that they are not the work of the great Peripatetic of Pallet. He was the greatest star of his day and, as Geyer surely saw, they are the product of much lesser light." (p. 646)

24. ———. 2011. "*De Interpretatione* 5-8: Aristotle, Boethius, and Abelard on Propositionality." In *Methods and Methodologies. Aristotelian Logic East and West, 500-1500*, edited by

Cameron, Margaret and Marenbon, John, 207–228. Leiden: Brill.

"Boethius' commentaries on *de Interpretatione* provided the Middle Ages with their introduction to the theory of meaning. Boethian semantics is developed on the basis of the distinction made by Aristotle in *De Interpretatione* 1, between the signification of terms and that of affirmations and negations – defined, remember, as the species of simple assertions. On this account of them affirmations signify mental states in which the mental items signified by their component significant terms are combined and negations signify mental states in which they are separated. Missing in the theory is an account of compound propositions showing how their meanings are obtained from the meanings of their components. Such an account requires a notion of unasserted propositional content. With it we may also locate what is common to different speech acts and explain how it is that they differ. The relevant differences are the differences in what we now call their force." (p. 211)

25. ———. 2012. "Logical Consequence." In *The Oxford Handbook of Medieval Philosophy*, edited by Marenbon, John, 289–311. New York Oxford University Press.

"In the present chapter, I will give an outline of this history with each section corresponding to what I take to be an important phase in it. In the first I consider the material transmitted to the Early Middle Ages from Antiquity in order to show how thinking about consequence and, in particular, about the conditional proposition became the central project of early-twelfth-century logic. In the second I try to summarise the extraordinary development by Abelard of a unified relevantistic theory of the conditional and argument on the basis of Boethius's confused accounts of the hypothetical syllogism and topical inference. This phase of my history ends with the collapse of Abelard's project when it was discovered that his proposed logic was inconsistent. It is followed by a period of crisis, discussed in the third section, and its resolution late in the twelft h century in favour of the medieval version of the classical account of logical consequence, which became the standard one for the following century. This account is

supplemented, however, with a relevantistic version of the consequence relation for use in special circumstances. The third phase ends, as does the chapter, with William of Ockham's rejection of this pair of consequence relations in favour of a contrast between what he calls material and formal consequences in which relevance as a semantical requirement no longer has a place." (pp. 289-290)

26. ———. 2016. "Abaelard on Logical Truth." In *Formal Approaches and Natural Language in Medieval Logic: Proceedings of the Xixth European Symposium of Medieval Logic and Semantics, Geneva, 12-16 June 2012*, edited by Cesalli, Laurent, Goubier, Frédéric and Libera, Alain de, 59–76. Turnhout: Brepols.

    "Abaelard insists in his *Dialectica* and other works that the dividing opposite of any given proposition is formed by negating it as a whole and that this truth-functional opposite should be represented by preposing the negative particle to the proposition. He distinguishes the operation of propositional negation, iterable without limit, which he calls destructive negation, from the application of the negative particle to the predicate of an affirmation, forming what he calls its separative negation, to signify the separation of the predicate from the subject, a proposition which is a contrary of the original rather than its

    contradictory. Separative negation is not iterable and if their subject term is empty both an affirmation and its separative negation are false. Abaelard also insists, explicitly contradicting Boethius, that the copulative conjunction «et» combines two propostions to form a single proposition which may be negated with destructive negation(39)." (pp. 68-69)

    (...)

    "Nowhere, as far as I know, does Abaelard classify the principles of conditional simplification. Given what he says about repetition and his remarks on propositional *loci,* it is hard, however, to suppose that he

would not classify it too as imperfect and local even though holds for all substitution of terms. But again it doesn't really matter since he clearly supposes that it is logically true in just the same way as «si est homo, est animal' is logically true as are all instances of contraposition and transitivity. Because he thinks this, however, he has left himself with no room for escape from the arguments which would be directed at his logic during his last decade in Paris(66)." (p. 76)

27. ———. 2016. "Modality without the Prior Analytics: Early Twelfth Century Accounts of Modal Propositions." In *Logical Modalities from Aristotle to Carnap*, edited by Cresswell, Max, Mares, Edwin and Rini, Adriane, 113–132. Cambridge: Cambridge University Press.

    Abstract: "Peter Abaelard's birth around 1079 coincided with the promulgation by Pope Gregory VII of a decree instructing his bishops to ensure that all clerics were trained in the liberal arts, and Abaelard's life was shaped by the consequent increase in the number and importance of teaching masters. These early twelfth century teachers commented on the works of what would later be called the logica vetus , including from Aristotle only the Categories and De Interpretatione . Abaelard also had some access to the *Sophistical Refutations* and, indeed, seems to have known a little about the *Prior Analytics*. The latter work, however, played no role in the development of thinking about modal propositions in the period to be considered here. Rather it was Aristotle's remarks on the proper placing of the negative particle in forming the contradictory of a given modal proposition in *de Interpretatione* 12, and 13, and a distinction made by Boethius between different forms of modality in his *De Syllogismis Hypothetic*is that prompted early twelfth century philosophers to investigate the nature of modal propositions."

28. ———. 2016. "The Invention of Relations: Early Twelfth-Century Discussions of Aristotle's Account of Relatives." *British*

Journal for the History of Philosophy no. 24:447–467.

Abstract: "Aristotle's discussion of relatives in the Categories presented its eleventh- and twelfth-century readers with many puzzles. Their attempt to solve these puzzles and to develop a coherent account of the category led around the beginning of the twelfth century to the invention of relations as items which stand to relatives as qualities stand to qualified substances. In this paper, I first discuss the details of Aristotle's accounts of relatives and the related category of ‘situation’ and Boethius' commentary on them. I then examine some of the earliest mediaeval commentaries on the Categories showing how the notion of relation, and in particular of individual relations, was developed. I conclude by showing how Peter Abaelard's treatment of relations in his Dialectica was part of an ongoing and sophisticated debate over the nature of relations."

29. ———. 2018. "The Theory of Natural Consequence." *Vivarium* no. 56:340–366.

    Abstract: "The history of thinking about consequences in the Middle Ages divides into three periods. During the first of these, from the eleventh to the middle of the twelfth century, and the second, from then until the beginning of the fourteenth century, the notion of natural consequence played a crucial role in logic, metaphysics, and theology. The first part of this paper traces the development of the theory of natural consequence in Abaelard’s work as the conditional of a connexive logic with an equivalent connexive disjunction and the crisis precipitated by the discovery of inconsistency in this system.

    The second part considers the accounts of natural consequence given in the thirteenth century as a special case of the standard modal definition of consequence, one for which the principle *ex impossibili quodlibet* does not hold, in logics in which disjunction is understood extensionally."

30. ———. 2019. "Only God Can Make a Tree: Abaelard on Wholes and Parts and Some Evidence of His Later Thinking about Them." *Oxford Studies in Medieval Philosophy* no. 7:44–66.

Abstract: "Problems about the nature of integral parts and wholes werecentral to twelfth-century discussions of the individuationand persistence over time of both substances and artifacts.This paper examines in detail Abaelard's contribution tothese discussions arguing that Abaelard proposes a solutionto these problems which preserves our common senseintuitions about identity over time. In Abaelard's work wefi nd an explicit solution to the problem of the identity overtime of living things which appeals to the persistence of thevegetative soul through the loss or addition of corporealmatter. In work from the school of the Montani weapparently also have an account of Abaelard's solution to theproblem of the identity over time of artifacts which distinguishes between the role of a part in an integral whole and the material which plays that role such that the rolepersists when the matter is replaced."

32. Mesaroş, Claudiu. 2005. "From Porphyry to Abelard: How Many Questions on Universals?" *Chôra* no. 3:253–262.

    Abstract: "From the panoply of authors that tried to offer their solutions on the well known problem of the universals in the present paper there are selected three of them: Porphyry, Boethius and Abelard. The first, Porphyry is the one that can be considered the parent of the problem and in his *Isagoge* we can find its first formulation and for this we can have two alternative readings: a dialectical and a neo-platonic one. In the case of the second, Boethius, we also find two ways of interpreting the problem: a dialectical one and the latter from a theological point of view. The last of these authors, Abelard, we can observe an account of the problem from the perspective of his status theory which can be said to resemble the theological reading from Boethius."

Reprinted as Essay II in: Constant J. Mews, *Abelard and his Legacy*, Aldershot: Ashgate 2001.

"Conclusion

This study has been concerned with the close relationships, both textual and thematic, between the anonymous *Glossae secundum vocales*, found in the Milan, Biblioteca Ambrosiana MS. M. 63 sup., ff. 73ra-81vb, and various known writings of Abelard on logic and theology.

These anonymous glosses seem to represent a revision made by Abelard of his *Logica 'Ingredientibus'*, while they appear to have been themselves revised in the L*ogica 'Nostrorum petitioni sociorum*'. Geyer's argument that they were compiled by a disciple of Abelard from various genuine glosses of his master is unnecessarily complicated and does not fit with the evidence. The text of the *Glossae* as found in the Ambrosian library manuscript may not be free from a number of scribal errors incurred in copying of the work, but this does not mean that the glosses themselves cannot be genuine. Detailed comparison of the work with other writings of Peter Abelard confirms Ottaviano's opinion that the *Glossae secundum vocales* were written by Abelard himself." (p. 55)

34. ———. 1987. "Aspects of the Evolution of Peter Abaelard's Thought on Signification and Predication." In *Gilbert de Poitiers et ses Contemporains. Aux Origines de la 'Logica Modernorum'*, edited by Jolivet, Jean and Libera, Alain de, 15–41. Napoli: Biblioplis.

Reprinted as Essay VIII in: Constant J. Mews, *Abelard and his Legacy*, Aldershot: Ashgate 2001.

"In another study, I have advanced the hypothesis that some arguments of the *Dialectica* may not only be less sophisticated than those of the glosses on Porphyry, Aristotle and Boethius, but may predate those of the *Logica 'Ingredientibus'*. The intention of this paper is to look in a little more detail at the evolution of Abaelard's thought on signification and predication through comparison of arguments in the *Theologia*

'Summi boni' and *Theologia Christiana* with those in the *Dialectica* and glosses. We shall also examine references Abaelard makes in *TChr* [*Theologia Christiana*] to his *Grammatica* (either no longer extant or not yet identified),

enigmatically described as a *retractatio predicamentorum*, and suggest that this work contained some important new ideas of the peripatetic philosopher." (p. 16, a note omitted)

35. ———. 1994. "Philosophy and Theology 1100-1150: The Search for Harmony." In *Le XIIe siècle: Mutations et renoveau en France dans la première moité du XIIe siècle*, edited by Gasparri, Françoise, 159–203. Paris: Léopard d'Or.

Reprinted as Essay II in: C. J. Mews, *Reason and Belief in the Age of Roscelin and Abelard*.

"In the *Historia calamitatum*, Peter Abelard passed over in silence his long period of study under Roscelin of Compiègne. Over a decade earlier, he had been chastised by Roscelin for not recognizing the debt which he owed to his former master, with whom he studied at Loches 'from being a boy to being a young man', perhaps from around 1093 to 1100. (66)" (p. 168, a note omitted)

(...)

"Sometime around 1100, Abelard came to Paris to study under William of Champeaux, then teaching dialectic as well as theology at the cathedral school of Notre-Dame. After attending William's lectures on dialectic, he established himself as a teacher in his own right at schools attached to the royal castles of Melun and Corbeil." (p. 168)

(...)

"William left St-Victor in 1113 to become bishop of Châlons-sur-Marne, a position he held until his death in 1121. Abelard was invited to teach at the cathedral school of Notre-Dame. Probably sometime before 1120, Abelard began work on his *Dialectica*. In the first of its five tractates, dealing with various parts of speech, there are frequent discussions with the opinions of 'our teacher' or 'our teacher V.', once identified as

‘our teacher W.’, undoubtedly William of Champeaux. The section which might have dealt with universal categories is missing from the manuscript. The criticisms of ‘our teacher’ relate not to universal categories as such, but to the question of whether or not a noun signified everything on which it was imposed. This is the debate he presents as between Garmundus, who held ‘rationally’ that an utterance signified only what was in *sententia vocis,* and his teacher who held that it signified whatever that on which the vox was imposed, supposedly on the authority of Priscian’s definition that a noun signified a substance with a quality. (79) Abelard’s insistence here that album principally signified a quality, only secondarily a substance, restated the Aristotelian argument emphasised by the *Glosule* on Priscian. He was contradicting William’s definition in the *Introductiones* that an utterance like ‘animal’ signified a thing. Abelard also rejected William’s idea that a thing like ‘race’ inhered in a verb, like ‘he runs’, which meant no more than ‘he is running’. (81) The verb ‘is’ did not carry any substantive significance itself in ‘Socrates is white’ (as distinct from its meaning in ‘Socrates is')." (p. 169, some note omitted)

36. ———. 2001. "Hugh Metel, Heloise, and Peter Abelard. The Letters of an Augustinian Canon and the Challenge of Innovation in Twelfth-Century Lorraine." *Viator. Medieval and Renaissance Studies* no. 32:59–91.

    Abstract: "The fifty-five letters of Hugh Metel (ca. 1080-1150), an Augustinian canon of Toul, were edited by C. L. Hugo in 1731, but have attracted little scholarly attention, even though some of them are addressed to such famous personalities as Bernard of Clairvaux, Peter Abelard, and Heloise. This paper questions simplistic attempts to describe Hugh as a traditionalist by showing that although he admired Bernard of Clairvaux, he was much more interested than Bernard in combining classical poetic allusions with scriptural imagery. Hugh was interested in innovative educational trends in the

twelfth century, but became critical of negative tendencies, such as those embodied in Peter Abelard. At the same time his two letters to Heloise provide valuable evidence into the extent of her reputation as an innovative writer. Hugh's prose is compared to other contemporary letter collections, in particular the Epistolae duorum amantium, which, this article argues, records the early letters of Abelard and Heloise."

37. ———. 2003. "Peter Abelard on Dialectic, Rhetoric, and the Principles of Argument." In *Rhetoric and Renewal in the Latin West 1100-1540. Essays in Honour of John O. Ward*, edited by Mews, Constant J., Nederman, Cary J. and Thomson, Rodney M., 37–53. Turnhout: Brepols.

    "Analysis of Abelard's dialectic has often concentrated on his teaching about universals as an issue in ontology. The topic of the meaning of a universal term (a term predicated of different individuals) was only a preliminary issue, however, leading up to analysis of the principles of argument. By far the largest part of the *Dialectica* is taken up with discussion of topics, the principles on which all argument is based. Abelard both summarizes and revises what Boethius has to say in his *De differentiis topicis* and *In Topica Ciceronis*. As Jean Jolivet argued in his 1969 study *Arts du langage et théologie chez Abelard*, Abelard's discussion of universals was part of a much broader analysis of signification in general.(16) He argued that whether Abelard was writing about language as a whole, or more specifically as theological discourse in particular, he introduced a consistent questioning of the notion that language ever signifies things, an approach that he suggested could be called *non-réalisme*.

    Jolivet was principally concerned with Abelard's critique of traditional semantics. More recently, John Marenbon has questioned the assumption that Abelard never moved beyond being a critical thinker, by arguing that after an early phase in his teaching, dominated by logical concerns, he transferred his attention to an ethically based theology, directed at nothing less than 'moral reformation'.(17)" (p. 40)

    "Only with the researches of Cousin, first published in 1836, has Abelard's significance as a thinker begun to be appreciated.

    Abelard's earliest known writings on dialectic are relatively brief, so-called 'literal' glosses on key texts then being used in the teaching of logic: Porphyry's *Isagoge* or Introduction, Aristotle's *Categories* and *Periermeneias* or *On Interpretation* of Aristotle and Boethius' *On Divisions*. These texts, along with Boethius' *On Categorical Syllogisms*, *On Hypothetical Syllogisms* and *On Different Topics*, had begun to supplant more derivative treatises on the subject since the late tenth century.(80) Abelard would never gain more than a passing knowledge of other Aristotelian works, like the *Sophistical Refutations* and *Prior Analytics*, which only became known in Paris in the 1130s(.81).

    In the 'literal' glosses on the *Isagoge*, Abelard examined classes in general (like genus, species, and so on) as *voces* or vocal utterances of human imposition in a manner already developed by Roscelin of Compiegne. Roscelin himself may have been influenced by the ideas of the anonymous *Glosule* on Priscian's *Grammatical Institutes*, an influential commentary from the late eleventh century which applied Aristotelian principles to

understanding the 'causes' of the voces discussed by Priscian. (82) In particular it refined Priscian's rather crude definition that a noun signified 'a substance with a quality', by defining a noun such as *homo* as an utterance originally imposed to name or denote an individual person, but signifying the quality of manhood.(83)" (p. 27)

(81) De Rijk 1970^2, xvi-xviii.

82 On the *Glosule*, see M. Gibson, *The Early Scholastic «Glosule» to Priscian, «Institutiones Grammaticae»: The Text and its Influence',* Studi Medievali 3a ser. 20, 1 (1979), 235-54. Mews 1992 suggests that its author is the John who taught that dialectic was an *ars vocalis,* according to the *Historia Francica*, ed. Bouquet, 12, 3, and numbered Roscelin, Robert of Paris and Arnulf of Laon among his disciples.

40. Moonan, Lawrence. 1989. "Abelard's Use the "Timaeus"." *Archives d'histoire doctrinale et littéraire du Moyen Age* no. 56:7–90.

"In part I this study presents, in the order in which they occur in the *Timaeus*, the texts which Abelard uses. I distinguish 1) verbatim quotations of sentence length or more, 2) texts where he is plainly paraphrasing the *Timaeus*, and 3) texts to which arguably purposeful allusions are to be found in Abelard. I draw attention to interesting peculiarities of Abelard's text, to the varying extent to which the critical state of the texts we now have for Abelard permits comparison with what is available in

either the text or the apparatus of the modern edition of Calcidius.(3) And I note potentially

significant features of the doctrinal and literary contexts in Abelard where the *Timaeus* texts are being used. In particular I note which of four discernible genres, arguably to be distinguished in Abelard, are in question in the various uses of the texts. Towards the end of part I, Abelard's poetical uses of the *Timaeus,* which have hitherto had less specific attention than they merit, are isolated and examined.

In part II I go on to consider just how Abelard handled themes or issues in which texts from the Timaeus appeared (in pt I) to have been playing a noteworthy part.

(...)

In part III, I offer some conclusions and some fresh starting-points. Besides conclusions of a narrower sort, as on the number, distribution and nature of Abelard's textual debts to Plato and his translators, some wider ones are drawn, on the specific content of certain positions of Abelard which are not otherwise easy to appreciate justly, and on what specifically was at issue between him and his early critics, on certain matters of importance. Notably, the study permits us to argue that, on the notorious question of whether God could make a better, or any other, world than he did, the *Timaeus* was indeed of great importance, but only in a rather special way: not by providing grounds of substance for any serious condemnation alleging failure in orthodoxy, but by making it only too easy for some of his critics to organise opposition to Abelard's theological work more generally from defenders of orthodoxy." (pp. 8-9)

Ramos, Aline Medeiros and Noël, Roxane, 221–238. Cham (Switzerland): Springer.

Abstract: "What is understood when “man” is understood? This question proves troublesome for Peter Abelard’s nominalist account of universal understandings which, to be sound, must attend to things as they really are. If there are no universal things, how can universal understandings be sound? His answer, in the *Treatise on Understandings*, is that such understandings, far from being about nothing, are about natures. However, it is hard to see how this solves the problem, given how he states earlier in the treatise that natures are identical to individuals. In this paper, I present a reading of what he means by “nature” that allows us to make sense of his proposed solution to the problem. In addition, I contend that, for his solution to work, the relevant relation between the mind and the world is to be understood as attention (or “attending to”), instead of his previous view based on similitude."

42. Normore, Calvin G. 1987. "The Tradition of Mediaeval Nominalism." In *Studies in Medieval Philosophy*, edited by Wippel, John F., 201–217. Washington, D.C:: The Catholic University of America Press.

"When does nominalism begin? Most of our earliest sources are completely silent about this question, but there are two sentences by the twelfth-century historian Otto von Freising which just might suggest an answer. It is thought that Otto studied in Paris from about 1127 to 1133, so his testimony has some authority. In book I of his *Gesta Frederici Imperatoris*, Otto writes of Peter Abaelard that "he had for his teacher first one Roscelin, who first taught in our time the *sententia vocum*."(6) This gnomic remark could perhaps be glossed with the help of Otto's claim just a bit later in the passage that Abaelard, "holding in the faculty of natural studies the *sententia vocum seu nominum*, incautiously introduced it into theology." (7)" (p. 203)

(...)

"What, then, is mediaeval nominalism and with which of the two faces of twentieth-century nominalism does it connect? My

argument here has been that mediaeval nominalism began in a series of worries about the relation of sentences and clauses to the world, worries made central by Abaelard, and that it is as much a problem in semantic theory as in metaphysics. I have argued that it has nothing to do with the problem of universals and that seeing it as focused on the problem of universals simply distorts our picture of what went on. I think it less distorting but still inaccurate to see it as a position about the ontological status of abstract entities. The impulse toward eliminating a layer of semantic entities for sentences to signify would support a parsimony about abstract entities but does not absolutely require it.

Nominalists resist multiplying things when they multiply terms, but there remains ample room for disagreement about how this economy is to be obtained. This disagreement about the methods by which language can describe the world without being in any way isomorphic with it is what underlies the debate between supporters of the *complexe significabile* and their opponents. It is a family quarrel and I suspect just one of the many which a thorough investigation of the tradition of mediaeval nominalism and the efforts to do physics and theology from a nominalist perspective will reveal." (pp. 16-217)

43. ———. 1992. "Abelard and the School of the *Nominales*." *Vivarium* no. 30:80–96.

"What of the positive evidence that the Nominales were in any sense Abelard' s followers. Otto [of Freising] says that Abelard held the 'sententia vocum seu nominum' in natural philosophy and introduced it into theology, and Walter Map says that he was 'princeps' among the Nominales. We know that Abelard was a charismatic and popular teacher, and we have no evidence at all of his followers (who must have been many) being called by any other name. We must conclude, then, that either he did not found a distinctive school or that the Nominales are that school. On the other hand I know of no text which both identifies itself as from the Nominales and calls Abelard 'our master' and no text which attributes views identified in the text as Abelard' s to the Nominales. The identification of the Nominales as Abelard's followers would,

then, have to rest squarely on finding them characterized by distinctive theses which we have independent reasons to think of as in some way peculiar to Abelard.(9)

(9) The need to find *distinctive* theses and not merely theses which Abelard and the Nominales both held is emphasized in Courtenay [1992a.

Abstract: "This paper examines Abelard’s engagement with disputation (*disputatio*) from the vantage point of twelfth-century scholasticism.

Eschewing the well-worn details of Abelard’s personal life and philosophical positions, analysis is instead focused on two parallel dimensions of his career: the manner in which he attempted to face-off with his adversaries through public debate and his underlying theory of disputation. It is argued that Abelard’s theory is to be found not in his theological or logical works, but in his polemical letters and his ethical dialogue, the *Collationes,* which together offer a coherent hermeneutical strategy for discerning truth.

Abelard’s contribution to the art of disputation needs to be assessed in light of his broader involvement in the scholastic method and contemporary Jewish-Christian relations."

48. ———. 2012. "Universals." In *The Oxford Handbook of Medieval Philosophy*, edited by Marenbon, John, 385–402. New York Oxford University Press.

    "Peter Abelard, at the same period [early-twelfth century], goes so far as to reformulate Porphyry's questions in a straightforwardly semantical way (see King 2007, 263–68). 'Are genera and species real or in bare thoughts alone?' is reinterpreted as asking about genus and species terms like the words 'animal' and 'man' if they 'signify any truly existing things' (Peter Abelard 1994 , 51). 'Are genus and species bodies

or incorporeals?' becomes: 'Do they [genus and species terms] signify subsistents that are corporeal or that are incorporeal?' (*ibid.*). And 'Are they separated or in sensibles?' is understood as a way of asking if these terms 'signify an intrinsic substance existing in a sensible thing' or something separate? (*ibid.*, 53). These questions, Abelard adds, 'rightly arose about universal words' (*ibid.*, 54), making it clear that Porphyry's questionnaire, in his interpretation, is about the 'modes of signifying' of general terms." (p. 391)

49. Pinzani, Roberto. 2003. *The Logical Grammar of Abelard*. Dordrecht: Kluwer.

"Having hopefully clarified what we are looking for and which notional tools we will utilize, it is perhaps worth saying where the subject of our study lays. The notion of logical grammar allows to unify, from a thematic point of view, doctrines and exegetic traditions not always originated from a single archetype text. The logical-linguistic works of Aristotle (first of all the *De Interpretatione*) and Priscian's *Institutio*, represent the main sources for Abelard's dialectic.

(...)

In addition to the comments on the *Categoriae* and *Isagoge* which put into practice the 'nominalism' (or, better, semanticism) of the author, we have comments or original treatises devoted to *De Interpretatione* and Boethius' logical works. In the *Dialectica* the part which precedes the treatise on syllogistic (Treatise 1 of *Dialectica*), is devoted to the grammatical analysis of terms and sentences, whereas the first books of the syllogistic deal with the different kinds of

categorical propositions with particular attention to the issues of the predicative link, syncategorematic expressions and modal sentences. In the treatises on topics (in *Introductiones Dialecticae* and in Treatise 3 of *Dialectica*) as will be seen, Abelard considers the truth of hypothetical propositions, as well as the meaning of the predicative link. *De Hypoteticis* (Treatise 4 of *Dialectica)* contains the syntactic analysis of hypothetical forms (the semantic interpretation of which is postponed to the treatise on topics). The books on defmition and division (Treatise 5 of *Dialectica*), due to their close links with both categories and topics, offer the same occasions to debate about and study the syntax and semantics of declarative sentences. In conclusion we can say that Abelard enlarged the previous context of logical grammar (*De Interpretatione*) so as to include almost the whole *logica vetus*, by carrying out a sort of contamination of the logical authorities with the texts of the grammatical tradition."     Chapter 8: *The Position of Abelard on Porphyry*, pp. 198-234.

    "I will focus on the writings devoted to the Porphyrian problem. My reconstruction of Abelard's position on the problem of universals is essentially based on the commentaries on Porphyry in the *Logica Ingredientibus* and the *Logica nostrorum petitioni sociorum*. In these works Abelard does not abide by the genre rules of the literal glosses and provides lengthy and independent doctrinal developments. The reader is invited to reflect upon the fact that in addition to the problems raised by Porphyry, "there are other no less demanding issues, such as the common cause of imposition and the conceptual meaning."

    This observation seems on the one hand to indicate the urgency of certain important themes, and on the other a somewhat unconventional style.(2)

    The general picture which emerges is that of a discussion taking place within a rigid framework: universals are the genera and species mentioned by Porphyry. However, there are

'wormholes' in the established framework that lead to hidden theoretical points. One of these has to do with a concept of property which is closer to contemporary sensibilities than one may expect. It was mentioned during our discussion of realism (see in particular the section on the 'missing thesis') and it will be further discussed here. The issue is linked to the theme of syntactic and semantic categorization, and it is of particular importance in Abelard's works, since his dialectics arises from a combination of logic (in the Aristotelian tradition) and grammar (in the tradition of Priscian commentators).(3)" (pp. 198-199, a note omitted)

(2) Cf. *Log. Ing.*, 8, 11–14. This point is duly noted by P. King, P. King, 'Abelard's answers to Porphyry,' *Documenti e studi sulla tradizione filosofica medievale*, 18 (2009), 249–270.

(3) The first two chapters of our *The Logical Grammar of Abelard* are devoted to this contamination and the topic of categorization.

51. Piolata, Thomas. 2021. "The Significance of Supposition. Abelard and Bonaventure on the Question of God Begetting God." *Collectanea Franciscana* no. 91:27–49.

    Summary: "This article treats the way in which Peter Abelard and Bonaventure deal with the logic of the phrase *Deus genuit Deum*, that is, how to understand logically the idea – rooted in the Creed – that God generates God ("God from God"). As Augustine had affirmed, essence cannot generate itself. Consequently, this aspect of the faith poses a potential problem. To handle it, the logical theory of supposition is key. This theory concerns the reference of a given term in a phrase, and not its signification. Abelard did not have the privilege of supposition. By the time of Bonaventure, however, it had become a standard tool of logical analysis. The goal of this study is thus to articulate the logical treatment of this phrase in Abelard and Bonaventure, and thereby to highlight the importance of the theory of supposition."

52. Potter, Joel M. 2009. "The Status of Status: Boethian Realism in Abelard." *Carmina Philosophiae* no. 18:127–135.

Abstract: "Peter Abelard's claim that universals are only words is well known, yet its metaphysical bearing for Abelard's philosophy is much disputed. Peter King has recently suggested that Abelard's nominalism is only an element of his larger irrealist metaphysic. Against this interpretation, I argue that Abelard's view is better understood as a form of moderate realism and a development of the solution attempted by Boethius in his Second Commentary on Porphyry's Isagoge. Both Abelard and Boethius clearly deny the independent existence of universals, yet they should not be called irrealists, since they agree that universal words or concepts have a firm basis in real, individual things."

Selected Bibliography on Abelard's Logic and Ontology. Fourth Part: Rij - Z

Bibliography

1. Rijk, Lambertus Marie de. 1980. "The Semantical Impact of Abailard's Solution of the Problem of Universals." In *Petrus Abaelardus (1079-1142). Person, Werk und Wirkung*, edited by Thomas, Rudolf, 139–151. Trier: Paulinus-Verlag.

   Reprinted as chapter III in: L. M. de Rijk, *Through Language to Reality. Studies in Medieval Semantics and Metaphysics*, Edited by Bos Egbert, Northampton: Variorum Reprints, 1989.

   "It is most unfortunate that as late as in the second edition of his *Theory of Universals* Richard Aaron has based his rather unfavourable view on Peter Abailard's contribution to the solution of the problem of universals on the older work of our famous logician only, viz. the Logica Ingredientibus. As is known, the French Master's most mature solution is found in the Logica Nostrorum petitioni (LNP) (*).

   In this work (LNP 522, 10 ff.) Abailard attributes the commonness of common nouns neither to extramental things nor to words (voces), rather he states that it is significant word (sermo), that is either singular or universal. He finds much support in Aristotle's definition of the universal: 'a universal is that which is by its nature predicated of a number of things.' (**) Abailard lays much stress on the nature of the formation of sermones, which to his mind is a human establishment

(hominum institutio), unlike the formation of extramental things and that of words taken as articulated sounds, which are creations of nature. His solution is entirely focused on his explicit distinction between the material identity of vox and sermo as opposed to their formal diversity ('non-identity').

There is, he says, a clear formal distinction between 'being predicable of many,' or: 'predicability' and 'that which is predicable of many'. It is predicability that must belong to a vox for it to be a universal; just being something that is predicable of many is not enough.

Well, Abailard makes every effort to explain the formal difference between vox (word, i. e. articulated sound) and sermo (significant word), which should be put beside their material identity. The distinction is so important to him that we need not wonder that throughout the whole discussion Abailard makes use of his best weapon, his incomparable skill in the field of linguistic (or rather: semantic) analysis." (p. 139)

2. ———. 1981. "Abailard's Semantic Views in the Light of Later Developments." In *English Logic and Semantics: From the End of the 12th Century to the Time of Ockham and Burleigh*, edited by Braakhuis, Henk A.G., Kneepkens, Corneille Henri and Rijk, Lambertus Marie de, 1–58. Nijmegen: Ingenium Publishers.

   Reprinted as chapter VI in: L. M. de Rijk, *Through Language to Reality. Studies in Medieval Semantics and Metaphysics*, Edited by Bos Egbert, Northampton: Variorum Reprints 1989.

   "1. Semantics in Abailard's solution of the problem of universals. Abailard's attempt at solving the problem of universals may be characterized as a remarkable achievement in the filed of semantics. The procedure of this solution found in his mature work, the *Glosses on Porphyry* (*) can be divided into two stages: first, the extensive discussion of the formal

distinction between *vox* and *sermo*, the the semantic analysis of the intensional act of intellection." (p. 1)

(*) *Logica nostrorum petitioni,* ed. Geyer (Münster 1933), pp. 505-533 (henceforth quoted as L.N.P.)

"Finally, I will briefly sum up some of the important items of Mediaeval semantics which may be fitted into the frame-work of what I have labeled the 'semantic stratification of appellative names'.

First. There is the distinction of *esse actuate* and *esse habituate* as adhered to by many 13th century authors but energetically rejected by Roger Bacon, whereas William of Sherwood turns out to stand somewhere half-way between Roger and the majority. The point at issue is the significative force of an appellative noun. Whereas others commonly accepted a name's referring to an *esse habituale* (that is, being common to present, preterite and future being and even to what actually is and what actually is not), Roger most strictly held that even in such metaphysical propositions as *'omnis homo de necessitate est animal'* the subject term can only refer to actually existing things (therefore they are all false on Roger's view). William, though admitting the distinction between *esse actuale* and *esse habituale,* regarded such propositions as equivocal. This reminds us of William's view that a name's meaning is determined by the language - users rather than by speech itself *(Syncat.,* 52, 25 - 26). The pivotal point of this controversy seems to be the different application of our *F.R.* On Roger's view, for instance, the determination *'de necessitate'* in propositions such as *'omnis homo de necessitate est animal '* is unable to strip an appellative noun of its primary function, of signifying only existing things, whereas his opponents are apparently of the opinion that that phrase compels the noun to withdraw to its second semantic level of designating just an *esse habituale,* with the result that the proposition is true.

Secondly, the problems concerning verbs expressing a mental attitude may be looked at from the same point of view. To quote Abailard (L.N.P. 531, 9 - 13; cfr. also above, pp. 4 - 5): When it is said: "I want a hood (*desidero cappam*); well, every hood is

this or *that* hood", yet it does not follow that I want *this* or *that* hood. If, however, one would say as follows: "I want a hood; well, every one who wants a hood is wanting this or that hood; (therefore I am wanting *this* or *that* hood) ", then, indeed, the argument would go on correctly.

However, the assumption would be false, then. This much is certain, Abailard rejects that in *'I want a hood'* and *'every hood is this hood or that hood'* the term *'hood'* has the same signification. As a matter of fact the term *'hood'* in the former proposition, unlike that in the latter proposition, does not designate a hood actually existing, (except in case, I have some particular hood in mind, of course). So we have to conclude that the verb *'desidero'* governing the object *'cappam'* precludes us from taking it for an actually existing hood and compels us to understand it in the second-level-meaning of *'a concrete, particular, hood',* whether or not actually existing." (pp. 50-51)

No doubt, it is Abailard who initiated many developments in Mediaeval semantics. So I have considered it useful to draw the attention to the achievements of this great master in the field of logic, since 'the logic before Ockham' cannot be properly understood unless Abailard is recognized as the man who stood, in many respects, at the craddle of fourteenth century logic." (p. 52)

3. ———. 1985. "Martin M. Tweedale on Abailard: Some Criticisms of a Fascinating Venture." *Vivarium* no. 23:81–97.

"Mr. Tweedale's study is bound to give any of his readers the firm impression that, as logician, Peter Abailard has accomplished a tremendous achievement. Unfortunately, however, Tweedale, (...) is on the wrong track in claiming- throughout his study that the modern interpreter has to 'ferret' Abailard's answers out of 'rather obscure passages' (p. 7), and that he is inconsistent (p. X and *passim).* Tweedale has failed to appreciate Abailard's lucidity and clear language. He has missed the point several times and more than once this is due to his defective knowledge of Latin. However, let me not move too hurriedly to my conclusion.

In writing this book, the author had two main objectives in mind, as we learn from the *Preface*. First, 'to present in a form easily accessible to professional philosophers, theologians and historians those scattered portions of Abailard's logical writings which seem to record a very original scrutiny of the foundations of logic and in particular the problem of unversals'. Secondly, 'to interpret the texts in a way that would connect them with the ancient tradition and also make them intelligible to contemporary philosophers.' So chapters I and II try to give an insight into the classical and post-classical background. The core of the essay is to be found in Chapters III-V; Chapter VI contains a comparison between Abailard and Frege.

Without doubt, the author has succeeded in enlarging the modern scholar's acquaintance with, and admiration of, Abailard as a logician and early Medieval philosopher and theologian. Even someone who has had only a glimpse of the contents of this rich essay, cannot help experiencing a kind of thrill on realising that he is meeting in Peter Abailard a remarkable and original thinker.

However, to write a successful book something more is needed. To my mind the author was heavily hampered in realising the two objectives he had set himself, as a result of his poor knowledge of (both classical and Medieval) Latin grammar and syntax. Sometimes his judgment of Abailard's achievements is incorrect, for no other reason than his inability to correctly read Abailard's concise language." (pp. 81-82)

4. ———. 1986. "Peter Abelard's Semantics and His Doctrine of Being." *Vivarium* no. 24:85–127.

"6. *Conclusion*. Upon surveying Abelard's investigations about sentencehood it may be stated that it certainly developed gradually and, as a result, so to speak, of our author's continuously scrutinizing the recalcitrant problems concerning the ways in which, in our linguistic behaviour, we deal with the vital problem of being.

First, Abelard makes us recognize the peculiar nature of the substantive verb 'to be' ('esse'), peculiar indeed, since it is the only verb that is capable of conjoining but, at the same time,

when serving, thus, as a device for predication, conveys, due to its proper invention, the notion of 'substantialness' ('essentia'). As was said before (above, p. 109), Abelard's entire discussion of the problem is ostensibly concerned with mastering the antagonism between coupling and predication. First, he considers the vicissitudes the predicate noun cannot escape undergoing as the very result of this antagonism and finds a remedy in splitting up the different strata present in nouns such as 'album' ('the *or* a white thing'). In this endeavour, the chimaera and the like (the 'non-existents') turn out to be a real spoil-sports.

In the *Dialectica,* then, Abelard maintains, a a whole, his previous position (which is found in two parts of the *Logica Ingredientibus, viz.* the *Perihermeneias* commentary and the one on Boethius *De topicis differentiis),* but sets on to refine it in that he gives the *coupling* of 'substantialness' a predominant position over and against the *predication* of a (substantial or accidental) form. However, he aptly combines this move (quite unavoidably, it may seem) with a subtle emptying of the notion of 'essentia' ('substantialness'), with the result that, from now on, 'est' ('is') has developed into a mere container (meaning 'undetermined substantialness') for a 're-al' ('thing-like') content (or sememe) conveyed by a predicate noun (which also may be a participle of an ordinary verb). An additional result is that, on this interpretation, the existential import seems to come from the predicate noun, so that our chimaera is no longer a spoil-sport. Finally, the empty-container view of the copula is completed by Abelard's suggestion to take the 'is' *plus* the predicate noun as merely one linguistic construct.

(...)

However this may be, Abelard's achievements in semantics are astonishingly great and even remain unparalleled for centuries." pp. 123-124 and 125.

Note: This paper is meant as a continuation to the series '*On Ancient and Mediaeval Semantics and Metaphysics'* published in this Journal [Vivarium] from 1977-82. For bibliographical reasons the original title has been dropped and the studies will be continued under separate titles.

5. ———. 2003. "The Logic of Indefinite Names in Boethius, Abelard, Duns Scotus, and Radulphus Brito." In *Aristotle's Peri hermeneias in the Latin Middle Ages. Essays on the Commentary Tradition*, edited by Braakhuis, Henk A.G. and Kneepkens, Corneille Henri, 207–233. Groningen: Ingenium Publishers.

   "Aristotle's doctrine of indefinite names (nouns) was handed down to the Middle Ages together with Boethius' comments and explanations. Boethius' view of the matter has two characteristic features. For one thing, there is a certain ambiguity on his part concerning the precise semantic value of such terms; for another, Boethius deviates considerably from Aristotle in that he explicitly assigns the property of 'holding indifferently of existents and non-existents' not only to the indefinite *rhéma* (as it is found in Aristotle, De interpr. 3, 16b15) but to the indefinite name (*onoma*) as well.

   Until the end of the 12th century the logic and grammar (1) of indefinite terms (nouns and verbs) was a much debated issue. Although assiduously echoing the well-known *auctoritates* Medieval thinkers did not always go the whole way with their predecessors. For example, Abelard and Scotus, starting from their own philosophical tenets, more or less inconspicuously corrected some dubious elements in Boethius' interpretation of Aristotle's doctrine of the indefinite name. Peter Abelard, especially, took great pains to precisely define the meaning of indefinite terms. He focussed his attention on the proper

meaning of indefinite terms rather than on the question whether they are 'holding indifferently of existents and non-existens'. In contrast, 13th-century scholars like Duns Scotus and Radulphus Brito based their discussion of the proper meaning of the indefinite name upon the question '*Utrum nomen infinitum aliquid ponat*' ("Whether an infinite name posits something"), which calls to mind Boethius' claim that indefinite names 'hold indifferently of existent and non-existents'.

Abelard's discussion of the proper meaning of the indefinite name is also interesting in that it helps us to gain a good understandiiip of what Boethius had in mind in claiming that the indefinite name 'siginifes an infinite number of things' ('*significat infinita*'). For, thanks to Äbelard's expositions, it becomes clear that the phrase '*significare infinita*', which, on the face of it, may be taken as referring to the extensional of the indefinite name, on closer inspection proves to concern its intension, because the controversy between Abelard and Boethius turns out to be about two different views of the indefinite name's intension rather that about any opposition of intension as against extension." (pp. 207-208.)

Kneepkens, "Orléans 266 and the Sophismata Collection: Master Joscelin of Soissons and the infinite words in the early twelfth century", in St. Read (ed.) *Sophisms in Medieval Logic and Grammar*. Acts of the Ninth European Symposium for Medieval Logic and Semantics, held at St Andrews, June 1990 (Nijhoff International Philosophy Series, 48; Dordrectt/Boston/London 1993), 64-85.

6. Rosier, Irène. 2002. "Abelard and the Meaning of the Propositions." In *Signification in Language and Culture*, edited by Gill, Harjeet Singh, 23–49. Shimla: Indian Institute of Advanced Study.

   Abstract: "For Abelard (first half of the twelfth century), nouns signify things on one hand, inteilections on the other. But what about propositions, which are composed of words? Do they

signify things, intellections, or neither of those? We will consider the various problems involved in that question, which lead Abelard to conclude that, although they are about things, propositions signify something which is neither a thing, nor a complex of things. nor an intellection, but a dictum : “what is said by the proposition". It is the dictum which is true or false. Although it is “absolutely nothing”, it is a projection in reality of the way our intellect connects things. When I think of Socrates and of his whiteness, I decide to connect them by saying Socrates is white, or to separate them by saying Socrates is not white, thus seeing these two things as connected in some way, as being ins some kind of relation. But this connection does not exist in reality: it is by comparing this connection which I produce with the actual state of the world, that What I am actuaily saying, not the words themselves but the dictum they express, will be judged true or false. Abelard’s positions will be discussed in connection with other logicians and grammarians of his time. It will be shown that, although the theory of the dictum answers problems, it seems not to have been known, even in his own school, and other theories were devised. The relevance of this theory for theology will also be discussed briefly."

7. Rosier-Catach, Irène. 2007. "Priscian on Divine Ideas and Mental Conceptions: the Discussions in the *Glosulae in Priscianum*, the *Notae Dunelmenses*, William of Champeaux and Abelard." *Vivarium* no. 45:219–237.

   Abstract: "Priscian's *Institutiones Grammaticae*, which rely on Stoic and Neoplatonic sources, constituted an important, although quite neglected, link in the chain of transmission of ancient philosophy in the Middle Ages. There is, in particular, a passage where Priscian discusses the vexed claim that common names can be proper names of the universal species and where he talks about the ideas existing in the divine mind. At the beginning of the 12th century, the anonymous *Glosulae super Priscianum* and the *Notae Dunelmenses*, which heavily quote William of Champeaux (as master G.), interpret the passage in the context of a growing interest in the problem of universals, raising semantic as well as ontological questions, and

introducing a Platonic view on universals in the discussions on the signification of the noun. Moreover, this same passage will be used by Abelard to elaborate one of his opinions about the signification of universal or common names-that they signify "mental conceptions".

8. ———. 2017. "Understanding as Attending. Semantics, Psychology and Ontology in Peter Abelard." In *The Language of Thought in Late Medieval Philosophy. Essays in Honor of Claude Panaccio*, edited by Pelletier, Jenny and Roques, Magali, 249–274. Dordrecht: Springer.

   Abstract: "How can we explain that understandings (*intellectus*) and sound understandings are formed or that expressions signify when there is no *res subiecta* that corresponds to them? Abelard discusses this question in various contexts relating to the formation of understandings, the signification of nouns, the problem of universals, and the formation of propositions. In all of them, the notion of *attentio-attendere*, Augustinian in origin, plays a crucial role. It orients Abelard towards an intentionalist semantics, which insists on the difference between the speaker's act of focusing on something (the *modus attendendi*) and this something as existing (*the modus subsistendi*), and away from a semantics based on the notion of similitude. I would like to show how all these analyses are connected, thereby showing the links between ontology, semantics, and psychology in Abelard's thought."

9. Schuman, Boaz Faraday. 2024. "Do Thoughts Have Parts? Peter Abelard: Yes! Alberic of Paris: No!" *British Journal for the History of Philosophy* no. 32:974–998.

   Abstract: "Spoken sentences have parts. Therefore they take time to speak. For instance, when you say, 'Socrates is running', you begin by uttering the subject term Socrates, before carrying on to the predicate. But are the corresponding thoughts also composite? And are such thoughts extended across time, like their spoken counterparts? Peter Abelard gave an affirmative response to both questions. Alberic of Paris denied the first and, as a corollary, denied the second. Here, I first set out

Abelard's account. I then present a series of arguments against Abelard, reconstructed from (sometimes fragmentary) manuscripts associated with Alberic's school. I conclude with an observation about present philosophy of language: this twelfth-century debate points to some undefended (and largely unstated) assumptions common to more recent thinking about propositions."

10. Seuren, Pieter Albertus Maria. 2009. *Language from Within: Vol. I: Language in Cognition*. New York: Oxford University Press.

    Summary of the two volumes: "Volume I begins by setting up certain central principles of the natural ontology according to which humans develop a theory of the actual world with the help of nonactual, thought-up 'worlds' or, better, situations. It then presents a view of how language expresses thoughts developed in terms of this natural ontology, with an emphasis on the mechanism of reference not only to extensional, actually existing objects but also to intensional, thought-up objects. An important aspect, elaborated in Chapter 4, is the fact that human communication does not, as is usually thought, consist in the transfer of propositionally structured information, but, rather, in a socially binding form of position-taking with respect to such information.

    We then go on to a discussion of the general semantic aspects of language in the context of the total ecological 'architecture' of language, mind, and world.

    This leads to a cursory tour of lexical meaning and of the ways lexical meanings are structured so as to make linguistic utterances fit into given contexts or discourses.

    Concentrating again on propositional content, basic principles of logic are introduced in Volume II, although not in the traditional fashion. A new and unconventional view of logic is developed there, in which the logical constants are treated as lexical items, in fact as lexical predicates, with the special property that their meanings allow for the computation of entailments. It is argued that this reduction of logic to lexical meaning shows better than anything else the relevance of logic

and logical analysis for the study of linguistic meaning. This point of view is reinforced in Chapter 10 of Volume II, where it is shown that presuppositions are a general semantic property of lexical predicates and where it is argued that a proper theory of presuppositions requires a trivalent presuppositional logic. We then concentrate, in Chapter 3 of Volume II, on a reconstruction of the natural logic which nature may be taken to have instilled into human cognition.

This reconstructed logic is then placed in a historical perspective, which shows that basic natural predicate logic is, in fact, largely but not entirely identical with the logic proposed and defended by the Edinburgh philosopher William Hamilton in the nineteenth century. Aristotelian predicate logic is dissected in Chapter 5 of Volume II and reconstructed on the basis of Aristotle's own texts, whereby it is found that Aristotle was not guilty of the logical error of undue existential import but left his logic incomplete. It is also found that the twelfth-century French philosopher Abelard completed Aristotelian predicate calculus in Aristotle's spirit, avoiding undue existential import in a way that leads to a logically sound system that is more powerful than standard modern predicate logic. Chapter 4 of Volume II shows that traditional predicate logic, with its undue existential import, has maximal logical power, in stark contrast to standard modern predicate logic, which has hardly any logical power left. It also shows that the logically sound Abelardian system of predicate logic has much greater logical power than standard modern predicate calculus, while still staying within the bounds of a strictly extensional ontology - a fact which raises questions regarding the status of standard modern predicate calculus in mathematics and mathematical logic.

In Chapter 6 of Volume II it is shown that traditional predicate logic is also much more functional from the point of view of transmitting information than its standard modern counterpart. The fact that, as a matter of principle, linguistic utterances need anchoring in context before they can be keyed to a given situation and the objects in it, is first discussed in Chapter 3, in the context of Aristotle's concept of proposition.

Chapters 7 to 9 of Volume II are devoted to a further theoretical elaboration of the context-sensitivity of natural-language sentences and utterances. The notion of presupposition is central in this respect. Chapter 10 of Volume II is devoted to the logical aspects of the context-sensitivity of language. A presuppositional logic is developed for both the propositional operators and the universal and existential quantifiers. In this logic, a distinction is made between, on the one hand, a default, discourse-restricted area of metalogical relations, which is taken to have some degree of psychological reality, and a purely theoretical area which has no psychological reality but is presented merely to show the character and properties of the logic involved." (pp. 7-8).

12. Shimizu, Tetsuro. 1995. "From Vocalism to Nominalism: Progression in Abaelard's Theory of Signification." *Didascalia* no. 1:15–46.

    "In the present paper, I propose to analyse Abaelard’s theory of signification with reference to his evolution from vocalism (or so called early nominalism) to nominalism in the strict sense. I shall examine (1) how the vocalist theory is defined and criticized by Abaelard in his *Glossae* on Porphyry’s *Isagoge* with the incipit “Ingredientibus”, (2) how he revises the vocalist theory in answering objections, and (3) how his later sermo-theory in his another gloss on Porphyry, entitled *Glossulae super Porphyrium* and distinguished by the incipit “Nostrorum petitioni sociorum”,(2) is different from that of the Glossae ‘I’. In other words, I suppose three stages in Abaelard’s discussion: the first stage is the vocalist definition of universals in the *Glossae* ‘I’, which is his starting-point in it; the second is Abaelard’s revision of vocalist theory of signification in the *Glossae* ‘I’ ; and the third is the sermo-theory in the Glossulae ‘NPS’, which is a further revision of vocalism, but deserves to be called nominalism, and not vocalism any longer. That is,

Abaelard's change in terminology from *vox* to *sermo* involves a revision in his basic conception of word itself." (p. 15, two notes omitted)

(2) While using the abbreviation 'LNPS' for Geyer's edition, I shall call this gloss Glossulae 'NPS'(...)

13. ———. 1999. "Words and Concepts in Anselm et Abelard." In *Langage, sciences, philosophie au XIIe siècle*, edited by Biard, Joël, 177–197. Paris: Vrin.

    "The main concern of the present article is with the theory of words and concepts in Anselm and Abelard. The Augustinian tradition tells us that mental concepts are words (*verba*) and that they correspond to God's Word, and the expository tradition since Philo combines the story of creation with Plato's *Timaeus*, identifying primordial ideas in God's mind before creation with God's words, or Word. By contrast, grammar - the preliminary, or introductory, discipline in early medieval schools -begins its course from vocal sounds (*voces*), so that words in grammar are defined as « vocal entities ». Furthermore, dialectic treats names and verbs as a subspecies of *vox significativa secundum placitum*, at least in the relevant chapter of Aristotle's *De interpretatione*. How, then, did the scholars at that period deal with the supposed inconsistency between these secular disciplines and the traditional Christian teaching on words?

    To answer this question, I shall first examine a theory of the signification of names in the field of grammar from the late eleventh century, and show that the dominant tendency at that time was to interpret grammar on the basis of Aristotle's theory of categories. Then, I shall go on to examine Anselm and Abelard's viewpoints to show that both, basing themselves on Aristotle's *De interpretatione*, introduced new theories on signification independently from the theory in grammar, while they differed from each other in how to accept the Augustinian theory of God's Word and consequently on how to apprehend words in general." (p. 177)

14. ———. 2006. "Word and *Esse* in Anselm and Abelard." In *Anselm and Abelard. Investigations and iuxtapositions*, edited

by Gasper, Giles E.M. and Kohlenberger, Helmut, 179–195. Toronto: Pontifical Institute of Mediaeval Studies.

"The medieval controversy about the nature of universals was about nothing other than the relationship between word and thing. In order to understand the history and essence of the controversy, it is most important to examine the thoughts of the two key figures: Anselm and Abelard, respectively the revered authority among the realists (*reales*), and the founder of the nominalists (*nominales*). Though there certainly lies a crucial divergence in their views, nevertheless Abelard, as well as contemporary realists, owes many of his ideas, conceptions and terms to Anselm. Having examined elsewhere their views on the relationship between word and concept, I would like to examine here those on the relationship between word and the world. Through this examination I shall show how Anselm's metaphysical investigation about God's locution was transformed into Abelard's logical one about human words.

In the following, I shall first examine Anselm's theory of God's locution, showing how he explains it in terms of human language and in its relationship with created things, by examining some passages from his *Monologion* and *De grammatico*.

Secondly, I shall focus my attention on Abelard's corresponding theories in his two commentaries on Porphyry, *Glosse 'ingredientibus*' and *Glossule* '*nostrorum petitioni sociorum*'." (p. 179)

"Conclusion. The terms and concepts that Anselm proposed in his meditation on God's locution as the origin of created things constitute a common vocabulary for the controversy about universals. Even Abelard, the founder of nominalism, when refuting the realists, uses these terms and concepts to differentiate himself from them. Such terms, among others, are *essentia, esse hominem,* and *status hominis,* which is Abelard's substitute for Anselm's *esse hominis*. Again, Anselm's idea of *significatio* as an act of producing understanding in the hearer becomes the main idea in Abelard's semantics. We can, however, recognize elements of discrepancy between them as

well as these examples of agreement. Abelard excludes *essentia* from his theory of universals, separating it from *esse hominem,* and shifts the idea of *esse hominis* to the one of *status hominis*. Again, Anselm's *intellectus* produced by a word is the understanding by which an *essentia,* or something's *esse,* is understood, and the latter is based on the *principalis essentia* in God, while Abelard's is separated from *essentia* and even from the facts in reality *(status),* in his later theory, though connected in his earlier one. It seems that Abelard cultivates a new realm of conceptions independent of things' *essentia;* this realm is properly for human beings, not for God, the creator. In this sense, 'Deus homo' happened between Anselm and Abelard." (p. 195)

15. ———. 2006. "The Place of *Intellectus* in the Theory of Signification by Abelard and *Ars Meliduna*." In *Intellect et imagination dans la philosophie médiévale / Intellect and imagination in medieval philosophy / Intelecto e imaginação na filosofia medieval / Actes du XIe Congrès international de philosophie médiévale de la Société internationale pour l'Étude de la philosophie médiévale (S.I.E.P.M.): Porto, du 26 au 31 août 2002*, edited by Pacheco, Maria Cândida and Meirinhos, José F., 927–939. Turnhout: Brepols.

    "The main concern of the present paper is with some theories of *significatio* in the 12th century, and how *intellectus* and *imaginatio* play a role in them, but not in others. In the present paper, I shall restrict my attention to Abelard and *Ars meliduna*, hoping to contrast them.

    ABELARD'S THEORY OF SIGNIFICATION

    As for Abelard's theory, I will make some comments concerning the present subject, with a summary of the conclusions that I have described elsewhere (1). In *Glosse super Porphyrium* ("Ingredientibus"), Abelard's theory of signification bound up with his explanation and revision of the vocalist theory of a universal. He starts with the definition of the universal, which involves the idea of *impositio* and *nominatio*, and so far the theory contains the name-things relationship only. Abelard, however, also shows its difficulties, by raising the two cardinal

aspects of signification: the first concerns *nominatio*, or *significatio* in the broader sense, while the second, the *intellectus* that a name produces in the hearer, and this act of a name is *significatio* in the strict sense.

Then he tries to solve the difficulties and presents his revision of the theory regarding each of the two aspects (2)." (p. 927)

(...)

CONCLUSION

In sum, we can contrast Abelard and the *Ars meliduna* as for how *intellectus* are treated with reference to signification. For both of them, a *status* is some thing or some fact in the world, independent of *intellectus*, though it might be an object of *intellectus*,

but by no means a mental entity. This is the only point on which both will agree. To begin with, they oppose each other as for what is the *status*. For Abelard, status is *causa impositionis*, while for the *Ars meliduna*, it is the object of signification. On the contrary, *intellectus* is the object of signification for Abelard, while it is the *causa impositionis* for the *Ars meliduna*. Abelard thinks of *intellectus* from the hearer's point of view basing himself on Aristotle's *De interpretatione*, so that he attends to the act of producing *intellectus* in the hearer, while the *Ars meliduna* thinks of *intellectus* from the speaker's point of view, basing itself on Priscian's grammar, so that it attends to the vocal words as revealing the speaker's *intellectus*. Thus the *Ars meliduna* insists on the reverse of what Abelard insisted on." (p. 939).

"The discussion of universals in Peter Abelard's Logica 'Ingredientibus' has been interpreted in many ways. Of particular controversy has been the proper way to interpret his use of the term status. In this paper I offer an interpretation of status by comparing Abelard's account of knowledge of universals to Edmund Husserl's presentations of categorial and eidetic intuition. I argue that status is meant to be understood as something like an ideal object, in Husserl's sense of the term. First, I present Abelard's discussion of status and distinguish this term from universals, things, acts of understanding, and forms. Next, I consider Husserl's account of categorial and eidetic intuition. Finally, I draw parallels between the two while showing how an interpretation of status as ideal object overcomes the interpretive problems encountered by other commentators on Abelard."

    "Peter Abelard's Exposé on Single and Non-Single Propositions in the *Dialectica*(38)

    One of the works in which Abelard had concentrated on the question of single or simple propositions is the Dialectica, II, ii, in the treatise entitled 'De specierum differentiis categoricarum'. (39) At the beginning of his discussion Abelard makes it very clear that the property of being a single expression is based on the meaning (*sententia*) of an expression. In the same way as there are single words (*unae*), i.e. words that have one meaning, as well as non-single ones (*multiplices*), or the ones that have more than one meaning, he tells us, there are also complex expressions (*orationes*) that can be either single (*unae*) or non-single (*multiplices*). Moreover, it is not the privilege of complete propositions to be subjected to such a distinction, but incomplete expressions also, such as definitions or descriptions, can be either single or non-single." (p. 288)

(38) Abelard also discusses this topic in the *Logica 'lngredientibus ', Glossae super Periermeneias*, ed. Geyer (1927), 382ff. (see the contribution by C. Strub, elsewhere in this volume).

Essays on the Commentary Tradition*, edited by Braakhuis, Henk A.G. and Kneepkens, Corneille Henri, 257–273. Turnhout: Brepols.

"In his semantics, Abelard draws a basic threefold distinction between (a) what is said; (b) the object that something is said about; (c) the meaning of what is said. What is said are single words (*dictiones*) or sequences of such words (*orationes*); in the latter case they may be either incomplete expressions (such as 'a white man') or complete expressions, that is, full sentences (such as 'A man is white'). The meaning of what is said is grasped through specific mental concepts called understandings (*intellectus*). The object that something is said about is a thing (*res*) or a state of affairs (*dictum propositionis*). These objects are never named or expressed directly by a word or a sequence of words but always through understandings. Therefore, a criterion for the unity of sequences of words would have to depend upon a criterion for the unity of understandings. (9)

The task, then, for clarifying the distinction between unitary andmultiple understandings is to assign conditions that sequences of words, usually sentences, must meet in order to signify a unitary understanding. For this task it makes no difference initially whether we find these conditions at the level of utterances or of syntax or semantics." (pp. 259-260)

On Abelard, pp. 44-47.

"The extant twelfth-century commentaries on Boethius's *De top. diff.* give us reason to believe that it was a controversial theory and that it was associated with Peter Abelard. A number of the commentaries know of the claim that syllogistic inferences hold in virtue of their form and not because they are warranted by a Topic.(60) In some of those commentaries this view is associated with views similar to Abelard's or even explicitly ascribed to a master P., who Green-Pedersen argues should be identified as Abelard.(61) And, in general, the commentaries which raise the issue of the Topical dependence of categorical syllogisms recognize it as controversial.

(...)

The evidence from these commentaries and our examination of early twelfth-century treatises, then, suggests that the separation of categorical syllogisms from Topical inferences in the twelfth century was controversial and original with Abelard. Up to the time of IMm [*Introductiones Montane minores*] around 1130, we find no recognition of this view, which plays so large a part in Abelard's *Dialectica*, but in the commentaries we have evidence that it was a very controversial view which tended to be associated with Abelard." Chapter 5: *Abelard on the Topics* (pp. 89-109) and Chapter 6: *Logic in the Early Twelfth Century* (pp. 111-133).

"In this essay, I examine the general character of Abelard's discussion of Topics to show its place in the philosophical tradition between Garlandus Compotista and the thirteenth-century terminists; and then I consider in detail Abelard's discussion of those particular Topics which are the principal concern of early twelfth-century logic treatises to help determine the place of Abelard's work in the historical tradition of the twelfth century. In what follows I concentrate on Abelard's *Dialectica*, leaving to one side his commentary on Boethius. I think that it will be some time before a definitive account of Abelard's work on Topics can be written, and I am not attempting to do so here. For my purposes it is enough to make a preliminary study of Abelard's major work, *Dialectica*, investigating in detail Abelard's discussion of Topics there. (In the following essay I will say something more about Abelard's commentary on Boethius's *De top. diff.*).

A comparison of the tables of contents of Garlandus's *Dialectica* and Abelard's will suggest some of the fundamental

differences between them. Garlandus's treatment of hypothetical syllogisms is roughly five times as long as his treatment of categorical syllogisms, and it is by far the lengthiest and most elaborate part of the book. In Abelard, the section on hypothetical syllogisms seems perfunctory, and the section on categorical syllogisms is almost twice as long. What is at least as significant, if not more so, is that Abelard places his discussion of Topics before the section on hypothetical syllogisms but after the section on categorical syllogisms, unlike Garlandus, who puts his treatment of the topics before any discussion of either sort of syllogism." 21. Tarlazzi, Caterina. 2014. "'Iam Corpus' or 'Non Corpus'? On Abelard's First Argument Against Material Essence Realism in the Logica 'Ingredientibus'." *Vivarium* no. 52:1–22.

    Abstract: "This paper investigates Abelard's first argument against the 'material essence' realist view on universals in the Logica 'Ingredientibus'. It analyses three different interpretations of the argument, those of Alain de Libera, Peter King and Martin Tweedale. Much depends on the (for this section, single) manuscript reading 'iam corpus' in a crucial passage. The paper argues against the manuscript reading (endorsed by some scholars) and in favour of the emendation 'non corpus' suggested by the editor, Bernhard Geyer. The emended reading is supported by comparison with similar arguments of Abelard and his school found in published and unpublished sources."

23. ———. 2021. "The Debate Over Universals in the Time of Peter Abelard: What It Is, And Is Not, About." *British Journal for the History of Philosophy* no. 29:1012–1033.

Abstract: "From the nineteenth century onwards, the so-called ‘Debate over Universals’ from the time of Peter Abelard (c. 1100–50) is regarded as one of the major problems of medieval philosophy. This paper tries to advance the current approaches (which fall into two broad categories: a more analytical line of enquiry and a more historical one) by establishing a new understanding based on assumptions and questions. Through a comprehensive analysis of both published and unpublished logical commentaries from the first half of the twelfth century, it shows that – contrary to the received narrative – a lot is not discussed, but rather assumed. It therefore investigates what the debate is not about – arguing that this is just as relevant as what the debate is about."

24. Taylor, Andrew. 1998. "A Second Ajax: Peter Abelard and the Violence of Dialectic." In *The Tongue of the Fathers*, edited by Townsend, David R. and Taylor, Andrew, 14–34. Philadelphia: University of Pennsylvania Press.

    "The disputations in which Abelard first made his reputation offer an extreme instance of the adversarial method that remains the fundamental paradigm of academic philosophizing in the West.(63) This adversarial method now seems all too obviously characteristic of a specific culture, that male culture that “thrives on argument and prides itself on distinction"(64) yet to retain its authority the method must claim

    both objectivity and universality. It cannot afford to reveal itself as a masculine game. Abelard glories in this culture, but he shows as much, and in doing so gives the game away. Whether the figure of Ajax marks aggression, fear, or some combination of the two, he calls into question dialectic’s pose of impersonality. Dialectic’s claims to impersonal objectivity bear all too strongly the marks of its human proponents." (p. 30)

25. Teräväinen, Juha. 1983. "Ultimate Reality and Meaning in 12th Century Logic." *Ultimate Reality and Meaning* no. 6:22–31.

    "When discussing the task of logic Abelard notes that the function of logic is teaching people to distinguish valid arguments from non-valid, and this on the basis of logical principles (Abelard, 1933, p. 506). But then Abelard notes also

that there are other indispensable concerns, namely those involving important distinctions regarding the nature of the things (Abelard, 1970, p. 287). Here the modern researcher mainly

regrets the 'ambivalence' of Abelard's opinion (e.g. de Rijk, 1967, p. 188; Pinborg, 1972, p. 51). But for Abelard these 'external' aspects are necessary.

Abelard deals with non-logical fundamentals chiefly in his theory of terms (Abelard, 1919-1927, p. 112); when discussing the theory of argumentation and the theory of propositions he is interested in the strictly formal character of these logical matters (cf. e.g. Abelard, 1919-1927, p. 308f.). It even seems that he distinguishes between an inquiry that is strictly logical and one searching for truth itself (Abelard, 1954, p. 305).

While presenting the copula of an affirmative proposition he gives both the formal (the identity theory; Abelard, 1970, p. 132) and the metaphysical (the inherence theory; Abelard, 1919-1927, p. 360f.) aspect. The latter he deserts for the former, since the identity theory presumes nothing outside the proposition itself. Abelard's tendency was, therefore, towards a form of logic where non-logical presumptions are rejected or simply made superfluous." (pp. 24-25)

    Chapter 3: *Abélard*, pp. 43-64.

    "Abélard distinguishes between the syntactic features of a proposition *secundum constructionem* and *in sensu*. He asks two principal questions about modal propositions: What role does modality play in their syntactic structure, and. How are they derived from the corresponding assertorics?

    With regard to the first of these questions, Abélard's view is that modal words qualify neither the subject nor the predicate nor the whole proposition, but the relation between predicate and subject. On the second question, his view is that modal propositions are in sense de rebus - i.e. they share their subjects with the simple propositions from which they derive, rather than having the sense of those simple propositions as their subjects.(3) This is what it means to be de rebus. The doctrine that modal propositions are de rebus I will call actualism, since it claims that modal propositions are about the same actual things that are the subjects of assertoric propositions. Actualism, as we shall see, is not necessarily an anti-metaphysical doctrine." (p. 44)

    (3) Abélard (1956) 198:8-9. These words occur at the climax of a long polemic, 195:11-198:11, against 'his master's' *de sensu* analysis, according to which modals are about the sense of the corresponding simples.

27. ———. 2012. "Logical Form." In *The Oxford Handbook of Medieval Philosophy*, edited by Marenbon, John, 271–288. New York Oxford University Press.

"An explicit formulation of a concept of logical form can be found in Abelard's distinction between perfect and imperfect inferences. A perfect inference is one where the truth of consequent is clear from the structure of the antecedent (*ex ipsius antecedentis complexione*) because the construction of the antecedent is arranged in such a way as to contain the construction of the consequent—as happens in syllogisms.

(22) An imperfect inference lacks this kind of structural integrity, even if it is necessary—as is the inference 'If every man is an animal, every man is animate' or the inference 'If every man is an animal, no man is a stone'. (23) Our knowledge of imperfect inferences comes from our knowledge of the things that the inference is about (men, animals and stones in the above examples), not just our knowledge of the inference's

structure. (24) But knowledge of a perfect inference depends on no such knowledge since the inference holds for all terms similarly arranged, whether the premises relating them are true of false. (25) Imperfect inferences, by contrast, do not hold for all terms similarly arranged: if we replace 'man' by 'stone' in 'If it's a man it's an animal', the resulting inference is false. Perfect inferences don't depend on the nature of things, and their structure (*complexio*) preserves a necessary consequence equally in all things, no matter how they are related. (26)" (p. 276)

28. Thompson, Augustine. 1995. "The Debate on Universals before Peter Abelard." *Journal of the History of Philosophy* no. 33:409–429.

    "This essay is an experiment, in which I shall attempt three things. First, I shall draw together the widely scattered discoveries and scholarship that have ppeared since 1980 and reread our sources for the debate in light of them.

    Next, I shall propose that the theories advanced by participants in the debate on universals before Abelard, which have hitherto seemed fragmentary and incoherent--intelligible only in terms of their culmination in or their refutation by Peter Abelard--can be fitted into a coherent narrative. This narrative calls into question the trustworthiness of Peter Abelard and John of Salisbury's widely accepted version of the debate. Finally, it suggests that, discounting his self-promotion, Peter Abelard was a far less pivotal thinker than conventional wisdom would have him." (p. 411)

29. Tweedale, Martin. 1967. "Abailard and Non-Things." *Journal of the History of Philosophy* no. 5:329–342.

    "On several occasions in his logical writings Abailard extracts himself from embarrassing ontological implications of his analyses of language by resorting to the notion of a something that is not a thing. I shall note here two such occasions and then discuss Abailard's explanations of this procedure based on the grammatical distinction of personal and impersonal

constructions. Since the texts on this latter topic are especially confusing, a considerable portion of my effort will be spent on making sense of them as preparation for drawing some conclusions about Abailard's overall approach. My purpose here is to show how Abailard's grammatical analyses are fundamental to his defence of a number of metaphysical positions. I also want to suggest that Abailard's grammatical approach, especially on the question of *dicta*, contains insights of continuing interest." (p. 329)

30. ———. 1976. *Abailard on Universals*. Amsterdam: North-Holland.

    Contents: Preface IX-X; Introduction 1; I. Plato and Aristotle 17; II. Boethius and Porphyry 53; III. Abailard's Critique of Realist Solutions 89; IV. Abailard's Theory of Abstract Entities 133; V. Abailard's Theory of *Dicta* and *Status* 133; Vi. Abailard and Frege: A Comparison 305; Bibliography 329; Index of Names and Subjects 331; Index of Textual Extracts 335-337.

    "In writing this book I have had two main objectives in mind. The first was to present in a form easily accessible to professional philosophers, theologians and historians certain scattered portions of Abailard’s logical writings which seem to me to record a very original scrutiny of the foundations of logic and in particular of the problem of universals. I am of the opinion that if and when a complete history of logic in the West is written Abailard’s ideas will appear as one of the ablest and most penetrating efforts to establish a philosophical foundation for the subject. To accomplish this objective I have arranged, translated and commented on relevant passages from Abailard’s works in such a way that the reader, even if he knows no Latin, can follow Abailard’s train of thought and see the relationships between texts whose bearing on each other is far from immediately apparent. The translations are very literal, sometimes to the point of awkwardness. But one must remember that the original is rarely any sort of paragon of literary style. Scholastic writing in logic generally sacrifices beauty to economy and accuracy. Sometimes, Abailard is too economical, and then I have inserted in the translation what is required to give an intelligible rendering. (Such insertions are

bracketed.) For those who know Latin the original text is also provided from the most recent modern editions of Abailard's works.

The second objective was to interpret the texts in a way that would connect them with the ancient tradition and also make them intelligible to contemporary philosophers. I have tried to be both critical and sympathetic in this interpretive work. Indeed, criticism of Abailard without sympathy is almost bound to be superficial since he so frequently contradicts himself and talks in ways he himself knew to be misleading. Besides, Abailard is writing at a time when the conceptual tools of scholastic logic were being created; consequently it is not to be expected that his works would display the rigor of those, say, of Ockham or Tarski.

Chapters I and II give the classical background to the problem of universals, allowing the reader a glimpse of some of its ramifications. The real work of presenting and analysing texts takes place in chapters III through V. If the reader already has a good idea of the history of the subject, he could well limit himself to just this core part of the essay. Chapter VI tries to give a sense of the continuing relevance of Abailard's discussions by a comparison with Frege's philosophy of logic. I thought it was better to concentrate on one central figure in modern logic than attempt a general comparison with all the various strands of thinking on the subject since the nineteenth century. Only this last chapter supposes a bit of familiarity with modern philosophy. Elsewhere I have tried to write in a way historians and theologians, as well as philosophers, could understand. Certainly the range of interests a book on this topic appeals to should not be narrowed any more than necessary." (from the *Preface*)

"This work shows how Abailard elaborated and defended the view that universals are words, avoided the pitfalls of an image theory of thinking, and propounded a theory of "status" and "dicta" as objects of thought without treating them as subjects of predication. His defense of these views is shown to depend on certain fundamental departures from the Aristotelian term

logic of his day, including a proposal for subjectless propositions, the treatment of copula plus predicate noun as equivalent to a simple verb, and a transformation of the 'is' of existence into the 'is' of predication." (Review by P. S. Spade, *Noûs*, 14, 1980, pp. 479-483)

31. ———. 1980. "Abailard and Ockham: Contrasting Defences of Nominalism." *Theoria* no. 46:106–122.

    Abstract: "The Scholastics inherited from the Greeks a certain ideal of scientific knowledge, an ideal which both the nominalists and the realists of the middle ages accepted. In this paper I want first to show briefly how that ideal seems most naturally to lead to some form of realism as regards universals. I then review the attempts by Abailard in the 12th century and Ockham in the 14th to escape the realistic conclusions that apparently follow from that ideal, and in the course of this discussion I try to make clear just where their approaches differ. Finally, I point out that Ockham's approach suffers from certain basic difficulties which do not beset Abailard's and hope that this will motivate among the nominalistically minded a certain sympathy for the Abailardian view despite its admittedly enigmatic and nearly self-contradictory character."

32. ———. 1982. "Abelard and the Culmination of the Old Logic." In *The Cambridge History of Later Medieval Philosophy. From the Rediscovery of Aristotle to the Disintegration of Scholasticism, 1100-1600*, edited by Kretzmann, Norman, Kenny, Anthony and Pinborg, Jan, 143–157. Cambridge: Cambridge University Press.

    "Of all the scholastic logicians writing while the old logic (*logica vetus*) was still virtually the whole of the logical curriculum in the schools, Abelard is generally conceded to have been the most profound and original. (1) He himself was keenly aware of the subtlety required of the logician and in one place says it depends on a divinely bestowed talent, rather than anything that can be developed by mere practice.(2)Abelard treats dialectic (= logic) as an *ars sermocinalis*, i.e., like grammar a linguistic science. Its peculiar subject matter is arguments as expressed in language, whose validity it tries to

judge in a scientific way.(3) This linguistically oriented conception of the subject means that dialectic will overlap to some extent with grammar. In the first section below I shall selectively explore this overlap; in the second section I shall consider some of Abelard's views on more purely logical topics.

For Abelard logic also had a close relation to *physica*,(4) i.e., the sciences of nature, since in explaining the 'uses of words' the logician must investigate in a general way the 'properties of things' which the mind uses words to signify. This relationship leads to a concern with the psychology of signification, to be explored in the third section below, and with ontology, the topic of the fourth section. This discussion is necessarily very selective and must omit consideration of many of Abelard's philosophical insights on relevant topics." (p. 143)

    V. Abelard and his Contemporaries, pp. 216-226.

    "Abelard (1079-1142), it seems, was the first philosopher in the Latin West since ancient times to make full use of Aristotle's *De interpretatione* and Boethius' commentaries on it. The main effect of this appears to have been a greatly increased role for psychological considerations in semantic theory.

    Abelard promotes ideas (*intellectus*) to a key position in his analysis of how words signify. Having a simple idea is a mental act of attending to some nature of a thing; it differs from acts of sensing *(sensus*) in that it does not require an actually existent object or 'subject thing', whereas sensing does.

    Imagining too does not require the actual existence of what is imagined, but unlike having an idea it does not distinguish out any particular nature.(92)

    There are, as well, complex ideas corresponding to whole propositions, whereas simple ideas correspond to nouns and verbs. To construct a complex idea out of simple ones requires a joining activity of the mind.(93)

    Some words we use function merely as joiners or disjoiners without signifying any idea; such are the copula and various conjunctions like 'if and 'or'. Other words modify ideas without themselves signifying an idea; the modal operators and quantifiers are examples of this class. Such is Abelard's attempt to differentiate psychologically 'definite' and 'indefinite' terms, i.e. what later were to be called 'categorematic' and 'syncategorematic' terms.(94)" (pp. 216-217)

of Sten Ebbesen, edited by Fink, Jacob Leth, Hansen, Heine and Mora-Marquez, Ana María 105–124. Leiden.

"To celebrate Sten Ebbesen's birthday I would like to offer a paper about Peter Abelard and John of Salisbury; two twelfth-century thinkers who share with Sten and his favourite medieval masters—Boethius of Dacia, Radulphus Brito and John Buridan, *mutatis mutandis*—an interpretation of philosophy which emphasizes rationality, logic, and freedom. In particular, I intend to consider, although of necessity in a somewhat partial and provisional manner, both Peter Abelard's and John of Salisbury's views regarding the status of the philosopher within the context of their thoughts on the variety of kinds of human beings.

I will begin by analysing a passage from Macrobius's *Commentarii in somnium Scipionis,* for the text of book 1, chapter 8 is explicitly quoted by Abelard in both his *Theologia christiana* and *Dialogus inter philosophum, iudeum et christianum*. Macrobius's views are, in my opinion, one of the chief sources of Abelard's and Salisbury's own representations of philosophers whether they are real or simply ideal persons." (p. 105)

36. ———. 2015. "*Aliquid amplius audire desiderat*: Desire in Abelard's Theory of Incomplete and Non-Assertive Complete Sentences." *Vivarium* no. 53:221–248.

Abstract: One of the peculiarities of Peter Abelard's analysis of incomplete and non-assertive sentences is his use of the notion of desire: in both *Dialectica* and *Glosses on Peri hermeneias* the terms *desiderium* and *desidero* move to the foreground side by side with *optatio*, *expectatio, suspensio* and the related verbs. Desire plays a structural role in Abelard's descriptions of the compositional way in which the linguistic message is received, changing step by step from incomplete to complete: the person who receives the incomplete message (e.g., 'Socrates' or 'Socrates legens') desires to get further information through other words since he knows that the purpose of such words or sequences of words (their causa inventionis) is to combine with other words in order to form a

complete sentence. On the other hand, the expression of the speaker's attention to his inner affections renders the same semantic content a different complete sentence (injunction, prayer, or *desiderativa oratio*)."

37. Viri, Federico. 2022. "Mental Actions in Semantics. On Abelard's Question "Can a True Proposition Generate a False Understanding?": A Tentative Interpretation." *Vivarium* no. 60:192–225.

    Abstract: "This article aims to demonstrate the interdependence of semantics and noetics against the referentialist trend in Abelard studies conceiving semantics as confined to the truth/falsity function. The article takes as a turning point of the argument Abelard's question "can a true proposition generate a false understanding?" which secondary literature does not take into account. Starting from the analysis of this question, the article aims to show the development of an enhanced notion of understanding compared to the Boethian one. The core of this enhanced notion of understanding is the action of *attentio*, which is the condition for the elaboration of a coherent and global definition of signification (de rebus and *de intellectibus*). The analysis of the mental

    action of *attentio* entails the description of other kinds of mental actions, leading one to conceive understanding as a multi-layered complex of actions."

38. Wade, Francis C. 1963. "Abelard and Individuality." In *Die Metaphysik im Mittelalter. Ihr Ursprung und ihre Bedeutung*, edited by Wilpert, Paul, 165–171. Berlin: Walter de Gruyter.

    "Peter Abelard, in his *Logica Ingredientibus* proposed to inquire into and solve "diligenter et perquiramus et solvamus" (1) the questions concerning genus and species, which Porphyry had refused to answer in

    his *Introduction* to the *Categories* of Aristotle. Abelard states his intention: "and since it is known that genera and species are universals and in them Porphyry touches on the nature of all universals generally, let

us inquire here into the common nature of universals by studying these two (genus and species), and let us inquire also whether they apply only to words or to things as well."(2)

The thesis of this brief paper is that Abelard, in spite of his diligent inquiry, could not explain genus and species owing to his unanalyzed conception of an individual." (p. 165)

41. Wilks, Ian. 1993. *The Logic of Abelard's Dialectica*, University of Toronto.

    Available at ProQuest Dissertation Express. Order number: NN82768.

    Abstract: "In this work I provide a fairly discursive treatment of Abelard's logical theory, discussing his views on a considerable number of syntactic and semantic issues at the levels of argument, statement and word: the formulation of syllogistic rules, the *oratio*, assertion, tense, grammatical voice and number, the copula and the copula verb phrase, the quantifier, and the negative particle; the nature and varieties of inference, the nature of the statement, the co-referential theory of truth, identity conditions for names, signification, reference, the intellectus, imposition, abstraction and the status. My contention is that there is a unifying theme in Abelard's treatment of all of these issues: his concern to develop a logic with no theoretical reliance on what, for the purpose of this study, I call 'the standard ambiguity'. This ambiguity is present in Aristotelian formulations of syllogistic logic, where a statement such as 'Every man is mortal' will be described by a formula such as this: mortal is in the whole of man. This formula treats 'mortal' and 'man' as names referring, in each case, to a single item of some sort, and suggests that the statement 'Every man is mortal' simply expresses a relation holding between two such items. The general effect of the standard ambiguity is to suggest that logic has these kinds of items, and their relations, as its subject matter. For Abelard the subject matter of logic is language. A statement is to be considered syntactically as a group of words, not as a pair of standardly ambiguous items; but this view presupposes that the structural requirements of syllogistic inference (and in particular, conversion) can actually be met by statements considered in this light. I interpret Abelard's theory of syntax as an attempt to prove the truth of this presupposition; this is the essential business of Part 1 of my study. In Part 2 I show that Abelard likewise provides theories of inference, truth and

meaning which avoid theoretical reliance on the standard ambiguity, and treat these issues instead in terms (respectively) of the formal properties of syntax, coreferentiality in subject and predicate names, and the abstracted *intellectus*."

42. ———. 1998. "Peter Abelard and the Metaphysics of Essential Predication." *Journal of the History of Philosophy* no. 36:365–385.

    "Abelard's explanation of his reasoning in the passages from *DP* (where he justifies the statement that a penalty is *bona* but not *bonum* by observing that "changing the gender in adjectival names often varies the sense"(65) is obviously inadequate in capturing the full subtlety of his analysis, and one naturally assumes that he is writing for an audience expected to be already schooled in some of these technicalities. Indeed, a much fuller description of those technicalities is possible than any he provides in any one place; I have attempted to supply that desideratum in this study.

    The general lesson we take from the above sequence of texts begins with the insight that what is one essentially can be many definitionally, and that a predicate fully applicable to some member of that definitional plurality can fail to be fully applicable to so me other member. Most predicates, one would think, would either be fully applicable to all, or fully inapplicable; but some--those which actually constitute the differences in definition -- fall in this middle ground, where of at least one member they are adjacently and essentially predicable, and of at least one other they are only essentially predicable. As we have seen, there are three such cases that loom very large in Abelard's work: "predicable of many" in the definitional plurality that constitutes the universal, "is generated" in the definitional plurality that constitutes God, and "is good" in the definitional plurality that constitutes a good thing; the importance of these cases in providing centerpiece doctrines for his critical metaphysics, theology and ethics show the method they employ to be of the highest ìmportance for this philosopher.(66)

And one should, finally, give a thought to the unìqueness of thìs analytic approach; in the catalogue of methods that philosophers have used in quest of truth, this one of Abelard's presents itself to view as a distinctly nove! entry." (pp. 384-385)

(65) *DP,* x 29 (2335-37).

(66) Indeed, the potential range of application can be extended to the very distinction of genus and species itself, since the genus can be viewed as standing to the species just as the bronze of the statue does to the statue itself. See *LI Per*, 79 (5-14), 10 (29-34), and Jolivet, *Arts du langage*, 303.

"Enlightened study of semantic theory will repeatedly teach the same basic lesson about human language: that meaning is mapped onto words in a highly complex way, so that a simple correspondence of one distinct unit of meaning to each distinct word is rarely, probably never, what is involved in the meaningfulness of a whole sentence, clause, or even phrase. Context matters; words bear the meaning they do only by virtue of their use alongside other words-and can bear a quite

different meaning alongside other words. We typically understand a word by viewing it in context, which is as much as to say that we typically impute meaning to words not in fine-grained units of meaning, which correspond precisely to individual words, but in larger, less fine-grained units of meaning, which correspond less precisely to larger syntactic structures-to whole phrases, clauses, or even sentences.

It is impossible to do semantic theory at any level of sophistication without at least a rudimentary understanding of these facts. We find lots of evidence for this claim in the work of twentieth-century philosophers of language; and, perhaps more surprisingly, we find a good deal of similar evidence in the work of the medievals. It is, for instance, a fact that one of the medieval period's greatest semantic theorists, Peter Abelard, clearly had and expressed some insights along these lines; and it is the precise purpose of the present study to focus in on this one particular case, by paying special attention to his discussion of figurative language and transferred meaning. The issue of context dependency as a determiner of meaning was important enough to Abelard that he wrote in some detail about it-important enough, indeed, that he even changed his mind about it. In what follows I convey a few of his insights and suggest the direction in which they seem to have undergone a shift." (p. 171(

44. ———. 2007. "Abelard on Context and Signification." *American Catholic Philosophical Quarterly* no. 81:189–208.

Abstract: "Abelard maintains that individual words in a sentence represent distinct semantic units of its overall meaning. He employs two strategies to defend this position in the face of troublesome counterexamples. One strategy-the earlier of the two-sacrifices normal intuitions about what a word is, often labeling what seem to be words as non-signifying syllables. The later strategy invokes a rather fluid conception of what the signification of a word is, allowing this signification considerable latitude to alter under the contextual influence of other words. This evolution of strategy is linked to a new willingness on Abelard's part to adopt the principle of charity in interpreting sentences; this approach presumes the truth of the

statement, and tries to find an interpretation which bears that presumption out. This new willingness to adopt the principle is in turn linked to Abelard's developing vocation as an interpreter of biblical texts."

    "It is standard practice to develop an account of categorical logic which starts with a discussion of words, and moves through categorical propositions to the categorical syllogisms themselves. Abelard consciously adopts a parallel course for the logic of hypotheticals by beginning with a treatment of topics and hypothetical propositions. In general we can think of Abelard's development of material as falling along these two axes: discussion of words and categorical propositions leading to categorical syllogisms; and then discussion of topics and hypothetical propositions leading to hypothetical syllogisms. This way of organizing material is overtly embraced by Abelard in the *Dialectica*, in his attempt to depart from the commentary format. So it can be taken as representing his most basic intuitions on how the subject matter of logic should be organized.

    I will structure my discussion below accordingly. Part 1 deals with words, categorical propositions and categorical syllogisms. Part 2 deals with topics, hypothetical propositions and hypothetical syllogisms. These two parts complete the treatment of Abelard, and Part 3 turns to his contemporaries and their schools." 47. ———. 2020. "Peter Abelard." In *Encyclopedia of Medieval Philosophy: Philosophy between 500 and 1500. Second*

Edition, edited by Lagerlund, Erik, 1406–1413. Dordrecht: Springer.

Abstract: "The characteristic doctrines of Peter Abelard (1079–1142) can be arranged under the headings of logic, metaphysics, and ethics.

Abelard rejects the position that logical theory deals with universals taken as things (*res*).

It deals with words, whose signification is explained by their association with thoughts stripped of individuating detail. His account of propositions is shaped by his distinction between propositional force and propositional content, and by his notion of the *dictum*, the causally efficacious non-thing which is what a proposition says. His account of inference is especially focused on the nature of conditionals and the sorts of relationships between terms that can be used to verify them.

Abelard's most characteristic metaphysical view is that the only things which exist are individuals. Forms exist as individual to the things they inhabit, not as shared between things. Material objects are indeed matter/form composites, but their forms are simply arrangements of underlying matter; material objects are thus usefully subject to mereological analysis (i.e., analysis in terms of part/whole relations). Humans, but not animals, have immaterial souls, and are capable of freedom. By contrast God is not free; he can only do the things he does. Abelard's most characteristic ethical view is that it is the consent, not the action, that is to be judged as sinful or meritorious. A sinful consent is marked by contempt for God, and is formed explicitly in violation of God's law.

Law is itself revealed both in the Old and New Testament – yielding Old and New Law, respectively – but is also innately present to humans in the form of natural law. Meritorious consent is marked by love of God – in other words, by charity. Charity is the theological equivalent of justice, which itself holds central place among the cardinal virtues. Justice and charity both enjoin regard for the interests of others, but charity additionally does this as a product of the love of God,

and for that reason counts as a more fundamental virtue than justice." (pp. 1406-1407)

Buridan's Logical Works. I. An Overview of the *Summulae de dialectica*

The place of Buridan in the history of philosophy

"In this essay, I wish to question the view that the distinction between medieval and early modern philosophy is primarily one of method. I shall argue that what has come to be known as the modern method in fact owes much to the natural philosophy of John Buridan (ca. 1295-1361), a secular arts master who taught at the University of Paris some three centuries before Descartes. Surrounded by conflicts over institutional governance and curricular disputes, Buridan emerged as a forceful voice for the independence and autonomy of teachers in the faculty of arts, arguing that philosophy as properly practiced belonged to them, the "artists artistae", not to those who taught in the so-called 'higher' faculties of theology, law, and medicine. Now such voices had been heard before at Paris, most notably from Averroist arts masters in the late 13th and early 14th-centuries.(*) Buridan is different, however, because unlike Boethius of Dacia and John of Jandun, he knew how to make the case for artistic autonomy without denigrating the theology and thereby inviting official condemnation. His trick was not to argue that there are 'two truths', one acquired and the other revealed, which might well come into conflict with each other, or that propositions whose truth has been revealed in scripture in no way qualify as *scientia*. It was rather to recognize the profoundly different methods of theology and philosophy, without losing sight of the fact that what counts as evidence in a proof in natural philosophy does not work in a

theological argument, even if both have the same conclusion, such as that the human soul is immortal. Buridan seems to think that if only people would respect the differences between the rules of philosophical and theological inquiry, no conflicts would arise. He is not so naive as to claim this could ever happen, of course. But it does explain why he almost always diagnoses such conflicts in terms of some logical or linguistic confusion on the part of the people who propose them.

Buridan is also different because in him the secularizing sentiment already present in the Latin Averroists begins to take shape as a way of doing philosophy, i.e., as a philosophical grammar. This is clear in his greatest work, the *Summulae de Dialectica*, a comprehensive account of the titles of philosophical discourse written for the guidance of students and scholars alike. Due in large part to the enormous popularity of the *Summula*e and his commentaries on Aristotle's metaphysics and natural philosophy -- copies were made or (later) printed and circulated throughout France, Germany, Italy, Scotland, and Eastern Europe, well into the 16th century -- Buridan helped make possible the secularization of philosophical practice a crucial first step on the road to modernism." (pp. 34-35)

Notes

Buridan's logical work

"The extant writings of Buridan consist of the lectures he gave on subjects comprised in the curriculum of the faculty of Arts at Paris. In the fourteenth century this curriculum was largely based on study of the treatises of Aristotle, along with the *Summulae logicales* of Peter of Spain and other medieval textbooks of grammar, mathematics and astronomy. Buridan composed his own textbook of logic, a *Summula de dialectica*, as a "modern" revision and

amplification of the text of Peter of Spain, and he also wrote two treatises on advanced topics of logic, entitled *Consequentiae* and *Sophismata*, which are among the most interesting contributions to late medieval logic. All of his other works are in the form of commentaries, and of critical books of *Questions*, on the principal treatises of the Aristotelian corpus. The literal commentaries are extant only in unpublished manuscript versions, but the books of*Questions* on Aristotle's *Physics, Metaphysics, De anima, Parva naturalia, Nicomachean Ethics*, and *Politics* were published, along with Buridan's writings in logic, after the invention of printing. (...) Most of the printed editions represent the lectures Buridan gave during the last part of his teaching career, though earlier versions are found among the unpublished manuscript materials. Until a critical study of the manuscripts is made, however, there is no sure way of determining any order of composition among Buridan's works, or of tracing the development of his thought over the thirty odd years of his academic career.

Buridan made significant and original contributions to logic and physics, but one of his major achievements was that of vindicating the independence of natural philosophy as a respectable study in its own right, and of defining the objectives and methodology of the scientific enterprise in a manner which gave warrant for its autonomy in relation to dogmatic theology and metaphysics. This achievement was intimately connected with the movement of fourteenth century thought known as Nominalism, and with the controversies precipitated at the universities of Oxford and Paris by the doctrines associated with William of Ockham. Buridan's own philosophical position was thoroughly nominalistic, and indeed very similar to that of Jean de Mirecourt, a theologian of Paris whose teachings were condemned in 1347 by the chancellor of the university and the faculty of theology. That Buridan was able to escape the charges of theological scepticism that were directed against his fellow nominalists of the theological faculty was no doubt due, in part, to his personal qualities of prudence and diplomacy. But it was also due to his methodological, rather than metaphysical, way of employing the logic and the epistemological doctrines of nominalism in formulating the character and the evidential foundations of natural philosophy.

The formal logic presented in Buridan's *Summula de dialectica* is closely related, in topical structure and in terminology, to the so-called terminist logic of the thirteenth century represented by the textbooks of William of Sherwood and Peter of Spain. Though it presupposes the nominalist thesis that general terms are signs of individuals and not of common natures existing in individuals, it does not exhibit any strong evidence of direct influence by the logical writings of Ockham, and it may well have been developed independently of such influence on the basis of the modern logic (*logica moderna*) already well established in the Arts faculties of Oxford and Paris. The doctrine of the supposition of terms, basic to this logic, is used in defining the functions of logical operators or syncategorematic signs in determining the truth conditions of categorical propositions of various forms, and in formulating the laws of syllogistic inference both assertoric and modal. Treatises on topical arguments, fallacies, and on the demonstrative syllogism, conclude the work. Buridan's *Sophismata*, designed to constitute a ninth part of the*Summula*, was apparently written much later in his life, since it contains criticisms of the theory of propositional meanings, or *complexe significabilia,* which Gregory of Rimini introduced in 1344. This work presents a very fully developed analysis of meaning and truth which corresponds fairly closely to that of Ockham's *Summa logicae*, but it goes well beyond the work of Ockham in presenting original and highly advanced treatments of the problem of the non-substitutivity of terms occurring in intensional contexts, and of the problem of self-referential propositions represented by the paradox of the Liar. Buridan's treatment of these problems exhibits a level of logical insight and skill not again equalled until very recent times. His treatise on *Consequentiae*, which develops the whole theory of inference on the basis of propositional logic, marks another high point of medieval logic whose significance has only been appreciated in the twentieth century." (pp. 442-444 of the reprint)

Philosophical grammar

"Anneliese Maier once remarked of later scholastic natural philosophy that, «what changes is the method of knowing nature», so that «what is interesting is not the knowledge *(scientia*), but the method of knowing (*modus sciend*i)».(36) Buridan was one of the major agents of this change. His contribution was to rewrite the grammar of philosophy, supplanting older forms of inquiry with the more powerful method of the *Summulae de Dialectica*, the compendium of logical teachings that was his masterwork. By welding the logic of the *moderni* together with the indigenous Parisian tradition of propositional logic into a single, comprehensive package, he was able to effect a quiet revolution in the speculative sciences. The *Summulae* is essentially a 'how-to' book for the philosopher. The student who mastered its techniques would be equipped not only to read authoritative texts with confidence, but also to advance his knowledge through independent study and dialectical engagement with others.

To modern readers, the *Summulae* looks like a commentary on another text (which it is) on the way to a systematic overview of Aristotelian logical theory. But appearances can be deceiving. Buridan tends to be skeptical of systematizing pretensions in other fields,(37) and there is nothing in his remarks to suggest that he is interested in logical theory in the modern sense. Like most of his colleagues in the arts faculty, he believed that logic and grammar are not speculative but «practical sciences, for they teach its how to construct good syllogisms and well-formed expressions».(38) Once, when asked where the science of dialectic is taught, he does not reply 'in the *Summulae*'. Rather, his answer fragments along the lines of the division of sciences in the arts curriculum: «If it is asked where the science of dialectic is taught, we say that it is taught in the book of the *Metaphysics* as far as metaphysical conclusions are concerned, in the book of the *Posterior Analytics* as far as the conclusions of the posterior science [of demonstration] are concerned, in the book of the *Physics* as far as physical conclusions are concerned, and so on for the other [special] sciences». (39) If Buridan does have a theory

of logic, it must be extracted piecemeal from these texts and from the *Summulae*, often with great difficulty, and always with the nagging uncertainty that we have not quite captured what is going on.(40) It seems a better hermeneutical strategy to take Buridan at his word when he says that what holds logic together is not any single subject matter, but its relation to other subjects in the arts curriculum, over which it is said to rule.(41)

How did this new logic change the practice of speculative philosophy? Here we must turn to the details, which I cannot explore here. Suffice it to say that the extent to which Buridan uses logical techniques to clarify and resolve speculative questions is striking even by medieval standards. Thus, we find him considering the nature of universals by determining the significance of terms such as 'universal', 'whole' and 'part'; the relation between bodies and souls by establishing which names have been imposed on the soul to signify distinct natures and which signify merely diverse operations; the limits of human knowledge by asking how the existence of a substance can be inferred from the existence of an accident; the proper subject matter of psychology by distinguishing the various definitions of the soul; the nature of virtue by representing it in terms of the analytical concept of *impetus*; or the basis of human freedom by examining the epistemic character of propositions the will is capable of accepting or rejecting. What these topics have in common is the dialectical method taught in the *Summulae*. The *Summulae* gives the rules of the game." (pp. 44-46)

Notes

(36) Annelise Maier, *Ausgehendes Mittelalter. Gesammelte Aufsätze zur Geistesgeschichte des 14. Jahrunderts*, I Band. Roma: Edizioni di Storia e Letteratura 1964: «was sich ändert, ist die Methode des Naturekenntnis» (p. 434); «was interessiert, ist der modus sciendi, nicht die scientia» (p. 439).

(37) For example, he doubts whether anyone could show that the whole of physics is one, or even the whole of metaphysics (*In Metaphysicen Aristotelis Quaestiones* VI, 2, Johannes Buridanus 1518, fol. 33vb). Buridan has a more organic conception of the unity of each speculative science. Thus, «the whole of metaphysics derives its unity from our attribution of everything to it to the term 'being',

just as an army is unified by its commander» (*In Metaphysicen Aristotelis Quaestiones* VI, 2, Johannes Buridanus 1518, fol. 34ra). The commander metaphor is used of logic in the preface to the *Summulae*, but in the sense of leading reason to its desired goal (demonstrated truth) and repelling the invader (fallacies), not in the sense of unifying the study of dialectic.

(38) Buridan, *In Metaphysicen Aristotelis Quaestiones* VI, 2, Johannes Buridanus 1518, fol. 34rb: «logica et grammatica sunt scientiae practicae, docent enim quomodo faciamus bonos syllogismos et orationes congruas».

(39) Buridan, *In Metaphysicen Aristotelis Quaestiones* VI, 4, Johannes Buridanus 1518, fol. 15va: «Et si quaeratur ubi traditur illa scientia dialectica, dicitur quod in libro Metaphysicae quantum ad conclusiones metaphysicales, et in libro Posteriorum quantum ad conclusions posterioristicas, in libro Physicorum quantum ad conclusiones physicales, et sic de aliis».

(40) See especially his remarks on modal syllogisms. Of course, by treating Buridan's logic as *praxi*s rather than *theoria*, I am not calling into question all of the good scholarship that has been done on its different aspects over the past few decades, and from which I -- like every other student of Buridan -- have learned a great deal. These books and articles give legitimate readings of the text, but in a different way, i.e., by showing Buridan's place within the broader thematic traditions of medieval logic, e.g., as regards doctrine of supposition, syllogisms, consequences, sophismata, etc.

(41) In any case, logic as a freestanding discipline would have made little sense to someone accustomed to thinking of it as «the art of arts (*ars artium*)». The value of logic as a discipline is expressed in terms of its relation to other disciplines. That is why Buridan begins the *Summulae* with the quotation from the pseudo-Aristotelian *Rhetoric to Alexander* (*Summulae* I, preface, New Haven, Yale University Press, 2001, p. 25): «Just as the commander is the savior of the army, so is reasoning with erudition the commander of life (*ratiocinatio cum eruditione est dux vitae*)».

From: Jack Zupko, "John Buridan and the Origins of Secular Philosophical Culture", in: Stefano Caroti & Jean Celeyrette (eds.),

Quia Inter Doctores Est Magna Dissensio. Les débats de philosophie naturelle à Paris au XIVe siècle, Firenze: Leo S. Olschki 2004, pp. 33-48.

Summary of the Summulae de dialectica (to be completed)

References to the English translation are from: John Buridan - *Summulae de Dialectica* - Translated by Gyula Klima, New Haven, Yale University Press, 2001.

"In its most extensive form Buridan's *Summulae* consists of the following eight treatises:

I. On Propositions

II. On Predicables

III. On Categories

IV. On Suppositions

V. On Syllogisms

VI. On Topics

VII. On Fallacies

VIII. On Definitions, Divisions, and Demonstrations

Buridan himself at one time regarded his *Sophismata* as treatise IX, but there is no genuine formal connection between treatise IX and the rest, which are organized quite differently. (5)

On the texts commented upon by Buridan

Buridan's basic idea was to 'read', i.e. comment upon, basic introductory texts. For Tracts I-VII the basic text was taken from a contemporaneous interpolated version of Peter of Spain's thirteenth-century handy Introduction to logic, the *Tractatus* or *Summulae logicales*. Buridan himself added a special tract to deal with demonstrative knowledge, which he prefaced with two short expositions on division and definition, subjects that Peter and the writers of the adapted texts had neglected, as had other authors of thirteenth-century handbooks of logic. When dealing with the

introductory texts commented upon by Buridan in his *Summulae*, one has to distinguish between the Tracts I-VII and Tract VIII, *De demonstrationibus*.

[a] As for Summulae I-VII, it is clear throughout the work that Buridan had a text at his elbow that had already been considerably altered in the course of transmission, and which he himself may have subjected to further changes, and time and again major ones at that. Buridan regularly uses the term 'auctor' when referring to the text he comments on. Peter of Spain's work originally contained twelve treatises. (6) The 'auctor' had fused Peter's Tracts 8-12 (on relatives, ampliation, appellation, restriction, and distribution) with his own version of the tract on supposition (treatise IV). That left seven treatises. Thus Buridan's additional tract *De demonstrationibus* became *Summulae* VIII.

Buridan's text of tracts I-VII consists of lemmata from the auctor's *Summulae*, where the material is presented in such a way as to be easily memorized, and more extensive comments on those lemmata. As Pinborg (7) pointed out, the way Buridan speaks about his choice of Peter's work permits the conclusion that "using Peter of Spain's manual was not the obvious thing to do", and Pinborg may well have been right in his conjecture that Buridan was the first to introduce Peter's manual as a textbook at university level in Paris, where earlier it had been used only at less exalted levels of education ('pro iunioribus'; see also section 11.2.4). Buridan might have made his choice out of the different versions available at the time, but seems to have considered it unnecessary to make a complete version of his own, as may appear from his frequently criticizing that auctor's text quoted in the lemmata.

Buridan commented very extensively on the standard material, which he often re-interprets in ways its authors could scarcely have imagined. He certainly makes no secret of his intentions, as can be gathered from the general Introduction (*Prooemium*) prefaced to the whole work:

Prooemium: "Propter quod de logica tota volens sine nimis exquisita perscrutatione disserere quaedam communia, elegi specialiter descendere ad ilium logicae tractatum brevem quem venerandus doctor magister Petrus Hispanus dudum composuit, exponendum et

supplendum, immo etiam et aliter aliquando quam ipse dixerit et scripserit dicendum et scribendum, prout mihi videbitur opportunum."

[Therefore, wishing to learn something in general about logic in its entirety without an excessively detailed investigation, I have chosen to deal in particular with that short treatise of logic which the venerable professor, master Peter of Spain, composed a while ago, by commenting on and supplementing it; indeed, occasionally I am going to have to say and write things that differ from what he has said and written, whenever it appears to me suitable to do so. *Translation by Gyula Klima, Summulae,* p. 4]

In the Renaissance edition of what was issued as Buridan's Summulae,(8) John Dorp's comments have taken the place of Buridan's and thus the reader had no means of seeing how original Buridan was. This much is certain, as Buridan went on commenting upon the 'auctor', he seems to have grown increasingly irritated with the text at his elbow, and sometimes simply dispensed with it, composing instead an alternative text to comment on (thus I, 8, IV and VII).

[b] The basic text underlying Buridan's eighth treatise *De demonstrationibus* is still more difficult to identify. It is not found in any interpolated text of Peter's *Summulae* and it is uncertain if it is by Buridan's own hand. The first major survey of logic to include a chapter on demonstration was William of Ockham's *Summa logicae*, which may be only about ten years older than Buridan's, but it is unknown to what degree, if any, Buridan, or his exemplar, was inspired by Ockham. In any event, by adding treatise VIII Buridan produced a book covering all the main subjects of Aristotle's *Organon* as well as the usual medieval additions to logic, such as the doctrine of the properties of terms.(9)" (pp. XIII-XV)

Notes

(5) For more evidence of the independent character of the *Sophismata*, see: Johannes Buridanus, *Summulae. De practica sophismatum*, edited by Fabienne Pironet, Turnhout 2004, esp. pp. XII-XIV.

(6) See Peter of Spain, *Tractatus, called afterwards Summule logicales*. First Critical Edition from the Manuscripts with an Introduction by L.M. de Rijk, Assen 1972, ch. 3 of the Introduction.

(7) J. Pinborg, 'The Summulae, Tractatus 1, De Introductionibus', in: *The Logic of John Buridan*. Acts of the Third European Symposium of Medieval Logic and Semantics, ed. J. Pinborg, Copenhagen 1976, p. 72.

(8) Johannes Buridanus, *Compendium totius logicae,* cum Joannis Dorp expositione. Unverand. Nachdr. der Ausg.: Venedig 1499, Frankfurt/Main 1965.

(9) For more information about Treatise VIII, *De demonstrationibus,* see De Rijk's edition of this treatise, that appeared as part 8 in the present series.

From: Ria van der Lecq, "Introduction" to: Johannes Buridanus, *Summulae de propositionibus*, Turnhout: Brepols 2005.

"The first seven treatises of Buridan's work do, indeed, correspond to this description though the revision is sometimes so thorough that it is difficult to discern the remaining traces of Peter's text. Treatise 8, in which the main topic is the theory of knowledge and science, has no counterpart in Peter's *Tractatus*, nor has Treatise 9, *On Sophisms*, though it is not totally unrelated to Peter's Treatises 8-12. Treatise 8 retains the format adopted for the earlier part of the work, viz. alternation between (a) a text consisting of logical theorems (concise definitions, rules, etc.) and (b) an extensive commentary which explicates and supplements those theorems. The difference of Treatise 9 consists in the fact that the material for commentaries is furnished by logical examples -- *sophismata* -- rather than by logical theorems. The treatise on sophisms illustrates how some of the theorems of the preceding treatises may be put to use, but it is not a systematic practical companion to the preceding collection of theorems. In short, Treatise 9 bears all the marks of having an independent origin from the rest of the Summulae into which it was never successfully integrated." (pp. XII-XIII)

From: Fabienne Pironet, "Introduction" to: Johannes Buridanus, *Summulae: De practica sophismatum*, Turnhout: Brepols 2004.

The editorial project of the Summulae

"The present fascicle is number one of the first complete edition of Buridan's *Summulae*, which contains nine treatises, including a new edition of his *Sophismata*. The plan is being realized by an international team composed of scholars from Belgium, Denmark and the Netherlands. A first and overly optimistic version of the project was discussed in 1975 at the Third European Symposium on Medieval Logic and Semantics, which was devoted to the logic of John Buridan. In 1986 The Buridan Society was formed with the explicit purpose of producing an edition of the *Summulae*, and guidelines for the work were laid down. The following scholars initially joined the Society: E.P. Bos, H.A.G. Braakhuis, S. Ebbesen, H. Hubien, R. van der Lecq, E Pironet, L.M de Rijk, J.M.M.H. Thijssen.

To make the task manageable, it was decided to aim only at an edition based on a handful of manuscripts carefully selected on the advice of H. Hubien, who had made pilot studies of the tradition. Also, considering that all participants in the project were scholars with many other obligations and hence likely to be distracted from the work on Buridan at unpredictable times, it was decided to publish each fascicle of the work as soon as it was finished without regard to regular intervals or an orderly progression from fascicle 1 to fascicle 9." (p. XI)

"Buridan's philosophical production is closely connected to his work as a university teacher. He wrote commentaries on Aristotle, some of which have been edited, as has also his treatise on consequences. And then there is his *Summulae* or *Summa Logica(e)*, undeservedly neglected by historians of logic because it has never been printed. To be sure, there are printed books from the 16th, 17th and 18th centuries purporting to contain the work, but in fact they do not, despite their frequently going under Buridan's name. A fair number of preserved manuscripts, however, testify to the popularity of the *Summulae* during the late 14th century and well into the 15th, especially at the Central European universities".

In its most extensive form Buridan's *Summulae* consists of the following eight treatises:

I. On Propositions

II. On Predicables

III. On Categories

IV. On Suppositions

V. On Syllogisms

VI. On Topics

VII. On Fallacies

VIII. On Definitions, Divisions, and Demonstrations

Buridan himself at one time regarded his *Sophismata* as treatise IX, but there is no genuine formal connection between treatise IX and the rest, which are organized quite differently. (*)" (pp. XII-XIII)

Notes

(*) For more evidence of the independent character of the *Sophismata*, see: Johannes Buridanus, *Summulae. De practica sophismatum*, edited by Fabienne Pironet, Turnhout 2003, esp. pp. XII-XIV.

From: Ria van der Lecq, "Introduction" to: Johannes Buridanus, *Summulae de propositionibus*, Turnhout: Brepols, 2005.

Treatise I. De propositionibus

"The opening chapter of *De propositionibus* consists of six parts and covers some preliminaries. In the first part dialectic (logic) is defined in a way that echoes Aristotle's *Topics* 1.1 101b2-4: dialectic is the art of arts (*ars artium*), which has access to the principles of all inquiries (*methodi*). Dialectic should be distinguished from science (*scientia*). In every science training in logic has to come first, since every science needs to use syllogisms or other types of argument, the doctrine of which is taught by logic. Since logic is mostly exercised in a disputation, and a disputation cannot take place without speech (*sermo*) nor can speech occur without utterance (*vox*) or utterance without sound (*sonus*), sound is the starting point of Buridan's inquiry. Sound is divided into utterance and non-utterance, and utterance (*vox*) into significative and non-significative. Some

significative utterances (*voces significativae*) are significative by nature, others by convention. Chapter concludes with the division of conventionally significative utterances into complex (expressions or *orationes*) and incomplex ones (noun and verb). In his comments on this last distinction Buridan mentions Aristotle's division of ' expression' (*oratio*) into mental, vocal and written expressions. The distinction between mental and vocal language plays an important role in the *Summulae* and in Buridan's semantics in general. Spoken words and propositions are meaningful only by convention, whereas mental words and propositions signify naturally. Mental propositions are the bearers of truth and falsity. Vocal propositions are propositions only in so far as they designate mental propositions, and vocal propositions are true or false only in so far as they designate true or false mental propositions. (22)

Chapter 2 gives the traditional definitions of 'noun', 'verb' and 'expression' (*oratio*). Thus, a noun is a conventionally significative utterance, without time (*vox significativa ad placitum sine tempore*). Obviously, this definition does not apply to mental words: mental words are not *voces* and do not signify *ad placitum*. Peter of Spain does not intend to define mental nouns, but only spoken nouns, concludes Buridan. This is one of the first signs of Buridan's problems with Peter's text.

In chapter 3 we arrive at the core of this treatise: propositions. Peter's definition (a proposition is an expression that signifies something true or false) gives rise to Buridan's repeated warning that this definition applies to spoken language only (1.3.1). A mental proposition does not signify something true or false, it is something true or false. Next (1.3.2), propositions are divided in categorical and hypothetical propositions. In this part Buridan presents his theory that the concepts involved in a mental proposition are its subject, its predicate and a so-called complexive concept. Subject and predicate are called the matter of a proposition, because they are presupposed when a proposition is formed by adding an affirmative or negative complexive concept, i.e. the copula. The following parts discuss the definitions of subject and predicate (1.3.3), and various classifications of propositions: assertoric (*de inesse*) and modal (1.3.4), universal, particular, indefinite and singular (1.3.5) and, finally, affirmative and negative (1.3.6).

Chapter 4 is about the opposition between pairs of categorical propositions that "share both terms", i.e. in which the same two terms occur. If the shared terms occur in the same order, the propositions are contraries, subcontraries, contradictories or subalterns. This results in a simple square of opposition presented in 1.4.2 (page 61). When categorical propositions are per se true, they are said to be in natural matter (1.4.3). When they are *per accidens* true, they are said to be in contingent matter; when they are impossibly true, they are said to be in remote matter. This is the way Buridan explains Peter of Spain's text, although he himself prefers to use the term 'matter' for the subject and predicate of a proposition, as explained in 1.3.2. The fourth and final part of chapter 4 (1.4.4) explains what it means for propositions to be contraries, subcontraries, contradictories or subalterns.

Chapter 5 discusses the concept of formal equivalence (*aequipollentia* or *aequivalentia*) of propositions. The various relationships between categorical propositions with oblique terms and those between categorical propositions in which the predicate precedes the copula are clarified by means of two diagrams.(23) In addition four rules of equivalence are formulated.

Propositions can be converted in three ways: simply, accidentally, and by contraposition. This thesis as found in Peter of Spain's manual is discussed in chapter 6. What is a conversion? According to Buridan a formal conversion is the formal consequence holding between two propositions that share both terms, but in reverse order (1.6.1). In a simple conversion (1.6.2) the quality and the quantity of the propositions remain the same, as in 'some man is an animal; therefore, some animal is a man'. More complicated is accidental conversion (1.6.3), which involves changing the quantity of the proposition, as in 'every man is an animal; therefore, some animal is a man'. Various doubts arise, e.g. how should we convert 'some stone is in a wall' or 'a donkey is dead' or propositions about the future or the past? Buridan solves most of these problems by means of his theory of supposition. Conversion by contraposition (1.6.4) means changing the finite terms into infinite ones, as in 'some man is not a stone; therefore, some non-stone is not a non-man'. Buridan shows that conversions of this kind are not formal.

Hypothetical propositions of various kinds are discussed in chapter 7. Buridan denies Peter of Spain's thesis that a hypothetical proposition contains two categorical propositions. It would mean that a true hypothetical proposition like 'if a donkey flies, then a donkey has feathers' would have its principal parts false, which is absurd. Buridan finally arrives at a definition which is 'safer' (*tutior*) than Peter's: a hypothetical proposition is a proposition that has several subjects, several predicates and several copulas, but none of these is predicated of the rest by means of one copula (1.7.1). Peter distinguishes six species of hypothetical propositions: conditional, conjunctive, disjunctive, causal, temporal, and local. Buridan points out that some texts do not provide the species 'temporal' and 'local', and with good reasons, as he argues (1.7.2). In Peter's view the truth of a conditional requires that the antecedent cannot be true without the consequent. Given his remarks in 1.7.1 Buridan cannot possibly agree with this opinion, although "for the sake of brevity, and because phrases signify conventionally", he goes along with Peter's manner of speaking (1.7.3). On the topic of causal propositions Buridan corrects Peter, saying that "it is not properly said that the antecedent is the cause of the consequent". One should rather say that "the thing signified by the antecedent is the cause of the thing signified by the consequent" (1.7.6). A similar critical attitude regarding Peter's text can be seen in 1.7.8 (*De locali)*. There Buridan proposes to use a less complicated method to decide whether a hypothetical proposition (be it temporal or local or pertaining to some other Aristotelian category) is true or false.

Chapter 8, on modal propositions, is the last chapter of the treatise. Apparently, the topic was very important for Buridan, for not only is it very large, he also wrote almost the entire chapter himself, saying that "the author of the *Summulae* discusses modal propositions very briefly and incompletely." Only the first line is Peter's: "A mode is a determination belonging to the thing" (1.8.1). Obviously, taken literally, this sentence expresses a realist position, which Buridan rejects. Buridan's ontology and semantics require that 'thing' (*res*) in this context is restricted to supposit for significative terms. 24 The first eight paragraphs (*partes*) of the chapter discuss propositions that are modal in the proper sense, i.e. propositions in which the mode ('possible', 'impossible', 'necessary', 'contingent', 'true' or

'false') affects the copula, as in 'every man is necessarily an animal'. These are distinguished from propositions in which the modal term is predicated of a *dictum*, as in 'it is possible that a man runs' (*possibile est hominem currere*). The latter are called composite modals, but, according to Buridan, composite modals are in fact assertoric propositions. In proper modals the mode has to be placed between the subject and the predicate (1.8.3); the mode is a part of the copula. In the following parts Buridan discusses the quality (1.8.4) and quantity (1.8.5) of proper modals. Part 7 is about equivalency (*equipollentia*) of modal propositions, resulting in a *magna figura* of oppositions (see text: p. 100), and part 8 contains some rules regarding conversions of modal propositions, e.g. 'if the antecedent implies the consequent, then the contradictory of the consequent implies the contradictory of the antecedent'. The ninth part (1.8.9) discusses composite modals. Rules regarding their quality, quantity and conversion are the same as the rules for assertoric propositions. The remaining part of the book (1.8.10) discusses propositions that are contingent both ways (*de contingenti ad utrumlibet*).

11.3.3. *Prooemium*

"Just as the commander is the savior of the army, so is reasoning with erudition the commander of life."

This is Buridan's opening statement of the Preface (*Prooemium*) of the *Summulae*. The quotation comes from a "certain letter" of Aristotle to Alexander. The attribution appears to be false, (25) but this is not the place to discuss that question. It is Buridan's interpretation of this statement that concerns us here. The commander of an army, says Buridan, saves the army in two ways: first, by repelling the enemy, second, by leading it in the right direction. Logic is to be called reasoning with erudition (*ratiocinatio cum eruditione*), because it educates (*erudit* lit. 'polishes') us in all modes of reasoning and in every science, and it can be compared to the commander of an army, because it eliminates false arguments and it directs us to good arguments.

Furthermore, Buridan points out that, according to Aristotle, there are two most eligible ways of life: the *vita contemplativa* and the *vita civilis seu activa*: the life of a scholar and a scientist and the life of an

active citizen. Training in logic helps the scholar to obtain knowledge and discover the truth, and it helps the active citizen to decide what to strive after and what to avoid. In other words, logic is important not only for (future) scholars, but also for (future) politicians. It is the main constituent of a truly liberal education." (pp. XX-XXV)

Notes

(22) For the importance of this distinction see my Introduction to *De suppositionibus*, esp. p. XXV and my paper 'Mental Language: A Key to the Understanding of Buridan's Semantics' (forthcoming).

(23) Gyula Klima (in his translation pp. 44-45) presents a summary reconstruction of these figures in which he shows how these two diagrams are related to the modal diagram of chapter 8. For a detailed discussion of Buridan's modal diagram Klima (*ibid*. p. 43, n. 77) refers to G.E. Hughes, "The Modal Logic of John Buridan," in *Atti del Convegno internazionale di storia della logica: Le teorie delle modalità*, ed. G. Corsi, C. Mangione, and M. Mugnani, Bologna 1989, pp. 93-111.

(24) As I argued in my Introduction to *Summulae*, *De suppositionibus* (p. XXVI), Peter's realism might be one of the reasons for Buridan's growing irritation with Peter's text.

Treatise II. De praedicabilibus

"The present edition contains the second tract, *De praedicabilibus*, which deals with the five 'predicables', introduced by the Neoplatonist commentator of Aristotle, Porphyry (c. 233 - c. 304 A.D.) in his introductory book (*Isagoge*) to the Stagirite's *Categories*, viz. 'genus', 'species', 'differentia', 'proprium', and 'accidens'. From as early as the eleventh century, medieval authors commented upon Boethius' (480 - 524) translation of, and commentary upon, this work.

Buridan's discussion of the predicables is mainly based on the corresponding tract of Peter of Spain's manual. His comments are

preceded by the complete text of the lemma from Peter to be discussed. It should be no surprise that Buridan's quotations should go back to an adapted version of Peter's text." (p. XVII)

"II.3.2. A summary of its contents

2.1.1. The opening chapter discusses preliminary items. In this section the technical use of the word 'praedicabile' is explained. Buridan's terminism notably appears from his definition of the term 'praedicabile' properly used, in which the phrase 'praedicari de pluribus' equals 'supponere pro pluribus'.

2.1.2. The formal difference is discussed which exists between 'praedicabile' and 'universale', in spite of their being said convertibly of one another. Buridan feels obliged to reject Hispanus' view of the matter. Again, Buridan's terminism comes to the fore in his identifying 'inesse' and 'praedicari vere et affirmative'.

2.1.3. The division of the predicables is given, including an alternative one given by those who start from the erroneous assumption that the main division of the predicables should be based upon the distinction 'in quid' versus 'in quale'.

2.2. Chapter II deals with genus.

2.2.1. The common definition of genus is given and explained. Equivocal terms (such as 'canis') are said not to be the genus of their different meanings. Buridan's terminism makes him underline that if 'animal' is said to be predicated of 'man', both the subject and the predicate term have material supposition.

2.2.2. The concepts 'idem ('differens' or 'diversum') genere, specie' etc. are discussed. It is noteworthy that the identification of 'subject-substrate' and 'accident' (which is found in some versions of Hispanus' text: 'in aliquibus libris') is rejected by Buridan (lines 75 ff.).

2.2.3. The phrases 'in eo quod quid' and 'in eo quod quantum' etc. are explained.

2.2.4. - 2.2.5. An alternative definition of 'genus' and the latter's usual division into 'genus generalissimum' and 'genus subalternum'.

2.2.6. The definition of 'genus generalissimum' is given and completed by Buridan. In line with common doctrine, the 'genus generalissimum' is divided into the ten categories, and 'ens' is said not to be their 'genus superveniens'.

2.2.7. presents the definition of 'genus subalternum'. Again, the role of material supposition is pointed out.

2.3. This chapter discusses 'species'.

2.3.1. - 2.3.4. 'Species' is defined and divided. Buridan corrects Peter of Spain's definition of 'species specialissima'. The 'Porphyrian Tree' is introduced and explained.

2.3.5. contains the definition of 'individuum' and discusses some interesting 'dubia' on this matter, e.g. the question whether, contrary to the definition of 'individual', individual terms such as 'Johannes' may be predicated of many. Buridan rejects such suggestions by pointing to the equivocation involved in the use of proper names said of diverse individuals. Also the peculiar position of the term 'deus' is discussed.

2.4. Chapter IV deals with 'differentia'.

2.4.1.-2.4.5. The logical use of the word 'differentia' is explained. In Buridan's view, the phrase 'differentibus specie' found in the common definition should be dropped. An alternative definition of 'differentia' is mentioned, and the use of the phrases 'differentia constitutiva' and 'differentia divisiva' is explained. Finally, a corollary is added.

2.5. This chapter deals with 'proprium'.

2.5.1.-2.5.2. The predicable 'proprium' is defined. In this context, some key terms (e.g. 'praedicatio essentialis' versus 'praedicatio denominativa') are discussed, including Buridan's favourite device 'connotatio aliena'.

2.6. This chapter deals with 'accidens'.

2.6.1. Porphyry's definition of the predicable 'accidens' is explained along the lines of terminist logic. Buridan remarks that the 'adesse' of the definition should not be taken in the sense of 'inesse secundum

inhaerentiam proprie dictam', rather 'adesse alicui subiecto' is equivalent to 'praedicari vere et affirmative de illo'.

2.6.2. Another definition of 'accidens' is given. In an interesting 'dubitatio', Buridan discusses the relationship between 'praedicabile' and 'praedicatum' and that between the four 'predicates' found in Aristotle's *Topics* and the five 'Porphyrian predicables'.

2.6.3. A third definition of 'accidens' is discussed.

2.6.4.-2.6.5. 'Accidens' is divided into 'accidens separabile' and 'accidens inseparabile', and the proper nature of the latter is explained.

2.7. The final chapter deals with the specific properties of each of the five predicables and the properties they have in common. It contains a great number of interesting incidental remarks on various matters, such as 'praedicatio univoca' vs 'praedicatio aequivoca', and the distinction between 'real priority' and 'formal priority' (2.7.2.); the diverse grammatical 'modi significandi' (2.7.4.); and the logical difficulties involved in the use of comparatives and superlatives (e.g. 'albius' as the species of 'hoc album' and 'illud album').

In the seventh chapter, four of Buridan's five lemmata are completely lacking in Peter's text. Conversely, Peter's final sections (*De predicatione* and *De denominativis*, p. 25, 8-32) are missing in Buridan's tract on the predicables, but both from a doctrinal and from a didactic point of view this omission is quite understandable, as these items are more properly discussed in the third tract, *De praedicamentis*.(13)

Buridan's work consists of elementary exegesis as well as extensive objections and dubitationes in which specific questions are dealt with, mostly in an original fashion." (pp. XXIV-XXXI)

Notes

(13) See Johannes Buridanus, *Summulae in Praedicamenta*, ed. E.P. Bos, 3.1.3.

From: L. M. de Rijk, "Introduction" to: Johannes Buridanus, *Summulae: De praedicabilibus*, Nijmegen: Ingenium Publishers 1995.

Treatise III. In praedicamenta

“In his commentary Buridan presents an introductory section (3.1), in which the so-called *antepredicamenta* are discussed: first the definitions of *aequivoca* ('equivocals') (3.1.1), *univoca* ('univocals') (3.1.2) and *denominativa* ('denominatives') (3.1.2); then the division of *voces* ('words') (3.1.4) and of *eorum quae sunt* ('of those things that are') (3.1.5). Thirdly, two rules on the logical relations between predicates (3.1.6) and on the relation between genus and species are discussed (3.1.7). Buridan winds up this section with a division of *incomplexa* ('things without combination', 'incomplex things') into the ten categories (3.1.8) and the discussion of a property common to the ten categories (3.1.9), viz. that incomplex things cannot form an affirmation or negation.

In section 3.2 Buridan discusses the categories in the proper sense. First a division and some characteristics of substance (3.2.1 - 3.2.3), next six properties belonging to the members of this category are treated. Section 3.3 is on quantity: first divisions and species of quantity are discussed (3.3.1 - 3.3.4), then three properties (3.3.5 - 3.3.7). Section 3.4 is on relation: first Buridan gives definitions and species (3.4.1 - 3.4.2), then four properties (3.4.3 - 3.4.6). The section On quality contains a definition of quality and *quale*, and their four kinds (3.5.1 - 3.4.6), then three properties and a note on terms belonging to different categories (3.5.7 - 3.5.10). In section 3.6 Buridan discusses the categories of *actio* (action) and of *passio* (being acted upon) are dealt with as a whole; he presents their definitions, kinds and four properties. In section 3.7 he discusses the four last categories: 'when', 'where', 'being-in-a-position' and 'having' *(quando, ubi, situs* and *habitus*).

Sections 3.8 - 3.10 discuss what are traditionally called the postpraedicamenta: 3.8 is on four kinds of opposition (*oppositio*), 3.9 is on movement (*motus*) and mutation (*mutatio*) (their kinds, and what is contrary to these *postpraedicamenta*); 3.10 is on the meanings of *prius* ('prior'), *simul* ('simultaneous') and *habere* ('to have' -- in various senses, see below, III, 3. 4, section IX).

Insight into the philosophical principles which underlie Buridan's commentary is a precondition for understanding his detailed

interpretations of the categories. These principles can partly be gathered from the *Summulae* themselves, but Buridan has made them especially explicit in other treatises, notably his *Praedicabilia (*16), *Suppositiones, Ampliationes and Appellationes (*17). I shall try to present them here briefly. I shall not discuss Buridan's position in the history of the theories about tha categories, for this would exceed the proper limits of our Introduction.

It should be noted that Buridan's view of the categories is more elaborate, and sometimes clearer in his *Quaestiones in Praedicamenta* than in the treatise from the *Summulae* discussed here." (pp. XIX-XX)

Notes

(16) Buridan's commentary (*Summulae*) on Porphyry (the *Praedicabilia*) will be edited shortly by L.M. de Rijk; his *Quaestiones in Porphyrium* have not yet been edited [see the edition by Ryszard Tatarzynski in: *Przeglad Tomistyczny* 2: 111-195 (1986), *note added by R. Corazzon]*

(17) ed. M. E. Reina, 'Giovanni Buridano, *Tractatus de suppositionibus*, prima edizione a cura di Maria Elena Reina', in Rivista critica di storia della filosofia 12 (1957), pp. 175-208; 323-353. In the editorial project of which the present text is a part, Dr. R. van der Lecq is preparing a new critical edition of Buridan's *De suppositionibus* [published in 1998].

[For a detailed summary of the contents see pp. XXIV-XLIV]

From: E. P. Bos, "Introduction" to: Johannes Buridanus, *Summulae in praedicamenta*, Nijmegen: Ingenium Publishers 1994.

Treatise IV. De suppositionibus

"The present edition contains the fourth treatise *De suppositionibus*. As can easily be gathered from the *index capitulorum* (below, p. 3), it consists of six chapters, which deal with various aspects of supposition. (20)

Each chapter consists of several parts containing a lemma followed by an exposition and commentary. Unlike the lemmata of tracts I, II and III, the lemmata of *De suppositionibus* are not taken from Peter

of Spain's *Tractatus*. Buridan discusses the topics of Peter's chapters VI (*De suppositionibu*s), VIII (*De relativis*), IX (*De ampliationibus*), X (*De appellationibus*), XI (*De restrictionibus*) and XII (*De distributionibus*), but he has used an alternative text. He does not even refer to Peter of Spain.(21) An indication that Buridan may have written the basic text himself is found in the lemmata of 4.3.7.5 and 4.3.8.4, which contain a reference to another work of his, the*Sophismata*. Moreover, the commentary never indicates that Buridan disagrees with the lemma-text. More than once, e.g. in 4.1.2 and 4.1.4, he expresses some doubts concerning the text, but he subsequently solves them. Finally, in *De suppositionibus* Buridan does not refer to any *auctor*, as he frequently did in the previous treatises.

One may wonder why Buridan felt he could not go on commenting upon Peter's text the way he had done in the first three tracts." (pp. XVII-XVIII)

Treatise V. On Syllogisms

[In preparation]

Treatise VI. On Topics

(Critical edition not yet published)

Treatise VII. On Fallacies

(Critical edition not yet published)

Treatise VIII. On Definitions, Divisions, and Demonstrations

"The present edition contains the eighth tract, *De demonstrationibus*, by far the greater of which deals with demonstrative argument, and for the sake of this prefaces it with a discussion of the standard lore concerning division and definition.

The main division of the work clearly appears from the opening lines (1.1 in the present edition), in which Buridan proposes to deal with demonstration, but thinks it indispensable to discuss first the doctrine of division and definition which lies at the bottom of that concerning demonstrative argument, despite the fact that 'auctor noster' did not pay any attention to this important part of logic ('pars logicae magis nobilis et finalis')." (p. XXI)

"The following sketch of the contents of the three main parts ('materiae') may be given.

PRIMA MATERIA: *De divisionibus*

8.1 contains the general Introduction to the whole treatise, and explains its design, especially the addition of the two preambulary tracts on division and definition.

8.1.1 presents its division and the subdivision of the tract on division, and next it defines the notions 'division' and 'composition'.

8.1.2 explains what is understood by 'componere' and 'dividere'.

8.1.3 discusses the notions 'totum' and 'pars'.

8.1.4 deals with the various divisions of 'totum' and the corresponding kinds of composition and division.

8.1.5 discusses 'tota praedicabilia' and their parts.

8.1.6 is about perfect and imperfect division. Two problematic questions ('dubitationes') are raised, one concerning the division of some genera into their species, the other about why in such cases the genus can be regarded as the totum of its species, rather than the other way round, and how a species is a subjective part of its genus.

8.1.7 discusses the remaining, less common kinds of division.

SECUNDA MATERIA: *De definitionibus*

8.2 The eight common properties of definitions and things defined are enumerated.

8.2.1 The chapter is divided into seven parts, the first of which deals with the eight properties: (a) definitio (i.e. definiens) and definitum are said reciprocally, i.e. they have converse relationships as every definiens is the definiens of its definition, and vice versa; (b) definiens and definitum are mutually convertible; (c) every definiens notifies the definitum in an explicit way; (d) every definiens is a phrase ('oratio'), while every definitum is an incomposite term, or at least less complex than the definiens; (e) neither the definiens nor the definitum are singular terms; (f) nor are they a proposition; (g) no definiens has a parabolic or metaphoric sense; (h) no definiens should suffer from superfluity or deficiency.

8.2.2 Definitions ('definientia') are divided into nominal, quiditative, causal, and descriptive ones.

8.2.3 Nominal definition is defined and discussed.

8.2.4 Quiditative definition is defined, and its properties are dealt with. In a lengthy digression three questions of semantical interest are raised and extensively answered: (a) whether phrases such as 'nasus simus' are nugatory; (b) whether definitions such as 'simum est nasus cavus' is nominal; (c) whether a subject's property should be defined by including its subject in the definition.

8.2.5 Causal definition is defined and explained, including the diverse kinds of cause (formal, material, efficient, and final cause).

8.2.6 Description is defined, and its use is clarified.

8.2.7 discusses complex definitions and their use in demonstrative arguments.

TERTIA MATERIA: *De demonstrationibus*

8.3 General division of this tract into ten chapters. (...)

8.4 The next chapter deals with similarities and dissimilarities between demonstrative and dialectical argument, and the distinction between true knowledge ('scientia') and opinion.(...)

8.5 This chapter discusses first and indemonstrables principles.(...)

8.6 This chapter deals with the notions 'de omni', 'per se' and 'secudndum quod ipsum'. (...)

8.7 The next chapter is about the diviison of 'demonstratio'.(...)

8.8 This chapter deals with the 'demonstratio propter quid', about which many difficulties ('dubitationes') can be raised, as has already been observed in the introductory text.(...)

Like the treatises I-VII the present one, too, consists of elementary exegesis as well as extensive objections and *dubitationes* in which specific questions are dealth with, mostly in an original fashion and always along the lines of thought found in Buridan's numerous commentaries on Aristotle. (37) "

Notes

(37) The conspicuous coherence in Buridan's thought coming to the fore throughout his various works is rightly highlighted by Sten Ebbesen, 'Proofs and its Limits according to Buridan, Summulae 8', in Z. Kaluza-P. Vignaux *Preuve et raisons* ... etc., Paris 1984, p. 97: 'John Buridan was (...) remarkably consistent. He almost invariably says the same about the same things, and what he says about one subject is usually consistent with what he says about any other somehow related subject. His work abounds in cross-references, from one part of a work to another, and from one work to another. He obviously wanted his readers to think of his philosophical works as one coherent corpus presenting one coherent philosophy.

From: L. M. de Rijk, "Introduction" to: Johannes Buridanus, *Summulae de demonstrationibus*, Groningen-Haren: Ingenium Publishers 2001.

[Treatise IX.] Sophismata

"The Place of the Sophismata in Buridan's Work.

As a Master of Arts, Buridan was not allowed to teach or write on questions of theology, but his work covers most of the areas of philosophy. And as was common, most of his work is in the form of commentaries on the works of Aristotle. Most important among

these are commentaries on the Physica, De Caelo, De Generatione et Corruptione, Meteorologica, and the short physical treatises known as the parva naturalia, together with both commentaries and quaestiones on the Metaphysica and quaestiones on the Ethica ad Nicomachum and the Politica.

In the area designated by scholastics as logic, Buridan wrote three major works, of which the Sophismata is one. The largest of these is the Summula de Dialectica, and as is noted in its first few lines, the Sophismata may be regarded as a ninth tract of that general survey of logic. The other major logical work is the Consequentiae, which is a study of the forms of logical inference.

While the Consequentiae would be recognized today as a work clearly belonging to the field of logic, neither the Summula nor the Sophismata could any longer be so classified. The medieval conception of logic, based on classical grammar and rhetoric, Stoic logic, and Aristotle's Organon was very broad indeed by modern standards, embracing not only formal logic, but most of what is today known as the philosophy of language, together with some issues that seem now to belong to metaphysics or the theory of knowledge. Thus Buridan is firmly within the tradition when he includes within a summa of logic consideration of the nature of language, types of languages, the nature of signs, types of terms, the structure of concepts, the nature of propositions, a theory of meaning, a theory of reference, and the nature of truth. However, because of the way many issues were conceived, even this way of classifying the topics covered is apt to be misleading, and the reader would do well to learn the nature of medieval logic not through descriptions in secondary works, but through a study of representative works of the discipline.

Within the tradition of medieval logic itself, Buridan's work can be further specified as being of that variety known as "terminist" logic. Terminist logic, while long in developing, was apparently first brought together in a systematic way in the thirteenth century e. g. in the Summulae Logicales of Peter of Spain. It was so named because it was based on a doctrine that the term is the fundamental unit of all language, and on the view that the categorematic term is the only independent.

ly meaningful element of language. Theories of meaning and reference were then developed through an elaborate analysis of what were known as the "properties of terms".

The two principal properties of terms were significatio and suppositio, though virtually every author discussed a number of derivative properties based on these. Neither of these properties was understood in the same way by all terminists, so that it is difficult to make general remarks about them, a difficulty compounded by the fact that neither property corresponds very nearly with any conception in common use today. However, it may not be too misleading to suggest that significatio was usually the basis of a theory of meaning (or perhaps better, a theory of predicability), while suppositio was used to account for the actual referential use of terms in propositions and to develop truth-conditions for propositions of all sorts. For Buridan in particular, the theory of significatio is used to explain the relation of categorematic terms and propositions both to concepts of the mind and to the things conceived by those concepts. The theory of suppositio is then an account of the ways in which categorematic terms function as referring elements in propositions of various forms and in combination with various syncategorematic words to yield true and false propositions.

Buridan's Sophismata is best understood as an advanced "problems text" in the terminist tradition, and especially as a treatment of special problems associated with the properties of terms. Virtually the entire work consists of problems associated with significatio and suppositio, though it goes without saying that a great many other sorts of issues get involved in the working out of these problems. For more than a century prior to Buridan, teachers of logic had been compiling lists of problem-sentences or sophismata to be employed by their students as exercises. But Buridan's is different from most of these in that it is rather highly structured and is deliberately placed after the Introduction to the fundamental doctrines of terminist logic in the Summula de Dialectica as a systematic consideration of special problems growing out of the application of those doctrines." (pp. 10-11)

From: Theodore Kermit Scott, "Introduction" to: Johannes Buridanus, *Sophismata*, Stuttgart - Bad Cannstatt: Frommann-Holzboog 1977.

"Summary of the Sophismata.

Although a detailed study of the problems dealt with in the work cannot be undertaken here, it may prove useful, as a guide for the reader, to summarize briefly the main themes of each chapter.

Chapter I: This chapter is intended to clarify Buridan's doctrine of *significatio*. In particular, after the statement of the sixth *sophisma*, there are eleven conclusions which together constitute a remarkably clear statement of the doctrine.

The primary aim of the sophismata of this chapter is to bring out Buridan's view that truth cannot be a function of *significatio*, because every proposition, whether true or false, signifies a corresponding mental proposition and also signifies concrete particulars. Thus the traditional definition of truth stating that a proposition is true if *qualitercumque significat esse, ita est*, must be understood very broadly.

The fifth *sophisma* is of particular interest, since it involves Buridan's rejection of a fairly common scholastic doctrine, according to which every proposition signifies an abstract entity, known as a *complexe significabile*. For Buridan, every pro

position signifies something (even if one of its terms can have suppositio for nothing), but no proposition signifies anything other than concrete particulars. Chapter II: Having determined in Chapter I that truth and falsity are not a function of signification, Buridan proceeds in this chapter to his own account of the actual truth-conditions for categorical propositions. In stating these conditions, the doctrine of suppositio is introduced, and it is shown that truth is determined by identities and differences of suppositio among the categorematic terms of the proposition in question.

After the sixth sophisma, fourteen conclusions are given. The first eight of these further clarify the doctrine of significatio and make clear its relation to truth, while the last six use the doctrine of

suppositio to state actual truth-conditions for categorical propositions.

The reader might pay particular attention to the third sophisma, which appears tautological and yet is held by Buridan to be false, because of the basis of truth in suppositio.

Chapter III: This chapter contains an extraordinarily clear account of the doctrine of suppositio. The first five sophismata and the remarks which follow the fifth sophisma introduce the basic division into suppositio personalis and suppositio materialis and discuss a number of problems in a way which helps to clarify the distinction between the two types. The remaining sophismata and the discussion accompanying them is concerned with the several divisions of suppositio personalis and the use of these additional types in providing an analysis of propositions containing quantifying words. And finally a number of rules are given governing immediate inferences involving such quantified propositions.

Chapter IV: This chapter requires special attention, since it contains Buridan's fullest discussion of his doctrine of appellatio, which differs almost entirely from a doctrine of the same name that occurs in other terminist texts. And furthermore, Buridan applies the doctrine in two ways that are not merely distinct, but are so loosely connected as to seem hardly applications of the same doctrine.

The first application of the doctrine is developed in the first eight sophismata and the remarks associated with them. According to that discussion, every categorematic term is said to have appellatio for everything it signifies, beyond that for which it stands in suppositio personalis. Furthermore, everything that is thus signified bears some relation to that for which the term stands and so determines the reason why that certain term is used to stand for the thing in question. For example, in the proposition 'Socrates is white', the term 'white' stands for Socrates, but has appellatio for the quality of whiteness possessed by Socrates.

This discussion in the early part of the chapter also includes Buridan's view of the way in which the doctrine is to be applied in cases of tensed and other modal propositions or in cases where the

logical subject or predicate of a proposition consists of more than one term.

The second application of the doctrine of appellatio is covered in the remainder of the chapter. This application has to do with the reference of terms following certain verbs usually associated with cognitive attitudes, such as knowledge, belief, opinion, doubt, etc. In such contexts a term is said to have appellatio not for some concrete substances or properties, but for the ratio which accounts for the fact that just that term and no other is used in the proposition. And because the term does have appellatio for that particular ratio, Buridan holds that it is not possible to substitute another term for that one in such a context, even though the two terms may have the same suppositio. Thus in the proposition 'You know the one approaching', the predicate 'the one approaching' may stand for Plato, but it has appellatio for the ratio by which Plato is known not as Plato but as the one approaching, so that one cannot substitute the term 'Plato' for that predicate salva veritate.

Chapter V: This chapter is a rather straightforward discussion of the doctrine of the extension (ampliatio) and restriction (restrictio) of suppositio. Buridan's version of this doctrine is orthodox and the exposition is clear. In general the doctrine is that suppositio may be limited to presently existing things or it may be extended to things existing in either the past or the future or both, depending primarily on the tense and modality of the verb of the proposition, but also on the occurrence of certain other temporal or modal words, or even on the occurrence of certain prefixes or suffixes.

Chapter VI: The discussion in this chapter is probably more important for modern readers attempting to understand terminist logic than it was for Buridan's scholastic contemporaries. Today we are accustomed to a distinction between sentences and propositions and to thinking of a proposition as an abstract, timeless entity expressed by a spoken or written sentence, so that this chapter is important in emphasizing the common medieval view of a proposition as a purely conventional group of sounds or marks. It also brings out the distinction between propositions so understood and mental propositions, which were thought of as natural signs and so as independent of the human will, both as to content and as to

truth. Thus any group of sounds or marks conventionally instituted might be a true or false proposition, depending entirely on whether it was understood to be the correlate of some true or false mental proposition.

Chapter VII: This chapter extends the discussion of the preceding one, by considering the conception of the proposition as purely conventional in the light of certain problems concerning time, which had been alive in the medieval tradition at least since Augustine. Since a proposition is not a timeless entity, but is rather an object that comes to be as it is spoken or written and exists only so long as it is spoken or preserved in written form, how are we to understand the truth of such temporal beings? Does a spoken proposition ever exist, since its words are not all spoken simultaneously? How can a proposition of present tense be true, since the present is past before the proposition fully exists? And if we make it a matter of convention of what duration the present is, it would appear that the same proposition can be either true or false, depending on which convention is adopted.

Chapter VIII: The final chapter of the work is perhaps its richest, and for that reason, it is difficult to summarize briefly. It is a collection and discussion of a number of problems, which were grouped together by medievals and called insolubilia. Originally used as a pedagogical device, insolubilia eventually became the vehicle for discussion of the most advanced problems of terminist logic. Broadly speaking, most insolubilia are paradoxes of some sort and are usually propositions which, either by what they assert or by their form, seem to imply, directly or indirectly, their own denials. But this is not true of all. Some (such as the fifth and sixth sophismata of this chapter) seem to be little more than puns, while others (for example, the sixteenth and seventeenth sophismata) pose a dilemma for action. Because of the range of problems considered, the best brief Introduction to the chapter must be an invitation to the reader to give it his detailed attention. But special mention might be made of the seventh sophisma, which may be of particular interest to modern logicians, since it contains Buridan's way of dealing with semantic paradoxes, which are among the more common and interesting insolubilia." (pp. 14-16)

Buridan's Logical Works. II. The *Treatise on Consequence* and Other Writings

Tractatus de consequentiis

(In preparation)

Quaestiones longe super Librum Perihermeneias

"The present work contains the first critical edition of John Buridan's *Questiones longe super Librum Perihermeneias Aristotilis*.

(...)

Now we should have to answer the question: when were the questions on *Perihermeneias* written? Little is known about the chronology of Buridan's works. Even a relative date is difficult to establish. However, some remarks can be made. First, there is the fact that the questions on *Perihermeneias* are quoted several times in *Tractatus* I of the *Summule* (4), in a way that makes it highly probable that the *Summule* were written after the *Questiones on Perihermeneias* (5). Now, according to professor Pinborg the first lectura of the *Summule* may be dated as early as the late 1320es (6), that is at the very beginning of Buridan's career as a teacher of philosophy at the university of Paris. This may be an indication for an early date of the *Questiones* on *Perihermeneias*, possibly as early as 1325.

There are two other reasons for assuming that the commentary on *Perihermeneias* is one of Buridan's first works. The first clue is given

by the places where Buridan refers to one of his own works: once he refers to his commentary on Porphyry's *Isagoge* (7), twice to his commentary on Aristotle's *Metaphysic*s (8), and six times to his commentary on the *Physics* (9). The way in which he refers to these tracts seems also to be significant: the reference to his commentary on Porphyry's *Isagoge* shows that this work is of an earlier date than the present work. As to the other two works, he only refers to the number of the book in which he is going to treat a particular subject, not to the number of the question. A (cross)reference to the *Summule* is not given, although, as Pinborg remarks, there is a general doctrinal concordance between the two works. The questions on *Metaphysic*s do not contain a (cross)-reference to the questions on *Perihermeneias*, at least not on the places where one would expect them. I am not certain about possible references occurring in the commentary on *Physics*. However, we should be very careful to draw conclusions from the occurrence of references, since it is always possible that we are dealing with a second or third *lectura* of the text. (10)

Another argument in favour of an early date of the tract is based on the content of the work. Doctrinal analysis of the work shows that most subjects treated in the *Questiones* on *Perihermeneias* can also be found in other works of Buridan's in a more elaborate way. The work as a whole seems to show an early stage of Buridan's doctrinal development.

Unfortunately, this argument is not as strong as it seems, since the superficial way in which some subjects are discussed in the work may be related to the character of the tract: the questions on the *Logica vetus* were probably presented to the students in an early stage of their philosophical training.

Thus, there is not much certainty about the date of the questions on *Perihermeneias*. There are some reasons to believe that we have to deal with an early work of Buridan. Although, taken separately, none of these reasons is in itself sufficient, I am inclined to consider the work as an early tract.

The *Questiones breves*.

The present work does not contain an edition of the short version of the questions on Aristotle's *Perihermeneias*." (pp. XIII-XIV)

Quaestiones topicorum

"The commentary edited here is a question-commentary. This means that -- like most commentaries of its kind -- it offers the reader little help to understand Aristotle's text. Or to put the same in another manner: Though we find a considerable number of references to the *Topics* we could remove practically all the references and still have almost the same commentary. Or again: Nearly all the questions are occasioned by a section of Aristotle's text, but the discussions take place within a purely medieval frame-work.

We find, however, three references to *littera* (i.e. Aristotle's text) which are most naturally taken to mean that our work presupposes an exposition of the text.(11) These references need not mean that there was ever a 'published' literal-commentary on Aristotle's *Topics* by Buridan. Yet it has been argued convincingly by Christoph Flüeler(12) that Buridan's habit was to go through a prescribed text by expounding it and discussing questions on it within the same

period, though the exposition of the text might proceed at a quicker pace than the disputation of questions. This will mean that the present work originally did not stand alone, but had an explanation of the text as its background. No trace seems to be left of such an exposition of Aristotle's *Topics* by Buridan, and perhaps it was never written down, but only spoken in the class-room.

Flüeler further argues that all or most of Buridan's commentaries have come down to us as students' reportations of oral lectures and not in Flüelera form finished by Buridan himself.(13) This seems to hold true of the present work: In I qu. 5, arg. 1a we read: *sicut hen dicebatur*; in IV qu. 4 arg. 3b: *sicut hodie dicebatur*; in V qu. 2 arg. 4a: *sicut dicebam heri*; and in I qu. 17, dist. I: *descriptiones horum sunt vobis satis notae*. Such phrases are more naturally said in an oral lecture than written in a finished text. Inevitably this leads to the question: Has the student reported the lecture in the classroom, as it was spoken, or has he later written down a full text on the basis of notes taken in the class-room? Flüeler argues convincingly(14) for the existence of reportations written down in a complete form in the class-room, but certainly we cannot consider it to be proved that all reportations were made in that way. It is hardly possible to decide the question concerning our commentary, but when reading it we should keep in mind that there probably is, so to speak, a 'mediator' between Buridan and us.

Any reader of our commentary will quickly notice that it does not pay equal regard to all eight books of Aristotle's *Topics*. The questions on book I take up about one third of the work, and the same is true about the questions on book II. The remaining books are then dealt with quickly in the last third of the commentary. This selective attitude to Aristotle's text is one which our work shares with other commentaries from the same period.(15) If we compare with the much bigger number of questions in the commentaries from the 13th century by Boethius de Dacia(16) and Radulphus Brito(17) we cannot avoid the impression that Aristotle's *Topics* interested the authors of the 14th century much less than it did earlier commentators. Or perhaps we could say that the logic of the 14th century followed a course of development of its own, and was to a lesser degree directly inspired by a reading of Aristotle than the logic of the 13th century.

Already in the earliest question-commentaries on Aristotle's *Topics* it became customary for the authors to use the beginning of book II to discuss problems about the syncategoreme *omnis* (all/every).(18) Buridan does the same in our work. We find discussions of standard sophisms like *Omne animal fuit in arca Noe* (II qu. 2); (19) *Omnis phoenix est* (II qu. 3); *Omnes apostoli sunt duodecim* (II qu. 4); *Omnis homo est omnis homo* (II qu. 4); *Omnis homo de necessitate est animal* (II qu. 6); *Totus Socrates est minor Socrate* (II qu. 4). Further Buridan discusses sophisms like *Quicquid emisti, comedisti; crudum emisti; igitur crudum comedisti*(20) (II qu. 6, cf. I qu. 5) and *Denarios in bursa mea scis esse* pares(21) (II qu. 6). It is remarkable that, except for the last two, Buridan does not include these sophisms in his own collection of sophisms (= the last section of his*Summulae*). Rather they belong to the sophisms commonly discussed in the 13th century. Perhaps it is possible to suggest that this indicates that the commentary on the *Topics* was an early work by Buridan." (p. XIII-XV)

Questiones Elencorum

"The treatment of the problem of the *insolubilia* may give us some evidence for a relative date of the *Questiones elencorum*. The subject is discussed in question 19 of the present work. Someone who is not familiar with the discussions on paradoxes may wonder why the subject is treated here at all. Question 19 is one of the few questions in this work that contain no reference at all to Aristotle's text and at first sight it seems to have no connection with the subject of fallacies.

The reason that the subject is discussed here is that paradoxes were very often considered as originating from the fallacy *secundum quid et simpliciter*.(14) From that point of view an insoluble proposition, like '*Sortes dicit falsum*', supposing that Sortes says no other proposition than this one, is neither simpliciter false nor simpliciter true, and therefore it deserves the same treatment as the proposition about the black man with the white teeth. For the sake of clearness: Buridan has never defended this opinion himself. According to him the proposition *'Sortes dicit falsum*', where 'falsum' refers to the proposition itself, is simply false.

Buridan has dealt with the subject in more than one place in his works, but the most profound exposition can be found in chapter VIII of the *Sophismata*. In sophism 7 he exposes the principles of his solution. First Buridan argues that in the case presented, viz. that all

true propositions have been annihilated and only false ones has survived, when Socrates says 'every proposition is false' and nothing more, this proposition is simply false. Then he goes on to reply to some opposing arguments:

7.7.1: Some people have advanced the following view (and it was my opinion too at one time): Even if the only thing that the proposition signifies or asserts, simply in virtue of the meanings of its terms, is that every proposition is false, *nevertheless every proposition, by its very form, signifies or asserts itself to be true*, and as a result any proposition that either directly or indirectly asserts itself to be false, is false (transl. Hughes,(15) ital. ours).

(Aliqui enim dixerunt, et ita visum fuit mihi alias, quod licet ista propositio secundum significationem suorum terminorum non significet vel asserat nisi quod omnis propositio est falsa, tamen omnis propositio de forma sua significat vel assent se esse veram. Ideo omnis propositio asserens se esse falsam, sive directe sive consecutive, est falsa.) (16)

Let us follow G.E. Hughes(17) in referring to this theory (viz. that every proposition signifies its own truth) as the *meaning* theory.

Next Buridan goes on to say that strictly speaking it is not correct to say that every proposition signifies or asserts itself to be true. He prefers another view:

7.7.2: one that is quite close to the truth. According to it every proposition virtually implies a second proposition in which the subject would stand for the original proposition and the predicate 'true' would be affirmed of it.

(Ideo dicitur aliter, propinquius veritati, scilicet quod quaelibet propositio implicat virtualiter aliam propositionem de cujus subjecto pro ea supponente affirmatur hoc praedicatum ' verum'.)

Following Hughes we shall refer to this theory (viz. that every proposition implies its own truth) as the *entailment* theory. This Introduction is not the right place for a detailed study of Buridan's solution of the problem of paradoxes. What matters for our purpose here is that he first presents an opinion of which he says that he had that opinion too at one time.

Now if we take a look at his remarks in question 19 of the *Questiones Elencorum*, it becomes clear that this text must have been written before the *Sophismata*. In 19.3.2 Buridan states that every proposition formally signifies that it is true or at least it follows from every proposition that it is true:

Et sit prima suppositio quod omnis propositio de significatione forrnali significat se esse veram. Et ideo quia consequens includitur in antecedente, quaelibet propositio implicat se esse veram, nam omnis propositio est affirmativa vel negativa. Modo quaelibet illarum significat se esse veram vel saltem ad quamlibet illarum sequitur eam esse veram.

From this passage we may conclude that when writing the *Questiones Elencorum* he had no objections against the meaning theory, although he preferred the entailment theory himself.

Another text where the subject is discussed can be found in Buridan's commentary on Aristotle's *Metaphysics*. In book VI question 11 the author argues that some people suppose that every affirmative proposition formally signifies that in every way the facts are as it says they are (*qualitercumque significat esse ita est*).(18) Now 'that in every way the facts are as the proposition says they are' is considered a truth condition of an affirmative proposition. So it may be assumed that Buridan here refers to the opinion that every affirmative proposition formally signifies that this proposition itself is true: the meaning theory. According to Buridan the defenders of this opinion see the truth but they do not see it completely. Strictly speaking this opinion is not correct (iste modus loquendi vel non est verus vel non est proprius). He politely rejects this opinion with the same arguments as in the *Sophismata*, although in the *Sophismata* he seems to be more convinced of his being in the right. In the commentary on the *Metaphysics* as well as in chapter VIII of the *Sophismata* his objection against the opinion that every proposition signifies itself to be true is that in this opinion the signification of e.g. 'a man is an animal' would be "that a man is an animal' is true', that is, if the expression 'itself to be true' (se esse veram) is taken materially. This is incorrect, because according to Buridan in the *Sophismata*, "that a man is an animal' is true' is a proposition about second intentions, whereas the original proposition 'a man is an

animal' is a proposition about first intentions. In other words, as formulated in the commentary on the *Metaphysic*s, '*equus est asinus*' does not signify the proposition 'a horse is a donkey'; it only signifies horses and donkeys. If the expression 'itself to be true' or 'that a horse is a donkey' is taken not materially but significatively, the opinion would not be correct either, because in that case ' that a horse is a donkey' would not refer to anything (*pro nullo supponit*), since there is no such thing as a horse being a donkey, and in just the same way there neither is nor can be such a thing as that proposition being true. Now something that does not and cannot exist cannot be signified or asserted, according to Buridan. The vocal proposition '*homo est asinus*' signifies the corresponding mental proposition, but in reality outside the mind it only signifies men and donkeys and nothing else. From Buridan's discussion in the commentary on the *Metaphysics* and the *Sophismata* it can be concluded that this account holds for propositions that cannot possibly be true, like 'equus est asinus' and for insoluble propositions, like 'every proposition is false'. What does hold for every proposition is that it implies its own truth (comm. on*Metaphysics*: *tamen ad omnem propositionem de mundo sequitur quod ipsa est vera*), if at any rate it is formulated (*saltem si formaretur*).

It is clear that Buridan's theory as well as the arguments he uses to defend it are very similar in the *Sophismata* and in the commentary on the *Metaphysics*. The treatment in the *Sophismata* seems to be more formal, but that can be explained from the context in which the problem is discussed. Chapter VIII of the *Sophismata* is a logical treatise about the solution of *insolubilia*, whereas the subject in the commentary on the *Metaphysics* is the truth conditions of propositions in general and the question whether a proposition can be true and false at the same time.

Another text where the subject is discussed is the tenth question of Buridan's Questions on the Posterior Analytics. The subject of this question is the problem of the truth-condition of a proposition. Is the fact that in every way the facts are as some proposition says they are, a condition and a sufficient condition for the truth of that proposition (quaeritur utrum ad veritatem propositionis requiratur et sufficiat quod qualitercumque ipsa significat ita sit)? In many cases, our author argues, this is not a sufficient condition, e.g. in a

proposition that expresses its own falsity (' ego dico falsum'). Such a proposition is false, according to Buridan. Nevertheless the facts are as the proposition says they are, because the proposition signifies itself to be false, and it is false. Still the facts are not in every way (*qualitercumque*) as the proposition says they are, because it also signifies itself to be true, because that is what every proposition does (ex communi condicione propositionis).(19)

It is clear that in this connection Buridan 'defends' the opinion he rejects in chapter VIII of the *Sophismat*a and in the commentary on the *Metaphysics*: the meaning theory.

A comparison of these four texts of Buridan's leads us to the following tentative conclusion regarding the relative date of these works. The commentary on the *Posterior Analytics* should be dated first. Buridan clearly proposes the meaning theory (every proposition signifies that it itself is true) as his own. In the commentary on the *Sophistici Elenchi* (19.3.2) the meaning theory is still brought forward without any criticism (*prima suppositio quod omnis propositio de significatione formali significat se esse veram*), but Buridan adds the remark that every proposition also implies itself to be true, because every proposition is affirmative or negative. Supposedly Buridan wants to say that every speaker is implicitly claiming that he is speaking the truth. This text was probably written after the commentary on the *Posterior Analytics*. The commentary on the *Metaphysics* and the *Sophismata* are clearly of a later date. In the former work he speaks about the adherents of the meaning theory as people who see the truth, but not completely (aliqui videntes veritatem sed tamen non plene videntes), because properly speaking one cannot say that a proposition signifies itself *(unde non est propria locutio quod propositio significet seipsam*), because in some cases there would be nothing to be signified. The entailment theory seems to be advanced here as a better alternative for impossible and insoluble propositions *(licet non omnis propositio significet se esse veram quia forte nihil est ' se esse veram', tamen ad omnem propositionem de mundo sequitur quod ipsa est vera*), whereas in the *Sophismata* the meaning theory is simply rejected for every proposition. The*Sophismata* text seems to express a more radical point of view. Here Buridan does not show the sympathy for the adherents of the meaning theory in the way he did in the

commentary on the *Metaphysics*. He simply rejects this opinion as incorrect (*non videtur mihi valere de proprietate sermonis*) for every proposition, although he had defended it himself before. We are inclined to take this as an indication (although not as a proof) for a date of the *Sophismata* after the commentary on the *Metaphysics*. (20)" (pp. XV-XIX)

Notes

Buridan: Editions, Translations and Studies on the Manuscript Tradition

Introduction

I give an updated list of the published and unpublished logical and metaphysical works of Buridan, and a Bibliography of the editions and translations appeared after 2000.

A complete list of Buridan's works and manuscripts can be found in the ' *Introduction*' by Benoît Patar to his edition of "La *Physique* de Bruges de Buridan et le *Traité du Ciel* d'Albert de Saxe. Étude critique, textuelle et doctrinale" Vol. I, Longueil, Les Presses Philosophiques, 2001 (2 volumes), pp. 33* - 75*.

Summary of Buridan's works on logic and metaphysics

Logical Works:

N. B. The treatises known as *Artes Veterem* and commented by Buridan were the *Isagoge* by Porphyry and the *Categoriae (Predicamenta)* and the *Peri Hermeneias* by Aristotle.

1. *Expositio Super Artes Veterem*
2. *Quaestiones Super Artes Veterem*
3. *Expositio in duos libros Analyticorum priorum Aristotelis*
4. *Quaestiones in duos libros Analyticorum priorum Aristotelis*

5. *Expositio in duos libros Analyticorum posteriorum Aristotelis*
6. *Quaestiones in duos libros Analyticorum posteriorum Aristotelis*
7. *Quaestiones in octo libros Topicorum Aristotelis*
8. *Quaestiones in librum 'de sophisticis Elenchis' Aristotelis*

Summulae de dialectica, commentary of the *Summulae logicales* by Peter of Spain, composed by the following treatises:

1. *De propositionibus*
2. *De praedicabilibus*
3. *In praedicamenta*
4. *De suppositionibus*
5. *De syllogismis*
6. *De locis dialecticis*
7. *De sophisticis elenchis*
8. *De demostrationibus*
9. *De practica sophismatum* (sometimes considered the ninth treatise of the *Summa logicae*)
10. *Tractatus de consequentiis*

Metaphysical Works:

1. *Expositio Super Metaphysica* [in two redactions]
2. *Lectura Erfordiensis*
3. *Quaestiones Super Metaphysica* [in two redactions]

Polemical Woks:

1. *Duae quaestiones de universali*
2. *Tractatus de relationibus*
3. *Quaestio de possibilitate existendi secundum eandem et non essendi simul in eodem instanti*
4. *Quaestio de dependentiis, diversitatibus et convenientiis*

5. *Determinatio de diversitate generis ad speciem (Defensiones determinationis de diversitate generis ad speciem)*

The *Quaestiones super octo libros Politicorum Aristotelis* are not a work of Buridan, but of Nicolaus Girardi de Waudemonte (Nicholas of Vaudémont), a late Fourteenth-century French writer, as demonstrated by Christoph Flüeler, *Die Rezeption des Politica des Aristoteles an der Pariser Artistenfakultät im 13. und 14. Jahrhundert*, in: Jürgen Miethke (ed.), *Das Publikum politischer Theorie im 14. Jahrhundert*, 1992, pp. 127-138.

Detailed list with full bibliographical references

Logical Works:

1. Buridanus, Johannes. *Expositio in Artem Veterem*.

   Unpublished manuscript: Biblioteca de la Catedral de Tortosa (España) cod. 108 ff. 26r-74v.

2. ———. *Quaestiones in Artem Veterem (De Tertia Lectura; Ordinatio)*.

   This work is now available in critical edition (in three separated editions: see below).

3. Buridani, Johannis. *Quaestione Breves in Artes Veterem*.

   Unpublished manuscripts available at the Libraries of Cracow, Leipzig, and Città del Vaticano (two manuscrpits).

4. Buridan, Jan. 1986. "Komentarz Do *Isagogi* Porfiriusza [Quaestiones in Isagogen Porphyrii]." *Przeglad Tomistyczny* no. 2:111-195.

   Quaestiones Super Artes Veterem I.

   Critical edition of the Latin text with an Introduction in Polish by Ryszard Tatarzynski.

5. Buridanus, Johannes. 1983. *Quaestiones in Praedicamenta*. München: Verlag der Bayerischen Akademie der Wissenschaften.

   Quaestiones Super Artes Veterem II.

Edited by Johannes Schneider.

6. ———. 1983. *Quaestiones Longe Super Librum Perihermeneias*. Nijmegen: Ingenium Publishers.

   Quaestiones Super Artes Veterem III.

   Artistarium Supplementa Vol. 4.

   Edited with an Introduction by Ria van der Lecq.

7. Buridan, John. 1976. "Quaestio 3 *Perihemeneias*." In *The Logic of John Buridan*, edited by Jan, Pinborg, 89-90. Copenhagen: Museum Tusculanum Press.

8. Buridani, Johannis. *Expositio in Duos Libros Analyticorum Priorum Aristotelis*.

   Unpublished manuscript of 1356: Praha, Knihovna Metropolitní Kapituly, cod. L.34, ff. 107r -136v.

9. ———. *Quaestiones in Duos Libros Aristotelis Analyticorum Priorum*.

   Unpublished work available in manuscript at the Libraries of: Cracow, Leipzig, Liège, Münich, Prague, Vienne.

   Unpublished transcription by Hubert Hubien available at Peter King's Website.

10. Buridanus, Johannes. 1991. "Quaestiones Super Libris *Analyticorum Priorum*, Quaestio Xx: *Utrum Per Inductionem Probatur Propositio Immediata*." In *Historia Philosophiae Medii Aevi. Vol. I*, edited by Burkhard, Mojsisch and Olaf, Pluta, 100-103. Amsterdam: B. R. Grüner.

    Edited by Egbert P. Bos in Appendix (Anhang) to his essay: *Pseudo-Johannes Duns Scotus über Induktion* pp. 71-99.

11. Buridani, Johannis. *Expositio in Duos Libros Analyticorum Posteriorum Aristotelis*.

    Unpublished manuscript: Città del Vaticano, Biblioteca Apostolica Vaticana, Urb. lat. 1489, f. 119ra - 150rb.

12. ———. 2006. Quaestiones in Duos Libros Aristotelis *Analyticorum Posteriorum*.

This work was attributed to Albert of Saxony and published in 1497 wit the title: *Quaestiones subtilissimi Alberti de Saxonia super libros Posteriorum* Milan, Venise (modern anastatic reprint: Hildesheim, Olms, 1986.

13. Buridanus, Johannes. *Expositio in Topica*.

    The attribution of this work to Buridan is doubtful.

    Unpublished manuscript: Munich, Bayerische Staatsbibliothek, signature: Clm 12707, ff. 66ra - 99vb.

14. ———. 1994. *Quaestiones Elencorum*. Nijmegen: Ingenium Publishers.

    Artistarium Supplementa Vol. 9.

    Edited with an Introduction, notes and indices by Ria van der Lecq and H. A. G. Braakhuis.

15. ———. 2008. *Quaestiones Topicorum*. Turnhout: Brepols.

    Introduction, critical edition and indexes by Niels Jorgen Green-Pedersen.

16. Buridan, John. 1976. "Quaestiones Super *Sophisticos Elenchos* [Index]." In *The Logic of John Buridan*, edited by Jan, Pinborg, 159-160.

17. Buridanus, Johannes. *Perutile Compendium Totius Logicae Joannis Buridani Cum Praeclarissima Solertissimi Viri Joannis Dorp Expositione*.

    This work, also known as *Summulae de dialectica* or *Lectura de summa logicae* (the title of Hubert Hubien unpublished transcription) is composed by eight treatises: I. *De propositionibus*; II. *De praedicabilibus*; III. *De praedicamentis*; IV. *De suppositionibus*; V. *De syllogismis*; VI. *De locis dialecticis*; VII. *De sophisticis elenchis*; VIII. *De demonstrationibus*.

    A ninth treatise, *Sophismata,* is printed separately in the ancient editions.

    The first edition of the *Summulae* was edited by Thomas Bricot (? - 1516) at Paris in 1487.

An anastatic reprint of the edition of Venice 1499, with the commentary by John Dorp (late 14th century) was published at Frankfurt am Main, Minerva, 1965.

For critical editions of treatises I, II, III, IV, V, VI, VIII and IX see below; treatise VII is not yet available in a modern edition.

18. Buridan, John. 1976. " *Summulae,* Tractatus I." In *The Logic of John Buridan*, edited by Jan, Pinborg, 82-88.

    Edition of: I.1.1; I.1.5; I.1.6; I.2.2; 1.3.2.

19. Buridanus, Johannes. 2005. *Summulae De Propositionibus*. Nijmegen: Ingenium Publishers.

    Summulae Vol. I.

    Artistarium Supplementa Vol. 10-1.

    Introduction, critical edition, and indexes by Ria van der Lecq.

    "The present fascicle contains the first treatise of the *Summulae*, called *De propositionibus*. In earlier fascicles we referred to this treatise as *De Introductionibus*, which is the name of the corresponding chapter of Peter of Spain's *Tractatus*. (19) Buridan himself, however, does not use the term *Introductiones*; in 1.1.1 he announces that the first treatise is going to deal with propositions and their parts and attributes. Therefore, ' *De propositionibus*' seems to be a more appropriate title.

    The treatise consists of eight chapters, which correspond with Peter of Spain's *Tractatus 1* (*De Introductionibus*) in the following way:

    chapter in Buridan chapter in Tractatus 1

    1 De quibusdam praemittendis 1-3

    2 De nomine, verbo et oratione 4-6

    3 De propositione 7-10

    4 De oppositionibus propositionum categoricarum 11-14

    5 De aequipollentiis 18

6 De conversionibus propositionum 15

7 De propositionibus hypotheticis 16-17

8 De propositionibus modalibus 19-25

A closer comparison between the two treatises (20) shows that Buridan elaborated more on the topics of chapters 6 and 7 (conversions and hypothetical propositions) than the author of his basic text and that he had an extraordinary interest in modal propositions. He even preferred to write a new text for this chapter, because he considered the auctor's account to be incomplete (1.8.1).

The present edition includes the preface (*Prooemium*) of the *Summulae*, in which Buridan says some remarkable things about logic as an art (see below n.3.3) and in which he warns the reader that he will not follow his author's text in every respect: "occasionally I am going to have to say and write things that differ from what he has said and written, whenever it appears to me suitable to do so"."

(19) See for an exposition of the term 'Introductiones' by John of Salisbury: Peter of Spain, *Tractatus* (...), ed. L.M. de Rijk, p. LXXXIX..

(20) See Jan Pinborg, 'Summulae, Tractatus 1 De Introductionibus,' in Jan Pinborg (ed.), *The Logic of John Buridan*, Kopenhagen 1976, pp. 74-75.

20. ———. 1995. *Summulae De Praedicabilibus*. Nijmegen: Ingenium Publishers.

Summulae Vol. II.

Artistarium Supplementa Vol. 10-2.

Introduction, critical edition and indexes by L. M. De Rijk.

"The present edition contains the second tract [of Buridan's *Summulae*], *De praedicabilibus,* which deals with the five 'predicables', introduced by the Neoplatonist commentator of Aristotle, Porphyry (c. 233-c. 304 A.D.) in his introductory book (*Isagoge*)to the Stagirite's *Categories, viz.* 'genus', 'species', 'differentia', 'proprium', and 'accidens'. From as early

as the eleventh century, medieval authors commented upon Boethius' (480-524) translation of, and commentary upon, this work.

Buridan's discussion of the predicables is mainly based on the corresponding tract of Peter of Spain's manual. His comments are preceded by the complete text of the lemma from Peter to be discussed. It should be no surprise that Buridan's quotations should go back to an adapted version of Peter's text. (...)

Buridan's work consists of elementary exegesis as well as extensive objections and *dubitationes* in which specific questions are dealt with, mostly in an original fashion." pp. XVII and XXI.

21. ———. 1994. *Summulae in Praedicamenta*. Nijmegen: Ingenium Publishers.

    Summulae Vol. III.

    Artistarium Supplementa Vol. 10-3.

    Introduction, critical edition and notes by Egbert P. Bos.

22. ———. 1998. *Summulae De Suppositionibus*. Nijmegen: Ingenium Publishers.

    Summulae Vol. IV.

    Artistarium Supplementa Vol. 10-4.

    Introduction, critical edition and indexes by Ria Van der Lecq.

23. Buridano, Giovanni. 1957. "Tractatus De Suppositionibus." *Rivista Critica di Storia della Filosofia* no. 12.

    First part pp. 180-208; Second part pp. 323-352.

24. Buridanus, Johannes. 2010. *Summulae De Syllogismis*. Turnhout: Brepols.

    Summulae Vol. V.

    Artistarium Supplementa Vol. 10-5.

    Introduction, critical edition and indexes by Joke Spruyt

" *De syllogismis* is the fifth treatise of John Buridan's *Summulae dialecticae*, a textbook he wrote for his logic course in the Faculty of Arts at the University of Paris. *De syllogismis* contains material related to Aristotle's *Analytica Priora* and Boethius's *De hypotheticis syllogismis*. The textbook discusses inferences involving not only propositions de *inesse*, but also propositions featuring oblique, reduplicative and infinite terms. Buridan displays a keen interest in modal inferences and inferences involving propositional attitudes. Buridan's *De syllogismis* continues along the lines of his nominalist conception of the relations between mind, language and reality."

25. ———. 2013. *Summulae De Locis Dialecticis*. Turnhout: Brepols.

    Summulae Vol. VI.

    Artistarium Supplementa Vol. 10-6.

    Edited by Niels Jorgen Green-Pedersen.

    " *De locis dialecticis* is the sixth treatise of John Buridan's *Summulae dialecticae,* a textbook he wrote for his logic course in the Faculty of Arts at the University of Paris. *De locis dialecticis* immediately builds upon Peter of Spain, but Buridan shows his awareness that the doctrine of the *loci* took its origin in Boethius' *De differentiis topicis*, and he frequently quotes from that work. Though not introducing any basically new ideas Buridan contributes a large number of precisions to the standard descriptions of the several *loci*, and he shows that the list of the *loci* and the traditional division of it into three sections is not something given by nature, but was established by earlier logicians, as they found convenient. Accordingly such things can be changed if something better is found. Buridan has here given us perhaps the most precise and most interesting exposition of the doctrine of the *loci* in the medieval logical literature."

26. Buridan, John. 1976. "The *Summulae* of John Buridan. Tractatus Vi *De Locis*." In *The Logic of John Buridan*, edited by Jan, Pinborg, 121-138.

Edited by Niels Jörgen Green-Pedersen.

27. ———. 1976. "Extracts from the *Summulae*." In *The Logic of John Buridan*, edited by Jan, Pinborg, 153-158.

    Edited by Sten Ebbesen: 7.3.2; 7.3.4; 7.3.10 (*de figura dictionis*).

28. Buridanus, Johannes. *Summulae De Fallaciis*.

    Summulae Vol. VII.

    Not yet published.

29. ———. 2001. *Summulae De Demonstrationibus*. Groningen-Haren: Ingenium Publishers.

    Summulae Vol. VIII.

    Artistarium Supplementa Vol. 10-8.

    Introduction, critical edition and indexes by L.M. de Rijk.

30. ———. 2004. *Summulae De Practica Sophismatum*. Turnhout: Brepols.

    Summulae Vol. IX.

    Artistarium Supplementa Vol. 10-9.

    Introduction, critical edition and indexes by Fabienne Pironet.

    "Treatise 9, *De practica sophismatum,* or *Sophismata* for short, has been edited once in full and once in part within the last few decades. The 1977 publication of the full text by Th.K. Scott contributed significantly to the scholarly community's awareness of the merits of Buridan's work, but the Latin text was only weakly anchored in the manuscript tradition; in fact it reproduced an incunabulum (our Z) emended by means of collation with usually one manuscript (our F). G.E. Hughes' partial edition of 1982 was based on six manuscripts (our A, E, F, I, 'I' and W) as well as on an incunabulum (our Z) and represented a considerable step forward on the road to a sound text. Our aim is to take one more step along on that road, by re editing the whole treatise on the basis of not only more but, we think, also better manuscripts." (p. XI, notes omitted).

31. Buridan, Jean. 1966. *Sophisms on Meaning and Truth*. New York: Appleton-Century-Crofts.

    Latin text and translation by Theodore Kermit Scott.

32. ———. 1977. *Sophismata*. Stuttgart - Bad Cannstatt: Frommann-Holzboog.

    Critical edition with an Introduction by Theodore Kermit Scott (now superseded by Pironet 2004).

33. ———. 1982. *John Buridan on Self-Reference. Chapter Eight of Buridan's Sophismata*. Cambridge: Cambridge University Press.

    Latin text, translated, with an Introduction and a philosophical commentary, by George E. Hughes.

34. Buridani, Johannis. 1976. *Tractatus De Consequentiis*. Louvain: Publications universitaires.

    Critical edition by Hubert Hubien.

Metaphysical Works:

1. Buridanus, Johannes. *Expositio in Duodecim Libros Metaphysicorum Aristotelis [First Redaction]*.

    Unpublished manuscript (1340): Paris, Bibliothèque Nationale, ms. latin 16 131, 124ra - 214vb.

2. ———. *Expositio in Duodecim Libros Metaphysicorum Aristotelis [Second Redaction]*.

    Unpublished manuscript (1392): Carpentras, Bibliothèque Inguimbertine, cod. 292 (L. 288), 1ra - 42va; other manuscripts at the Libraries of Darmstadt, München, Paris and Wien.

3. ———. 2008. *Lectura Erfordiensis in I-Vi Metaphysicam, Together with the 15th-Century Abbreviatio Caminensis*. Turnhout: Brepols.

    Introduction, critical edition and indexes by L. M. de Rijk.

    "The aim of the present edition is to make two texts available which can throw some more light on the role of Aristotle's *Metaphysics* in 14th-15th academic teaching. One of them

contains part of an early (hitherto unknown) version of John Buridan's *Questions on Metaphysics*, the other is a 15th century abbreviation of precisely this early version. Remarkably, both texts belong to the East European tradition of Buridan's works, which is the more interesting as they testify to the master's earlier activities as a Parisian teacher on the subject of metaphysics. In particular, they elucidate Buridan's ongoing semantic approach to matters of metaphysics and ontology as well as his attitude to Aristotle's authority."

4. ———. *Quaestiones in Duodecim Libros Metaphysicorum Aristotelis [First Redaction].*

   Unpublished manuscript: Paris, Bibliothèque Nationale, ms. latin 16 131, 2ra - 122vb.

5. ———. *Quaestiones in Duodecim Libros Metaphysicorum Aristotelis [Secundum Ultimam Lecturam].*

   Manuscript: Carpentrat, Bibliothèque Inguimbertine, cod. 292, 45ra - 118rb.

   Other manuscript at the Libraries of Erfurt (two copies), Paris (two copies), Venezia and Wien.

   Printed edition: *In Metaphysicen Aristotelis questiones,* Paris, Josse Bede, 1518.

   Facsimile reproduction of this edition under the title *Kommentar zur Aristotelischen Metaphysik* (the date 1588 printed in the frontispice is an error), Frankfurt am Main, Minerva, 1965.

6. ———. *Quaestiones Breves in Duodecim Libros Metaphysicorum Aristotelis*.

   Unpublished manuscript: Biblioteka Narodowa (Poland), cod. 5835, 194 - 216.

Polemical Works:

1. Buridan, John. 2004. "John Buridan's Treatise, *De Dependentiis, Diversitatibus, Et Convenientiis*. An Edition." *Vivarium* no. 42:115-149.

   Edited by Dirk-Jan Dekker.

2. Buridani, Johannis. 1987. "Tractatus De Differentia Universalis Ad Individuum." *Przeglad Tomistyczny* no. 3:137-178.

   Also known with the title: *Duae Quaestiones (Tractatus) De Universali.*

   Critical edition of the Latin text by Slawomir Szyller.

3. Buridan, John. 1991. *John Buridan's Tractatus De Infinito: Quaestiones Super Libros Physicorum Secundum Ultimam Lecturam, Liber Iii, Questiones 14-19. An Edition with Introduction and Indexes*. Nijmegen: Ingenium Publishers.

   Artistarium Supplementa Vol. 6.

   Edited by Johannes M. M. H. Thijssen.

English translations of the logical and metaphysical works

1. Buridan, John. 2001. *Summulae De Dialectica*. New Haven: Yale University Press.

   An annotated translation, with a philosophical Introduction by Gyula Klima.

2. Buridan, Jean. 1985. *Jean Buridan's Logic. The Treatise on Supposition. The Treatise on Consequences*. Dordrecht: Reidel.

   Translated, with a philosophical Introduction by Peter King.

3. Buridan, John. 2014. *Treatise on Consequences*. New York: Fordham University Press.

   Translated, with an Introduction by Stephen Read.

4. Buridan, Jean. 1966. *Sophisms on Meaning and Truth*. New York: Appleton-Century-Crofts.

   Latin text and translation by Theodore Kermit Scott.

5. ———. 1982. *John Buridan on Self-Reference. Chapter Eight of Buridan's Sophismata*. Cambridge: Cambridge University Press.

Latin text, translated, with an Introduction and a philosophical commentary, by George E. Hughes.

Reprinted, without the Latin text, with the title: *Chapter Eight of Buridan's 'Sophismata'*, Cambridge University Press, 1982.

12. Ariane, Economos. 2009. *Intellectus and Induction: Three Aristotelian Commentators on the Cognition of First Principles, Including an Original Translation of John Buridan's "Quaestiones in Duos Aristotelis Libros Posteriorum Analyticorum"*.

    Unpublished Ph.D thesis by Ariane Economos, available at ProQuest Dissertations & Theses ref. AAT 3377044.

    Abstract: "Recent scholars have argued that the skeptical problem of induction was unknown until the 18 th century. They claim that a theory of knowledge such as the one embraced by medieval Aristotelians, which holds that an effect may be demonstratively proven to follow from its cause, must also hold that a necessary connection exists between a cause and its effect. What such scholars overlook is that medieval philosophers also argue that to claim that all knowledge of causal connections must be obtained demonstratively would lead to an infinite regress; the premises from which a demonstration proceeds cannot always themselves be demonstrated if a regress is to be avoided. Thus, medieval philosophers identify some indemonstrable premises which are causal in nature. They take propositions like, "scammony causes the purging of bile," and, "a certain herb results in the

reduction of fever," to be indemonstrable principles which may serve as the starting-points of demonstrations. Principles such as these, medieval Aristotelians claim, are known through induction. Thus, to truly understand whether or not a medieval "skeptical problem" could pre-date that of Hume, what we must examine is the medieval account of the acquisition of indemonstrable first principles.

An examination of such principles and an analysis of the medieval claim that they are acquired through induction is the theme of this dissertation. Over the course of the dissertation, I defend three theses. First, I argue that when medieval philosophers interpret Aristotle's claim that first principles are obtained through induction, they adapt this claim so as to apply to a kind of principle which we do not find in Aristotle, namely, a principle stating a causal connection. Second, I argue that three medieval commentators on Aristotle--Robert Grosseteste, Thomas Aquinas, and John Buridan--each interpret the role which induction plays in the acquisition of these principles in such diverse ways that we ought not look for one overarching "medieval view" of induction. Third and finally, I argue that Buridan's unique approach to induction and its relation to intellectus (the Latin equivalent of nous) is fueled almost entirely by his sensitivity to skeptical concerns."

Buridan's Logic and Metaphysics: An Annotated Bibliography (First Part: A - K)

Bibliography

I give an updated list of the published and unpublished logical and metaphysical works of Buridan, and a Bibliography of the editions and translations appeared after 2000.

For Buridan's contributions to the theories of supposition see: Medieval Theories of Supposition (Reference)

1. Anfray, Jen-Pascal. 2007. "*Non Ens Intelligitur*. Jean Buridan Sur Le Non-Être." *Cahiers de philosophie de l'Université de Caen* no. 43:95-129.

   "Est-il possible de parler de ce qui n'est pas ou d'y penser sans présupposer une forme d'être pour cela même que nous pensons ne pas exister ? La vieille énigme parménidienne, qui hante toujours la philosophie contemporaine, est au coeur non seulement de la philosophie médiévale mais aussi des études médiévales, comme en témoigne le récent ouvrage d'Alain de Libera sur la *référence vide* (1). L'objet de cette étude est en comparaison beaucoup très limité, dans la mesure où nous nous concentrerons sur le traitement de ce problème du non-être par Jean Buridan. Dans la logique et la métaphysique médiévale, le non-être (*non ens*) est l'objet de discussions relevant aussi bien de la logique des termes que de celle des propositions. En employant une terminologie moderne, nous pourrions dire que le non-être apparaît dans la discussion

philosophique tant à propos de l'engagement au domaine de quantification des énoncés qu'à propos de ce qui rend vrai les énoncés eux mêmes (2)." p. 95

(1) Sous le titre *La référence vide*, A. de Libera (Paris, Vrin 2002) a abordé ces deux ensembles de questions, en mettant l'accent sur le second (comme l'indique le sous-titre : *Théories de la proposition*). Au long des chapitres de l'ouvrage, l'auteur n'est jamais loin de l'une des problématiques annoncée en Introduction (p.3-4) : la référence aux particuliers inexistants, la référence aux objets imaginaires et le signifié propositionnel. Cependant, conformément à sa propre méthode historiographique, il soutient que le pont explicite entre ces différentes problématiques n'apparaît qu'à la fin du XIVe siècle. Pierre de Venise serait le témoin privilégié de cette quasi-fusion des problèmes à travers une formule définissant disjonctivement le signifié de la proposition : *aliquid vel aliqua vel aliqualiter*. Davantage qu'une fusion, ce serait même plutôt une absorption des deux premières problématiques au sein de celle du signifié propositionnel. La page 338 expose remarquablement ce point de vue: "grâce à la formule disjonctive [absente avant la deuxième moitié du XIVe siècle], les problèmes de référence vide d'un terme sont traités ultimement dans le cadre unifié d'une véritable sémantique des propositions." Si nous devions exprimer un désaccord avec l'auteur, il porterait seulement sur cette hypothèse méthodologique, car nous pensons que les problématiques de la référence vide et du signifié propositionnel sont également abordées conjointement par un auteur antérieur tel que Jean Buridan. Quoi qu'il en soit, notre dette envers le travail d'A. de Libera est immense.

(2) Pour un partisan des vérifacteurs, adversaire du nominalisme comme David Armstrong, il y a par conséquent, outre l'engagement ontologique classique (au domaine de quantification) un engagement distinct aux vérifacteurs.

2. Ashworth, Earline Jennifer. 1991. "Equivocation and Analogy in Fourteenth-Century Logic: Ockham, Burley and Buridan." In *Historia Philosophiae Medii Aevi. Studien Zur Geschichte Der Philosophie Des Mittelalters. Festschrift Für Kurt Flasch Zu*

Seinem 60. Geburtstag. (Vol. I), edited by Mojsisch, Burkhard and Pluta, Olaf, 23-43. Amsterdam, Philadelphia: B. R. Grüner.

3. ———. 2004. "Singular Terms and Singular Concepts: From Buridan to the Early Sixteenth Century." In *John Buridan and Beyond. Topics in the Language Sciences 1300-1700*, edited by Ebbesen, Sten and Friedman, Russell L., 121-151. Copenhagen: C. A. Reitzel.

   "This article considers medieval treatments of proper names and demonstrative phrases in relation to the question of when and how we are able to form singular concepts. The logical and grammatical background provided by the authoritative texts of Porphyry and Priscian is examined, but the main focus is on John Buridan and his successors at Paris, from John Dorp to Domingo de Soto. Buridan is linked to contemporary philosophers of language through his suggestion that, although the name 'Aristotle' is a genuine proper name only for those who have the appropriate singular concept caused by acquaintance with Aristotle, it can be properly treated as a singular tem by subsequent users because of their beliefs about the original imposition of the name."

4. Berger, Harald. 2008. "Der Substanzbegriff Im Spätmittelalterlichen Nominalismus." In *Substantia - Sic Et Non. Eine Geschichte Des Substanzbegriffs Von Der Antike Bis Zur Gegenwart in Einzelbeiträgen*, edited by Gutschmidt, Holger, Lang-Balestra, Antonella and Segalerba, Gianluigi, 235-255. Frankfurt: Ontos Verlag.

   "Late medieval nominalism's ontological commitment is mainly to Aristotelian individual substances and individual qualities, the status of quantities is a matter of dispute (not in semantics, however, but in natural philosophy). In this paper the commentaries on pertinent Aristotelian texts by three main figures of Fourteenth century nominalism, William of Ockham, John Buridan, and Albert of Saxony, are presented and discussed. Regarding the relation between substance and accident the Christian Aristotelians had to conceive of it as a relation of dependence according to the natural laws and not as a relation of logical dependence; otherwise, the sacrament of

the Eucharist could not be explained in Aristotelian terms. Finally, two deviating views are mentioned: According to John of Mirecourt reality consists solely of substances (with modes of being such and such), whereas according to Nicholas of Autrecourt ("the Medieval Hume") physical reality consists solely of accidents in the sense of appearances, sensations, sense data."

15. ———. 1999. "John Buridan on Substance in His Commentary (*Summulae*) on Aristotle's *Categories*." In *Signs and Signification. Vol. I*, edited by Gill, Harjeet Singh and Manetti, Giovanni, 85-99. New Delhi: Bahri Publications.

    "As a master of arts John Buridan commented on Aristotle's logic. The *quaestiones,* in which specific problems are discussed in the traditional medieval form, are more elaborate and detailed commentaries.

    One of Aristotle's text to *be* commented are the *Categories (Praedicamenta)*. The *Quaestiones in Praedicamenta* have been edited recently by J. Schneider (München, 1983); I have prepared a critical edition of Buridan's commentary *(summulae)* on the same work, which is due to appear soon. This edition is part of an intemational project, of which it is the intention to issue the first complete edition of Buridan's *Summulae,* which contains eight treatises, supplemented with a new edition of his *Sophismata*.

    In the present contribution I shall give an analysis of Buridan's commentary on the category of substance. Before entering this subject, I shall make some remarks on the general nature of the work. This contribution is practically the same as a part of the Introduction to my forthcoming edition." p. 85

    "4. A summary of the Contents

    Buridan starts with a discussion on *aequivocatio, univocatio* and *denominatio*. Sometimes, he says, *aequivocatio* is attributed to a *word* having signification, sometimes to *things*

signified. Here (3.1.1.) Buridan attributes *aequivocatio* to things as far as they are signified equivocally by one and the same word. This signification is not matched by one concept *(ratio,* 3.1.2), but by two, or more, one for each thing. E.g. a dog, a star and a fish are signified by the word *canis* ('dog') that may have supposition for them under different concepts.

There is univocation when the several things signified are united, not only by a common designation, but also by a common definition. Buridan emphasizes (3.1.2) that both *equivocatio* and *univocatio* are on the level of conventional terms and propositions, and are *not* properties of *mental* terms and propositions.

Equivocation and univocation are mutually opposed in an exhaustive division. The third item of the *Antepraedicamenta,* denomination *(denominatio),* is different. For a term to be denominative it must satisfy both a morphological-cum-semantical criterion and a purely semantical one. First, (1.a) it must be a concrete term (a term signifying concrete entities), and (1.b) it must be morphologically related to the corresponding abstract term; *album* ('white [thing]') satisfies (1.a-b), having *albedo* ('whiteness') as its abstract counterpart. Second, (2) the term must have appellation. This, Buridan explains, means that it must 'evoke' or 'connote' some disposition which is extrinsic to the nature of that for which the term supposits. *Album* ('white [thing]') satisfies this condition; it may supposit, say, for a man, but it also connotes something which is extrinsic (nonessential) to man, namely whiteness. By contrast, *homo* ('man') only satisfies criteria (1.a-b); it is a concrete noun with a morphologically related abstract counterpart, viz. *humanitas*. Criterion (2) remains unsatisfied because humanity is essential to all supposits of *homo* and thus cannot fulfil the role of an extrinsic disposition connoted by the term." p. 91 (notes omitted).

"John Buridan was a remarkable and courageous man. Remarkably consistent. He almost invariably says the same about the same things, and what he says about one subject is usually consistent with what he says about any other somehow related subject. His works abound in cross-references, from one part of a work to another, and from one work to another. He obviously wanted his readers to think of his philosophical works as one coherent corpus presenting one coherent philosophy. Perhaps this ought to scare the historian away from an attempt to interpret Buridan on the basis of one work. But, on the other hand, the fact that he very rarely disagrees with himself and the fact that he repeats his basic tenets in every work make it possible to reconstruct the essentials of Buridanian philosophy without using all available sources, in particular because his pen was as sharp as his mind. His prose possesses to an eminent degree the virtue of clarity. This paper is based on treatise 8 of his *Summulae*, or Handbook of Logic. As subsidiary sources I have used the remaining part of the *Summulae* and his *quaestiones* on the *Prior* and *Posterior Analytics* and on the *Metaphysics*.

The very existence of treatise 8 of the Summulae demonstrates that Buridan was a man of courage. Treatises 1-7, which deal with 1) terms and propositions, 2) predicables, 3) categories, 4) supposition, 5) syllogistic, 6) topics and 7) fallacies, all have models in earlier literature which helped him structure his work. Treatise 8 has no known predecessor. The subject is 'Division, Definition and Demonstration'. Treatise 8 is the longest treatise of all, and demonstration is the subject that takes up most space by far.

It lakes a bold man to write a summulistic treatise on a subject not thus treated by this predecessors. It requires extra courage when one is Buridan, for the subject is that of Aristotle's *Posterior Analytics*. Is the universalism of the *Posterior Analytics* compatible with Buridanian mentalism and particularist ontology? II might seem not, but a professor from

the fourteenth century could not neglect or reject Aristotle's treatment of a broad and important philosophical topic.

(...)

Buridan proceeds like people who renovate old uninhabitable houses. He keeps an Aristotelian facade, but changes the interior so that it fits his purposes. The titles of the ten chapters on demonstration look old-fashioned and Aristotelian. They are: 8.3 "On the questions about which knowledge is obtainable and on knowledge preceding demonstration"; 8.4 "On the affinity and difference between demonstrations and dialectical arguments, and between knowledge and opinion; 8.5 "On the indemonstrable principles of demonstration"; 8.6 "On 'being said of all and in itself 'and on 'universal 'or 'qua itself ' "; 8.7 "On various classifications of demonstrations"; 8.8 "On 'demonstration because of ' "; 8.9 "On 'demonstration that' and whether demonstration may be circular"; 8.10 "On demonstration 'ad impossibile' "; 8.11 "On comparison of the different sorts of demonstration"; 8.12 "On how to settle each of the questions about which knowledge is obtainable". But this is just the facade behind which Buridan builds up his own doctrine of proof, applying a strongly biased interpretation to Aristotle's text." pp. 97-98.

20. Epstein, Richard. 1992. "A Theory of Truth Based on a Medieval Solution to the Liar Paradox." *History and Philosophy of Logic* no. 13:149-177.

    "In the early part of the 14th century Jean Buridan wrote a book called Sophismata. Chapter 8 of that deals with paradoxes of self-reference, particularly the liar paradox. Modern discussions of the liar paradox have been dominated by the formal analysis of truth of Tarski, and more recently of Kripke, and Gupta. Each of those either denies that the sentence 'What I am now saying is false' is a proposition, or denies that the usual laws of logic hold for such sentences. In Buridan's resolution of the liar paradox that sentence is a proposition, every proposition is true or false though not both, and the classical laws of logic hold.

In this paper I present a formal theory of truth based on Buridan's ideas as exposited by Hughes, contrasting it with the analyses of Tarski, Kripke, and Gupta. I believe that Buridan's ideas form the basis for the most convincing resolution of the liar paradox in a modern formal theory of truth.

I first survey the theories of Tarski, Kripke, and Gupta. Then I state the principles on which the Buridanian theory is based. After a brief description of how these principles are used in analyzing the truth-values of propositions, I set out the formal theory. Following that I discuss a number of examples in which the informal principles and the technical methods are explained and tested for their aptness; in those discussions I often draw on Buridan's explanations."

21. Fitzgerald, Michael J. 2006. "Problems with Temporality and Scientific Propositions in John Buridan and Albert of Saxony." *Vivarium* no. 44:305-337.

    "The essay develops two major arguments. First, if John Buridan's 'first argument' for the reIntroduction of *natural supposition* is only that the "eternal truth" of a scientific proposition is preserved because subject terms in scientific propositions supposit for all the term's past, present, and future significata indifferently; then Albert of Saxony thinks it is simply ineffective.

    Only the 'second argument', i.e., the argument for the existence of an '*atemporal copul*a', adequately performs this task; but is rejected by Albert. Second, later fourteenth-century criticisms of Buridan's *natural supposition*, given in certain *Notabilia* from the anonymous author in, Paris, BnF, lat. 14.716, ff. 40va-41rb, are nothing but an interpolated hodge-podge of criticisms given earlier in the century against various views of Buridan's by Albert of Saxony. It is this fact that makes Albert the real source of late fourteenth-century criticisms of Buridan's view of *natural supposition*.

    "

22. Flüeler, Christoph. 1999. "From Oral Lecture to Written Commentaries: John Buridan's Commentaries on Aristotle's

Metaphysics." In *Medieval Analyses in Language and Cognition. Acts of the Symposium: The Copenhagen School of Medieval Philosophy*, edited by Ebbesen, Sten and Friedman, Russell L., 497-521. Copenhagen: Royal Danish Academy of Sciences and Letters.

"*Summary*. This paper focuses on John Buridan's reported commentaries, especially on the oldest manuscripts, with the aim of finding new evidence regarding the process from oral lecture to written commentary. Six among the more than 250 manuscripts containing authentic works by Buridan were written in Paris during the philosopher's lifetime, and at least two of them show how the oral teaching of the Parisian master was converted into a written form. The *Expositions,* i.e. the literal commentaries, play an important role in these oldest manuscripts. These were understood as the foundation of the subsequently treated *Quaestiones,* and they had a fixed place in university teaching. The Parisian manuscript BN, lat. 16131 probably contains an original reportation (the original student's copy book) of both exposition of, and questions on, Aristotle's *Metaphysics*. The manuscript Darmstadt, Hessische LuHB, Hs. 561 contains a "compilated", i.e. revised, lecture on the same Aristotelian work, but not the final version as edited in 1518 by Josse Bade. The present study will examine the formal character of these different versions and their relation to one another."

23. Friedman, Russell L., and Ebbesen, Sten, eds. 2004. *John Buridan and Beyond. Topics in the Language Sciences, 1300-1700*. Copenhagen: Royal Danish Academy of Sciences and Letters.

    Contains papers of a symposium held by the Royal Danish Academy of Sciences and Letters in Copenhagen in September 2001.

    "Whereas the impressive contributions made by John Buridan (d. after 1358) to medieval logic and linguistics are widely recognized today, his influence in the later Middle Ages and Early Modern period remains largely uncharted, as indeed does the development of the language sciences more generally in

that period. The eight articles and the introductory essay collected in this volume explore topics in logico-linguistic theory from Buridan in the fourteenth century through Hobbes and Vico in the seventeenth and eighteenth. The focus of the articles range from grammar and logic to epistemology and philosophical psychology, and in nearly every case they demonstrate the impact of Buridan's ideas in the centuries following his death. Moreover, by investigating early modern thought against the backdrop of medieval ideas, the articles address the issue of the continuity or discontinuity of thought in this period on the border between medieval and modern, and indicate possible avenues of future research."

24. Geach, Peter. 1965. "A Medieval Discussion of Intentionality." In *Logic, Methodology and Philosophy of Science (Vol. 4)*, edited by Bar-Hillel, Yehoshua, 425-433. Amsterdam: North-Holland.

    "In this paper I shall critically examine the way a fourteenth-century logician, Jean Buridan, dealt with certain puzzles about intentional verbs. The class of verbs I shall be considering will all of them be expressions that can be completed into propositions by adding two proper names; the class will include, not only ordinary transitive verbs, but also phrases of the verb-preposition type like 'look for' or 'shoot at', and furthermore constructions like 'hopes-will be a better man than his father' or 'believes-to be a scoundrel', which turn into propositions as soon as we add mention of who hopes or believes this and about whom he does so. In modern grammar, the term 'a verbal' rather than 'a verb' is used for this wider class; following a suggestion of Professor Bar-Hillel, I adopt this term.

    In either or both of the proper-name places that go with such a verbal, it is possible, without destroying the, propositional structure (salva congruitate, as medieval logicians say), to substitute a phrase of some such form as 'some A' or 'every A' or 'the (one and only) A'; the letter 'A' here represents a simple or complex general term which is grammatically a noun or noun-phrase. The peculiarity of certain verbals that presently concern us comes out when such a phrase formed from a

general term stands in object position, in a construction 'b F'd an A' or the like. Consider for example the sentence 'Geach looked for a detective story'. This sentence is ambiguous : in ordinary conversation we might successfully resolve the ambiguity by asking the question 'Was what Geach was looking for a particular detective story, or was it just a detective story?' It is an odd psychological fact that this question would convey the intended distinction of meanings; for logically the words of the question leave it wholly obscure what is intended. After all, nothing in this world or in any possible world could be "just a detective story" without being "a particular detective story"; and even if such an individuum vagum could somehow have being, Geach could not read it, so it certainly is not what he looked for." p. 425

"In a way parallel to the Buridan convention we may distinguish between 'There is a poet whom both Smith and Brown admire' and 'Smith and Brown both admire the same poet'; the latter would cover the case where both Smith and Brown are victims of the same literary fraud as to the existence of a poet, as well as the more normal case where they both admire (say) Wordsworth's poetry. Let us use the expression 'AP' as short for 'admire as a poet someone conceived under the ratio evoked by'; then 'There is a poet whom both Smith and Brown admire' would come out as:

For some x, x is,a poet and, for some w, w is a description true just of x, and-both Smith and-Brown AP w

whereas 'Smith and Brown both admire the same poet', taken as conveying only intentional identity, would come out in the simpler form:

For some w, w is a definite description, and Smith and Brown both AP w.

Unfortunately, the line of solution we have been following leads us into difficulties. Suppose we use 'D'd' as short for the verbal 'dreamed of someone under the ratio expressed by'. Then in our present view we should have to paraphrase 'There is a red-head Harris dreamed of as:

For some x, x is a red-head and, for some w, w is a description true just of x, and Harris D'd w.

Now suppose we take w to be the description 'the fattest woman in the world': The paraphrase would be true if Harris dreamed of the fattest woman ili the 'world and the fattest woman in the world is in fact a redhead; but the propostion paraphrased might then quite well be false, because in Harris's dream there may have been no red-head, and the fattest woman he saw in his dream may have been as bald as an egg. (I owe this counter-example to my pupil Mr. David Bird) Similar difficulties arise for our account of intentional identify: for if c and d each worshipped something under the ratio expressed by 'the deity of the Sun', it does not follow that c and d both worshipped the same deity-c might be an ancient Egyptian worshipping the ancestor of Pharaoh, and d a Japanese worshipping the ancestress of the Mikado.

I hope this paper shows why modern logicians still need to take medieval logicians seriously. In great measure their problems are ours; while for some of them, like the problems of suppositio, modern logic provides adequate solutions, there are other problems, about modal and intentional contexts for example, that are still wide open; and the talent that was shown by medieval logicians in wrestling with their problems demands our deepest admiration." pp. 432-433

    "This paper will be almost wholly expository. My aim in it is to give an outline, though I fear a very incomplete one, of the system of modal logic developed by one of the greatest of mediaeval logicians, the 14th century French philosopher John Buridan. I shall base my account on two of his logical works. One is his *Consequentiae,* a work on inferences in general, about a third of which is devoted to modal logic. There is an excellent modern edition of this work by Hubert Hubien, in the Introduction to which Hubien argues, to my mind convincingly,

that it was written about 1335. The other is his lengthy and comprehensive work on logic, the *Summulae de Dialectica,* which contains two substantial sections on modal logic. There are serious problems involved in dating this work, but I shall not try to discuss these here. Most of it, including all the modal material, still exists, unfortunately, only in manuscript form. The modal material is arranged differently in these two works, each is fuller than the other on certain topics, and there are a few discrepancies between them on points of detail; but substantially they present the same ideas, and for the most part I shall not try to distinguish between them here." p. 93

35. Karger, Elizabeth. 1984. "Un Débat Médiéval Sur Le Concept De Sujet D'un Énoncé Catégorique. Étude D'un Texte De Jean Buridan." In *Preuve Et Raisons À L'université De Paris. Logique, Ontologie Et Théologie Au Xive Siècle*, edited by Kaluza, Zénon and Vignaux, Paul, 111-125. Paris: Vrin.

    "Le présent essai porte sur quelques pages du *Traité des suppositions* (1) de Jean Buridan. Dans ces pages, l'auteur présente un débat portant sur l'identification du sujet d'énoncés catégoriques (2) dont le terme initial est à un cas dit "oblique", c'est-à-dire autre que le nominatif (3). Selon certains logiciens -- que Buridan ne nomme pas --, c'est ce terme à un cas oblique qui est le véritable sujet de l'énoncé; selon l'auteur, au contraire, le sujet ne peut être qu'un terme au nominatif.

    Un des exemples discutés est le suivant:

    (1) *Cuiuslibet hominis asinus currit*.

    Selon l'analyse récusée par Buridan, 'hominis ' est le sujet de cet énoncé, alors que, selon l'auteur, le sujet de (1) est 'hominis asinus' et "principalement" (4) 'asinus'.

    D'aucuns jugeront peut-être que l'intérêt de ce débat réside dans l'occasion qu'il fournit de mettre en évidence la difficulté de la tâche à laquelle s'est épuisée la logique scolastique -- tâche

qui aurait consisté à remédier aux insuffisances de la logique aristotélicienne.

Tel cependant n'est pas notre propos principal. Notre objectif dans l'étude de ce texte, fut de découvrir plutôt les divergences doctrinales en raison desquelles les théoriciens en présence proposent, pour les énoncés concernés, des analyses aussi différentes, et en particulier de dégager ce qui rend incompatibles *les deux concepts de sujet* présupposés par l'une et l'autre des positions adverses.

Nous présentons donc ici les résultats de cette étude. Nous commencerons par exposer l'essentiel de l'argumentation par laquelle, d'après Buridan, ces logiciens anonymes défendent leur thèse ; nous serons ainsi en mesure de dégager les éléments principaux d'une certaine doctrine logico-grammaticale. Nous passerons en second lieu à l'examen des objections que Buridan oppose aux raisons de ses adversaires, découvrant à travers elles ainsi que dans la défense qu'il apporte à sa thèse propre, les caractéristiques d'une doctrine profondément différente de la première. Nous terminerons par une évaluation, du point de vue de leur mérite logique, des deux positions en présence." pp. 111-112.

    "John Buridan discussed the problem, whether it follows from the definition of the term 'animal' that all quantitative parts of an animal are to be called animals. His solution was that parts of the animal are to be called animals, though in a extraordinary, non-connotative, sense of the term. The problem was variously discussed by some later Buridanian authors from Erfurt. Bartholomaeus Arnoldi de Usingen ends up to deny the use of such terms as 'animal' and 'human being' as connotative terms. Jodocus Trutfetter, however, uses the distinction between the absolute and connotative senses of these terms without reservation."

Copenhagen: Royal Danish Academy of Sciences and Letters.

    "*Summary:* The aim of this paper is to explore the relationships between Buridan's logic and the ontology of modes *(modi)*. Modes, not considered to be really distinct from

absolute entities, could serve to reduce the ontological commitment of the theory of the categories, and thus they were to become ubiquitous in this role in late medieval and early modern philosophy. After a brief analysis of the most basic argument for the real distinction between entities of several categories ("the argument from separability"), I point out that despite nominalist charges to the contrary, "older realists" - that is, authors working before and around Ockham's time - were not committed to such real distinctions, and thus to an overpopulated ontology, by their *semantic* principles. However, what *did* entail such a commitment on their part, along with the argument from separability, was treating abstract terms in several accidental categories as "rigid designators", that is, essential predicates (species and genera) of their *supposita*. Therefore, although in the form of "extra-categorial" *modi essendi* modes were well established in earlier medieval thought, their appearance *within* the theory of categories was conditioned on analyzing several abstract terms in the accidental categories as non-essential predicates of their particulars, something that "older realists" would in general not endorse. (This does not mean that even "older realists" were universally committed to really distinct entities in all ten categories. See on this e.g. notes 13 and 18.) Next, I show how this type of analysis is achieved "automatically" by Buridan's theory of "eliminative" nominal definitions (in contrast to the older "non-eliminative" theory). However, since "realist" semantic principles in themselves did not yield a commitment to really distinct entities in all categories, it was also open for later "realists" to operate with not-really-distinct modes in several categories, although using different, "non-nominalist" tactics to treat the abstract accidental terms signifying them as non-rigid designators. The conclusion of the paper is that, as a consequence, both nominalist and later "realist" thinkers were able to achieve the same degree of ontological reductions in their respective logical frameworks, and so it was not so much their ontologies as their different logical "tactics" that set them apart."

    "This paper argues for two principal conclusions about natural language semantics based on John Buridan's considerations concerning the notion of formal consequence, that is, formally valid inference. (1) Natural languages are essentially semantically closed, yet they do not have to be on that account inconsistent. (2) Natural language semantics has to be token based, as a matter of principle. The paper investigates the Buridanian considerations leading to these conclusions, and considers some obviously emerging objections to the Buridanian approach."

    "To many contemporary philosophers, the phrase "essentialist nominalism" may appear to be an oxymoron. After all, essentialism is the doctrine that things come in natural kinds characterized by their essential properties, on account of some common nature or essence they share. But nominalism is precisely the denial of the existence, indeed, the very possibility of such shared essences. Nevertheless, despite the intuitions of such contemporary philosophers, John Buridan was not only a

thoroughgoing nominalist, as is well-known, but also a staunch defender of a strong essentialist doctrine against certain skeptics of his time. But then the question inevitably arises: could he consistently maintain such a doctrine?

In the following discussion I will first examine Buridan's essentialism to show why he could reasonably think that he can both adhere to his nominalist metaphysics and endorse a version of essentialism that can serve as the foundation of genuine scientific knowledge in the strong Aristotelian sense.

In the subsequent section I will argue that on the basis of his logical theory of essential predication Buridan is definitely able to maintain a version of essentialism that is sufficient to provide the required foundation of valid scientific generalizations, and to refute skeptical doubts against the possibility of such a foundation.

Next, I will examine the question whether Buridan's solution is consistent with the broader context of his logic and epistemology. In this section I will argue that although Buridan's logical theory is consistent with his nominalist essentialist position, his cognitive psychology is not. In particular, I will argue that Buridan's abstractionist account of how we acquire our simple substantial concepts is incompatible with his account of the semantic function of absolute terms subordinated to these concepts.

Finally, I will draw some general conclusions from this discussion concerning the relationships between metaphysical essentialism and the philosophy of mind and language." (notes omitted)

Martinus Nijhoff.

"Here is a recipe for ontology. First divide the expressions of one's language into those which purport to pick things out and those which don't. Then see whether some of those which purport to pick things out can be defined in terms of others. Finally admit into your ontology whatever an undefinable term purports to pick out. This scheme expresses (though vaguely and incompletely) one of the central intuitions behind many ontological programmes. What is admitted by an ontologist operating within this framework will depend, of course, upon how he or she divides expressions, on what resources of definition are available, and, perhaps, on pressures from other theories. What I hope to do in this paper is to show the influence of the intuition behind this sketch on the work of the fourteenth century Parisian master Jean Buridan.

To some extent, I shall compare Buridan's views with those of his contemporary, William Ockham. In doing so, I hope both to present Buridan's own very striking contributions to ontology and to shed a little light on the inner life of 14th century nominalism." (p. 189).

11. Novaes, Catarina Dutilh. 2004. "The Buridanian Account of Inferential Relations between Doubly Quantified Propositions: A Proof of Soundness." *History and Philosophy of Logic* no. 25:225-243.

"On the basis of passages from John Buridan's *Summula Suppositionibus* and *Sophismata*, E. Karger has reconstructed what could be called the 'Buridanian theory of inferential relations between doubly quantified propositions', presented in her 1993 article 'A theory of immediate inference contained in Buridan's logic'. In the reconstruction, she focused on the syntactical elements of Buridan's theory of modes of personal supposition to extract patterns of formally valid inferences between members of a certain class of basic categorical propositions. The present study aims at offering semantic corroboration -- a proof of soundness -- to the inferential relations syntactically identified by E. Karger, by means of the analysis of Buridan's semantic definitions of the modes of

personal supposition. The semantic analysis is done with the help of some modern logical concepts, in particular that of the model. In effect, the relations of inference syntactically established are shown to hold also from a semantic point of view, which means thus that this fragment of Buridan's logic can be said to be sound."

12. ———. 2005. "Buridan's *Consequentia*: Consequence and Inference within a Token-Based Semantics." *History and Philosophy of Logic* no. 26:277-297.

    "I examine the theory of *consequentia* of the medieval logician, John Buridan. Buridan advocates a strict commitment to what we now call proposition-tokens as the bearers of truth-value. The analysis of Buridan's theory shows that, within a token-based semantics, amendments to the usual notions of inference and consequence are made necessary, since pragmatic elements disrupt the semantic behavior of propositions. In my reconstruction of Buridan's theory, I use some of the apparatus of modern two-dimensional semantics, such as two-dimensional matrices and the distinction between the context of formation and the context of evaluation of utterances."

13. ———. 2005. "In Search of the Intuitive Notion of Logical Consequence." In *The Logica Yearbook 2004*, edited by Behounek, Libor, 109-123. Prague: Filosofia.

    "After decades of predominant focus on the notion of logical truth, the debate on the concept of logical consequence among philosophers and logicians was re-ignited by J. Etchemendy's book *The Concept of Logical Consequence* (1990). His main tenet was that the model-theoretic notion of logical consequence did not capture adequately the corresponding intuitive notion. One of Etchemendy's central claims was that the intuitive notion could be understood essentially from two different perspectives, one representational and one interpretational - and that the model-theoretic notion failed to match either.

    Some years ago, S. Shapiro (1998) sought to vindicate the model-theoretic notion of logical consequence; one of his arguments was that the dichotomy

representational/interpretational notion of logical consequence was in a certain way infelicitous, since, according to him, a faithful rendering of the intuitive concept would have to have elements of both notions. Clearly, the resolution of issue as to whether the model-theoretic notion correctly captures the intuitive notion presupposes an at least minimally adequate characterization of this intuitive notion. Shapiro claimed that

Etchemendy hadn't really provided such a characterization (1), and attempted to formulate one himself. He further claimed that, thus characterized, the intuitive notion was indeed correctly captured by the model-theoretic notion (albeit with some adjustements). (2)

In this paper, I do not discuss Shapiro's defense of the model-theoretic notion; rather I examine his contention that the best rendering of the intuitive notion of logical consequence is what he called the 'conglomeration' notion, that is, the hybrid notion that combines both the representational and the interpretational view on consequence. More specifically, I claim that such a hybrid view was held by the medieval logician John Buridan (Cf. Hubien, *Iohannis Buridani tractatus de consequentiis,* 1976), and that this fact offers significant historical support to Shapiro's version of the intuitive concept of (logical) consequence."

(1) Cf. Stewart Shapiro 'Logical consequence: models and modality'. In Matthias Schirn (ed.), *Philosophy of Mathematics Today*. Oxford, Oxford University Press, 1988, pp. 131-156. p.143.

(2) 'My claim is that model-theoretic consequence can be made into a good model of this notion [the 'hybrid' intuitive notion of logical consequence] and that both the intuitive notion so characterized and its mathematical model are useful tools for shedding light on the normative/modal/semantic notion of correct reasoning in natural language, the target of logic.' (Shapiro 1998, 148)

14. ———. 2009. "Lessons on Sentential Meaning from Mediaeval Solutions to the Liar Paradox." *Philosophical Quarterly* no. 59:682-704.

"Fourteenth-century treatises on paradoxes of the liar family, especially Bradwardine's and Buridan's, raise issues concerning the meaning of sentences, in particular about closure of sentential meaning under implication, semantic pluralism and the ontological status of 'meanings', which are still topical for current theories of meaning. I outline ways in which they tend to be overlooked, raising issues that must be addressed by any respectable theory of meaning as well as pointing in the direction of possible answers. I analyse a Bradwardinian theory of sentential meaning as it emerges from his treatment of liar sentences, exploring where it requires more thorough elaboration if it is to be a fully developed theory of sentential meaning. "

18. Perini-Santos, Ernesto. 2008. "John Buridan on the Bearer of Logical Relations." *Logica Universalis*:59-70.

    "According to John Buridan, the time for which a statement is true is underdetermined by the grammatical form of the sentence - the intention of the speaker is required. As a consequence, truth-bearers are not sentence types, nor

sentence tokens plus facts of the context of utterance, but statements. Statements are also the bearers of logical relations, since the latter can only be established among entities having determined truth-conditions. This role of the intention of the speaker in the determination of what is said by an utterance is not isolated in medieval semantics."

19. ———. 2011. "John Buridan's Theory of Truth and the Paradox of the Liar." *Vivarium* no. 49:184-213.

    "The solution John Buridan offers for the Paradox of the Liar has not been correctly placed within the framework of his philosophy of language. More precisely, there are two important points of the Buridanian philosophy of language that are crucial to the correct understanding of his solution to the Liar paradox that are either misrepresented or ignored in some important accounts of his theory. The first point is that the Aristotelian formula, 'propositio est vera quia qualitercumque significat in rebus significatis ita est', once amended, is a correct way to talk about the truth of a sentence. The second one is that he has a double indexing theory of truth: a sentence is true in a time about a time, and such times should be distinguished in the account of the truth-conditions of sentences. These two claims are connected in an important way: the Aristotelian formula indicates the time about which a sentence is true. Some interpreters of the Buridanian solution to the paradox, following the lead of Herzberger, have missed these points and have been led to postulate truth-values gaps, or surrogates of truth-value gaps, when there is nothing of this sort in his theory. I argue against this tradition of interpretation of Buridan and propose an interpretation of his solution to the Liar."

20. Perreiah, Alan R. 1972. "Buridan and the Definite Description." *Journal of the History of Philosophy* no. 10:153-160.

    "Previously unpublished commentaries by Buridan on Aristotle's *Physics* (Book I, Question X) and *Metaphysics* (Book VII, Question XX) are examined in order to determine whether the 14th-century philosopher and logician anticipated a theory of descriptions. The writings show that Buridan's distinctions

between singular and common concepts parallels Russell's between knowledge by acquaintance and by description. Basic features of determinate concepts are studied, particularly those of existence and identity. Buridan's treatment of these matters shows that: (a) he had all of the concepts needed to analyze the iota-operator (b) he was sensitive to the restriction that predication involving unquoted descriptive phrases presuppose that existence and identity requirements are met and (c) he appreciated the peculiar behavior of determinate concepts in logical inference. Buridan's theory of concepts is applied to some problematic expressions in direct discourse."

24. Priest, Graham, and Read, Stephen. 2004. "Intentionality: Meinongianism and the Medievals." *Australasian Journal of Philosophy* no. 82:421-442.

    "Intentional verbs create three different problems: problems of nonexistence, of indeterminacy, and of failure of substitutivity.

    Meinongians tackle the first problem by recognizing nonexistent objects; so too did many medieval logicians. Meinongians and the medievals approach the problem of indeterminacy differently, the former diagnosing an ellipsis for a propositional complement, the latter applying their theory directly to non-propositional complements.

The evidence seems to favor the Meinongian approach. Faced with the third problem, Ockham argued bluntly for substitutivity when the intentional complement is non-propositional; Buridan developed a novel way of resisting substitutivity. Ockham's approach is closer to the Meinongian analysis of these cases; Buridan's seems to raise difficulties for a referential semantics. The comparison between the Meinongian and medieval approaches helps to bring out merits and potential pitfalls of each."

25. Read, Stephen. 2002. "The Liar Paradox from John Buridan Back to Thomas Bradwardine." *Vivarium* no. 40:189-218.

    "My aim is to counter recent infatuation with John Buridan's analysis in his *Sophismata* (circa 1356-7) of the liar paradox and other insolubles, and show not only how he derived his solution from Thomas Bradwardine's *Insolulibilia* (circa 1324), but how he altered it for the worse. Buridan was a great logician and philosopher. He was careful, methodical and had a great influence on succeeding generations. But his analysis of the liar paradox was flawed. It introduced an ad hoc supplement to the truth-conditions of just those propositions which induce paradox to prevent the contradiction from arising. What was really clever in his analysis, and attracted the attention of, among others in recent decades, Moody, Prior and Hughes, was in fact derived from Bradwardine, in whose hands it was dealt with both consistently and successfully. By all the historical evidence, Bradwardine's proposal was an original insight. On analysis, it is seen to be a great and instructive one, too."

26. ———. 2012. "John Buridans's Theory of Consequence and His Octagon of Opposition." In *Around and Beyond the Square of Opposition*, edited by Béziau, Jean-Yves and Jacquette, Dale, 93-110. Baserl: Birkhäuser.

    "One of the manuscripts of Buridan’s *Summulae* contains three figures, each in the form of an octagon. At each node of each octagon there are nine propositions. Buridan uses the figures to illustrate his doctrine of the syllogism, revising Aristotle’s theory of the modal syllogism and adding theories of syllogisms with propositions containing oblique terms (such as ‘man’s

donkey') and with propositions of "non-normal construction" (where the predicate precedes the copula). O-propositions of non-normal construction (i.e., 'Some S (some) P is not') allow Buridan to extend and systematize the theory of the assertoric (i.e., non-modal) syllogism. Buridan points to a revealing analogy between the three octagons. To understand their importance we need to rehearse the medieval theories of signification, supposition, truth and consequence."

28. Rijk, Lambertus Marie de. 1976. "On Buridan's Doctrine of Connotation." In *The Logic of John Buridan. Acts of the Third European Symposium on Medieval Logic and Semantics, Copenhagen 16-21 November 1975*, edited by Pinborg, Jan, 91-100. Copenhagen: Museum Tusculanum.

    Reprinted as chapter XI in: Through language to reality: studies in medieval semantics and metaphysics.

    "Mediaeval Terminist logic was concerned with the so-called properties of terms (proprietates terminorum), to the extent that it not only studied the formal structures of Latin language, its logical syntax, and all kinds of specifications within this scope, but also interpreted the linguistic elements and structures. This interpretation mainly focussed on what the moderns would call semantics rather than on formal logic as such. The properties of terms (significatio, appellatio, suppositio and its various forms: ampliatio, restrictio, distributio) were investigated in their relation to the so-called res extra animam (extra-mental reality).

    Two statements can be made. First: Who wants to detect a Mediaeval thinker's implicit ontological points of view, finds a wealth of firm evidence in his doctrine of the properties of terms. Secondly: Within the domain of these properties it is Buridan's appellatio that has a very interesting role because of its affinity with the modern concept of connotation. So Buridan's appellatio is entitled to have the attention of both the historians of Mediaeval thought and learning as of those

modern logicians who do not want to seclude themselves from the historical background of modern doctrines.

My approach to the matter concerned now is to compare Buridan's appellatio with modern connotation, more specifically to put the translation 'connotation' for Buridan's appellatio to the test." p. 91

29. ———. 1992. "John Buridan on Universals." *Revue de Métaphysique et de Morale* no. 97:35-59.

"It is common knowledge that Plato strongly believed that, in order to explain the nature of whatever is (either things or states of affairs, including Man and his environment), the assumption of Transcendent Universal Forms is indispensable. In his view, these universal Forms are the ontic causes of each and every sublunary entity, which all owe their being to their sharing in these Forms. Consequently, everyone who is in want of firm knowledge *(episteme)* about, the things of the outside world is bound to direct his attention to the transcendent domain of the universal Forms'.

However, Plato was the first to recognise, and seriously deal with, the objections that can be raised to this doctrine. These objections mainly concern the status (and the dignity, however modest) of our transient world and, above all, the possibility to obtain, true knowledge of this world as *it stands,* in its ever-changing nature, that is." p. 35

(...)

"To be sure, the Medievals all rejected the Platonic Ideas taken as separate substances and they adhered to the Aristotelian common sense principle that only individuals have independent existence. Nevertheless, they were still under the spell of the status of «universal being» as the indispensable basis of true knowledge.

Marylin McCord Adams has analysed some early fourteenth century solutions to the problem of universals (Scotus, Ockham, Burley and Harclay) (*). In McCord's article Buridan's view of the matter is left out of consideration. Quite understandably so, since Buridan's solution to the problem

differs considerably from the sophisticated arguments given by his contemporaries. Buridan seeks.for a solution in analysing the several ways of human understanding. In directing his attention to the propositional attitude involved in the cognitive procedure Buridan is remarkably close to the ingenious solution Peter Abelard had come up with two centuries earlier. In the next *sections* I shall give an outline of Abelard's treatment of the question of universals followed by an analysis of Buridan's discussion of the matter (as found in his commentary on the *Metaphysics* and elsewhere)." p. 37

(...)

"We may conclude, then, that two bright logicians of the Parisian tradition have come up with quite an ingenious solution to the problem of universals. Both of them started out from the firm conviction that nothing exists but particulars. Nevertheless, they apparently were not satisfied with purely extensional solutions as brought forward by Oxford logicians such as Heytesbury and Ockham. Maybe extensionalists are out to show how people *ought* to think. Abelard and Buridan, however, were especially interested in the various ways of conceiving we *actually* use in daily life, in our attempts to conceptually deal with the outside world." p. 59

(*) "Universals in the early Fourteenth century" in *Cambridge History of Later Medieval Philosophy, from the rediscovery of Aristotle to the desintegration of Scholasticism 1100-1600* pp. 411-439.

30. ———. 1993. "On Buridan's View of Accidental Being." In *John Buridan: A Master of Arts. Some Aspects of His Philosophy. Acts of the Second Symposium Organized by the Dutch Society for Medieval Philosophy Medium Aevum on the Occasion of Its 15th Anniversary*.

Leiden-Amsterdam (Vrije Universiteit), 20-21 June, 1991., edited by Bos, Egbert Peter and Krop, Henri A., 41-51. Nijmegen: Ingenium Publishers.

"One of the most striking characteristics of late medieval metaphysics is the upgrading of 'accidental being'. The strict

opposition between *'esse per se'* and *'esse per accidens',* which had been of paramount importance ever since Aristotle, has lost its relevance in the ontological discussions of the fourteenth century. The status of 'accidental being' came rather close to that of 'substantial being'. In the views of philosophers such as Ockham and Buridan (not to mention thinkers like Crathorn) the nature of 'accidental being' (or rather 'quantitative and qualitative being') can no longer be properly defined in terms of ontological dependency upon substance. In other words, '*per se* subsistence' is assigned not only to substance but to 'accidental being' as well.

In the present contribution I will illustrate this development by discussing some of Buridan's expositions in his *Questiones* commentary on Aristotle's *Metaphysics (IV,* q. 6 and VII, q. 3-4)." p. 41

    Miscellanea Mediaevalia, vol. 22/1.

    "As is well-known, two subjects are distinctive of the fourteenth century theory of cognition, namely *'certitudo'* and *'evidentia'*. It is true, thirteenth century philosophers, such as Thomas Aquinas, were also concerned with certitude and evidentness as indispensable requisites for 'true knowledge' *('scientia').* However, until the end of the thirteenth century certitude and evidentness were not prominent in the discussions about the cognitive procedure nor were they treated as separate matters, requiring separate attention. In Thomas Aquinas for example, the conviction that man is really capable of grasping the truth with certainty is really constitutive of his philosophical (and theological) thought and praxis (*)', or to speak with J. A. Aertsen, of 'Thomas' way of thought'.(**) This, however, does not alter the fact that in Aquinas' philosophy 'certitudo' is not highlighted as such, and the specific role of 'evidentia' is even virtually ignored.

Buridan's theory of cognition, on the contrary, clearly focusses on the ingredients *'certitudo'* and *'evidentia',* and, within this framework, on the notion of *'assensus'*. In the present paper I aim to elucidate the role of this key notion of John Buridan's theory of cognition."

    "Paradoxes similar to that of Epimenides the Cretan are present in the highly developed logic of the Late Medieval period. These "sophisms" were known as the "impossibilia" or "insolubilia." an interpretation is given of the analysis of "every proposition is false" which is to be found in the *Sophismata* of John Buridan."

35. ———. 1960. "A Chimera Is a Chimera: A Medieval Tautology." *Journal of the History of Ideas* no. 21:273-278.

    "Rejection of the truth of a tautology containing a fiction reveals something of the complexity of the Terminist logic of the late Middle Ages. The analysis of "a chimera is a chimera," to be found in the *Sophismata* of the Fourteenth century logician John Buridan, involves a theory of signs and an interpretation of logical truth."

36. Schönberger, Rolf. 1994. *Relation Als Vergleich. Die Relationstheorie Des Johannes Buridan Im Kontext Seines Denkens Und Der Scholastik*. Leiden: Brill.

    "All central concepts in philosophy contain a relational aspect. The type of reality to be accorded to relations is for this reason one of the core questions of philosophical thought. This is particularly so in the case of nominalism.

    This book is devoted to John Buridan. While his towering importance in the late Middle Ages and for the development of early modern science has been recognised, his works are still not really well known. How does his theory of relations relate to those of his contemporaries, for example William of Ockham or Gregory of Rimini? The question of the reality of relations is not only of interest as an "experimentum crucis of nominalism, but also because Buridan in his ethics frequently falls back upon older traditions.

    The first part of the book contains a discussion of theories of relation from Thomas Aquinas to Gregory of Rimini. The author then offers an exhaustive presentation of the basic lines of Buridan's philosophy and its relation to theology, before turning attention to his theory of relation. Finally he addresses particular forms of relation (identity, analogy, causality, etc.)."

38. Sylla, Edith Dudley. 2009. "John Buridan and Critical Realism." *Early Science and Medicine* no. 14:211-247.

    "In this paper I examine what John Buridan has to say in his *Quaestiones in Analytica Posteriora* relevant to the subalternate mathematical sciences, particularly astronomy. Much previous work on the scholastic background to the Scientific Revolution relies on texts that were written in the late sixteenth or seventeenth centuries. Here I am interested in texts that might reflect the context of Copernicus, and, in

particular those before 1500. John Buridan and Albert of Saxony were fourteenth century authors influential in Cracow in the fifteenth century, whose conception of science may be characterized as "critical realism." Their view would support the autonomy of astronomy, as well as the idea that sciences may progress over time."

40. Thijssen, Johannes M.M.H. 1987. "Buridan on the Unity of a Science. Another Chapter in Ockhamism?" In *Ockham and Ockhamists. Acts of the Symposium Organized by the Dutch Society for Medieval Philosophy Medium Aevum on the Occasion of Its 10th Anniversary (Leiden, 10-12 September 1986)*, edited by Bos, Egbert Peter and Krop, Henri A., 93-105. Nijmegen: Ingenium Publishers.

    "In an article that appeared in 1974, A.A. Maurer traced the contemporary notion of science as a body of knowledge to the 13th and 14th centuries. One may doubt Maurer's suggestion that the development of the notion of science as a body of knowledge is another chapter in the eclipse of Thomism during the Late Middle Ages. Nevertheless he has certainly pointed out an important change in the notion of the unity of a science which took place in the Later Middle Ages (2).

    Within the spectrum of medieval opinions on the unity of a science, Maurer was of the opinion that the extreme positions were represented by Thomas Aquinas and William of Ockham. The purpose of this paper is to determine the position of John Buridan in the debate on the unity of a science. Because Buridan is generally pictured as an 'Ockhamist', a comparison will be made between the essentials of Buridan's and Ockham's theory of science. Apart from their views on the unity of a science, these essentials also include their views on the immediate object of scientific knowledge in general. In this comparison, priority will be given to Buridan's theory of science, for in contradistinction to Ockham's texts, his texts on

this subject are not yet available in a modern edition. Besides, some aspects of Ockham's theory of science which will be touched upon here, have already been studied (3). So, Ockham's philosophy of science will more serve as general background for the presentation of Buridan's opinions (4).

This presentation will be rounded off with some brief remarks on the vexed question as to whether it really makes sense to designate Buridan as an Ockhamist."

(2) A.A. Maurer, 'The Unity of a Science. St. Thomas and the Nominalists' in: *St. Thomas Aquinas 1274-1974*, p. 275 and already in 'Ockham's Conception of the Unity of Science' in: *Mediaeval Studies* 20 (1958), pp. 100-101 and p. 104. A. Zimmermann, *Ontologie oder Metaphysik?* Leiden - Kean 1965, p. 353 has arrived at the same conclusions with regards to the change that took place in the notion of the unity of a science. This change is also documented in Spade, 'The Unity of Science according to Peter Auriol' in: Franciscan Studies 32 (1972).

(3) Especially in Maurer, 'Ockham's Conception of the Unity of Science', and 'The Unity of a Science. St. Thomas and the Nominalists'. See further Goddu, The Physics of William of Ockham, Leiden - KOln 1984, pp. 23-27.

(4) Some aspects of Buridan's theory of the unity of a science are discussed in Zimmermann, *Ontologie oder Metaphysik*, pp. 339-348, but he confines himself exclusively to a presentation of some passages taken from Buridan's *Commentary on the Metaphysics*. He does not provide a real analysis of Buridan's position, and besides, he does not draw attention to the differences that exist between Buridan's and Ockham's theories.

    "In this paper we look at the suitability of modern interval-based temporal logic for modeling John Buridan's treatment of tensed sentences in his Sophismata. Building on the paper [Øhrstrøm, P., Buridan on interval semantics for temporal logic. *Logique et Analyse* 106: 211-215, 1984], we develop Buridan's analysis of temporal logic, paying particular attention to his notions of negation and the absolute/relative nature of the future and the past.

    We introduce a number of standard modern propositional interval temporal logics (ITLs) to illustrate where Buridan's interval-based temporal analysis differs from the standard modern approaches. We give formal proofs of some claims in [Øhrstrøm 1984], and sketch how the standard modern systems could be defined in terms of Buridan's proposals, showing that his logic can be taken as more basic."

47. Yrjönsuuri, Mikko. 2008. "Treatments of the Paradoxes of Self-Reference." In *Mediaeval and Renaissance Logic*, edited by Gabbay, Dov and Woods, John, 579-606. Amsterdam: Elsevier.

    Handbook of the history of logic: Vol. 2.

    On Buridan see pp. 600-606.

    "John Buridan's massive textbook of logic *Summulae de Dialectica* ends with a collection of sophisms, seemingly as a section containing exercises. The last set in this collection deals with self-referential propositions and thus also with insolubles.

    This is not the only location where Buridan discusses paradoxes of self-reference, but it is perhaps the most accessible one. The textbook as a whole was widely used for several centuries, but no other section in it is directly dedicated to self-reference." p. 600 (note omitted)

    "If compared to Bradwardine's work, Buridan's discussion of the insolubles does not appear very ingenious and original. He wavers and leaves room for doubt, allowing the reader to get the feeling that his solution is sketchy. The work is, however, clearly on a very advanced logical level and the problems obviously result from difficulties in the subject matter. Given the extremely wide circulation of Buridan's *Summulae*, it is very understandable that his solution achieved a very high reputation and a wide influence in the coming centuries." pp. 605-606

Proceedings of the Eight International Congress of Medieval Philosophy (Siepm), Helsinki, 24-29 August 1987*, edited by Asztalos, Monika, Murdoch, John Emery and Niiniluoto, Ilkka, 393-403. Helsinki: Acta Philosophica Fennica.

    Vol. II.

"For the nominalist, the claim that the mind can cognize universally, or that its thoughts can range over non-individual objects such as 'human being', or 'whiteness', requires further explanation. What is it that happens, psychologically speaking, when I cognize universally? Given the standard assumption of nominalist ontologies that the world contains no non-individual entities, what status do the objects of universal thought have, and how do they come to be entertained?

There are two distinct questions here: one semantic, asking how a mental act can mean something universal, and the other psychological, asking about the genesis of universal thoughts. Aristotle's answer to the second can be found in De memoria, where he says, "... someone who is thinking, even if he is not thinking of something with a size, places something with a size before his eyes, and thinks of it not as having a size;" (1) thus, the intellect thinks of what is common or universal, such as triangularity, by an effort of abstraction from what is determinate or particular - triangles having physical dimensions. (2) His answer to the first can be reconstructed from his famous remark in De anima that "in the case of objects which involve no matter, what thinks and what is thought are identical." (3)3 The identity in question is formal - thinking is, like perceiving, defined as the sort of change in which form is received without matter - and so what makes my thought of triangularity a thought of that universal is my intellect becoming triangularity formally. But does this mean that there is something universal in my mind whenever I think universally?" (p. 393)

"In conclusion, I think Buridan is for most part successful in reconciling his nominalistic world-view with the problem of how we think universally. The task for the nominalist is to explain our evident ability to cognize universally without postulating universals, either as products of abstraction or thought-objects. Buridan endeavours to steer clear of both these obstacles by on the one hand stipulating that the species by which we entertain a universal is itself singular, and on the other by treating the universality of thought as a function of the way in which concepts refer not to abstract concepts or entities,

but to individuals in the world. And although his account of concept-generation explains intellectual abstraction in such a way that its product still looks like a good candidate for a universal, we can tell a more suitable story without much difficulty. At least in this respcet, Buridan's psychology does not compromise his ontology." (p. 403).

Bibliography on the Medieval Commentaries on Aristotle's *De Interpretatione*

Bibliography

1. Adamson, Peter. 2006. "The Arabic Sea Battle: al-Fārābī on the Problem of Future Contingents." *Archiv für Geschichte der Philosophie* no. 88:163–188.

   Abstract: "Ancient commentators like Ammonius and Boethius tried to solve Aristotle's "sea battle argument" in *On Interpretation* 9 by saying that statements about future contingents are "indefinitely" true or false. They were followed by al-Farabi in his commentary on *On Interpretation*. The article sets out two possible interpretations of what "indefinitely" means here, and shows that al-Farabi actually has both conceptions: one applied in his interpretation of Aristotle, and another that he is forced into by the problem of divine foreknowledge. It also explains the relevance of al-Farabi's remarks as a link between the non-statistical modal theories of Philo and Avicenna."

   Supplementary volume 17 to Canadian Journal of Philosophy.

   "This paper compares the views of a number of Arabic and thirteenth-century Latin commentators on Aristotle's *Peri Hermeneias* on the status of logic as a linguistic art and its relation to grammar. The discussion considers the commentators' general positions on the logician's treatment of linguistic topics, and their attempts to reconcile the dual claim of logic to be both a linguistic and a rational art. These general principles are then traced through the treatment of a number of

particular themes in the *Peri Hermeneias's* linguistic sections: The definition of the noun,the cases of the noun, and the indefinite or infinite noun (i.e., of the form non-X). The article concludes that, although there are basic differences between the Latin and Arabic traditions stemming from the presence in the Latin world of a philosophical theory of grammar, authors in both traditions are adamant that a balance must be maintained between the linguistic and rational characterizations of logic."

"The majority of the twenty essays of the present volume were originally delivered at the Xth European Symposium on Medieval Logic and Semantics held at Nijmegen, 22 - 26 June, 1992, that was devoted to the tradition of Aristotle's *Peri hermeneias* in the Latin Middle Ages. Circumstances made it impossible to publish the proceedings immediately after the symposium. Since the editors were, nevertheless, aware that the material presented was extremely important for further studies on the history of medieval logic, semantics and philosophy of language, they decided, some time ago, to ask the contributors to update, revise or rewrite their essays in preparation for the publication of this collection. Although some authors have partially drawn on material found in this collection for publications elsewhere, most of the information contained in these essays remains new, including the many detailed descriptions and editions of unedited works that will constitute a greatly appreciated resource in the study of medieval philosophy."     "Ibn Sina's discussions of single expressions represent an expansion on Aristotle's brief treatment of the subject in his *De Interpretatione*.

    This expansion introduces ideas that have intrinsic logical interest, although, as we shall try to show, they are not secure against criticism.

    In Part I of what follows, a brief exposition of Ibn Sina's views on the nature of single expressions will be given. The exposition will include a discussion of the reasons why, according to Ibn Sina, the logician must first know single expressions, and the manner in which he must know them. Part 2 offers a closer look at the nature of single expressions, leading to a discussion of the signification of expressions. Some difficulties with Ibn

Sina's treatment of the signification of expressions are then pointed out and discussed." (p. 148)

28. ———. 2010. "Medieval Commentators on Future Contingents in *De Interpretatione* 9." *Vivarium.An International Journal for the Philosophy and Intellectual Life of the Middle Ages and Renaissance* no. 48:75–95.

    Abstract: "This article considers three medieval approaches to the problem of future contingent propositions in chapter 9 of Aristotle's *De interpretatione*. While Boethius assumed that God's atemporal knowledge infallibly pertains to historical events, he was inclined to believe that Aristotle correctly taught that future contingent propositions are not antecedently true or false, even though they may be characterized as true-or-false. Aquinas also tried to combine the allegedly Aristotelian view of

the disjunctive truth-value of future contingent propositions with the conception of all things being timelessly present to God's knowledge. The second approach was formulated by Peter Abelard who argued that in Aristotle's view future contingent propositions are true or false, not merely true-or-false, and that the antecedent truth of future propositions does not necessitate things in the world. After Duns Scotus, many late medieval thinkers thought like Abelard, particularly because of their new interpretation of contingency, but they did not believe, with the exception of John Buridan, that this was an Aristotelian view."

34. Monteil, Jean-François. 1996. "De la traduction en arabe et en français d'un texte d'Aristote: le chapitre VII du *Peri Hermeneias*." *Bulletin d'Etudes Orientales* no. 48:57–76.

    "Les propositions indéterminées du chapitre VII de *Peri Hermeneias* sont des particulières traduites par des universelles fausses. La cause de cette bizarrerie est dans le maître, et non dans les traducteurs. Aristote mutile un système naturel de propositions dont l'intégrité est restaurée par l'hexagone de Robert Blanché. Celui-ci ajoute deux postes au carré: Y (quantité partielle) et U (exclusion de la quantité partielle). Le carré représente A (totalité) et E (quantité zéro), mais pas avec la tierce quantité Y. Or, la quantité partielle (Y) est essentielle: c'est celle des particulières naturelles contenant notoirement plus d'information que les particulières logiques. U (exclusion de la quantité partielle) est le signifié commun aux deux phrases qu'Aristote élimine du système naturel."

35. ———. 2004. "La transmission d'Aristote par les Arabes à la chrétienté occidentale: une trouvaille relative au *De Interpretatione*." *Revista Española de Filosofia Medieval* no. 11:181–195.

    "*Some men are not white* and *Some men are white* versus *No man is white* are illegitimately identified to the two pairs of logical contradictories constituting the logical square: *A* versus *O* and *I* versus *E*, respectively. Thus, the level of natural language and that of logic are confused. The unfortunate Aristotelian alteration is concealed by the translation of propositions known as *indeterminates*. To translate these, which, semantically, are *particulars*, all scholars, except for Paul Gohlke, employ the two natural *universals* excluded by the

Master! The work of Isador Pollak, published in Leipzig in 1913, [*Die Hermeneutik des. Aristoteles in der Arabischen übersetzung des Ishiik Ibn Honain*] reveals the origin of this nearly universal translation mistake: the Arabic version upon which Al-Farabi unfortunately bases his comment. In adding the vertices *Y* and *U* to the four ones of the square, the logical hexagon of Robert Blanché (*) allows for the understanding of the manner in which the logical system and the natural system are linked."

36. ———. 2005. "Isidor Pollak et les deux traductions arabes différentes du *De interpretatione* d'Aristote." *Revue d'Études Anciennes* no. 107:29–46.

    Résumé : "Dans le chapitre VII du *De interpretatione*, Aristote mutile un système naturel de trois couples de contradictions naturelles. Il évince le couple où deux universelles naturelles "Les hommes sont blancs", "Les hommes ne sont pas blancs" s'opposent contradictoirement. Conséquence grave: les deux couples de contradictoires naturelles, qu'Aristote considère exclusivement, sont identifiés illégitimement aux deux couples de contradictoires logiques constituant le carré logique. Cette mutilation est dissimulée par la traduction des propositions dites "indéterminées". L'ouvrage d'Isidor Pollak, publié à Leipzig en 1913 (*Die Hermeneutik des Aristoteles in der arabischen Übersetzung des Ishak Ibn Honain, Abhandlungen für die Kunde des Morgenlandes*, 13,1), révèle l'origine de cette faute de traduction quasi universelle: la version arabe sur laquelle al-Farabi fonde son commentaire."

History of Renaissance and Modern Logic from 1400 to 1850

Introduction: Logic in Continental Europe

"At the end of the fourteenth century there were roughly three categories of work available to those studying logic. The first category is that of commentaries on Aristotle's 'Organon'. The most comprehensive of these focussed either on the books of the *Logica Vetus*, which included Porphyry's *Isagoge* along with the *Categories* and *De Interpretatione*; or on the books of the *Logica Nova*, the remaining works of the 'Organon' which had become known to the West only during the twelfth century. In addition there were, of course, numerous commentaries on individual books of the 'Organon'. The second category is that of works on non-Aristotelian topics. These include the so-called *Parva logicalia*, or treatises on supposition, relative terms, ampliation, appellation, restriction and distribution. To these could be added tracts on *exponibles* and on syncategorematic terms. Peter of Spain is now the best-known author of *parva logicalia*, but such authors as Thomas Maulvelt and Marsilius of Inghen were almost as influential in the late fourteenth and fifteenth centuries. Another group of works belonging to the second category consists of the so-called 'tracts of the moderns', namely treatises on consequences, obligations and insolubles. A third group includes treatises on sophisms, on the composite and divided senses, and on proofs of terms, especially the well-known *Speculum puerorum* by Richard Billingham. The third and last category is that of comprehensive textbooks. The most famous example is the *Summulae logicales* of Peter of Spain, which gives a complete outline of Aristotelian logic, including categories,

syllogisms, topics and fallacies; but others must be mentioned. John Buridan's *Summulae*, which was printed several times with a commentary by John Dorp, was a reworking of Peter of Spain, but integrated the topic of supposition by placing it in Book IV. It also added a new tract on definition, division and demonstration. Paul of Venice's *Logica parva*, which was to be very popular in Italy, presented the material of the *summulae* (except for topics and fallacies) in tract one, and then added a series of tracts dealing with the *parva logicalia* and with consequences, obligations and insolubles. All three categories of works had a role in the curriculum of the late medieval university, though the authors and tracts chosen varied from place to place. It is a mistake to think that Peter of Spain provided the only supplement to Aristotle, for in some places he was not read at all, and in other places only a part of his work was read. Moreover, when studied he was studied through the medium of later commentators.

The medieval traditions of logical writing survived well into the sixteenth century particularly at Paris and at the Spanish universities, though with considerable internal changes. Treatises on sophisms and on proofs of terms ceased to be written; whereas there was a sudden flurry of activity concerned with the various divisions of terms and with the opposition of propositions, i.e. the logical relations between different kinds of categorical proposition. These internal changes were not, however, sufficient to keep the tradition alive, and after about 1530 not only did new writing on the specifically medieval contributions to logic cease, but the publication of medieval logicians virtually ceased. The main exceptions were the logical commentaries by (or attributed to) such authors as Thomas Aquinas and John Duns Scotus, which found a place in their *Opera Omnia,* and which benefited from a revived interest in the great medieval metaphysicians.

The main changes in the teaching and writing of logic during the sixteenth century were due to the impact of humanism. First, commentaries on Aristotle came to display a totally new style of writing. One reason for this was the influence of new translations of Aristotle, and new attitudes to the Greek text. Another reason was the publication of the Greek commentators on Aristotle's logic, Alexander, Themistius, Ammonius, Philoponus and Simplicius. A

third reason was the new emphasis on Averroes, which expressed itself in the great Aristotle-Averroes edition of 1550-1552. (30) The effects of these new factors can be seen in the commentaries on individual works of the 'Organon' by such Italians as Agostino Nifo (1473-1546) and Jacopo Zabarella (1533-1589), the latter of whom offered a particularly influential account of scientific method. They can also be seen in the 'Organon' edition of Giulio Pace (15501635), which was first published in 1584 and contained the Greek text side-by-side with a new translation which was designed not only to read well but also to capture the philosophical significance of Aristotle's words. The culmination of the new style of writing on Aristotle is found in the Conimbricenses, the great series of commentaries produced by the Jesuits of Coimbra, especially (for our purposes) the *Commentarii in universam dialecticam Aristotelis* which appeared in 1606. This has aptly been described as presenting a fusion of two late sixteenth century approaches to Aristotle, the philosophical one of Zabarella and the philological one of Pace. (31) In addition it contains a wealth of material about different interpretations of Aristotle found in the Greek and Arab commentators, the medieval writers such as Aquinas, and more recent Thomists such as Cardinal Cajetan and Capreolus. One finds the occasional reference to Ockham or Marsilius of Inghen, but the perception of who constituted the important logical writers of the middle ages had clearly changed radically since the beginning of the sixteenth century.

Humanism can also be held at least partially responsible for the virtual disappearance of works on the specifically medieval contributions to logic, including the *parva logicalia*, and for the replacement of medieval textbooks by textbooks in a completely new style. The disgust that humanists expressed at the barbarous language and twisted Latin of the scholastics was in itself a minor factor. More important were the philosophical ideals that lay behind the work of Lorenzo Valla (1407-1457) and his follower Rudolph Agricola (1444-1485). As Lisa Jardine has argued, both Valla and, to a lesser extent, Agricola were concerned to offer a logic which was linked with Cicero's Academic skepticism rather than with Aristotelian certainties.(32) They wished to present argumentative strategies for rendering plausible each of the two sides of an

undecidable question, or for supporting one of them as, perhaps only marginally, more plausible than the other. They were thus drawn to consider a variety of non-deductive strategies in lieu of the formal techniques which had dominated a large part of medieval logic, especially in the treatises on consequences, and in lieu of Aristotle's own syllogistic. Their attention was focussed on the Topics which, especially as presented by Cicero and Quintilian, seemed to offer a method of classifying these strategies by their key terms rather than by their form. At the same time, much of Agricola's concern was with the art of discourse as such, that is, with the problem of presenting and organizing complete arguments and narrations, whether written or spoken. Logic, or as he preferred to call it, dialectic, was to be applied to all types of discourse, and hence to all areas of teaching. As a result of this interest both in persuasive techniques and in discourse as such, logic came to embrace much of what had traditionally been regarded as belonging to rhetoric; and rhetoric came to be seen as concerned not with the invention of topics but with the ornamentation of discourse.

These doctrines as presented in Agricola's *De inventione dialectica libri tres*, first published in 1515, turned out to be seductive. One of those who was considerably influenced by Agricola was Philip Melanchthon (1497-1560) whose logic text, first published in 1520 as *Compendiaria dialectices ratio*, but replaced by two later versions, became very popular. In it we see how the insights of Valla and Agricola were transmuted to serve the textbook tradition. Melanchthon enjoyed the Agricolan emphasis on clarity of style and the use of literary allusions; he accepted the importance of the Topics and that part of logic called invention; and some remarks on order in the first version of his text grew into a full section on logical method as a way of ordering discourse.(33) At the same time, Melanchthon was a convinced Aristotelian. The formal techniques he used were those of syllogistic, and his work included a discussion of the other standard Aristotelian subjects including the categories and the square of opposition for propositions. Indeed, the last version of his logic, the *Erotemata dialectices* of 1547, seems considerably less Agricolan in tune than the earlier versions, though it retains references to Cicero and Quintilian. (34)

Another writer who was influenced by Agricola is Petrus Ramus or Pierre de la Ramée (1515-1572), the most notorious logician of the sixteenth century. He is known both for his attacks on Aristotle and for the simplified logic presented in his *Dialectique* of 1555 (published in Latin in 1556 as *Dialecticae libri duo*), a work which enjoyed a remarkable publishing history. Ong lists 262 editions, 151 of which appeared in Germany. (35) The *Dialectique* had two parts. The first, on invention, covered the Topics; and the second, on judgment, presented a deliberately simplified version of the syllogism followed by an account of method as a means of ordering in the arts and sciences. No reference was made to such standard material as the categories, the square of opposition, conversion, demonstration and fallacies. On the other hand, the work is rich with quotations from the poetry and prose of classical authors, which must have strengthened the impression among students that logic was both easy and fun. It is small wonder that (in Jardine's words), Ramus 'cornered the textbook market' despite the absence of genuine logical innovation.(36)

Whatever its attractions, the deficiencies of Ramus's book as a teaching tool became rapidly apparent to those seriously interested in logic at the university level. As a result, a new school of textbook writers known as the Philippo-Ramists appeared in Germany in the 1590s. These authors had the aim of combining what was best in Ramus with what was best in the more Aristotelian work of Philip Melanchthon. Thus they tended to restore all those parts of Aristotelian logic which Ramus had deliberately omitted. An important writer who can be seen as allied to the Philippo-Ramist school, though he is more frequently described as a Systematic, is Bartholomew Keckermann (c. 1572-1609). Keckermann was primarily concerned to defend Aristotle and such Aristotelians as Zabarella, but he paid careful attention to Ramist doctrines. He was particularly noteworthy for his theoretical discussion of the notion of a system, and the criteria for determining whether a body of doctrine, such as logic or ethics, could properly be called a system. (37) J. H. Alsted (1588-1638) was also an important Systematic, who displayed a good deal of sympathy toward Ramism.(38)

Another important group of textbooks from the latter half of the sixteenth century owed a smaller debt to the humanist logic of

Rudolph Agricola and Petrus Ramus, and is noteworthy for an attempt to integrate certain parts of the specifically medieval contribution to logic into a generally Aristotelian framework. I shall mention three such texts. The earliest, and most medieval in tone, is the *Compendium logicae* by Chrysostomo Javelli (d. c. 1538) which was first published posthumously in 1551. Javelli retained discussion of such topics as the proofs of terms, and he also retained a number of sophisms and puzzle- cases from the medieval literature. He can therefore be described as a transitional author, representing an intermediate stage between the old medieval textbooks and the Counter- Reformation texts of the Jesuits Francisco de Toledo (1533-1596) and Pedro de Fonseca (1528-1599). Toledo's *Introductio in dialecticam* was first published in 1561 in Rome; and Fonseca's *Institutionum dialecticarum* was first published in 1564 in Lisbon. The Jesuit *Ratio Studiorum* of 1586 had recommended the *Summula* of Fonseca for its breadth, clarity, relevance to Aristotle and lack of sophistry; (39) and in the *Ratio Studiorum* of 1599, Toledo was recommended in addition to Fonseca.(40) The two books share important features. Their main objective is to present standard Aristotelian logic. This material is supplemented with an account of certain medieval doctrines, specifically supposition theory, exponible propositions, and consequences, but the presentation of these doctrines is new. There is a complete absence of the sophisms which had formed a prominent feature of late medieval texts. There is also little discussion of problems caused for such operations as conversion by the presence of different linguistic structures. The highly technical language which struck the humanist as barbaric has gone and, in Fonseca at least, there is a conscious attempt to use classical terminology. All three texts were widely disseminated in Europe and, interestingly enough, all seem to have disappeared at much the same time. The last editions that I know of are as follows: Toledo: Milan, 1621; Fonseca: Lyon, 1625; Javelli: Cologne, 1629." (pp. XVI-XXII)

The teaching of logic in university curriculum

“The period 1500 - 1650 is a distinctive one in the history of logic. It begins when the great works of fourteenth-century logic, embedded in university curricula all over Europe (1), are replaced by new and different texts; it ends when the 'new philosophies', first of Descartes and later of Locke, infiltrate the study of logic and lead logicians to embrace an '[e]xplicit consideration of the cognitive faculties and their operations' (2) at the expense of more formal concerns. Eyed within the 150 year period thus demarcated, there is an enormous variety of change and development to be taken into consideration. At the expense of over-generalization, four different streams can be isolated. First, there is the continuity of the medieval tradition, particularly exemplified by the publications of those working at Paris in the first three decades of the sixteenth century (3). Second, there is the new rhetorical humanism of such men as Rudolph Agricola, whose influential *De inventione dialectica libri tres* was first published posthumously in 1515 (4). Third, there is the Aristotelian humanism of those who, especially in Italy, were involved with the publication of the Greek Aristotle (5), with the publication and translation of the Greek commentators on Aristotle (6), and with the production of new commentaries on Aristotle (7). Finally, there is the investigation of demonstration and scientific method, culminating in the logical work of Jacopo Zabarella, the well-known Paduan Aristotelian (8).

So far as textbook production was concerned, all these four streams were to intermingle. Writings purely in the medieval tradition ceased abruptly after 1530, at least outside Spain; but some parts of the medieval contribution to logic continued to be included in at least some textbooks. The new interests of rhetorical humanism, the emphasis on the topics, on strategies for plausible argumentation, on methods of organizing discourse, on the use of literary examples, had a great impact on the classroom. However, teachers soon found that the works of Agricola himself or of the later Pierre de la Ramée contained insufficient formal material, and their writings were soon supplemented by Aristotelian syllogistic. Thus in Germany from 1520 on, Philip Melanchthon produced a series of textbooks

combining humanist insights with Aristotelian logics; and in the 1590s, Germany gave rise to Philippo-Ramism, a school of textbook writers whose aim was to combine what was best in Pierre de la Ramée with what was best in the works of Philip Melanchthon (10). The study of the Greek Aristotle and the Greek commentators had a strong impact on the textbook writers of the second half of the sixteenth century; and, after Zabarella, sections on scientific method were also to find their way into logic textbooks." pp. 75-76

I shall begin my investigation by considering the types of logic text that would have been used at a fifteenth-century university. There are three groups. First, there is the 'Organon' of Aristotle, together with the commentaries so exhaustively enumerated by Charles Lohr (21). I shall not be concerned with this type of literature, except to note that it underwent considerable changes during the sixteenth century owing to the influence of humanism and to the recovery of the Greek commentators. Second, there is the textbook proper, such as the *Summulae logicales* of Peter of Spain, itself typically presented with a commentary by some later author. Third, there is the group of independent texts, each devoted to some aspect of the specifically medieval contribution to logic. If one is to understand later developments, this group must be investigated in some detail, and I shall start by analyzing its subdivisions (22).

The core of the first subdivision is provided by the so-called parva logicalia, or treatises dealing with the properties of terms, including their reference in various contexts. Here we find tracts on supposition, on relative terms, on ampliation, appellation, restriction and distribution. These core treatises were supplemented in three ways. Logicians wrote about syncategorematic terms, those logical particles such as 'all', 'some', and 'not', which determine the logical structure of a proposition; they wrote about exponible terms, those logical particles such as 'except' and 'only' whose presence requires the analysis of an apparently simple categorical proposition into several conjoined propositions; and they wrote about the proof of terms, or the way in which the truth-conditions of propositions are affected by the presence of exponible terms, of modal terms such as 'necessary' and 'possible' or of epistemic terms such as 'knows' and 'believes'. Obviously there was a good deal of overlap between writings on syncategorematic terms, on exponibles and on the proof

of terms, since one and the same logical particle could be treated in all three types of treatise.

The second subdivision contains the 'three tracts of the moderns', the treatises on consequences, obligations and insolubles. Treatises on consequences covered all types of argumentation, beginning with a good deal of what is now called propositional logic, and they often included the syllogism as a special example of one kind of argumentation. They were also noteworthy for lengthy discussions of the notion of consequence itself, and of the difference between formally valid and materially valid inferences. Treatises on obligations dealt with the rules to be followed in a certain kind of disputation which was specifically designed to test the logical skills of undergraduates, and which therefore deliberately confined itself to exploring the logical consequences of accepting an often bizarre falsehood. Treatises on insolubles dealt with semantic paradoxes, such as the standard liar: 'What I am now saying to you is false', and they explored in some depth the semantic presuppositions of language, including the truth-conditions for contradictory and synonymous propositions.

The third subdivision is formed by the treatises on sophisms in which problematic or puzzling statements were analyzed and tested against various logical rules. Since these rules were drawn from the areas of investigation already mentioned, including supposition theory and its ramifications, there was considerable overlap between the contents of these treatises and those belonging to the first and second subdivisions. Indeed, the latter treatises, as well as the commentaries on Aristotle and on Peter of Spain, themselves made heavy use of sophisms in order to test the rules they enunciated against possible counter-examples. Thus we get a two-way movement. A treatise on sophisms begins with the sophisms and proceeds to the rules; a treatise on, for instance, consequences begins with the rules and proceeds to the sophisms. Paul of Venice's *Logica magna* (written 1397 - 98) is a particularly noteworthy example of the use of sophisms as a testing device (23)". (pp. 78-79)

5. Angelelli, Ignacio. 1970. "The Techniques of Disputation in the History of Logic." *Journal of Philosophy* no. 67:800-815.

   "The aim of this paper is to outline tentatively some aspects of the techniques of disputation in their history, on the basis of some texts. Modern logic ("mathematical" logic) was conceived *more geometrico* by Frege, who intended to improve upon Euclid essentially by adding an explicit list of rules of inference (*Grundgesetze* I, p. VI). Thus, the notion of *dialectica* in the sense of "speech between two," so important in the past, could

hardly be found relevant by modern historians of logic, who were guided by the new model. These, in fact, have so far neglected to investigate this portion of the logical heritage.(1) Only recently there has been an increasing interest in the *Topica*, not extended, however, to the medieval and post-medieval developments. Good old Prantl seems to be still the best source in this respect. Historical works of a more general nature are of very little help even when they abundantly refer to disputation, because the formal aspects are usually overlooked. For example, a direct examination of the sources mentioned by Thurot would be very rewarding, but what Thurot himself says on disputation is simply useless from a technical point of view. (2)

The dialogical logic developed in the last ten years by Paul Lorenzen and his school provides the needed "modern" motivation to go back to the *ars disputandi*.(3) Sources for antiquity and for medieval *obligationes* (a form of disputation) are known. Before 1800 disputation was considered by a very large number of books on logic; after 1800 at least by most neoscholastic treatises. Fortunately, in recent years bibliographical research in the history of logic has increased so much (4) that now we also know of a small, yet interesting list of postmedieval (second-scholastic) works especially devoted to the theory of disputation."

(1) There are hardly any references in the most distinguished works on the history of logic. In E. Moody's *The Logic of William of Ockham* (London: Sheed & Ward, 1935), the topic of obligations is considered "not very relevant to logic" 294.

(2) Charles Thurot, *De l'Organisation de l'enseignement dans l'Universiteé de Paris au Moyen Age* (Paris: E. Magdeleine, 1850); pp. 87-90 for the *disputes*.

7. ———. 2004. "Predication Theory: Classical Vs Modern." In *Relations and Predicates*, edited by Hochberg, Herbert and Mulligan, Kevin, 55-80. Frankfurt: Ontos Verlag.

   "This essay aims, first, at describing the conflict between the theory of predication (classical, Aristotelian) prevailing in philosophy until the end of the 19th century, and the theory arisen with the new logic (modern, Fregean). Three features characterize the pre- Fregean period: 1) conflation of predication and subordination (extensionally: membership and class-inclusion), 2) conflation of identity and predication, 3) the view of quantificational phrases (e.g. "some men") as denoting phrases. A possible fourth feature is suggested by the consideration of the so-called Locke's "general triangle". Most of the paper is devoted to the first feature, also called the "principal" one, stated by Aristotle. Frege seems to be the first, in 1884, to reject the first feature; he E ISO rejected, not less vehemently, the second and the third features. Fregean predication theory became standard, and just taken for granted in the subsequent developments of logic as well as in the mainstream of philosophy. The second aim of this paper is to evaluate- relative to the notion of predication submitted in section I - the conflict between the two traditions, and to determine if both are somehow right, or one is right and the other wrong. The main result is that the Fregean revolution in predication theory is, at least with regard to the first and second features of the classical view, a clarification that would

probably be welcomed by the classical authors themselves (*pace* Hintikka's "logic of being")."

   Also published in French as: "Descartes, les premiers Cartésiens et la logique" *Revue de Métaphysique et de Morale* 4 (2005): 55-71.

9. Ashworth, Earline Jennifer. 1974. *Language and Logic in the Post-Medieval Period*, *Synthèse Historical Library Vol. 12*. Dordrecht: Reidel Publishing Company.

   This book is the first attempt to provide a general Introduction to the type of logical inquiry pursued in Europe after 1429 by means of a systematic presentation of the doctrines which were actually written about and taught. It radically alters traditional views of the period by demonstrating that not only were medieval doctrines still of overriding importance at the beginning of the sixteenth century, but that they continued to be discussed in many European universities at least until the mid-seventeenth century.

    Handbook of the history of logic: Vol. 2.

    "To understand the significance of these developments for the logician, we have to consider three questions. First, how much of the medieval logic described in the previous chapters survived? Second, insofar as medieval logic survived, were there any interesting new development in tit? Third, does humanist logic offer an interesting alternative to medieval logic?

    In Part One of this chapter I shall consider the first two questions in the context of a historical overview in which I trace developments in logic from the later middle ages thorough to 1606, the year in which the Jesuits of Coimbra published their great commentary on Aristotle's logical works, the

Commentarii Conimbricenses in Dialecticam Aristotelis. I shall begin by considering the Aristotelian logical corpus, the six books of the *Organon*, and the production of commentaries on this work. I shall the examine the fate of the specifically medieval contributions to logic. Finally, I shall discuss the textbook tradition, and the ways in which textbooks changes and developed during the sixteenth century. I shall argue that the medieval tradition in logic co-existed for some time with the new humanism, that sixteenth century is dominated by Aristotelianism, and that what emerged at the end of the sixteenth century was not so much a humanist logic as a simplified Aristotelian logic.

In Part Two of this chapter, I shall ask whether the claims made about humanist logic and its novel contributions to probabilistic and informal logic have nay foundation. I shall argue that insofar as there is any principled discussion of such matters, it is to be found among writers in the Aristotelian tradition." p. 610

    "The first Scot to have a book of his printed while he was yet alive was James Liddell (Jacobus Ledelh) from Aberdeen. The book came out in 1495, and was sufficiently well received to go through several further editions during the author's lifetime. In view of the chief historical thesis I am concerned to defend here, Liddell's book is a fitting place at which to start the defence, for Liddell, though in his latter days a physician of note, was first and foremost a philosopher and logician, and the book itself was a work of epistemology entitled *Treatise on Concepts and Signs*. Liddell matriculated at the University of Paris, a very common choice of university for young Scots of that period. He took his master's degree there in 1483 and in the following year began teaching in Paris. Two years later he was appointed examiner of Scottish students working for their bachelor's degree.

    In 1491 or 1492 that substantial contingent of Scottish students at Paris was joined by John Mair from the village of Gleghornie near Haddington in East Lothian. Mair rose quickly up the academic ladder. He took his master's degree in 1494 and the following year became a lecturer in arts, while also beginning his studies in theology in the College of Montaigu. He published his first book in 1499, a work on exponible propositions, and by 1506, when he received his doctorate of theology and began teaching theology at the College of Sorbonne, he had already published numerous volumes on logic. In 1517 Mair returned to Scotland to take up the post of principal of the University of Glasgow, though while there he also taught in the Faculties of

Arts and Theology. His very full timetable at Glasgow did not however prevent him returning to Paris in 1521 to see through the presses his enormous *History of Greater Britain,* a book motivated at least in part by a desire to further the cause of the union of England and Scotland in a single country, a 'Greater Britain'. In 1523 Mair transferred to the University of St Andrews where he continued his teaching in arts and theological subjects though also actively involved in important administrative roles in that university. Three years later he returned to Paris where he remained teaching theology till 1531 when, for reasons which remain obscure, he again took up a post at the University of St Andrews, and this time he stayed in Scotland. In 1530 he published a critical edition, with extensive commentary, of Aristotle's *Nicomachean Ethics*. It proved to be his last book, though he lived for a further twenty years, dying an octogenarian in 1550.

Among the pupils of Mair at Paris were several Scots whose writings I shall be examining in the succeeding chapters. They were David Cranston, George Lokert, Robert Caubraith, and William Manderston. David Cranston, a priest of the Glasgow Diocese, arrived in Paris in 1495, studied under Mair at the College of Montaigu, and himself began to teach in that college in 1499. Within thirteen years, having completed a number of books of his own and also edited works by Mair and Martin le Maitre, Cranston had died. We shall be studying his *Terminorum* in some detail." pp. 2-3

"Chapter 8. Conclusion.

The discussion of rules of valid syllogistic inference completes our survey of the formal logic presented in the textbooks of John Mair and his circle. The survey has not dealt with all the main areas of concern represented in those textbooks. We have not, for example, discussed insoluble propositions, that is, paradoxical propositions where typically the paradoxicality is generated by a self-referential element in the proposition. The Liar Paradox 'I now speak falsely' is the most famous, though numerous other paradoxes were investigated. And the problem of the analysis of future contingent propositions, an important

subject in which present-day philosophers are taking a lively interest, has not been discussed in the foregoing pages, though both Lokert and Manderston wrote treatises on the subject.

However a great deal of ground has been covered, enough to show that the poor opinion many have of medieval logic is unjustified. There are many philosophers and logicians who believe that medieval logic constituted not so much an advance on the Aristotelian system from which it emerged, as an inflation of that system by endless definitions and divisions all made in a hopeless attempt to provide, from within the resources of natural language, rules for making valid inferences from propositions expressed in natural language to other propositions likewise expressed.

But the reputation of medieval logic as Aristotle's logic become obese is based on a travesty. And the negative purpose of this book has been to show up that travesty. The first point that has to be made is that the logic we have been examining marks an immense advance on Aristotle's system with respect to the area of *proprietates logicales,* the logical properties of terms. The single most distinctive contribution of medieval logic was the doctrine of supposition, with the attendant notions of descent to and ascent from singulars, and the consequent ability to give a detailed account of the way quantifier expressions signify. It was in virtue of the doctrine of supposition and its associated rules of order of descent under terms with different sorts of supposition, that the late-scholastic logicians were able to give a detailed exposition of such fallacies as that of the quantifier shift. And it enabled them also to give an account of the validity of inferences involving propositions in which crucially one term stands in genitival relation to another.

The doctrines of ampliation, restriction, and alienation are also characteristically medieval doctrines, not investigated by Aristotle, but clearly of the greatest logical importance in view of the need to be able to state, for example, the truth conditions of past- and future-tensed propositions, an area which has been within the fold of modern formal logic since the late Arthur Prior's seminal work on tense logic. Certainly his employment

of tense operators operating on (temporally or timelessly) present-tense propositions accords with the scholastic technique of expressing the tensed element of a non-present-tensed proposition in a predicate whose argument place is to be filled by a present-tense proposition.

The examination of exponible propositions is also a distinctively medieval contribution to logic. It should not be forgotten that the medieval logicians at all times stayed close to natural language and sought to formulate rules of valid inference for propositions in natural language. And given that propositions expressing, say, something's being the only member of a given class, or being an exception to a rule, or being different from something else, or coming to be or ceasing to be, can imply other propositions, the late-scholastic logicians considered there to be a real problem concerning the identification of the associated rules of inference. And if it was not within the remit of the logicians themselves to identify and formulate those rules then whose job was it? The recent interest in this field shown by E. J. Ashworth, Norman Kretzmann, and others, is not merely antiquarian; it reflects a concern with concepts which are of current philosophical interest.

In the field of syllogistic itself the late-scholastics made important advances. Two areas that we considered in which advances were made were, first, the validity conditions of syllogisms in which the middle term does not constitute the whole extreme in each premiss, and secondly the validity

conditions of syllogisms whose premisses and conclusion are non all present-tensed. Once again it has to be noted that the medieval logicians were concerned to formulate rules of inference applicable to the kinds of argument that ordinary people using ordinary language commonly formulate.

In the late fifteenth and early sixteenth centuries there was a glorious flowering of logic. It was the last major achievement of the terminist tradition, and the circle of John Mair was especially prominent in that final flourish. Why the fortunes of logic suddenly foundered is a matter for speculation, but there is no good reason to suppose that the explanation is that there

was suddenly nothing interesting left to say in that tradition. It would itself be even more in need of explanation why a tradition, which until the third decade of the sixteenth century had been finding so many interesting things in what had proved such a rich seam, should suddenly strike clay. But it should be said that whatever the reason for a dead hand falling on logic at the time of the Reformation, and whether or not logic itself was a casualty of the Reformation, it remains true that many matters dealt with in the terminist textbooks of the late-scholastics have an immediate bearing on matters of current concern to logicians working within the tradition created by Frege, the man who prised off that dead hand. The logical writings of John Mair and his circle bore little fruit, and gradually slipped away into nearly total oblivion. Perhaps after five centuries those writings will at last come into their own."

    "Lorenzo Valla's rhetorical reform of logic resulted in important changes in sixteenth-century mathematical sciences, and not only in mathematical education and in the use of mathematics in other sciences, but also in mathematical theory itself. Logic came to be identified with dialectic, syllogisms with enthymemes and necessary truth with the limit case of probable truth. Two main ancient authorities mediated between logical and mathematical concerns: Cicero and Proclus. Cicero's 'common notions' were identified with

Euclid's axioms, so that mathematics could be viewed as core knowledge shared by all human kind. Proclus' interpretation of Euclid's axioms gave rise to the idea of a universal human natural light of reasoning and of a *mathesis universalis* as a basic mathematics common to both arithmetic and geometry and as an art of thinking interpretable as algebra. "The papers collected in this volume address two closely related themes: the faculty psychology and the logic of the early modern period. The themes are related because, firstly, early modern logic-especially the early modern "logic of ideas" was explicitly psychologistic. It dealt with "concepts" rather than terms, "judgments" rather than propositions, and "reasoning" rather than arguments, and it saw all of these fundamental explanatory categories as grounded in contents or operations of the mind. And secondly, the lines of influence ran in the other direction as well. The higher cognitive faculties identified by early modern (and, indeed, by medieval and ancient) psychology were determined by logical and even grammatical considerations. Each cognitive faculty was understood relative to the notion that reasoning consists of arguments and that judgments assert relations between concepts. The intellect was understood as the faculty for abstracting universal concepts from the deliverances of sense; judgment, as the faculty for compounding and dividing concepts or as the faculty for inventing the middle term for a syllogism; and finally, reasoning was understood as the faculty for drawing inferences from previously made judgments. Faculty psychology cannot, therefore, be completely understood independently of traditional logic, and early modern logic certainly cannot be understood independently of faculty psychology.

For most of this century both of these themes have been neglected by philosophers and historians of logic, philosophy, and psychology. The explanatory categories of traditional faculty psychology now seem naive and ill-founded. And the notion that a normative discipline like logic might be grounded

on purely descriptive facts of our psychology, or on the arbitrary and conventional features of the grammar of a particular natural language, is rejected as an instance of the naturalistic fallacy. The early modern period has accordingly been judged to be the dark age of logic-a time when the advances of the Middle Ages were forgotten and the entire discipline was turned down the wrong path.

But, as Fred Michael observes in one of the introductory essays to this volume, although early modern logic made virtually no contribution to the history of logic, it was a central part of early modern epistemology and metaphysics. One does not have to look far into the standard early modern logic textbook, with its four-part treatment of ideas or concepts, judgments, reasoning, and method, to find themes of crucial importance to early modern philosophy. It was obligatory that a textbook of early modern logic discuss the notions of conceptual clarity, distinctness and adequacy-notions that played a key role in the epistemology of Descartes, Locke, Leibniz, and Wolff, to name but a few. And in early modern logic, a discussion of general terms could no more be separated from the issues of abstraction and abstract ideas-issues that were to become of central importance for later British empiricism-than a medieval treatment of the same topic could be separated from the issue of the nature of universals. Similarly, the early modern logic of propositions, because it could not be separated from the operation of judgment, dealt not just with the concept of relation, but with the act of relating, and referred crucially to the basis of that act in the (rationalist) analysis of concepts and the (empiricist) evidence of experience. Again, syllogistic reasoning, based as it is on categorical propositions (out of which the paradigmatic syllogistic forms are constructed), carried with it an implicit ontology of substance and property (the subject and the predicate of the categorical proposition)-an ontology that continued to dominate early modern metaphysics and epistemology long after substantial forms and real qualities had been banished from early modern philosophy of nature. Furthermore, such popular principles of early modern ontology as the notion that whatever is conceivable is a possible object of

experience, are obviously parasitic on notions of logical and real possibility. And the analytic and synthetic methods discussed in the fourth part of most early logic textbooks have an obvious relation to the opposed Cartesian and Newtonian paradigms for scientific research." pp. I-II.

    Contents: Foreword by John R. Gallup VII; Introduction XV-XVI; Part I. Historical survey. Chapter I. Modern logicians (1662-1966) 1; Chapter II. Medieval and ancient logicians (1658-530 B.C.) 78; General summary of Chapter I and II 124; Part II: A doctrinal survey. Chapter III. An essay in doctrine 129; 1. Non-logical meanings of 'extension' 129; 2. Non-logical meanings of 'comprehension' 135; 3. Extension and comprehension with reference to the theory of knowledge 142; 4. Extension and comprehension in logic 149; 5. General summary of Chapter III 172; Epilogue 177; Appendix I. Grammatical sources 179; Appendix II: Different terminology and meanings 183; Bibliography 215; Footnotes 243-293.

    "The purpose of this work is to analyze what has been frequently described by logicians as the extension and comprehension of concepts. Even if there is a justification for extension and comprehension in logic, it may be questioned whether there are any concomitant dangers since one historian of logic claims that this distinction has done more harm than good. Can it be said that the importance of extension and comprehension has been magnified out of proportion to the other parts of logic? Would it be more advantageous to correlate extension and comprehension with the predicables, or would it be better to try to eliminate the distinction altogether?

    It is the aim of this study to explore the distinction existing between extension and comprehension, to ascertain whether such distinction is justifiable, where it should be placed in a treatise on logic, and how it should be presented. These are

questions which should be answered if one intends to have a thorough grasp of logic.

This treatise will be divided into two parts. The first part will be subdivided into two chapters. Chapter I will examine the writings of modern logicians starting from 1662. Chapter II will treat of the works of classical and ancient authors in a reverse order of time starting from 1658. The second part will present an evaluation of extension and comprehension as a doctrine of logic.

It might be stated briefly here that the conclusion of this treatise hopes to present as probable the following declarations: (1) Extension and comprehension are basically an Aristotelian distinction. (2) Extension and comprehension are closely allied with the predicables. A logician cannot have a proper understanding of the former without a thorough understanding of the latter. (3) Any well-organized treatise on logic should begin with a study of the predicables.

The method of the first part which will be employed in this research is the empirical, or *a posteriori*, method. This particular mode is characteristic of all historical research. On the other hand,

the deductive, or a priori, method is unsound because it would oblige one to posit a principle according to which all subsequent facts ought to correspond. There is a constant danger associated with such procedure, namely, the tendency to misstate or distort historical facts for the sake of preserving a methodic balance. However, inasmuch as the second part involves an evaluation, both the a posteriori and a priori methods will be utilized.

Perhaps it will seem strange to the reader to discover that in the initial historical research, the philosophical works of modern logicians will be examined in a chronological order, whereas, when attention is turned to the classical and ancient authors, the order of time will be reversed for this historical research. This mode of procedure was not adopted in any haphazard manner, nor was it introduced merely for the sake of adding

variety to the presentation of the study. Inasmuch as the historical evidence on the distinction of extension and comprehension is limited and oftentimes confusing, it was not deemed feasible to begin the investigation at the very moment when the reality underlying the distinction was first discovered and introduced into logic so as to trace its development in one chronological direction. Instead it seemed more reasonable to select one source of information to which many modern authors had recourse and by which they were greatly influenced. It was not difficult to make such a choice. The text which was cited most frequently and which influenced modern logicians was none other than the *Port Royal Logic* (1662)." (pp. XV-XVI).

40. ———. 1980. *Modern Theories of Higher Level Predicates. Second Intentions in the Neuzeit*. München: Philosophia Verlag.

Table of Contents: Foreword by Ignacio Angelelli 7; Introduction 9; Part One 15; Chapter One: Predication 17; Chapter Two: Logical concepts 32; Part Two 57; Chapter Three: Higher level predicates 59; Chapter Four: Second Intentions: Conceptualism One and Nominalism 73; Chapter Five: Second Intentions: Conceptualism Two 103; Chapter Six: Second Intentions: Conceptualism Three 132; Part Three 167; Chapter Seven: Special problems 169; Bibliography 183; Index of names and subjects 189-191.

"The theory of higher predicates (predicates of predicates) contained in the traditional discussions on second intentions has been largely ignored, even by historians of logic, who as a rule have concentrated on nominalism, a scholastic trend so fruitful in formal logic yet so poor in this particular topic.

Larry Hickman's work makes available for modern readers many of the riches related to higher predication, that have been so far buried in rather unknown authors mainly from the post-medieval or "second" scholasticism.

Hickman not merely shows us selected "pictures" of the unfamiliar territories he has been exploring: his inquiry, although primarily historical, is analytical and systematically oriented.

Bochenski wrote about twenty years ago: "Logic shows no linear continuity of evolution. Its history resembles rather a broken line. From modest beginnings it usually raises itself to a notable height very quickly -- within about a century -- but then the decline follows as fast. Former gains are forgotten; the problems are no longer found interesting, or the very possibility of carrying on the study is destroyed by political and cultural events. Then, after centuries, the search begins anew. Nothing of the old wealth remains but a few fragments; building on those, logic rises again." (1)

Obviously during the cycle of so-called modern philosophy (Descartes to Kant, roughly) the problem of higher predication was not found interesting and this explains why Frege may have believed that the distinction of proper ties of the second

and first level *(zweiter and erster Stufe)* was *his* ("meine, Unterscheidung"). At any rate, one can hardly find a better example of the "broken line" character of the history of logic than in this issue of iterated predication and properties of properties.

Predication is perhaps one of the very few topics in which most if not all philosophical schools seem to have something in common. This should be sufficient as a hint at the significance of Hickman's historical investigations, not merely for the logical historiography but for philosophy in general." (from the Foreword).

"Logic, conceived today as the science of validity of thought, and as the term for the canons and criteria that explain trustworthy inferences, was in the English Renaissance a theory not so much of thought as of statement. For all practical purposes, the distinction between thoughts and statements is not a very real distinction, since the latter are merely the reflection of the former, and the former cannot be examined without recourse to the latter. But what distinction there is consists in a differentiation between mental phenomena and linguistic phenomena, the assumption being that the thing to which either set of phenomena refers is reality Itself. Logicians of the twentieth century are primarily interested in mental phenomena as an interpretation of the realities of man's environment, and in that part of mental phenomena which we call valid or invalid inference. Logicians of the English Renaissance were primarily interested in statements as a reflection of man's inferences, and in the problem of the valid

and invalid statement. Thus Renaissance logic concerned itself chiefly with the statements made by men in their efforts to achieve a valid verbalization of reality. Since such statements were the work of scholars and science, not of laymen, Renaissance logic founded itself upon scholarly and scientific discourse and was in fact the theory of communication in the world of learning. The data upon which this theory rested were all learned tractates of that and earlier times. The theory itself attempted on the one hand to explain the nature of these tractates, as to language, sentence structure, and organization, and on the other to offer assistance to the learner in his effort to master learned communication, as part of his entrance fee to the scientific and philosophical world." p. 3

"This book undertakes to present an analysis of the major eighteenth-century British writings on logic and rhetoric and to place those writings in a chronological perspective, so that the reader may see them in relation to their antecedents in the seventeenth and their consequents in the nineteenth centuries and also in relation to their influences upon each other. Moreover, this book undertakes, as part of these two objectives, to introduce the reader to the authors of these writings and to make them and their works stand together as partners in an intellectual effort of appreciable size and duration. If history, as Carl Becker observed, is the memory of things said and done, then the present history is an attempt to tell our modern world what the chief British logicians and rhetoricians of the 1700's said when they wrote about their specialties, and what their works mean within the context of their particular time.

The main conclusion to be drawn from this history is that the changes which took place in logical and rhetorical doctrine between 1700 and i 800 are perhaps best interpreted as responses to the emergence of the new science.

The old science, as the disciples of Aristotle conceived of it at the end of the seventeenth century, had considered its function to be that of subjecting traditional truths to syllogistic examination, and of accepting as new truth only what could be proved to be consistent with the old. Under that kind of arrangement, traditional logic had taught the methods of deductive analysis, had perfected itself in the machinery of testing propositions for consistency, and had served at the

same time as the instrument by which truths could be arranged so as to become intelligible and convincing to other learned men. In short, traditional logic prided itself upon being a theory of learned enquiry and of learned communication. Meanwhile, traditional rhetoric also prided itself upon having a share in these same two offices, its special purpose being to communicate truths through a process which, on the one hand, blended scientific conclusions with popular opinions and manners, and, on the other hand, transmitted that blend to the general populace. For all practical purposes, the differences between logic and rhetoric, within the context of the old science, were derived from the differences between the learned and the popular audience. A good statement of the concepts which governed this view of the relations of these disciplines to each other is contained in the epigraph at the head of this chapter.

The new science, as envisioned by its founder, Francis Bacon, considered its function to be that of subjecting physical and human facts to observation and experiment, and of accepting as new truth only what could be shown to conform to the realities behind it. Bacon's vision became that of the Royal Society of London, and of similar organizations throughout Europe. The intoxicating novelty and enormous productivity of the new methods of investigation led young scientists and scholars to practice them with increasing sophistication; and logic, which had always claimed anyway to be the theory of enquiry, began to incorporate the new methods into its doctrines and ended by becoming so enamored of them that it allowed them to crowd out its waning interest in the methods of learned communication. Meanwhile, rhetoric began to see itself as the rightful claimant to the methods of learned communication and as the still unrivaled master of the arts of popular discourse; and by making these two activities its new concern, it came ultimately to think of itself as the art which governed all forms of verbal expression, whether popular or learned, persuasive or didactic, utilitarian or aesthetic. Thus in the context of eighteenth-century learning, rhetoric became the sole art of communication by means of language, and logic moved

towards the realization that it was destined to become the science of scientific enquiry. A good statement of the concept which controlled these emerging relations of logic and rhetoric to each other was made by John Stuart Mill in the first half of the nineteenth century, and I have quoted it as the epigraph of Chapter 7, although in a real sense it also belongs to this Introduction." pp. 5-6

46. ———. 1988. "Humanistic Logic." In *The Cambridge History of Renaissance Philosophy*, edited by Schmitt, Charles B. and Skinner, Quentin, 173-198. Cambridge: Cambridge University Press.

"The history of medieval and Renaissance logic has traditionally been the history of the great medieval syllogistic logicians and the *fortuna* of their innovatory treatments down through the fifteenth and sixteenth centuries. When historians of logic characterise humanist dialectic as a misguided and non-rigorous intervention which disrupted the smooth development of medieval syllogistic logic, they confirm their own commitment to the interests and techniques pioneered by logicians like William of Sherwood. It is not surprising, then, if these scholars find the very different approach of the humanists trying. They hold up against the `non-rigorous' humanist treatment of ratiocination, the 'rigour' of a commitment to formal validity as the central focus for the study of logic - a commitment, that is to say, to those fixed patterns of

argumentation which guarantee that from any true premises whatsoever one can only infer a true conclusion Humanist treatments of logic, on the other hand, have a good deal in common with the interests of some recent, modern logicians, who have chosen to give a good deal of attention to non-deductive inference, and to 'good' arguments (arguments which can be counted on to win in debate), and the problematic nature of their validity. Like modern logicians they are interested, above all, in 'good' arguments.

A humanist treatment of logic is characterised by the fundamental assumption that *oratio* may be persuasive, even compelling, without its being formally valid (or without the formal validity of the argument being ascertainable). It takes the view, therefore, that any significant study of argument (the subject-matter of logic/dialectic) must concern itself equally with argument (strictly, argumentation) which is compelling but not amenable to analysis within traditional formal logic.' It is this fundamental difference of opinion over what is meant by 'compelling' argument which accounts for the dogmatic insistence (on ideological grounds) of the scholastic (and of the historian of scholasticism) that the humanist is a 'grammarian' or a 'rhetorician'. Either term announces that what the humanist is concerned with is not 'rigorous' in the restricted scholastic sense: all discourse not amenable to such 'rigorous' analysis is, for the scholastic, a matter for the grammarian (to parse and construe) or the rhetorician (to catalogue its persuasive devices). It is in the same spirit that humanists always refer to their study of ratiocination as 'dialectic' (reasoning conducted between two interlocutors), rather than as 'logic', to emphasise the active, pragmatic nature of the argumentation which captures their interest." "Introduction.

It is quite obvious that epistemology permeates most of the logic texts written from a period beginning in the late seventeenth century and continuing into the beginning of the contemporary era in logic at the end of the nineteenth century. The model of this kind of logic appears to be the *Port Royal Logic*. Since this is a work suffused throughout with Cartesian doctrine, it is natural to conclude that this kind of logic is of Cartesian inspiration. Even though Descartes himself did not think of logic in this way, indeed he appears to have viewed logic, and abstract thought generally, with suspicion, the epistemological approach to logic taken in the *Port Royal Logic* can be seen to be a natural outgrowth of Cartesian philosophy. The problem with this judgment is that there had been an earlier logic of this same type and its author, Pierre Gassendi, not only was not Cartesian, but was Descartes's principal rival among the moderns. His *Institutio Logica,* published not as a separate work, but as part of the *Syntagma Philosophica,* which itself is available only as the first two volumes of

Gassendi's posthumous *Opera Omnia,* was, as I will try to show, both conceptually and structurally, the *Port Royal Logic's* principal model.

Inasmuch as each of these logics has as its foundation a theory of ideas, it seems appropriate to call this kind of logic, the logic of ideas. Historians of logic do not look with much favour upon this kind of logic. In the Introduction to his English translation of Gassendi's *Institutio Logica,* Howard Jones states that this work is "not a revolutionary logic which rejects all that the logical tradition has to offer, but a logic which Gassendi renders contemporary by selecting from that tradition only what is appropriate to seventeenth century needs."(1) Wilhelm Risse's assessment of the *Port Royal Logic* is similar. He says of this work, that it is historically one of the high points of logic, comparable in influence to that of Aristotle, Peter of Spain, Ramus and Wolff. But he adds: "This logic is certainly not original. Its extraordinary success is due to its elegance and its pedagogically effective manner of presentation."(2) With respect to logic after the medieval period, which includes the humanist logics of the Renaissance period in addition to the logic of ideas, William and Martha Kneale in their *The Development of Logic* remark that "from the 400 years between the middle of the fifteenth and the middle of the nineteenth century we have...scores of textbooks but few works that contain anything at once new and good."(3) The logic of this same era is called by I.M. Bochenski, "classical logic" and is characterized by him as "something held the field in hundreds of books for nearly four hundred years"(4) but while he sees it as new, he certainly does not see it as good. This is his assessment: "Poor in content, devoid of all deep problems, permeated with a whole lot of non-logical philosophical ideas, psychologist in the worst sense-that is how we have to sum up the "classical" logics.(5)

While I don't think that this attitude is wholly wrong, I would contend that the logic of ideas *was* revolutionary. More specifically, it was the completion of a revolution that took two hundred years to accomplish, from the sixteenth to the eighteenth century. This was the era of the religious

reformation, and it would be as appropriate to speak of a philosophical and scientific reformation in this era as well. It was a period of intense intellectual ferment and upheaval, in which the medieval world view was abandoned and replaced by the modern world view. It began with an attack on medieval logic. This at first sight seems odd inasmuch as if there is one area of medieval philosophy which those involved with the history of philosophy do not think was in need of reformation, it is logic. That is no doubt at least part of the reason why the reformed logics are viewed today with so little enthusiasm

The reform of logic occurred in two phases. The first phase was largely reactive. Medieval logic was discredited by the humanists and largely abandoned. The humanists hoped to convert logic from the formal and theoretical discipline of the medieval period into a practical study, which they hoped would be an improved instrument for argumentation and disputation, and so for the discovery of truth. There was however no consensus about how this was to be accomplished. The second phase in the reformation of logic began in the early seventeenth century, with the abandonment of the view that the way to truth is via argumentation and disputation. Disputation does not lead to truth, it was held, rather the road to truth is by the way of ideas.

The logic of this era is, as Bochenski says, something new. It is an important development in the history of logic. But is it also something good? Were the humanists responsible for an advance in logic? Was the epistemological turn which the logic of ideas brought about, the right turn for logic? For the most part, I would have to answer no. These developments were on the whole not good for logic; certainly they were not good for formal logic. In the four hundred years from the end of the medieval era to the beginning of the era of contemporary logic, while there was some development in informal logic, formal logic was largely neglected. It was a reform of logic, a revolutionary change. But revolutions aren't always good and this one was not good for formal logic. Contemporary logicians and historians of logic have reason to be dismayed by its results.

On the other hand, the situation could hardly have been more favourable for the development of epistemology, and of the theory of ideas in particular. Logic was typically the first subject in a course of university studies, and in the logic of ideas, the theory of ideas was the subject matter to which the student was first exposed. The chief focus in the logic of ideas was not on form but on content, principally on epistemological content. Yet it really was a form of logic, as I hope to make clear and the conception of logic it embodies is legitimate.

My principal purpose in this paper is to examine the logic of ideas as it is found in Gassendi's *Institutio Logica* and in the *Port Royal Logic,* to compare these two works and to explain how this form of logic came about. But I do not think that this form of logic can be understood except in its broad intellectual context. Accordingly, it is with this that I begin." pp. 1-3

    "According to the received view (Bocheński, Kneale), from the end of the fourteenth to the second half of nineteenth century, logic enters a period of decadence. If one looks at this period, the richness of the topics and the complexity of the discussions that characterized medieval logic seem to belong to a completely different world: a simplified theory of the syllogism is the only surviving relic of a glorious past. Even though this negative appraisal is grounded on good reasons, it overlooks, however, a remarkable innovation that imposes itself at the beginning of the sixteenth century: the attempt to connect the two previously separated disciplines of logic and mathematics. This happens along two opposite directions: the one aiming to base mathematical proofs on traditional (Aristotelian) logic; the other attempting to reduce logic to a mathematical (algebraical) calculus. This second trend was reinforced by the claim, mainly propagated by Hobbes, that the activity of thinking was the same as that of performing an arithmetical calculus. Thus, in the period of what Bocheński characterizes as 'classical logic', one may find the seeds of a process which was completed by Boole and Frege and opened the door to the contemporary, mathematical form of logic."

    "Although we now dismiss Kant's suggestion that logic was already essentially a completed science, we ourselves embrace its ghost, the idea that the conception of logical inference with which we are most familiar is just the common conception of our illustrious philosophical ancestors. This ghost works mischief. It causes us to think whiggishly of the history of logic and so lends respectability to the thought that only since 1879 has there been great logic. More concretely, I shall argue here, the idea that were is and always has been a single dominant conception of valid inference (ours) blinds us to part of Descartes's project. By setting that project against its medieval background I hope to revive our sense of both its strangeness and its possibilities."

63. Nuchelmans, Gabriel. 1994. "Can a Mental Proposition Change Its Truth-Value? Some 17th-Century Views." *History and Philosophy of Logic* no. 15:69-84.

    " In the first half of the seventeenth century the Aristotelian view that the same statement or belief may be true at one time and false at another and, on the other hand, the conception of a mental proposition as a fully explicit thought that lends a definite meaning to a declarative sentence originated a lively debate concerning the question whether a mental proposition

can change its truth- value. In this article it is shown that the defenders of a negative answer and the advocates of a positive answer argued on the basis of different notions of what a mental proposition is: one side taking it as more or less equivalent to a specific utterance- meaning and the other side as more or less equivalent to a generic sentence-meaning."

67. Peckhaus, Volker. 1999. "19th Century Logic between Philosophy and Mathematics." *Bulletin of Symbolic Logic* no. 5:433-450.

    "The history of modern logic is usually written as the history of mathematical or, more general, symbolic logic. As such it was created by mathematicians. Not regarding its anticipations in scholastic logic and in the rationalistic era, its continuous development began with George Boole's *The Mathematical Analysis of Logic* of 1847, and it became a mathematical subdiscipline in the early 20th century. This style of presentation cuts off one eminent line of development, the philosophical development of logic, although logic is evidently one of the basic disciplines of philosophy. One needs only to

recall some of the standard 19th century definitions of logic as, e.g., the art and science of reasoning (Whateley) or as giving the normative rules of correct reasoning (Herbart).

In the paper the relationship between the philosophical and themathematical development of logic will be discussed. Answers to the following questions will be provided:

1. What were the reasons for the philosophers' lack of interest in formal logic?

2. What were the reasons for the mathematicians' interest in logic?

3. What did "logic reform" mean in the 19th century? Were the systems of mathematical logic initially regarded as contributions to a reform of logic?

4. Was mathematical logic regarded as art, as science or as both?"

    "The aim of the paper is to reassess the role of British Aristotelianism within the history of early modern logic between the sixteenth and seventeenth centuries, as a crucial moment of cultural transition from the model of humanistic rhetoric and dialectic to that of facultative logic, that is, a logic which concerns the study of the cognitive powers of the mind. The paper shows that there is a special connection between Paduan Aristotelianism and British empiricism, through the mediation of British Aristotelianism. British Aristotelians took the ideas of the Paduan Aristotelian tradition and carried them to an extreme, gradually removing them from the original Aristotelian context in which they were grounded and developing what would later become the fundamental ideas of British empiricism."

3. Abraham, William E. 1969. "Complete concepts and Leibniz's distinction between necessary and contingent propositions." *Studia Leibnitiana* no. 1:263–279

   "There is a widely held view that Leibniz is unable to draw a logical, as distinct from a psychological, an epistemological, or a theological, distinction between necessary and contingent truths.

   According to the psychological, view, contingent truths are necessary truths whose analysis is so complex that our minds are unable to complete or grasp the analysis. According to the epistemological distinction, certain facts appear differently to us from how they appear to God. God knows all things non-temporally or timelessly, while we can only know facts as appearing in time. Hence certain propositions must appear contingent to us. According to the theological distinction, contingent truths are necessary(1) truths which are made contingent by their presupposition of the free decree of God, while necessary truths only presuppose his understanding.

   I propose to show that Leibniz draws a consistent and distinctly logical contrast, and to show that the above gloomy opinion springs from an indefensible interpretation of the nature and purpose of the "complete concept", as well as an omission to

investigate properly what Leibniz means by a reduction, and by a "virtual identity"."

4. ———. 1975. "Predication." *Studia Leibnitiana* no. 7:1–20

   Abstracvt: "Paralogisms concerning Leibniz's predicate doctrine are pointed out and refuted.

   Being included means the inverse of derivative; to the two kinds of derivation that Leibniz knows, correspond to two kinds of containment. The two types of entailment provide Leibniz with the possibility to make the logical and irreducible distinction between necessary and conditional truths. The distinction between an individual and a property is made with set-theoretic methods and also with the help of epistemological terms.

   The particular categorical form of the declarative sentence implies that there is only one deep grammar for all statements, which are essentially different forms of expression of categorical statements."

5. Alama, Jesse, Oppenheimer, Paul Edward, and Zalta, Edward. 2015. "Automating Leibniz's Theory of Concepts." In *Automated Deduction – CADE 25: Proceedings of the 25th International Conference on Automated Deduction*, edited by Felty, Amy P. and Middeldorp, Aart, 73–97. Berlin: Springer

   Abstract: "Our computational metaphysics group describes its use of automated reasoning tools to study Leibniz's theory of concepts. We start with a reconstruction of Leibniz's theory within the theory of abstract objects (henceforth `object theory'). Leibniz's theory of concepts, under this reconstruction, has a non-modal algebra of concepts, a concept-containment theory of truth, and a modal metaphysics of complete individual concepts. We show how the object-theoretic reconstruction of these components of Leibniz's theory can be represented for investigation by means of automated theorem provers and finite model builders. The

fundamental theorem of Leibniz's theory is derived using these tools."

6. Alcantara, Jean-Pascal. 2011. "On internal relations in Leibniz, British Neo-realism and Whitehead." *Logique et Analyse* no. 214:173–209

   Abstract: "The aim of this paper consists in asking whether Whitehead's philosophy of organism would be a reenactment of Leibniz's doctrine of internal relations. As this terminology depends on Russell's reading of Leibniz, it is first necessary to restore the so-called thesis of reducibility of relations through the opposition of the main commentaries. Secondly, we distinguish Russell's refusal of the axiom of internal relations from Moore's criticism, which is rather related to the exclusiveness of this axiom. Thirdly, we follow Whitehead on relations from 1905 to 1925, agreeing with Russell about the untenable supremacy of the judgement of predication, but getting closer to Moore about the axiom, for the very reason that if there were any internal relation, there could be no process in the nature."

7. ———. 2012. "Leibniz, Modal Logic and Possible World Semantics: The Apulean Square as a Procrustean Bed for His Modal Metaphysics." In *Around and Beyond the Square of Opposition*, edited by Béziau, Jean-Yves, 53–71. Basel: Birkhäuser

   Abstract: "Even if Leibniz didn’t have the opportunity to actually conceive an explicit modal logic system, remains the fact that he had worked out a modal metaphysics, of hich the inaugural act, in his *Elementa juris naturalis* (c. 1671) was an obvious reference to the Apulean square of opposition. Later, scholars acknowledged in this passage probably one of the first sketch of deontic logic of norms. His modal metaphysics rather deals with the so-called alethic modalities, sometimes expounded through a language such as R.M. Adams wondered whether Leibniz could be “a sort of grandfather of possible worlds semantics for modal logic”.[*] In the following study, the Apulean square is used as a hermeneutic tool: however, is the square really well-fitted to express some basic implications

of the modal metaphysics? The most remarkable point is that Leibniz was well aware of the K-distributive axiom (p ⊃ q) ⊃ (p ⊃ q) common to the main modal systems today. This awareness dissuaded him to trust the too easy solution of the necessitarianism issue grounded on the well-known distinction coming from Boethius between a "*necessitas consequentiae*" and a "*necessitas consequentis*".

Thus Leibniz must consider a proof-theory solution style (for a contingent proposition, the reducibility of the predicate to its subject cannot be achieved). A new square could be making up, however implying a difficulty: if the modal metaphysics cannot admit the logical convertibility of the contingent propositions of which the *dictum* of one is exactly the negation of the *dictum* of the other, known since Aristotle. This is the reason for what the Apulean square could represent a Procrustean bed for Leibniz' modal metaphysics.

At the end, a new modality square may be drawn, according to which each modality in the corner is expressed by quantifications on possible worlds. Whether possible worlds semantics could supersedes Leibniz' own explanation of contingency thanks to this new square of modalities, i.e. a possible worlds square of modalities, will be the topic of a second part of this study."

8. Andrews, F. E. 1983. "Leibniz's Logic Within His Philosophical System." *Dionysius* no. 7:73–128

   Abstract: "The work purports to provide a philosophical history of Leibniz's logical works. The principal conclusion is that Leibniz's work on logical calculi, the modifications in it coinciding with the three periods identified by Couturat, rest upon refinements in the expression of his philosophical system, and end when his philosophical thought reached that point at which it is manifest that a logical calculus such as he had envisaged is not competent to his philosophical standpoint."

9. Angelelli, Ignacio. 1965. "Leibniz's misunderstanding of Nisolius' notion of "multitudo"." *Notre Dame Journal of Formal Logic* no. 6:319–322

   "The Renaissance humanist Nizolius(1) is a remarkable exception in the history of philosophy, where the notion of class appears to be extremely rare. Nizolius substitutes traditional universals by what he calls *multitudines* and during more than four hundred pages he tries to convince his readers that in the real world there are only individuals and collections of individuals. It is not perhaps clear whether Nizolius' *multitudo* comes closer to *class* or to *heap*." (p. 319)

   (...)

   "Now, it is extremely puzzling that Leibniz seems to have completely missed such a point of Nizolius' theory, because he erroneously thinks that Nizolius' approach leads to such absurdities as {horno} ε {animal}

   or to such falsities as {homo}={animal}. How or why this could happen, is indeed quite enigmatic." (p. 319)

   (...)

   "Nizolius' pyrrhic fame, due to the fact of his having been edited by Leibniz, should be substituted by a more important one: his book is an excellent introduction - in Ciceronian style - to the problems of the notion

   of class." (p. 320, notes omitted)

   (1) ...Marius Nizolius was born in Brescello (Italy), 1498, and died in 1576. He was a disciple of Valla, and he taught at the University of Parma.

   [Leibniz reedited the book *Marii Nizolii de veris principiis et vera ratione philosophandi libri IV*, in 1670, with an important preface.]

10. ———. 1967. "On Identity and Interchangeability in Leibniz and Frege." *Notre Dame Journal of Formal Logic* no. 8:94–100

"The main purpose of this paper is to show that Leibniz did not accept what today is usually known as Leibniz's rule of substitutivity (or indiscernibility of identicals, etc.). This purpose is attained by quoting three texts, in Latin, one of them not yet published. Another aim of the paper is to show how Frege believed that the rule Leibniz had used only for restricted calculi, could be extended to the ordinary language. This is construed as the source of the axiomatic status enjoyed by the rule among philosophers in the last century."

11. Arthur, Richard T. W. 2019. "Leibniz in Cantor's Paradise: A Dialogue on the Actual Infinite." In *Leibniz and the Structure of Sciences: Modern Perspectives on the History of Logic, Mathematics, Epistemology*, edited by De Risi, Vincenzo, 71–109. Cham (Switzerland): Springer.

12. Baron, Margaret E. 1969. "A Note on the Historical Development of Logic Diagrams: Leibniz, Euler and Venn." *The Mathematical Gazette* no. 53:113–125

    "It was, however, Gottfried Wilhelm Leibniz (1646-1716), who first devoted serious study to the analysis of logical propositions by means of diagrams. He was also the first to conceive the idea of a calculus of logic as a piece of purely abstract mathematics, i.e., mathematics not concerned with space or number. Unfortunately much of the value of this work was lost as only a small proportion of it was published in his life-time.

    Leibniz professes always the greatest admiration for traditional logic." (p. 116)

    (...)

    "Nonetheless, he considered the logic of Aristotle imperfect and wanted to complete it. In so doing, he explored at some length the possibility of representing syllogistic arguments by means of geometric figures developing not only the now familiar circle diagrams attributed to Venn and Euler, but also an ingenious linear form which he considered clearer and easier to work with." (p. 117)

13. Bassler, Otto Bradley. 1998. "Leibniz on Intension, Extension, and the Representation of Syllogistic Inference." *Synthese* no. 116:117–139

    Abstract: "New light is shed on Leibniz's commitment to the metaphysical priority of the intensional interpretation of logic by considering the arithmetical and graphical representations of syllogistic inference that Leibniz studied. Crucial to understanding this connection is the idea that concepts can be intensionally represented in terms of properties of geometric extension, though significantly not the simple geometric property of part-whole inclusion. I go on to provide an explanation for how Leibniz could maintain the metaphysical priority of the intensional interpretation while holding that logically the intensional and the extensional stand in strictly inverse relation to each other."

14. Benis-Sinaceur, Hourya. 2023. ""Ars invenendi" today." *Acta Morphologica Generalis* no. 9:1–11

    From the original article: *"Ars inveniendi" aujourd'hui*, Les Études philosophiques, 1989, pp. 201-214. Translated from the French by Asunción Álvarez.

    "In his obituary of Abraham Robinson(1), Simon Kochen gave a portrait of Kurt Gödel (1906-1978) that will be of interest to Leibniz scholars. Gödel, who, it should be borne in mind, was particularly interested in Leibniz's philosophy, regarded Abraham Robinson's work as the best realisation of the Leibnizian ideal of logic serving as an ars inveniendi for mathematics. In this paper, I would like to examine which aspect of ars inveniendi is done justice by this claim, and which characteristic of contemporary logic it highlights. Given that we are dealing with Abraham Robinson's work, I will only discuss model theory, although there are other domains where logical results may facilitate mathematical discoveries.

    Leibniz's project of a "universal calculus"(2) has been widely discussed in the light of the findings of modern logic. By contrast, the idea, which is essential to Leibniz's mathematics and philosophy, that the establishment of calculus presupposes

a “concept analysis” has been hardly considered from the point of view of modern logic. Yet this was what Gödel, for whom conceptual analysis is a precious component of scientific research and logic a useful discipline for mathematicians(3), had in mind." (p. 1)

16. Bertran-San Millán, Joan. 2021. "Lingua characterica and calculus ratiocinator: The Leibnizian background of the Frege-Schröder polemic." *The Review of Symbolic Logic* no. 14:411–446

Abstract: "After the publication of *Begriffsschrift*, a conflict erupted between Frege and Schröder regarding their respective logical systems which emerged around the Leibnizian notions of *lingua characterica* and *calculus ratiocinator*. Both of them claimed their own logic to be a better realisation of Leibniz’s ideal language and considered the rival system a mere *calculus ratiocinator*. Inspired by this polemic, van Heijenoort (1967b) distinguished two conceptions of logic—logic as language and logic as calculus—and presented them as opposing views, but

did not explain Frege's and Schröder's conceptions of the fulfilment of Leibniz's scientific ideal.

In this paper I explain the reasons for Frege's and Schröder's mutual accusations of having created a mere *calculus ratiocinator*. On the one hand, Schröder's construction of the algebra of relatives fits with a project for the reduction of any mathematical concept to the notion of relative. From this stance I argue that he deemed the formal system of *Begriffsschrift* incapable of such a reduction. On the other hand, first I argue that Frege took Boolean logic to be an abstract logical theory inadequate for the rendering of specific content; then I claim that the language of *Begriffsschrift* did not constitute a complete *lingua characterica* by itself, more being seen by Frege as a tool that could be applied to scientific disciplines. Accordingly, I argue that Frege's project of constructing a *lingua characterica* was not tied to his later logicist programme."

17. Besler, Arman. 2018. "Syllogistic Expansion in the Leibnizian Reduction Scheme." *Cilicia Journa of Philosophy* no. 2:1–16

Abstract: "The standard inferential scheme of traditional assertoric syllogistic, based on the initial chapters of Aristotle's Prior Analytics, employs single-premissed deductions, i.e., principles of immediate inference, in the reduction of imperfect valid moods to perfect moods. G. W. Leibniz (among others) has attempted to replace this scheme with his own version of syllogistic reduction (the core of which is, again, based on Aristotle's observations on syllogistic transformation), in which the principles of immediate inference themselves are modelled as (and hence justified by means of) valid syllogisms. This paper examines the place of this modelling, i.e. syllogistic expansion, of immediate inferences in Leibniz's scheme of syllogistic reduction (which he describes in his Nouveaux Essais and presents in one of his papers on syllogistic), and shows through this examination that the tenability of the whole

scheme actually hinges on the interpretation to be given for the categorical propositional forms."

18. Blank, Andreas. 2008. "Ramus and Leibniz on analysis." In *Leibniz: What Kind of Rationalist?*, edited by Dascal, Marcelo, 155–166. Dordrecht: Springer

    "In the present chapter, I argue for two claims: (1) In the 1547 edition of the *Dialectical Institutions* – the first three volumes Latin edition that came out under his own name(4) – Ramus explicitly dissociates human discourse from truth in the Divine mind. Rather, he holds that dialectics is founded on innate, natural capacities of the human mind which function as a substitute for insight into Divine truth. According to his view, analysis has the task of disentangling the elements of common human discourse, thus providing us with examples, which subsequently, in the process of genesis, fulfill the function of models for forming new discourses. (2) Leibniz's attitude towards Ramus is not a matter of simply accepting or rejecting such an account of the role of analysis in the constitution of discourse. On the one hand, Leibniz does not accept Ramus' views about the connection between analysis and the function of examples as models for constructing new discourses. According to Leibniz, rather, analysis provides us with the concepts and truths that function as starting points for demonstrative arguments. On the other hand, he shares with Ramus the view that philosophical analysis can only explicate what implicitly already is known. As for Ramus, for Leibniz analysis has a purely descriptive starting point in the common usage of language." (pp. 155-156)

    (4) For the history of the three-book Latin editions of the *Dialectical Institutions*, see Ong 1958: 200–201. In what follows, I refer to the 1547 edition of the *Dialectical Institutions* as "DI".

    Abstract: "To explore the extent of embeddability of Leibnizian infinitesimal calculus in first-order logic (FOL) and modern frameworks, we propose to set aside ontological issues and focus on procedural questions. This would enable an account of Leibnizian procedures in a framework limited to FOL with a small number of additional ingredients such as the relation of infinite proximity. If, as we argue here, first order logic is indeed suitable for developing modern proxies for the inferential moves found in Leibnizian infinitesimal calculus, then modern infinitesimal frameworks are more appropriate to interpreting Leibnizian infinitesimal calculus than modern Weierstrassian ones."

Metaphysics and Its Foundations, Gottfried Wilhelm Leibniz. Critical Assessments,* Vol. I, New York, Routledge, 1994, pp. 82-96.

    "At the beginning of this century, Russell and Couturat made the important discovery that some of Leibniz's most fundamental metaphysical views (his view that substances do not interact, his theory of pre-established harmony as a soIution to the mind-body problem, etc.) were based upon his intensional analysis of the truth of propositions, upon his logical principle that the predicate is contained in the subject in every true proposition.(1) Since their discovery, this principle has been the subject of much controversy.

Did Leibniz think that it applied to existential judgments? What is its relation to the principle of sufficient reason, another of Leibniz's fundamentalprinciples? Does it have the consequences that Leibniz thought it had?

Strangely enough, throughout all of this controversy, little attention has been directed to Leibniz's reasons for maintaining this principle. It is just this that I want to consider in this paper. I hope to show that (a) it is more or less original with Leibniz, and not something that he borrowed from his predecessors, (b) he had a variety of interesting and important arguments for it, and (c) these arguments reveal that this logicaI principle was based upon certain of Leibniz's fundamental metaphysical presuppositions. In light of this last result, I shall also argue for a reevaluation of the relation between Leibniz's logic and his metaphysics." (p. 43)

22. Burdick, Howard. 1991. "What was Leibniz's problem about relations?" *Synthese* no. 88:1–13

Abstract: "The main purpose of the article is to get clear what Leibniz's concerns about relations were. His:

I do not believe that you will admit an accident that is in two subjects at the same time. My judgement about relations is that paternity in David is one thing, sonship in Solomon another, but that the relation common to both is a merely mental thing whose basis is the modifications of the individuals

is best seen as akin to:

'Father' is true of David. 'Son' is true of Solomon. But 'Being a father of' is not true of any individual.

Leibniz, like modern nominalist Nelson Goodman, could not allow the ordered pair (David, Solomon). To establish this I must argue against Hidé Ishiguro's claim that Leibniz should have straightforwardly constructed a logic of relations, and

Jaakko Hintikka's claim that Leibniz could have allowed the use of relational predicates in such forms as '(Ex) Rax' and '(Ey) Ryb'. I must also argue that what they say about the windowlessness doctrine (especially the 'as if' formulation) is beside the point."

"The subject of our paper is the history of whole and part, a topic much neglected in the more recent history of philosophy and theory of science. We shall deal in particular with the part-whole relation in Leibnlz's metaphysics.

The relation of part and whole was by no means always an object of neglect. For Aristotle and the tradition the part-whole relation is a relation fundamental to ontology and metaphysics, being treated as of equal standing with the substance-accident relation and with the four different kinds of cause (material, formal, efficient and final)." (p. 3)

(...)

"The logically basic relation of concept to part-concept is for Leibniz also a whole-part relation -- or at least it seems to be such. At the time of his *Dissertatio*, Leibniz had been convinced that there are minimal, simple concepts, that is concepts which cannot be divided further but which can be known by human beings, and which are the ultimate compository elements of all other concepts. His later view, on the other hand, is that, while

there are such simplest or atomic concepts (*notiones absolute primae*), we do not know what they are, so that we have to be content with composite or 'molecular' concepts *(notiones quoad nos primae*). Hence Leibniz does not at all renounce his earlier idea of a combination of concepts. It remains an ineluctable part of his philosophy and the very heart of his logic -- we must always remember that Leibniz is a logician of concepts or terms and not of propositions. For the purpose of his logic, he also reduces the relation of substance-accident to the more easily treatable relation of concept to part-concept, for example the inclusion of the concept animal in the concept man or even the inclusion of the concept married to Susan in the individual concept Peter. " (p. 6, a note omitted)

    § 8. *Leibniz*, pp. 110-122.

    "The German logician and philosopher Gottfried Wilhelm Leibniz (1646–1716) has a foremost role in the history of formal logic. However, it is almost impossible (and probably misleading) to represent his contributions to logic as a single and coherent set of theories nicely inserted within a linear path of development. There are at least three reasons that rule out such a reassuring view. In the first place, Leibniz contributed ideas—often through scattered and incomplete fragments rather than through structured and polished writings—to a

plurality of logically relevant subjects: from the arithmetization of syllogistic to the theory of relations, from modal logic (and semantic of modal logic) to logical grammar—and the list could be easily extended. Moreover, relevant contributions are often found in works, fragments, or letters not explicitly devoted to the field of logic.

In the second place, most of Leibniz's writings testify to a work in progress in the deepest meaning of the expression: Different and sometimes incompatible strategies are explored in fragments dating back to the same years or even to the same months, corrections and additions may substantially modify the import of a passage, promising and detailed analysis remain uncompleted or are mingled with sketchy hints. Nevertheless, there is a method in Leibniz's passionate and uninterrupted research: a deeper unity that is given by a set of recurring problems and by the wider theoretical framework in which they are dealt with. Last but not least, it should always be kept in mind that Leibniz's works known by his contemporaries and immediate successors constitute a very limited subset of his actual production. It is only during the twentieth century that Leibniz's role in the history of logic came to be fully appreciated, and this appreciation is connected to at least two different moments: the publication by Louis Couturat, in 1903, of the *Opuscules et fragments inédits de Leibniz* (Leibniz 1966; see also Couturat 1901), many of which were devoted to logic, and the progress made during the second half of the century in the publication of the complete and critical edition of Leibniz's texts (*Leibniz* 1923–). Almost three centuries after his death, this edition (the so-called Akademie-Ausgabe) is, however, still to be completed." (pp. 110-111)

    "My primary purpose here is to contribute to a better understanding of Leibniz's view of concepts and their coincidence salva veritate. I also want to advocate a certain Darwinian methodology for future studies in Leibniz's philosophy. These goals will be pursued through a critical examination of Hide Ishiguro's recent and valuable book *Leibniz's Philosophy of Logic and Language*.[1]

    (...)

    Here I dispute Ishiguro's five main theses about Leibniz's view of concepts. These are (A)-(E) below. In my opinion, these interesting theses run counter to crucial texts, but, more importantly, they destroy the significance of Leibniz's work in logic and distort his ontology without enhancing the value of his contribution to the philosophy of logic or the philosophy of language.

    I have something to say about Ishiguro's treatment of Leibniz's view of relations and of existence, but I cannot go into full details here.

    Fortunately, and unexpectedly in the course of working on the problems of referential opacity, I have developed a system of ontology in [2] that is thoroughly Leibnizian in its handling of relations and of existence.

    It shows how relations are beings of reason by being instances of the pre-established harmony. Thus, that system contains an indirect, partial reply to Ishiguro's discussion on pages 103ff." (p. 381, a note omitted)

29. ———. 1976. "Leibniz's Syllogistico-Propositional Calculus." *Notre Dame Journal of Formal Logic* no. 17:481–500

"In his research in logical theory after 1680 Gottfried Wilhelm Leibniz worked intensively at devising a formal calculus that would be interpreted as a general logic. He was convinced that the classical types of categorical propositions were the fundamental ones, so that the central core of his general calculus had to consist of the theory of the syllogism. He conceived the rest of the logical relationships between propositions as developments of syllogistics. Thus, the calculus he was aiming at was not to be merely a calculus that could have a double interpretation: as a syllogistic calculus and, alternatively, as a calculus of other types of implication. His general calculus was to have the principles of syllogistics and the other logical principles together at once. His calculus would be powerful enough to handle mixed inferences involving classical syllogisms and other reasonings.

Undoubtedly because of his algebraic researches and his view on the nature of truth, Leibniz took it for granted that a fully satisfactory logical calculus must be an equational one. Thus, his first efforts at treating the theory of syllogism were directed toward the construction of an equational syllogistic calculus. (And he anticipated some equations of Boolean algebra.) His *General Inquiries about the Analysis of Concepts and Truths* (1686), referred to here as [I],(1) contains a series of reflections on the syllogistic equations. He tries several approaches, and discovers some valid equations. But two things are of special interest to us now:

(i) Leibniz formulates there principles that allow the generalization of syllogistics to propositional logic; (ii) Leibniz moves toward a higher level of abstraction. In his [2], *The Primary Bases of a Logical Calculus* (August 1, 1690), he takes up the topic again, and this time he begins with general logical principles and discusses applications to syllogistics. He distills

the general system in [3], *The Bases of a Logical Calculus* (August 2, 1690).

My purpose here is to examine critically the system slowly developed by Leibniz in those three papers. " (p. 481)

"Here I argue that the concluding round of logical theorizing in Leibniz's *Generales Inquisitiones*, Sections 195-200, 6 is a brilliant short essay. It contains a significant logical accomplishment. With minor editing, it should have been published in 1686 or soon thereafter.

Our current standards of rigor would require more editing, but no revision of principles, except a clarification about the association of conjunction.

The *GI* is a manifold of philosophical reflections undergirded by a series of logical investigations. Leibniz's goal is to construct a general logical calculus that encompasses traditional syllogistics. He makes attempt after attempt at developing the envisaged calculus.

(...)

"I submit that Leibniz is completely justified in claiming that the principles he has given are fundamentals of logical form.

(Since Latin does not have articles, it is not clear that he meant the fundamentals, or simply some fundamentals.) At any rate, a set of principles for a certain logical domain may be complete; yet there are always equivalent alternative characterizations of the same domain of valid inferences. Hence, the issue of uniqueness is not so important as whether the principles under consideration are valid and of central value. The next important question is whether the set of such principles is in an appropriate sense complete.

Here I want to argue for two major theses. First, the principles Leibniz formulates in GI 195-200 are valid, important, and exciting. Second, with the adjunction of the principle of associativity of conjunction, which Leibniz does not mention, although he uses it all over, the set of principles he formulates explicitly includes a redundant complete formulation of the standard propositional calculus. Moreover, these principles also contain a full characterization of the truth-table semantics of propositional logic. Furthermore, that calculus includes a correct Boolean treatment of syllogistics." 31. Castro-Manzano, J. Martín. 2017. "Re(dis)covering Leibniz's Diagrammatic Logic." *Tópicos, Revista de Filosofía* no. 52:89–116

Abstract:"In this paper I attempt to retrieve Leibniz's linear diagrammatic logic for his syllogistic and highlight its computational and logical features by providing a formal

approach to it in metalogical terms, which is something that, as far as we know, has not yet been accomplished. Thus, in this contribution I pursue two goals, one historical and the other logical: i) to bring more attention on the algorithmic aspects of Leibniz's linear diagrammatic system for his syllogistic, which I believe has been neglected because of a general bias against diagram-based reasoning; and ii) to prove the metalogical properties of the system in order to argue that such a system is a *bona fide* logical system."

33. Cook, Roy T. 2000. "Monads and Mathematics: the Logic of Leibniz's Mereology." *Studia Leibnitiana* no. 32:1–20

    Summary: "There are profound connections between Leibniz' mathematics and his metaphysics. This paper aims to increase understanding of both of these areas by examining Leibniz's mereology (the theory of parts and wholes). First, Leibniz' mereology will be reconstructed primarily on the basis of his work "Initia rerum mathematicarum metaphysica". This ambitious program begins with the simple notion of compresence, then moves on to more complex notions such as equality, similarity, and homogeneity, and culminates in Leibniz's definition of the notions of part, whole, and composition. In the course of the essay, further insights are gained in other areas, e.g. in relation to the identity of the indistinguishable. Finally, within the framework of the presented theory, I will try to dispel a misunderstanding regarding Leibniz's analogy between monads and mathematical points, which relates to the spatiality of monads."

    Summary: "In his *Dissertatio de arte combinatoria,* G.W. Leibniz develops a method to find predicates from a subject and subjects to a predicate, and he sets up a formula to calculate their number. In what follows I would like to explain

how this method works and why it forms both a part of what Leibniz calls *logica inventiva* and a direct consequence of his theory of variations, which forms the central part of his *Dissertatio*. In the last section of this article I will go into some theoretical and historical connections between *logica inventiva* and Aristotelian logic. In particular, I will explain how Leibniz's method relates to some traditional attempts to determine the *tota minora* of a given term, and whether the Aristotelian theory of categorical propositions was able to support Leibniz's method of finding subjects and predicates to be justified within *logica inventiva*."

46. Di Bella, Stefano. 2005. "Leibniz's Theory of Conditions: A Framework for Ontological Dependence." *The Leibniz Review* no. 15:67–93

    Abstract: "The aim of this paper is to trace in Leibniz' s drafts the sketched outline of a conceptual framework he organized around the key concept of 'requisite'. We are faced with the project of a semi-formal theory of conditions, whose logical skeleton can have a lot of different interpretations. In particular, it is well suited to capture some crucial relations of ontological dependence. Firstly the area of 'mediate requisites' is explored - where causal and temporal relations are dealt with on the basis of a general theory of 'consequence'.

    Then the study of 'immediate requisites' is taken into account - a true sample of mereological inquiry, where Leibniz strives for a unitary treatment of part-whole relation, conceptual inclusion and inherence. Far from simply conflating these relations one with another and with causality, therefore, Leibniz tried to spell them out, while at the same time understanding them within a single conceptual framework."

47. Doull, Floy Andrews. 1991. "Leibniz's Logical System of 1686-1690." *Theoria.Revista de Teoria, Historia y Fundamentos de la Ciencia* no. 6:9–28

    Abstract: "Logical works of this period, beginning with "Generales Inquisitiones" and ending with the two dated pieces of August 1, 1690 and August 2, 1690, are read as a sustained effort, finally successful, to develop a set of axioms and an appropriate schema for the expression of categorical propositions faithful to traditional syllogistic. This same set of axioms is shown to be comprehensive of the propositional calculus of "Principia Mathematica", providing that 'some A is A' is not a "thesis" in an unrestricted sense. There is no indication in the works of this period that Leibniz understood just how significant is this logical system he developed. But it is undeniable that he held tenaciously to this particular set of axioms throughout the period, a set of axioms of great power."

48. Drago, Antonino. 2008. "The square of opposition and the four fundamental choices." *Logica Universalis* no. 2:127–141

    Abstract: "Each predicate of the Aristotelian square of opposition includes the word “is”. Through a twofold interpretation of this word the square includes both classical logic and non-classical logic. All theses embodied by the square of opposition are preserved by the new interpretation, except for contradictories, which are substituted by incommensurabilities. Indeed, the new interpretation of the square of opposition concerns the relationships among entire theories, each represented by means of a characteristic predicate. A generalization of the square of opposition is achieved by not adjoining, according to two Leibniz’ suggestions about human mind, one more choice about the kind of infinity; i.e., a choice which was unknown by Greek’s culture, but which played a decisive role for the birth and then the development of modern science.

    This essential innovation of modern scientific culture explains why in modern times the Aristotelian square of opposition was disregarded."

49. ———. 2012. "Pluralism in Logic: The Square of Opposition, Leibniz'Principle of Sufficient Reason and Markov's Principle." In *Around and Beyond the Square of Opposition*, edited by Béziau, Jean-Yves and Jacquette, Dale, 175––189. Basel: Birkhäuser

Abstract: "According to the present pluralism in mathematical logic, I translate from classical logic to non-classical logic the predicates of the classical square of opposition.

A similar unique structure is obtained. In order to support this new logical structure, I investigate on the rich legacy of the non-classical arguments presented by ingenuity by several authors of scientific theories. A comparative analysis of their ways of arguing shows that each of these theories is severed in two parts; the former one proves a universal predicate by an ad absurdum proof. This conclusion of every theory results to be formalised by the A thesis of the new logical structure. Afterwards, this conclusion is changed in the corresponding affirmative predicate, which in the latter part plays the role of a new hypothesis for a deductive development. This kind of change is the same suggested by Leibniz' principle of sufficient reason. Instead, Markov's principle results to be a weaker logical change, from the intuitionist thesis I in the affirmative thesis I. The relevance of all the four theses of the new logical structure is obtained by studying all the conversion implications of intuitionist predicates. In the Appendix, I analyse as an example of the

above theories, Markov's presentation of his theory of real numbers."

    "Given a structure for a first-order language *L*, two objects of its domain can be indiscernible relative to the properties expressible in *L*, without using the equality symbol, and without actually being the same. It is this relation that interests us in this paper.

    It is called Leibniz equality. In the paper we study systematically the problem of its definability mainly for classes of structures that are the models of some equality-free universal Horn class in an infinitary language *L* subscript kappa kappa, where kappa is an infinite regular cardinal."

"1. Intrduction

The aim of this article is twofold. First, I intend to present the fundamental outlines of two conceptions of ontological frame. The first one connected to Kant's concept of possible object and the second one related to Leibniz's.

Leibniz maintains that the source of possibility is the mere logical consistency of the notions involved, so that possibility coincides with analytical possibility. Kant, instead, argues that consistency is only a necessary component of possibility. According to Kant, something is possible if there is a cause capable of bringing it into existence; to this end consistency alone is not sufficient. Thus, while the Leibnizian notion of consistency is at the root of the concept of analytical possibility, the Kantian notion of possibility is the source of real possibility. This difference underlies the distinction between the ontological structure (which is characterized by Kant's interpretation) and the Leibnizian ontological structure. Both structures are presented as the semantic basis for two systems of logic of existence (**PE** and **PEL**), the second of which is the Leibnizian extension of the first. The distinction between the two different conceptions of ontological structure plays an important role in the discussion of Gödel's ontological proof, that can be formally interpreted on the ontological frame of the pure perfections.

While this proof, under some emendation condition, is conclusive in the context of Leibniz's ontological structure, it is not so within the Kantian one. Then, in the second part of this paper I'll say something about their relations to Leibniz's and Gödel's ontological argument." (pp. 215-216)

66. Garcia Rodrigues, Antonielly, and Dias, Eduardo Mario. 2023. "Proofs of valid categorical syllogisms in one diagrammatic and two symbolic axiomatic systems."1–66

    Preprint available on Academia.edu.

    Abstract: "Gottfried Leibniz embarked on a research program to prove all the Aristotelic categorical syllogisms by diagrammatic and algebraic methods. He succeeded in proving

them by means of Euler diagrams, but didn't produce a manuscript with their algebraic proofs. We demonstrate how key excerpts scattered across various Leibniz's drafts on logic contained sufficient ingredients to prove them by an algebraic method –which we call the Leibniz-Cayley (LC) system– without having to make use of the more expressive and complex machinery of first-order quantificational logic. In addition, we prove the classic categorical syllogisms again by a relational method –which we call the McColl-Ladd (ML) system– employing categorical relations studied by Hugh McColl and Christine Ladd. Finally, we show the connection of ML and LC with Boolean algebra, proving that ML is a consequence of LC, and that LC is a consequence of the Boolean lattice axioms, thus establishing Leibniz's historical priority over George Boole in characterizing and applying (a sufficient fragment of) Boolean algebra to effectively tackle categorical syllogistic."

67. Glashoff, Klaus. 2002. "On Leibniz's Characteristic Numbers." *Studia Leibnitiana* no. 34:161–184

    Abstract: "In 1679, Leibniz wrote nine manuscripts on three different arithmetical models of Aristotelian logic. This was a part of his project of a "calculus universalis". First we show the precise relations of these three models to each other by presenting three criteria which serve the purpose of classifying models of Aristotelian logic. This facilitates the understanding of Leibniz' constructions.

    Our method is of special value for the sophisticated third model, the domain of which consists of pairs of natural numbers. We present a simple approach to Leibniz' definitions which on first sight appear complicated. We show that it is possible to deduce, from the "universal positive" relation a (= "All ..."), the other three "Aristotelian relations" i, o, and e. – It has always been difficult to understand the exact nature of Leibniz' characteristic numbers because of his misleading nomenclature, since he utilized the signs + and – in order to designate the "positive" and "negative" part of a characteristic number pair. We present a new interpretation of Leibniz' symbolism, showing that the number pairs should be

interpreted as numerator and denominator of a rational number. Thus we can identify the last model as the natural extension of the first and second one, showing the continuity in Leibniz' different attempts towards an arithmetization of logic. – We close our paper by discussing two well known problematic aspects of Leibniz' characteristic numbers, formulating two open questions concerning the formal structure of the system."

68. ———. 2010. "An Intensional Leibniz Semantics for Aristotelian Logic." *The Review of Symbolic Logic* no. 3:1–11

    Abstract: "Since Frege's predicate logical transcription of Aristotelian categorical logic, the standard semantics of Aristotelian logic considers terms as standing for sets of individuals. From a philosophical standpoint, this extensional model poses problems: There exist serious doubts that Aristotle's terms were meant to refer always to sets, that is, entities composed of individuals. Classical philosophy up to Leibniz and Kant had a different view on this question—they looked at terms as standing for concepts ("Begriffe"). In 1972, Corcoran presented a formal system for Aristotelian logic containing a calculus of natural deduction, while, with respect to semantics, he still made use of an extensional interpretation. In this paper we deal with a simple intensional semantics for Corcoran's syntax—intensional in the sense that no individuals are needed for the construction of a complete Tarski model of Aristotelian syntax. Instead, we view concepts as containing or excluding other, "higher" concepts—corresponding to the idea which Leibniz used in the construction of his characteristic numbers. Thus, this paper is an addendum to Corcoran's work, furnishing his formal syntax with an adequate semantics which is free from presuppositions which have entered into modern interpretations of Aristotle's theory via predicate logic."

70. Govindarajulu, Naveen, and Bringsjord, Selmer. 2016. "Leibniz's Art of Infallibility, Watson, and the Philosophy, Theory, and Future of AI." In *Fundamental Issues of Artificial Intelligence*, edited by Müller, Vincent C., 183–200. Cham (Switzerland): Springer

    Abstract: "When IBM's Deep Blue beat Kasparov in 1997, Bringsjord (Technol Rev 101(2):23–28, 1998) complained that despite the impressive engineering that made this victory possible, chess is simply too easy a challenge for AI, given the full range of what the rational side of the human mind can muster. However, arguably everything changed in 2011. For in that year, playing not a simple board game, but rather an open-ended game based in natural language, IBM's Watson trounced the best human *Jeopardy!* players on the planet. And what does Watson's prowess tell us about the philosophy, theory, and future of AI? We present and defend snyoptic answers to these questions, ones based upon Leibniz's seminal writings on a universal logic, on a Leibnizian "three-ray" space of computational formal logics that, inspired by those writings, we have invented, and on a "scorecard" approach to assessing real AI systems based in turn on that three-ray space."

71. Griffin, Nicholas. 2012. "Russell and Leibniz on the Classification of Propositions." In *New Essays on Leibniz Reception: In Science and Philosophy of Science, 1800-2000*, edited by Krömer, Ralf and Chin-Drian, Yannick, 85–127. Dordrecht: Birkhäuser

    "In this paper, however, I do not propose to assess Russell's interpretation of Leibniz, nor his contribution to Leibniz scholarship (12) - both of which would require more knowledge of Leibniz and Leibniz scholarship than I possess. Rather, I want to look at one aspect of the contribution that Russell's foray into Leibniz scholarship made to the development of his own philosophy, in particular his philosophy of logic. Russell's interpretation of Leibniz was famous for treating almost the whole of Leibniz's philosophy as the outcome of his logical doctrines. This was not a view that Russell had when he started his study of Leibniz, but an interpretation he arrived at in the

course of his work. It was a view that had a clear attraction to Russell and one which was consonant with Russell's own recently acquired position on how philosophy should be conducted; a view which placed logic at the beginning of philosophy, and the analysis of propositions at the beginning of logic. (13) This was a view that Russell thought he shared with Leibniz, though some prominent Leibniz scholars dissented (e.g., Duncan [1901]). After a summary of Leibniz's premisses, Russell begins his account with the following bold declaration: 'That all sound philosophy should begin with an analysis of propositions, is a truth too evident, perhaps, to demand a proof. That Leibniz's philosophy began with such an analysis, is less evident, but seems to be no less true' (POL, p. 8). Russell and Leibniz differed, however, on how propositions were to be analyzed. It is Russell's treatment of Leibniz's account of propositions, and its relation to Russell's own account, on which I want to concentrate in this paper. It will require a little background on where Russell stood philosophically in 1899." (p. 88)

(...)

Russell summed up Leibniz's position with admirable concision as follows:

Every proposition is ultimately reducible to one which attributes a predicate to a subject. In any such proposition, unless existence be the predicate in question, the predicate is somehow contained in the subject. The subject is defined by its predicates, and would be a different subject if these were different. Thus every true judgment of subject and predicate is analytic - i.e., the predicate forms part of the notion of the subject - unless actual existence is asserted. Existence, alone among predicates, is not contained in the notions of the subjects which exist. Thus existential propositions, except in the case of God's existence, are synthetic, i.e., there would be no contradiction if the subjects which actually do exist did not exist. Necessary propositions are such as are analytic, and synthetic propositions are always contingent. {POL, pp. 9-10)

I shall examine the various parts of this account in what follows. The view that the predicate is contained in the subject is dealt with in § 2. The thesis, which I shall call (SP) that all propositions are of subject-predicate form (SP-propositions, for short) is considered in §3. The vexed question of whether this means that all propositions are analytic occupies §4, and the question of whether any propositions arc synthetic is considered in §5. The remaining two sections deal with Russell: §6 with the relation between the containment thesis and Russell's conception of analysis and § 7 with what Russell might have learnt about relations from his study of Leibniz." (pp. 90-91)

(12) There is a mass of usefule information about the book, its composityion and its reception, in O'Briant [1979].

(13) In a letter of 5 May 1900 Russell told Couturat, then at work on his own book on Leibniz's logic (Couturat [1901]), that, while POL was on the whole of Leibniz's philosophy, it was the logie that interested him and he decided to write the book only after he discovered that the whole of Leibniz's system was based on his logic ([BRLC], i, pp. 170-1).

77. Herget, Don Emil. 1987. "Non-standard categorical syllogisms: four that Leibniz forgot." *History and Philosophy of Logic* no. 6:1–13

    Abstract: "In his "Mathesis rationis" Leibniz discounted out of hand four categorical propositions that would have considerably broadened the resultant syllogistic logic. He did this despite the facts both that he had devised a suitable manner for expressing the latent quantification over terms, and that he had reasoned adequately to determine which of the syllogisms in the resulting broadened logic were valid. Leibniz's

reasons for discounting these non-standard propositions are shown to be inadequate, and the resultant syllogistic logic is outlined."

78. Ishiguro, Hidé. 1971. "Leibniz and the Ideas of Sensible Qualities." *Royal Institute of Philosophy Lectures* no. 5:49–63

    "IN order to understand the thoughts of Leibniz it is important to stop putting Leibniz into the convenient pigeon-hole of rationalist, and stop thinking of him merely as the metaphysician and constructor of systems so vividly ridiculed by Voltaire in *Candide*. Most important of all, one should not attempt to see Leibniz's philosophy as a completely articulated and integrated whole or as built on three or five metaphysical and logical principles. It is better to remember that Leibniz was a very prolific writer, who was interested in the most varied aspects of philosophy, logic, mathematics, natural science, jurisprudence, history and philology: a man who was constantly trying to work out a large number of heterogeneous theories and thoughts. The collected editions of his writings make up more than twenty thick volumes, and these hardly exhaust his manuscripts." (p. 49)

    (...)

    "In the first part of this paper, I will attempt to expound some of the views Leibniz held about our ideas of sensible qualities such as colour and heat, which I believe throw light on Leibniz's views on logical analysis and semantics in general. In the second part of this paper, I will discuss the problem of property identity, which is raised by Leibniz's views." (p. 50, a note omitted)

    "Problems concerning substitutivity are discussed in the light of examples from Leibniz, Frege, Carnap, Mates, Putnam. Leibniz reduced truth to interconceptual relations, which accordingly must not be changed by substitutions *salva veritate*. In moderm logic "salva veritate" has an entirely different meaning. Attempts to formulate conditions of substitutivity, applicable e. g. to belief sentences of everyday language, in terms of intensional isomorphy, are criticized. heir failing depends on the fact that a substitution *salva veritate* in such a sentence presupposes empirical knowledge, not expressed by this sentence, about the linguistic usage, theknowledge, the opinions, etc. of the person concerned."

90. Konkova, Antonina, and Legeydo, Maria. 2022. "Intensional Semantics for Syllogistics: what Leibniz and Vasiliev Have in Common." *Logic and Logical Philosophy* no. 31:339–356

    Abstract: "This article deals with an alternative interpretation of syllogistics, different from the classical (extensional) one: an intensional one, in which subject and predicate are not associated with a set of individuals (the extension of the concept) but a set of attributes (the content of the concept).

    The authors of the paper draw attention to the fact that this approach was first proposed by Leibniz in works on logical calculus, which for a long time remained in the shadow of his other philosophical works. Currently, the intensional approach is gaining more and more popularity due to the development of non-classical logics, and the article will present several existing intensional formal syllogistic semantics.

    The paper will also consider another historical approach to syllogistics, associated with the name of the Russian logician Nikolai Vasiliev, who is not only one of the founders of non-classical (non-Aristotelian logic) but also of a different intensional interpretation of such logic. The authors, along with the already known formalizations of Vasiliev's ideas, present two new systems. One of them is a reconstruction of one type of imaginary logic with statements of three qualities: affirmative and two types of negative statements (with absolute and ordinary negation). The second system is the one that is

adequate to semantics, in which instead of the four classical ones, only three types of statements are presented (two particular statements are replaced by one - accidental), and their significance is determined through the relation of the classical logical entailment. Both of them are interpreted intensionally.

The intensional approach in logic and, in particular, in syllogistics allows us to expand the class of accepted principles (which occurs due to the expansion of the class of correct moods of syllogisms)."

3. Lenzen, Wolfgang. 1987. "Leibniz's calculus of strict implication." In *Initiatives in Logic*, edited by Srzednicki, Jan, 1–35. Dordrecht: Reidel

   Translated in German and revised in: W. Lenzen, *Calculus Universalis* (2004) pp. 281-308.

   "At first the title of this paper will provoke both logicians and Leibnitians to shake their heads: while talking about calculi of strict implication one rather associates it with the names of C I. Lewis, W. Ackermann, or some other contemporary logician, but hardly with the 17th century philosopher G. W. Leibniz. Yet already some 30 years ago in an essay on “Leibniz’s interpretation of his logical calculi” the well known Leibniz scholar, Nicholas Rescher (1954), had put forward the then bold thesis: in an interpretation that Leibniz himself had suggested, one of these calculi would become “a precursor of C.

I. Lewis' systems of strict implication" (p.10), Unfortunately, Rescher did not give a factual justification of this prophetic view. Had it been done, it would have thrown some light on the real significance of Leibniz's logic. One reason for this omission consists, perhaps, in the fact that Rescher incorrectly interpreted the important logical constant 'est Ens', or, synonymously, 'est Res' or 'est Possibile' as logical necessity instead of logical possibility."

   "It is well known that in Leibniz's thought several interrelations exist between Logic, Mathematics, and Metaphysics. Logic and Mathematics have been linked together, e.g., in the attempts of April 1679 to

   develop a semantics of characteristic numbers for the theory of the syllogism (cf. C. 49-92). Logic and Metaphysics have been connected, e.g., by applying the principle "praedicatum inest subjecto" to the realm

   of monadology. This led Leibniz to the view of monads as self-sustained, complete entities which contain every truth not only about themselves but also about every other monad and which hence "mirror" the whole world. Mathematics and Metaphysics have been intertwined, e.g., by transferring the ideas of continuity and maximization to a theory about God's creation of the world. This culminated in the famous idea "Cum Deus calculat [...] fit mundus" (GP 7, 191). In this paper, however, I will neglect such great metaphysical speculations and concentrate instead upon a very specific relation between Mathematics and Logic, viz. the way in which Leibniz gradually derived an algebra of sets or, equivalently, an algebra of

concepts from the ordinary algebra of numbers. In the 1st part the necessary mathematical background will be outlined. In the 2nd part I will show how the idea of “real” addition and subtraction evolved from the mathematical theory of + and -. It will turn out that a major reason why Leibniz thus discovered not the whole but only a part of set-theory is due to his “metaphysical” assumption that just as there are “privative objects” in the realm of numbers, there will also be “privative objects” in the realm of concepts or sets."    "We first present an edition of the manuscript LH VII, B2 39, in which Leibniz develops a new formalism in order to give rigorous definitions of positive, of private, and of primitive terms. This formalism involves a symbolic treatment of conceptual quantification which differs quite considerably from Leibniz's "standard" theory of "indefinite concepts" as developed, e.g., in the "General Inquiries". In the subsequent commentary, we give an interpretation and a critical evaluation of Leibniz's symbolic apparatus. It turns out that the definition of privative terms and primitive terms lead to certain inconsistencies which, however, can be avoided by slight modifications."

    Abstract: "This paper deals with the interconnections between mathematics, metaphysics, and logic in the work of Leibniz. On the one hand, it touches upon some practical aspects such as Leibniz's construction of a Four-species calculating machine, a mechanical digital calculating machine, and even a cipher machine.

    On the other hand, it examines how far Leibniz's metaphysical dreams concerning the "calculus ratiocinator" and its underlying "characteristica universalis" have in fact been realized by the great philosopher. In particular it will be shown that Leibniz not only developed an "intensional" algebra of concepts which is provably equivalent to Boole's "extensional" algebra of sets, but that he also discovered some basic laws of quantifier logic which allowed him to define individual

concepts as maximally-consistent concepts. Moreover, Leibniz had the ingenious idea of transforming the basic principles of arithmetical addition and subtraction into a theory of “real” addition and subtraction thus obtaining some important building blocks of elementary set-theory."

16. ———. 2019. "“Ex nihilo nihil fit”: On Leibniz’s “Principia Calculi rationalis”." *The Leibniz Review* no. 29:59–81

    Abstract: "In the essay “Principia Calculi rationalis” Leibniz attempts to prove the theory of the syllogism within his own logic of concepts. This task would be quite easy if one made unrestricted use of the fundamental laws discovered by Leibniz, e.g., in the “General Inquiries” of 1686. In the essays of August1690, Leibniz had developed some similar proofs which, however, he considered as unsatisfactory because they presupposed the unproven law of contraposition: “If concept A contains concept B, then conversely Non-B contains Non-A”. The proof in “Principia Calculi rationalis” appears to reach its goal without resorting to this law. However, it contains a subtle flaw which results from failing to postulate that the ingredient concepts have to be “possible”, i.e. self-consistent. Once this flaw is corrected, it turns out that the proof – though formally valid – would not have been approved by Leibniz because, again, it rests on an unproven principle even stronger than the law of contraposition."

17. ———. 2019. "Leibniz's laws of consistency and the philosophical foundations of connexive logic." *Logic and Logical Philosophy* no. 28:537–551

    Abstract: "As an extension of the traditional theory of the syllogism, Leibniz’s algebra of concepts is built up from the term-logical operators of conjunction, negation, and the relation of containment.

Leibniz's laws of consistency state that no concept contains its own negation, and that if concept A contains concept B, then A cannot also contain Not-B. Leibniz believed that these principles would be universally valid, but he eventually discovered that they have to be restricted to self-consistent concepts.

This result is of utmost importance for the philosophical foundations of connexive logic, i.e. for the question how far either "Aristotle's Thesis", $\neg(\alpha \rightarrow \neg \alpha)$, or "Boethius's Thesis", $(\alpha \rightarrow \beta) \rightarrow \neg(\alpha \rightarrow \neg \beta)$, should be accepted as reasonable principles of a logic of conditionals."

18. Levey, Samuel. 2002. "Leibniz and the Sorites." *The Leibniz Review* no. 12:25–49

    Abstract: "The sorites paradox receives its most sophisticated early modem discussion in Leibniz's writings. In an important early document Leibniz holds that vague terms have sharp boundaries of application, but soon thereafter he comes to adopt a form of nihilism about vagueness: and it later proves to be his settled view that vagueness results from semantical indeterminacy. The reason for this change of mind is unclear, and Leibniz does not appear to have any grounds for it. I suggest that his various treatments of the sorites do not spring from a single integrated view of vagueness, and that his early position reflects a mercenary interest in the sorites paradox - an interest to use the sorites to reach a conclusion in metaphysics rather than to examine vagueness as a subject to be understood in its own right. The later nihilist stance reflects Leibniz's own (if undefended) attitude towards vagueness."

21. Look, Brandon C. 2010. "Leibniz's Metaphysics and Metametaphysics: Idealism, Realism, and the Nature of Substance." *Philosophy Compass* no. 5:871–879

    Abstract: "According to the standard view of his metaphysics, Leibniz endorses idealism: the thesis that the world is made up solely of minds or monads and their perceptual and appetitive states. Recently, this view has been challenged by some scholars, who argue that Leibniz can be seen as admitting corporeal substances, that is, animals or embodied souls, into his ontology, and that, therefore, it is false to attribute a strict idealism to him. Subtler accounts suggest that Leibniz begins his philosophical career as an advocate of (some form of) the modern 'mechanical' philosophy and ends his career as an idealist, raising the issue when and why Leibniz adopts his monadological metaphysics.

    This article argues that, given a constellation of metaphysical, logical, and theological views, Leibniz is committed to the ontological primacy of mind or form even in his 'middle years'."

    Abstract: "It is still difficult to say what the main source of Leibniz's modal thinking was; at least, his acquaintance with the ideas of Spanish Jesuits about the "moral necessity" is to be dated to the epoch when the modal ideas already took shape in

his mind. There was, however, one name normally referred to by Leibniz himself as his main predecessor in modal thinking, Richard Swineshead. In fact, Leibniz created his personal myth about Swineshead even before having read his works, and so, he attributed to Swineshead some of his own ideas, including the modal reinterpretation of the term *intensio* borrowed from the mediaeval physics."

31. ———. 2019. "The Peripatetic Program in Categorical Logic: Leibniz on Propositional Terms." *The Review of Symbolic Logic* no. 13:141–205

    Abstract: "Greek antiquity saw the development of two distinct systems of logic: Aristotle's theory of the categorical syllogism and the Stoic theory of the hypothetical syllogism. Some ancient logicians argued that hypothetical syllogistic is more fundamental than categorical syllogistic on the grounds that the

latter relies on modes of propositional reasoning such as *reductio ad absurdum*.

Peripatetic logicians, by contrast, sought to establish the priority of categorical over hypothetical syllogistic by reducing various modes of propositional reasoning to categorical form. In the 17th century, this Peripatetic program of reducing hypothetical to categorical logic was championed by Gottfried Wilhelm Leibniz. In an essay titled *Specimina calculi rationalis* [*], Leibniz develops a theory of propositional terms that allows him to derive the rule of *reductio ad absurdum* in a purely categorical calculus in which every proposition is of the form A is B. We reconstruct Leibniz's categorical calculus and show that it is strong enough to establish not only the rule of *reductio ad absurdum*, but all the laws of classical propositional logic. Moreover, we show that the propositional logic generated by the nonmonotonic variant of Leibniz's categorical calculus is a natural system of relevance logic known as RMI¬→."

Moriconi, Enrico. 2011. "Some Remarks on Negation and Quantification in Leibniz's Logic." *L&PS – Logic and Philosophy of Science* no. 9:247–253

    Abstract: "We argue, with special reference to various passages from Leibniz's *Generales Inquisitiones*, that the simultaneous presence of two switches concerning the negation operator is the main source of the difficulties raised by many people against his logical investigations. The former switch carries negation from outside to inside of the proposition to which it is applied; the latter is the so-called obversion law (which asserts the equivalence of "non est" and "est non"). Applied in sequence, the two switches transform an outside (propositional or *de dicto*) negation into a conceptual (predicative or *de re*) negation. We also investigate the further difficulties which arise from the interplay between these switches and Leibniz's use of indefinite letters."

et Analyse no. 249:97–109

Abstract: "The critical edition of *Generales Inquisitiones*, published in 1999 by the Berlin Akademie Verlag in the Vol. A VI 4A of the *Sämtliche Schriften und Briefe*, promoted new interests in Leibniz's logic, as witnessed by new translations and many specific and general papers devoted to these topics. Sometimes scholars stressed difficulties and also mistakes involved in the way Leibniz managed to treat 'negation', especially focusing on the questions arising from the interplay between that operator and the use of indefinite letters. We will discuss these difficulties, trying to find a rationale for Leibniz's 'mistakes' and, on the other hand, to draw some lessons from them."

49. Mortensen, Chris. 1997. "The Leibniz continuity condition, inconsistency and quantum dynamics." *Journal of Philosophical Logic* no. 26:377–389

    Abstract: "A principle of continuity due to Leibniz has recently been revived by Graham Priest in arguing for an inconsistent account of motion. This paper argues that the Leibniz Continuity Condition has a reasonable interpretation in a different, though still inconsistent, class of dynamical systems. The account is then applied to the quantum mechanical description of the hydrogen atom."

    "In his article *Propositions and Sentences* (1956) Alonzo Church pointed out -- on the basis of a suggestion made by Joseph Maria Bochenski -- that strong analogies exist between Bolzano's theory of *Satz an sich* and Gregory of Rimini's doctrine of complexe significabile.' In the same essay, Church also pointed out that Bolzano appealed to Leibniz as to a logician who plainly recognized propositions in the abstract

sense. After Church's essay, it became very usual to mention Gregory of Rimini in reference to Bolzano's ontological conceptions. Nevertheless, we do not have any evidence of a direct influence of Gregory of Rimini's ideas on Bolzano's philosophy of logic. Bolzano seems to have only a limited acquaintance with the logic of the late medieval period: the credit accorded to Savonarola's Compendium logicae - a standard work which is absolutely lacking in originality - corroborates, I think, this view.2 Yet Bolzano may have benefited by late scholastic inheritance through the intermediation of later works, like those of Campanella, Clauberg, Fonseca, Keckermann, Leibniz and Wolf.' In fact, as already mentioned, Leibniz is the first author whom Bolzano explicitly refers to, in paragraph 21 of the Wissenschaftslehre, as a forerunner of the Satz an sich theory:

"Thus Leibniz uses as equivalent the expressions *proposition* and *cogitatio possibilis (Dial. de Connexion inter Verba a Res* [C. I. Gerhardt, ed. *Philos. Schriften, vol.* VII, p. 190]. This obviously presupposes that by propositions he meant propositions in themselves." (*)

The Leibniz's work on which Bolzano explicitly bases this conviction is the *Dialogus de connexione inter res et verba*, first published by Raspe in 1765 -- a work whose content paradoxically seems to partly disprove Bolzano's interpretation.' Thus Church considers it «

"an exaggeration or a misunderstanding" on Bolzano's part to have attributed to Leibniz's D*ialogus* "the use of the word propositio for proposition in the abstract sense" or *Satz an sich*. (6) The same remarks are repeated by Prof. Berg in his monograph on Bolzano's logic: after having identified Bolzano's *Satz an sich* with Frege's *Gedanke*, Prof. Berg writes:

According to Leibniz a proposition (*propositio*) is a possible thought (*cogitatio possibilis*), which is capable of being true or false... But no thought or reasoning is possible without words or some other kind of signs. And under transformation of a proposition into a different language a certain relationship (*proportio*) among the signs and between the signs and the

objective reality is transformed into a similar relationship. The last two conditions fit Aristotle's and Peter of Spain's but not Frege's notion of proposition. Therefore... it must have been a misunderstanding on Bolzano's part to have attributed to Leibniz the use of the world "propositio" for *Satz an sich*.(7)

In what follows, I intend to take up the problem of the correcteness of the interpretation given by Bolzano and then to develop a comparison between the positions of Leibniz and those of Bolzano relative to the notions of idea, proposition and truth.

59. ———. 2022. "Leibniz on Relations, Again. A Reply to Florian Vermeiren." *Studia Leibnitiana* no. 54:250–266

Abstract: "In his article, Florian Vermeiren attributes to Leibniz – like other interpreters before him – the distinction of two different kinds of relations: 1) relations in the proper sense of the word as, for example, the fatherhood subsisting between Sophroniscus and Socrates, which Leibniz considers situated 'outside the subjects' involved; 2) relational properties, such as being a father, inherent in Sophroniscus. The distinction is clearly present in Leibniz's writings. According to Vermeiren, Leibniz considers 'purely mental' only the relations 'out of the subjects' and not the relational predicates, by means of which, on the other hand, the individuals of the Leibnizian world would be truly related. In this sense, therefore, Leibniz would admit the reality of relations, which would play an important role in his ontology. At least since 1686 (the year in which he wrote the *Discourse*), however, Leibniz states that the world is made only of individuals with their internal modifications: just

as there are no properties with a leg in one subject and a leg in another, there are no individuals bound together by any kind of material nexus or 'real' ties. Thus, if we make a list of all fathers on the one hand and sons on the other, there remains the problem of how to properly connect the fathers exactly with their sons. Attributing to each of two related individuals a relational property is not enough to connect them. Being a father in David must necessarily refer in some way to Solomon as a son. Leibniz is aware of this, as his attempts to analyze relational propositions in his essays on rational grammar show.

Given the sentence 'Cajus is killed by Titius' for example, Leibniz attempts to reduce it to an inference between a pair of categorical sentences, each of which attributes a relational predicate to the subject. Relations (and relational properties) result from the substances and their modes, "without producing any change" of themselves but only in virtue of a consequence, that is of a logical inference. The image of the world derived so from the *Monadology* and other Leibnizian writings is that of a world composed of a collection of isolated individuals, independent of each other and lacking mutual connections. Relational properties correspond to internal modifications of each individual: the second term, in the case of binary relations (the 'external' one: Helen, if Paris loves Helen) is resolved into an internal representation (of Paris, in this case).

It is God who coordinates the various representations of individuals with each other, to result in a harmonious whole. Since relations are a consequence of the existence of the individual substances with their intrinsic properties, God himself can be said to be the creator of relations, in so far as he calls the individuals into existence. And this is exactly what Leibniz states, in his commentary on Temmik's book."

    Abstract: "Reasoning with diagrams is considered to be a peculiar form of reasoning.

    Diagrams are often associated with imagistic representations conveyed by spatial arrangements of lines, points, figures, or

letters that can be manipulated to obtain knowledge on a subject matter.

Reasoning with diagrams is not just 'peculiar' because reasoners use spatially arranged characters to obtain knowledge – diagrams apparently have cognitive surplus: they enable a quasi-intuitive form of knowledge. The present paper analyses the issue of diagrams' cognitive value by enquiring into the tradition of symbolic cognition developed by Leibniz, Lambert, and Kant. The proposal resulting from this enquiry is to question the idea that the cognitive value of diagrams lies solely in allowing evidence for inferences. The imaginative dimension of diagrams connects reasoning to doxastic attitudes of meditation and enquiry."

"1. The problem

Leibniz's impact on the emergence of mathematical (algebraic, algorithmic or symbolic) logic is an important topic for understanding the emergence and development of the current views on logic.(1) However, the question whether Leibniz had any influence at all, or whether his ideas were not more than ingenious anticipations of later developments, is still disputed. The significance of this problem can be shown by referring to Louis Couturat who claimed that in respect to the logical calculus Leibniz had all the principles of much later logical systems of the algebra of logic (George Boole, Ernst Schroder) and in some points he was even more advanced than they (Couturat, *La Logique de Leibniz d'aprés des documents inédits,* Paris: Alcan 1901, 386). One important step in dealing with the problem can be seen in an answer to the question whether early "modern" logicians like Boole, Schroder, or Frege had had any knowledge of Leibnizian logic, i.e., could Leibniz have had any influence on these pioneers of modem logic?" (p. 13)

(...)

6. Conclusions

No doubt, the new logic emerging in the second half of the 19th century was created in Leibnizian spirit. The essentials of

Leibniz's logical and metaphysical program and of his idea concerning a logical calculus were available at least since the 1840s. Erdmann's edition of the philosophical works and Trendelenburg's presentation of Leibniz's semiotics were the most important steps towards the further reception of Leibnizian ideas among mathematical logicians at the end of the 19th century. As soon as these logicians were aware of the Leibnizian ideas they recognized Leibniz's congeniality and accepted his priority. However, the logical systems had already been established. Therefore there was no initializing influence of Leibniz on the emergence of modern logic in the 2nd half of the 19th century." (p. 22)

74. Piekarski, Michał. 2020. "The problem of logical form: Wittgenstein and Leibniz." *Studia Philosophiae Christianae* no. 56:63–84

    Abstract: "The article is an attempt at explaining the category of logical form used by Ludwig Wittgenstein in his *Tractatus logico-philosophicus* by using concepts from Gottfried Wilhelm Leibniz's *The Monadology*. There are many similarities and analogies between those works, and the key concept for them is the category of the inner and acknowledged importance of consideration based on basic categories of thinking about the world. The Leibnizian account allows for a broader look at Wittgenstein's analysis of the relation between propositions and facts, between language and the world. Using the Hanoverian philosopher's terminology allows for the demonstration of the ambivalence of the concept of logical form in the philosophy of Wittgenstein and also the metaphysical nature of his first book"

Leibniz, Berlin, 10. – 14. September 2001*, edited by Poser, Hans, 1020–1027. Hannover: Gottfried-Wilhelm.Leibniz-Gesellschaft

    Abstract: "This paper aims at sketching the impact of Aristotle's logic and metaphysics from Melanchthon to Hegel, a matter for which Leibniz plays a central role. Let me begin with Melanchthon. The three editions of his logic show a development from a Ciceronianism combined with Neoplatonism toward a recognition of the primacy of Aristotle. Like most Renaissance philosophers, though, Melanchthon felt a profound need of harmonizing Plato and Aristotle, whereby the latter, he said, should be considered for his clarity and the former for his depth."

    "Leibniz's original source was the wide understanding of categories asordines rerum of metaphysics, and finally was taken over both in Rhenius's logic and in Thomasius's logic and metaphysics." (p. 1025).

    "As regards the role attributed to categories and forms, Hegel's programis in its essence truly Aristotelian, but it is also the

consequence of Leibniz's particular twist to the history of Aristotele's impact on logic and metaphysics." (p. 1027).

""I have already observed that the explicit subordination of all other forms of opposition to contradiction is an element that Leibniz could have found in previous logical reflections. And it can be further observed, conversely, that traces of the more 'intuitive' treatment of opposition are still present in Leibniz. A field which seems of particular interest from this point of view is that of dynamics. All the terminological tools typical of the theory of opposition and discussed so far are, in fact, widely used by Leibniz in his writings on dynamics." (p. 183)

    Abstract: "In this note I discuss some issues around the law of Identity of Indiscernibles and, above all, its difference with the so-called law of indiscernibilty of identicals. In this way I distinguish between the notions identity, sameness and equality, through a phenomenological discussion and using the key idea of intentionality. In order to formulate the Leibnizian law of Identity of Indiscernibles, and examine its validity, we need higher order logic. I will give semantic rules for a second-order logic with identity in the framework of the dialogical logic, introduced by P. Lorenzen. Then I will demonstrate the validity of the law of Identity of Indiscernibles by means of the introduced logic."

108. Sotirov, Vladimir. 1999. "Arithmetizations of Syllogistic *à la* Leibniz." *Journal of Applied Non-Classical Logics* no. 9:387–405

    "Two models of the Aristotelian syllogistic in arithmetic of natural numbers are built as realizations of an old Leibniz idea. In the interpretation, called Scholastic, terms are replaced by integers greater than 1, and s.Ap (“Every s is a p”) is translated as “s is a divisor of p”, sIp (“Some s is a p”) as “g.c.d. (s, p) > 1” (the same letters are used for the replacing numbers as well as for the terms). In the interpretation, called Leibnizian, terms are replaced by proper divisors of a special “Universe number” u < 1 (i.e., s < u, p < u), and sAp is translated as “s is divisible by p”, sIp as ‘l.c.m. (s, p) < u”. Both interpretations are proved to be adequate to the Aristotelian syllogistic. They are extended to syllogistic including term negation and term conjunction as well (and, therefore, all Boolean operations with terms)."

Abstract: "The idea of automation of reasoning in science, which is extremely high-ranking nowadays in connection with the development of computer technology and research into artificial intelligence has been presented in the history of mind since taking up a cohered with the idea of mechanization of reasoning. It is therefore proper to present the greatest enthusiast every of this idea on the threshold of the contemporary science, who treated the idea of mechanization in reasoning very widely, assuming that every mind process can be expressed in some physical manner – Gottfried Wilhelm Leibniz."

117. Swoyer, Chris. 1994. "Leibniz's Calculus of Real Addition." *Studia Leibnitiana* no. 26:1–30

"I examine what is probably Leibniz's most complete logical system and show that it is well- developed formal logic with a number of original and important features. Among other things, Leibniz discusses alternative interpretations of his system, provides detailed proofs of over twenty theorems about (what are now known as) semilattices and shows their relevance to logic, and he develops what is probably the first formal theory of the part- whole relation. I then show how Leibniz's system illuminates other aspects of his logic and philosophy, including his views on the structure of concepts and on infinite analysis."

127. Vermeiren, Florian. 2022. "Questioning the Conceptualist Reading of Leibniz's Theory of Relations." *Studia Leibnitiana* no. 54:225–249

Abstract: "This paper challenges Mugnai's conceptualist reading of Leibniz's theory of relations.

I specifically question his idea that relational accidents are mental additions to absolute foundations. I examine some of the evidence on which he relies. Most importantly, I question his interpretation of Leibniz's rejection of purely extrinsic denominations (abbreviated "NPED") as stating that relations result from non-relational foundations. Mugnai thereby understands Leibniz's notion of 'extrinsic' as 'relational' or 'relative'. Such a reading contradicts both Leibniz's definition of 'extrinsic denominations' and the scholastic meaning of this notion.

Furthermore, Leibniz's use of NPED shows that some relations are intrinsic denominations.

Additionally, I argue that conceptual relations cannot do all the work in Leibniz's metaphysics.

Fundamental notions such as expression, order and, most importantly, coexistence rely on non-conceptual relations."

128. Vilkko, Risto. 2001. ""Lingua universalis" and "calculus ratiocinator" in the 20th century." In *Nihil sine ratione. Mensch, Natur und Technik im Wirken von G. W. Leibniz. VII. 136. Woleński, Jan. 2018. "Something, nothing and Leibniz's question. Negation in logic and metaphysics." *Studies in Logic, Grammar and Rhetoric* no. 54:175–190

    "This paper discusses the concept of nothing (nothingness) from the point of logic and ontology (metaphysics). It is argued that the category of nothing as a denial of being is subjected to various interpretations. In particular, this thesis concerns the concept of negation as used in metaphysics. Since the Leibniz question 'Why is there something rather than nothing?' and the

principle of sufficient reason is frequently connected with the status of nothing, their analysis is important for the problem in question. Appendix contains a short critical analysis of Heidegger's famous statement *Das Nichts nichtet*."

General Works and Bibliographies on the History of Logic in Western Thought

Some works on the history of logic up to 1977

There is a paucity of works which treat the complete history of logic. Investigation of some of the problems in this field has increased in the last decades, mostly due to symbolic logic, which has established that many of the results obtained were familiar to the Stoics and particularly to the Scholastics. But these have not been overall studies of the science. The authors of the studies we possess usually aimed at rediscovering the results reached in symbolic logic by earlier logical schools, and so many problems of historical interest have in the past been only little explored or not at all. We shall quote below only those studies published in volumes, and which have a more general aim, even when treating special problems, or limited periods of time.

The first history of logic seems to be the work of Petrus Ramus, entitled *Scholae in liberales artes* -- "Schools of Liberal Arts" (Basle, 1569). The first eight chapters of this book deal with history of logic and are called *Scholae dialecticae* -- "Dialectic Schools". Unfortunately, the author naively believes all historical or legendary personages to have been logicians and in the chapter *Logica Patrum* ("Logic of our Ancestors") he lists among them Noah and Prometheus.

After this, studies of the history of logic become more scientific. Here we quote:

- Bartholomäus Keckermann: *Praecognitorum Logicorum Tractatus III* -- "Three Treatises on the most well-known Logicians" (Hanover, 1598). It is rather a useful list of authors and titles, with some indication of contents.
- Jacob Friedrich Reimmann: *Critisirender Geschichts-Calender von der Logica* -- "Critical and Historical Calendar of Logic" (Frankfort-on-Main, 1699). Written in defective German, this work nevertheless contains valuable information.
- Pierre Gassendi: *De origine et varietate logicae* -- "On the Origin and Diversity of Logic" (Lyons, 1658), a very valuable work.
- Johann Albert Fabricius: *Specimen elencticum historiae logicae* -- "Index of Subjects of the History of Logic" (Hamburg, 1699). This "Index" is actually a catalogue of the treatises of logic known by this scholar.
- Johannes Georgius Walchius [Johann Georg Walch]: *Historia Logicae* -- "History of Logic" (Leipzig, 1721). This book differs from the preceding ones in the correctness of its information.
- Heinrich Christoph Wilhelm Sigwart: De historia logicae inter Graecos usque ad Socratem commentatio -- "On the History of Logic among Greeks as far as Socrates" (Tübingen, 1832).
- Frederich Auguste de Reiffenberg: *Principes de la Logique suivis de l'Histoire et de la bibliographie de cette Science* --" The Principles of Logic followed by the History and Bibliography of this Science" (Brussels, 1833).
- Adolphe Frank: *Esquisse d'une histoire de la logique precedée d'une Analyse etendue de l'Organum d'Aristote* -- "Sketch of a History of Logic Preceded by an Extensive Analysis of Aristotle's Organon" (Paris, 1838).
- Friedrich Adolf Trendelenburg: *Geschichte der Kategorienlehre* -- "History of the Theory of Categories" (Berlin, 1845).
- Robert Blakey: Historical Sketch of Logic, *from the Earliest Times to the Present Day* (Edinburgh, 1851).

- We have reached now the monumental work in four volumes, Carl Prantl's *Geschichte der Logic im Abendlande* -- "History of logic in Western Europe" (Leipzig, 1855-1870). This writing offers an inexhaustible source of information, of original Greek and Latin texts, some of them copied down from inaccessible books and manuscripts (which the present, work has also used). Yet this work has at least two shortcomings: it expounds the history of logic only down to the sixteenth century, and it is blemished by opinions that are inadmissible because of their violence and by a lack of understanding of ideas different from his own. Although Prantl was convinced he had written a work "so that it would not be necessary, at least for some time, to write another history of logic" (op. cit., IV, *Vorwort*), the material he collected can be only a source of information for other histories of logic. Prantl's method is exclusively chronological and therefore entails repetitions.
- Paul Janet and Gabriel Séailles: *Histoire de la Philosophie* (Paris 1887). In this "History of Philosophy", a large part deals with history of logic in a very original manner, dividing it into its main problems: history of the problem of concept, of judgement, of syllogism, of induction. It is a didactic handbook, supplying an important amount of information, sometimes following closely the treatise of Prantl.
- Friederich Harms: *Die Philosophie in ihrer Geschichte* "Philosophy in its History".
- The second volume of this work is entitled *Geschichte der Logik* - “History of Logic”. (Berlin, 1881), and deals in a very general way with the history of this discipline.
- Robert Adamson: *A Short History of Logic* (Edinburgh, 1911; reprinted, Dubuque, Iowa, 1962).
- Clarence Irving Lewis: *A Survey of Symbolic Logic* (Berkeley, 1918). This book contains numerous historical indications about mathematical logic.
- Theodor Ziehen: *Lehrbuch der Logik auf positivistischer Grundlage mit Berücksichtigung der Geschichte der Logik*, -

"Treatise on Logic, on Positivist Ground, Considering also the History of Logic" (Bonn, 1920).

- Oswald Külpe: *Vorlesungen über Logik* - "Lessons on Logic" (Leipzig, 1923). The first part of this book is a short history of logic, containing competent opinions, and a very judicious division of the history of this science.
- Federigo Enriques: *Per la storia della logica* - "For the History of Logic" (Bologna, 1922). This study contains some interesting remarks, gives the logic a larger framework, (including the methodologic and philosophical logic), but aims to show the connections between mathematics and logic.
- Henrich Scholz: *Geschichte der Logik* - "History of Logic" (Berlin, 1931). This is a short, but very erudite study, which underlines only those data which confirm or prefigure the results of mathematical logic.
- Jörgen Jörgensen: *A Treatise of Formal Logic* (3 vols., Copenhagen - London, 1931). The first volume bears the title *Historical Developments*, and offers precious information.
- Evert Willem Beth: *De Wijsbegeerte der Wiskunde van Parmenides tot Bolzano* - "The Theory of Science from Parmenides to Bolzano" (in Dutch, Antwerp-Nijmegen, 1944);
- Evert Willem Beth: *Geschiedenis der Logica* - "History of Logic" (in Dutch, the Hague, 1944).
- Francesco Albergamo: *Storia della logica delle scienze esatte* - "History of the Logic of Exact Sciences" (Bari, 1947).
- Antoinette Virieux-Reymond: *La logique et l'épistémologie des Stoïciens* - "Logic aad Epistemology of the Stoics" (Lausanne, 1949).
- Philotheus Boehner: *Medieval Logic, an outline of its development from 1350 to c. 1400* (Manchester, 1952).
- Robert Feys: *De ontwikkelung van het logisch denken* - "Development of Logic Thought" (in Dutch, Antwerp - Nijmegen, 1949).

- Alonzo Church: *Introduction to Mathematical Logic* (Princeton, 1956). This masterly treatise on mathematical logic contains numerous and important historical references. Church has also published regularly in "Journal of Symbolic Logic" the Bibliography of this science (beginning from 1936).
- Józef Maria Bochenski: Formale Logik - "Formal Logic" (Freiburg - Munchen, 1956). This is, in our opinion, an important work in this field. It contains an anthology of texts, taken from the original writings of the logicians, beginning with Greeks until now, translated into German, and is chronological. The principle of this work is to give the texts which prefigure or present the results obtained in our time by mathematical logic. Formale Logik also gives short information about Indian logic. [Translated in English as *A history of formal logic* (1961)
- Francesco Barone: *Logica formale e Logica transcendentale* - "Formal and Transcendental Logic" (2 vols., Turin, 1957-1965). The first volume is entitled *Da Leibniz aKant* - "From Leibniz to Kant", and the second one *L'algebra della logica* - “The algebra of logic”. Barone's work, although limited to a certain determined period, is rich in personal comment and contains much information.
- Ettore Carruccio: *Matematica e logica nella storia e nel pensiero contemporaneo* "Mathematics and Logic In the History and In the Contemporary Thought" (Turin, 1958).
- Benson Mates: *Stoic Logic* (Berkeley and Los Angeles, 1961).
- William and Martha Kneale: *The Development of Logic* (Oxford, 1962): We think this is the third important work in this field (chronologically, after those of Prantl and of Bochenski), very important as a work of references. The aim of this book is, as the authors say in the "Preface", "an account of the growth of logic, rather than an attempt to chronicle all that past scholars, good or bad, have said about their science". Kneale's method is not that used by Bochenski (anthology of texts), but their aim coincides with Bochenski's, being "to record the first appearances of those ideas which seem to us most important in the logic of our own day".

- Tadeusz Kotarbinski: *Leçons sur l'histoire de la logique* - "Lessons in the History of Logic" (Paris, 1964). The book is the translation of the lessons given by the author at the University of Warsaw, and though short offers a larger framework for the history of this discipline, also discussing other logic problems, for instance methodological ones, which were not considered by Bochenski or Kneale. Notwithstanding, this work aims to show the historical filiation of mathematical logic.
- Nicolai Ivanovici Stiazhkin: *Stanovlenie idei matematiceskoi logiki* - "The Genesis of the Idea of Mathematical Logic" (Moscow, 1964). This book has been translated into English under the title History of Mathematical Logic from Leibniz to Peano (Cambridge, Mass., London, 1969).
- Ernst Kapp: *Der Ursprung der Logik bei den Griechen* - "The Origin of Logic with Greeks" (Gottingen, 1965) [Originally published in English as *Greek foundations of traditional logic*, 1942)
- Wilhelm Risse : *Bibliographia Logica*. The author intends to continue the work of Prantl, in his studies bearing this general title, but in an objective manner, beginning from where the last has left it, i. e. end of the sixteenth century. This Bibliography is planned to appear in four volumes, the first being already published: *Bibliographia Logica. Verzeichnis der Druckschriften zur Logik mit Angabe ihrer Fundorte*. Band I, 1172 -1800 - "Logic Bibliography. List of printed writings with indication where they are to be found. Vol. I, 1472-1800" (Hildesheim - New York, 1965). Beside this vast Bibliography, (which will also list the manuscripts of logic), Risse has published another work in two volumes (which will be continued too): *Die Logik der Neuzeit* Band I, 1600-1640 - "Logic of Recent Times, vol. I, 1500-1640" (Stuttgart - Bad Cannstatt, 1964); *Die Logik der Neuzeit* Band II, 1640-1780 (Stuttgart - Bad Cannstatt, 1970). These two volumes expound, in Prantl's manner, but more systematically, the treatises on logic from the mentioned periods. The studies of Risse, as well as those of Prantl, are indispensable to all researches in the field of history of logic.

- Peter Harold Nidditch: *The Development of Mathematical Logic* (London, New York, 1960).
- Guido Calogero: *Storia della logica antica* - "History of the ancient logic" (Bari, 1967). The author, mentions that this is the first of a series of volumes - "The Archaic Epoch", dealing with logic from Heraclitus to Leucippus and Democritus [other volumes were never published]. Calogero also published the important work *I fondamenti della logica aristotelica* - The Bases of Aristotle's Logic" (2nd ed., Florence, 1968) [First edition: Rome, 1932]
- Alexandr Osipovich Makovelski: *Istoria Logiki* - "History of Logic" (Moscow, 1967), short general and didactic handbook of this discipline [translated in French by Geneviève Dupond as: *Histoire de la logique*, Moscou, Éditions du Progrés, 1978].
- James C. Colbert: *La evolucion de la logica simbolica y sus implicaciones* - "Evolution of Symbolic Logic and its Philosophical Implications" (Pamplona, 1968). This writing studies mathematical logic and some important authors.
- Anton Dumitriu: *Istoria Logicii* - "History of Logic" (Bucharest, 1969). The work highlights all the historical aspects of logic. It contains a chapter on logic in China and another on logic in India. An ample compendium of the whole book, in two parts, was published by “Scientia”, and appeared simultaneously in French and English versions (Nos. VII-X, 1971). [Translated in English as *History of logic* (1977)]
- Robert Blanché: *La logique et son histoire. D'Aristote à Russell* - "Logic and its History. From Aristotle to Russell" (Paris, 1970), The book is full of interesting remarks, but it neglects, as many other works do, methodology, Renaissance logic, and other important problems.
- Reuben Louis Goodstein: *Development of Mathematical Logic* (NewYork, London 1971).
- Vicente Muñoz Delgado: *Logica Hispano-Portuguesa hasta 1600* - "The Spanish- Portuguese Logic till 1600" (Salamanca,

1972). This is an important study of logic in the Iberian Peninsula, containing information ignored till now.
- Stanislaw Surma (editor): *Studies in the History of Mathematical Logic* (Wroclaw - Warszawa - Krakow - Gdansk, 1973).

We can see from the above list, that very few of the works quoted are really "histories of logic". The importance of all these contributions cannot be diminished but -- and this is a curious fact -- they generally defend or emphasize some particular results and thus neglect others.

We realize, in this way, that, indisputably, one veritable historical work, in the above list, is nevertheless, in spite of its weak side, Prantl's *Geschichte der Logik im Abendlande*, because the author does not select the logicians nor the theories he is treating of. He is judging them severely when they contradict his conception, and that is his error. But his work is unquestionably historical in character, and Prantl is really a historian, although his judgements are often too subjective and rudely expressed." (Vol. I, pp. XIII-XVI)

From: Anton Dumitriu, *History of logic*, Tunbridge Wells: Abacus Press, 1977.

The most important recent works are the *Handbook of the History of Logic,* edited by Dov Gabbay and John Woods (11 volumes) and *The Development of Modern Logic* edited by Leila Haaparanta; see the following section for the bibliographic details.

General works on the history of logic

Studies in English

Handbook of the History of Logic

1. Gabbay, Dov, and Woods, John, eds. 2004. *Greek, Indian and Arabic Logic*. Amsterdam: Elsevier.

   Handbook of the History of Logic: Vol. 1.

   Contents: Dov M. Gabbay and John Woods: Preface VII-VIII; List of Contributors IX; Julius Moravcsik: Logic before Aristotle: Development or Birth? 1; John Woods and Andrew

Irvine: Aristotle's Early Logic 27; George Boger: Aristotle's Underlying Logic: 161; Fred Johnson: Aristotle's Modal Syllogisms 247; Jonardon Ganeri: Indian Logic 309; Robert R. O'Toole and Raymond E. Jennings: The Megarians and the Stoics 397; Tony Street: Arabic Logic 523; Charles Burnett: The Translation of Arabic Works on Logic into Latin in the Middle Ages and Renaissance 597; Index 607-617.

2. ———, eds. 2008. *Mediaeval and Renaissance Logic*. Amsterdam: Elsevier.

   Handbook of the History of Logic: Vol. 2.

   Contents: Dov M. Gabbay and John Woods: Preface VII; List of Contributors IX; John Marenbon: Logic before 1100: The Latin Tradition 1; John Marenbon:: Logic at the Turn of the Twelfth Century 65; Ian Wilks: Peter Abelard and his Contemporaries 83; Terence Parsons: The Development of Supposition Theory in the Later 12th through 14th Centuries 157; Henrik Lagerlund: The Assimilation of Aristotelian and Arabic Logic up to the Later Thirteenth Century 281; Ria van der Lecq: Logic and Theories of Meaning in the Late 13th and Early 14th Century including the Modistae 347; Gyula Klima: The Nominalist Semantics of Ockham and Buridan: A 'Rational Reconstruction' 389; Catarina Dutilh Novaes: Logic in the 14th Century after Ockham 433; Simo Knuuttila: Medieval Modal Theories and Modal Logic 505; Mikko Yrjönsuuri: Treatments of the Paradoxes of Self-reference 579; E. Jennifer Ashworth: Developments in the Fifteenth and Sixteenth Centuries 609; Petr Dvořák: Relational Logic of Juan Caramuel 645; Russell Wahl: Port Royal: The Stirrings of Modernity 667; Index 701-716,

3. ———, eds. 2004. *The Rise of Modern Logic: from Leibniz to Frege*. Amsterdam: Elsevier.

   Handbook of the History of Logic: Vol. 3.

   Contents: Dov M. Gabbay and John Woods: Preface VII; List of Contributors IX; Wolfgang Lenzen: Leibniz's Logic 1; Mary Tiles: Kant: From General to Transcendental Logic 85; John W. Burbidge: Hegel's Logic 131; Paul Rusnock and Rolf George:

Bolzano as Logician 177; Richard Tieszen: Husserl's Logic 207; Theodore Hailperin: Algebraical Logic 1685-1900 323; Victor Sanchez Valencia: The Algebra of Logic 389; Ivor Grattan-Guinness: The Mathematical Turn in Logic 545; Volker Peckhaus: Schr6der's Logic 557; Risto Hilpinen: Peirce's Logic 611; Peter M. Sullivan: Frege's Logic 659; Index 751-770.

4. ———, eds. 2008. *British Logic in the Nineteenth Century*. Amsterdam: Elsevier.

   Handbook of the History of Logic: Vol. 4.

   Contents: Dov M. Gabbay and John Woods: Preface VII; List of Contributors XIII; Gordon R. McOuat and Charissa S. Varma: Bentham's Logic 1; Tim Milnes: Coleridge's Logic 33; James Van Evra: Richard Whately and Logical Theory 75; Ralph Jessop: The Logic of Sir William Hamilton: Tunnelling through Sand to Place the Keystone in the Aristotelic Arch 93; Laura J. Snyder: "The Whole Box of Tools": William Whewell and the Logic of Induction 163; Fred Wilson: The Logic of John Stuart Mill 229; Michael E. Hobart and Joan Richards: De Morgan's Logic 283; Dale Jacquette: Boole's Logic 331; Maria Panteki; French 'Logique' and British 'Logic': On the Origins of Augustus de Morgan's Early Logical Enquiries, 1805–1835 381; Amirouche Moktefi: Lewis Carroll's Logic 457; James Van Evra: John Venn and Logical Theory 507; Bert Mosselmans and Ard van Moer: William Stanley Jevons and the Substitution of Similars 515; Shahid Rahman and Juan Redmond: Hugh McColl and the Birth of Logical Pluralism 533; David Sullivan: The Idealists 605; William J. Mander: Bradley's Logic 663; Index 719-735.

5. ———, eds. 2009. *Logic from Russell to Church*. Amsterdam: Elsevier.

   Handbook of the History of Logic: Vol. 5.

   Contents: Preface VII; Contributors XI; Andrew D. Irvine: Bertrand Russell's Logic 1; Dale Jacquette: Logic for Meinongian Object Theory Semantics 29; Joan Rand Moschovakis: The Logic of Brouwer and Heyting 77; Jens Erik Fenstad and Hao Wang: Thoralf Albert Skolem 127; Claus-Peter

Wirth, Jörg Siekmann, Christoph Benzmüller, Serge Autexier: Jacques Herbrand: Life, Logic. and Automated Deduction 195; Michael Potter: The Logic of the *Tractatus* 255; Peter M. Simons: Leśniewski' Logic 305; Wilfried Sieg: Hilbert's Proof Theory 321; Barry Hartley Slater: Hilbert's Epsilon Calculus and Its Successors 385; Mark van Atten and Juliette Kennedy: Gödel's Logic 449; Keith Simmons: Tarski's Logic 511; Alasdair Urquhart: Emil Post 617; Jan von Plato: Gentzen's Logic 667; Felice Cardone and J. Roger Hindley: Lambda-Calculus and Combinatorics in the 20th Century 723; Jonathan P. Seldin: The Logic of Church and Curry 819; Andrea Cantini: Paradoxes, Self-Reference and Truth in the 20th Century 875; Index 1015-1056.

6. Gabbay, Dov, Kanamori, Akihiro, and Woods, John, eds. 2012. *Sets and Extensions in the Twentieth Century*. Amsterdam: Elsevier.

   Handbook of the History of Logic: Vol. 6.

   Contents: Preface VII; Contributors XI; Akihiro Kanamori: Set Theory from Cantor to Cohen 1; Juris Steprāns: History of the Continuum in the 20th Century 73; Jean A. Larson: Infinite Combinatorics 145; Akihiro Kanamori: Large Cardinals with Forcing 359; William J. Mitchel!: Inner Models for Large Cardinals 415; Paul B. Larson: A Brief History of Determinacy 457; Menachem Kojman: Singular Cardinals: From Hausdorff's Gaps to Shelah 's pcf Theory 509; M. Randall Holmes, Thomas Forster, and Thierry Libert: Alternative Set Theories 559; John L. Bell: Types, Sets, and Categories 633; Jean-Pierre Marquis and Gonzalo E. Reyes: The History of Categorical Logic: 1963-1977 689; Fairouz Kamareddine, Twan Laan, and Robert Constable: Russell 's Orders in Kripke's Theory of Truth and Computational Type Theory 801; Index 847-865.

7. Gabbay, Dov, and Woods, John, eds. 2006. *Logic and the Modalities in the Twentieth Century*. Amsterdam: Elsevier.

   Handbook of the History of Logic: Vol. 7.

   Contents: Preface VII; List of Contributors XI; Rob Goldblatt: Mathematical Modal Logic: A View of its Evolution 1; Paul

Gochet and Pascal Gribomont: Epistemic Logic 99; Paul McNamara: Deontic Logic 197; Greg Restall: Relevant and Substructural Logics 289; Peter Øhrstrøm and Per F. V. Hasle: A. N. Prior's Logic 399; Peter Øhrstrøm and Per F. V. Hasle: Modern Temporal Logic: The Philosophical Background 447; Jan van Eijck and Martin Stokhof: The Gamut of Dynamic Logics 499; Keith Devlin: Situation Theory and Situation Semantics 601; Erik Krabbe: Dialogue Logic 665; Index 705-719.

8. ———, eds. 2007. *The Many-Valued and Nonmonotonic Turn in Logic*. Amsterdam: Elsevier.

   Handbook of the History of Logic: Vol. 8.

   Contents: Preface VII; List of Authors XI; Grzegorz Malinowski: Many-valued Logic and its Philosophy 13; Bryson Brown: Preservationism: A Short History 95; Graham Priest: Paraconsistency and Dialetheism 129; Maria Luisa Dalla Chiara, Roberto Giuntini and Miklos Rédei: The History of Quantum Logic 205; Dominic Hyde: Logics of Vagueness 285; Didier Dubois, Francesc Esteva, Lluís Godo and Henri Prade: Fuzzy-set Based Logics — An History-oriented Presentation of their Main Developments 325; Karl Schlechta: Nonmonotonic Logics: A Preferential Approach 451; Grigoris Antoniou and Kewen Wang: Default Logic 517; Alexander Bochman: Nonmonotonic Reasoning 557; Carl J. Posy: Free Logics 633; Index 681-689.

9. Gabbay, Dov, Siekmann, Jörg H., and Woods, John, eds. 2014. *Computational Logic*. Amsterdam: Elsevier.

   Handbook of the History of Logic: Vol. 9.

   Contents: Jörg Siekmann and Dov Gabbay: Editorial note VII; List of Authors and Readers VIII;

   Part I. Introduction

   Jörg Siekmann: Computational Logic 15; Martin Davis: Logic and the Development of the Computer 31;

   Part II. General

Dov Gabbay: What is a Logical System? An Evolutionary View: 1964-2014 41;

Part III. Automated Reasoning

John Harrison, Josef Urban and Freek Wiedijk: Interactive Theorem Proving 135; Christoph Benzmüller and Dale Miller: Automation of Higher Order Logic 215; Claude Kirchner and Hélène Kirchner: Equational Logics and Rewriting 255; Didier Dubois and Henri Prade: Possibilistic Logic — An Overview 283; Fairouz Kamareddine, Joe Wells, Christoph Zengler and Henk Barendregt: Computerizing Mathematical Text 343;

Part IV. Computer Science

Jos Baeten and Davide Sangiori: Concurrency Theory: a Historical Perspective on Coinduction and Process Calculi 399; Klaus Ambos-Spies and Peter A. Fejer: Degrees of Unsolvability 443; Lance Fortnow and Steven Homer: Computational Complexity 495; Robert Kowalski: Logic Programming 523; Jack Minker, Dietmar Seipel and Carlo Zaniolo: Logic and Databases: A History of Deductive databases 571; John-Jules Ch. Meyer: Logics for Intelligent Agents and Multi Agent Systems 629; Matthias Knorr and Pascal Hitzler: Description Logics 659; Pascal Hitzler, Jens Lehmann and Axel Polleres: Logics for the Semantic Web 679;

Index 711-734.

10. Gabbay, Dov, Hartmann, Stephan, and Woods, John, eds. 2011. *Inductive Logic*. Amsterdam: Elsevier.

    Handbook of the History of Logic: Vol. 10.

    Contents: Introduction VII; Contributors IX; J. R. Milton: Induction Before Hume 1; Marc Lange: Hume and the Problem of Induction 43; Malcolm Forster: The Debate Between Whewell and Mill on the Nature of Scientific Induction 93; Stathis Psillos: An Explorer Upon Untrodden Ground: Peirce on Abduction 117; Maria Carla Galavotti: The Modern Epistemic Interpretations of Probability: Logicism and Subjectivism 153; Alan Musgrave: Popper and Hypothetico-Deductivism 205; Jan Sprenger: Hempel and the Paradoxes of

Confirmation 235; S. L. Zabell: Carnap and the Logic of Inductive Inference 265; Ilkka Niiniluoto: The Development of Hintikka Program 311; Frederick Eberhardt and Clark Glymour: Hans Reichenbach's Probability Logic 357; Robert Schwartz: Goodman and the Demise of Syntactic and Semantic Models 391; James M. Joyce: The Development of Subjective Bayesianism 415; Jonathan Weisberg: Varieties of Bayesianism 477; Nick Chater, Mike Oaksford, Ulrike Hahn and Evan Heit: Inductive Logic and Empirical Psychology 553; Jan-Willem Romeijn: Inductive Logic and Statistics 625; Ulrike von Luxburg and Bernhard Schölkopf: Statisical Learning Theory: Models, Concepts, and Results 651; Daniel Osherson and Scott Weinstein: Formal Learning Theory in Context 707; Ronald Ortner and Hannes Leitgeb: Mechaninzing Induction 719; Index 773-785.

11. Gabbay, Dov, Pelletier, Francis Jeffrey, and Woods, John, eds. 2012. *Logic: A History of its Central Concepts*. Amsterdam: Elsevier.

    Handbook of the History of Logic: Vol. 11.

    Contents: Preface VII; List of Authors X; Conrad Asmus and Greg Restall: History of the Consequence Relation 11; Daniel Bonevac: A History of Quantification 63; J. L. Speranza and Laurence R. Horn: A Brief History of Negation 127; Daniel Bonevac and Josh Dever: A History of the Connectives 175; Jean-Yves Beziau: A History of Truth-Values 235; Simo Knuuttila: A History of Modal Traditions 309; Francis Jeffry Pelletier and Allen P. Hazen: A History of Natural Deduction 341; Storrs McCall: A History of Connexivity 415; Fairouz Kamareddine, Twan Laan and Rob Nederpelt: AHistory of Types 451; John Woods: A History of the Fallacies in Western Logic 513; Amirouche Moktefi and Sun-Joo Shin: A History of Logic Diagrams 611; Index 683-706.

Other studies in English A - C

1. Angelelli, Ignacio, and Cerezo, María, eds. 1996. *Studies on the History of Logic. Proceedings of the III. Symposium on the History of Logic*. Berlin: Walter de Gruyter.

Contents: Preface V; List of Contributors XI; Mario Mignucci: Aristotle's theory of predication 1; Robin Smith: Aristotle's regress argument 21, Hermann Weidemann: Alexander of Aphrodisias, Cicero and Aristotle's definition of possibility 33; Donald Felipe: Fonseca on topics 43; Alan Perreiah: Modes of scepticism in medieval philosophy 65; Mikko Yrjönsuuri: Obligations as thoughts experiments 79; Angel d'Ors: *Utrum propositio de futuro sit determinate vera vel falsa* (Antonio Andrés and John Duns Scotus) 97; Earline Jennifer Ashworth: Domingo de Soto (1494-1560) on analogy and equivocation 117; Allan Bäck: The *Triplex Status Naturae* and its justification 133; William E. McMahon: The semantics of Ramon Llull 155; Paloma Pérez-Ilzarbe: The doctrine of descent in Jerónimo Pardo: meaning, inference, truth 173; Jeffrey Coombs: What's the matter with matter: *Materia propositionum* in the post-medieval period 187; Rafael Jiménez Cataño: *Copulatio* in Peter of capua (12th century) and the nature of the proposition 197; Lynn Cates: Wyclif on *sensus compositus et divisus* 209; Mauricio Beuchot: Some examples of logic in New Spain (Sixteenth-Eighteenth century) 215; Adrian Dufour: necessity and the Galilean revolution 229; Guy Debrock: Peirce's concept of truth within the context of his conception of logic 241; Pierre Thibaud: Peirce's concept of proposition 257; Jaime Nubiola: Scholarship on the relations between Ludwig Wittgenstein and Charles S. Peirce 281; José Miguel Gambra: Arithmetical abstraction in Aristotle and Frege 295; Herbert Hochberg: The role of subsistent propositions and logical forms in Russell's 1913 *Philosophical logic* and in the Russell-Wittgenstein dispute 317; Alfonso García Suárez: Are the objects of the *Tractatus* phenomenological objects? 343; María Cerezo: Does a proposition affirm every proposition that follows from it? 357; Javier Legris: Carnap's reconstruction of intuitionistic logic in the *Logical syntax of language* 369; Albert C. Lewis: Some influences of Hermann Grassmann's program on modern logic 377; Juan Carlos León: Indeterminism and future contingency in non-classical logics 383; Christian Thiel: Research on the history of logic at Erlangen 397; Index 403.

2. Bar-Am, Nimrod. 2003. "A Framework for a Critical History of Logic." *Sudhoffs Archiv* no. 87:80-89.

Abstract: "The view that science has evolved while using the critical method (dialectics) is undisputed these days. Initially, the traditional view that scientific knowledge is sound and unshakable knowledge, has hindered the view of its development as a critical process. In this respect the history of logic suffered more than other branches of knowledge because the view of logic as developing belongs essentially to the last 150 years. Even today, there is no critical history of logic (the telling of its development by the critical method). This paper is a preliminary attempt in this direction."

"Let us sum up then: At the heart of traditional logic lies the traditional question, what is a sound inference? Modern logic took its first step by criticizing this question (Hume, Bolzano and Boole) and, by replacing it with the modern question, what is a valid inference?

(Boole, Russell and Tarski). This was not a technical novelty. It was a type 6 novelty, an upheaval, a meta-logical revolution which determined future agenda for years to come. Key figures, such as Whewell and Frege, did not take part in this revolution. This discovery is an interesting result of the use of our framework: Their achievements were made despite them being fence-sitters. On the one hand, they still clung to judgments, viewing as useless the merely valid inferences. On the other hand, they postponed the task of securing empirical science by means of logic." (p. 89)

3. Barth, Else M. 1974. *The Logic of the Articles in Traditional Philosophy. A Contribution to the Study of Conceptual Structures*. Dordrecht: Reidel.

   Revised translation from the original Dutch (1971) by E. M. Barth and T. C. Potts.

   Table of Contents: Preface XIX; Preface to the original edition XXI; On the use of symbols and graphical types XXIII-XXV; Part 1. The problem. I. Introduction: problems and sources 3; II. Naming what is 34; III. The semantics of the logical constants 50; Part 2. Historical survey. IV. From the history of the logic of indefinite propositions 75; V. From the history of the logic of individual propositions 141; VI. Singular - General -

Indefinite 180; VII. The identity theories of the copula 204; Part 3. Descent. VIII. Argument by analogy 291; IX: The problem of the logic of relations and its connection with the logic of the articles 337; Part 4. X: Introduction of indefinite propostions by ekthesis 381; XI. Conjunction, potentiality, and disjunction 417; XII. Summary and conclusion 457; Bibliography 482; Index of proper names 502; Index of subjects 509.

"As anybody may verify, both in German, French and other continental philosophical literature, as well as in English philosophical literature written in the continental philosophical tradition, very frequent use is made of the articles - “der”, “die”, “das” in German, “le” and “la” in French, “de” and “het” in Dutch, “-en”, “-a”, “-et” in Scandinavian languages and so on - that is, of the definite articles as grammarians call them.

Sentences which in German would begin with a definite article are frequently translated into English by indefinite articles, and often also occur without any preceding article or other operator. In any case, the choice between a definite and an indefinite prenex article in English philosophical literature can seldom be said to be philosophically significant." (p. 4)

(...)

"It is certainly no accident that sentences with definite articles, or, as is often the case in English, indefinite articles, and general sentences with no prenex articles or other prenex operators at all, were found earlier much more frequently in scientific literature, too, than today. The development on this point which introduction: problems and sources has taken place in the social sciences can be illustrated by the following

quotation: “The emphasis has shifted from the attempt to discover the characteristics of the leader, to an understanding of the leader-follower relationship” (Klineberg 1954/466). Due to the development of a logic of relations by De Morgan and Peirce, from 1860 onwards, in combination with Frege’s revision of the logic of “all” and “some”, the language form exemplified by “the state” and “die Sprache” gradually

disappeared from theoretical logic. The development in the social sciences to which Klineberg refers is not necessarily directly connected with that theoretical logic, but it could be. In any case the similarity between these developments is an interesting symptom of a generally felt need." (p. 5, a note omitted)

References

Klineberg, O., 1954 [1940], *Social Psychology*. Second revised edition. New York.

4. Bochenski, Joseph. 1961. *A History of Formal Logic*. Notre Dame: Indiana University Press.

Translated from the German edition "*Formale Logik*" (1956) by Ivo Thomas.

Reprinted New York, Chelsea Publishing Co., 1970.

"As an introduction to the present state of research and to justify the arrangement of this book, a summary presentation of results is now needed. The view we present is a new one of the growth of formal logic, stated here for the first time. It is a view which markedly diverges not only from all previous conceptions of the history of logic, but also from opinions that are still widespread about the general history of thought. But it is no 'synthetic a priori judgment', rather is it a position adopted in accordance with empirical findings and based on the total results of the present book. Its significance seems not to be confined within the boundaries of the history of logic: the view might be taken as a contribution to the general history of human thought and hence to the sociology of knowledge." (p. 10)

(...)

"The history of western logic can be divided into five periods: 1. the ancient period (to the 6th century A.D.); 2. the high Middle Age (7th to 11th centuries); 3. the Scholastic period (11th to 15th centuries); 4. the older period of modern 'classical' logic (16th to 19th centuries); 5. mathematical logic (from the middle of the 19th century). Two of those are not creative periods - the

high Middle Age and the time of 'classical' logic, so that they can be left almost unnoticed in a history of problems. The hypothesis that there was no creative logical investigation between the ancient and Scholastic periods might very probably be destroyed by a knowledge of Arabian logic, but so far little work has been done on this, and as the results of what research has been undertaken are only to be found in Arabic, they are unfortunately not available to us." (p. 11)

5. ———. 1974. "Logic and Ontology." *Philosophy East and West* no. 24:275-292.

   Abstract: "The scope of this article is to present a broad survey of the relations between logic and ontology as they have been conceived of in the history of Western thought. While it is true that Hindu philosophy offers a similar field of research, the impression is that we are not yet prepared to handle it in any synthetic way. We simply do not know enough about the details of the Hindu doctrines."

6. ———. 1981. "The general sense and character of modern logic." In *Modern Logic - A Survey. Historical, Philosophical, and Mathematical Aspects of Modern Logic and Its Applications*, edited by Agazzi, Evandro, 3-14. Dordrecht: Reidel.

   "By 'Modem Logic' (abridged as 'ML') the class of studies is meant which were originated by Leibniz, developed, among others, by Boole, Peirce, Frege, Peano, Lesniewski and their followers; in other terms the class of studies listed in Alonzo Church's Bibliography and in *The Journal of Symbolic Logic*."

   (...)

   "The aim of the paper is to describe - as the title selected by the organizers of the conference indicates - the general sense and character of ML thus understood. In other terms an attempt will be made to find the fundamental characteristics of ML-al studies.

   The method used will be comparative. We are going to ask: How does ML compare with three fields with which it is usually linked: logic, mathematics and philosophy? Is ML Logic and, if so, how does it differ from

other types of logic? Is it a mathematical discipline and, if that is the case, what is the difference between it and other mathematical sciences? Is it philosophy and, this being admitted, what is its place among the other philosophical disciplines?

The present paper will be mostly concerned with the first class of problems, the comparison between ML and the other types of logic; the other two classes of problems will be treated only marginally. As far as the

main problems are concerned, the method will necessarily be historical: for, contrary to mathematics and philosophy, all other forms of logic with which ML may be compared belong to the past." (p. 3)

7. Brumberg-Chaumont, Julie, and Rosental, Caude, eds. 2021. *Logical Skills: Social-Historical Perspectives*. Cham (Switzerland): Birkhäuser.

"The volume wishes to address a variety of questions arising when logic is approached by overriding compartmentalization, by adopting an interdisciplinary viewpoint, and by taking into account its fully social and historical dimensions. By raising the question of logical skills, it aims at pausing and stepping aside from an approach essentially centered on the doctrinal history of logical theories." (Preface, p. V)

(...)

"This volume differs from many psychology publications in that it does not seek to highlight the acquisition, possession, or lack of logical skills in anonymous and interchangeable “subjects” according to a reference logic. It deals with socio-historically situated actors and groups and analyzes the conceptions of logic that are mobilized to valuate their skills and to devise educational “politics of logic.”

The volume is also different from various philosophical works that offer a reflection on the (il)logical ways of thinking and acting of societies—or of the individuals who compose them. On the contrary, such reflections are taken as an object of social historical study in its own right.

Furthermore, it differs from histories of ideas in the field of logic. It does not set out from a definition of logic that would serve as a once-and-for-all fixed reference, which would lead to select some approaches to logic and exclude others from the scope of our study. It develops a social historical approach to logic. By focusing on logical skills, it shows the many ways in which logic can be understood. Logic does not simply appear as a set of theories and doctrines, but also as a tool that individuals and groups use for numerous purposes in various institutional, political, and social contexts. Generally speaking, logic is seen as a social practice." (Preface, p. VI)

8. Carruccio, Ettore. 1964. *Mathematics and Logic in History and in Contemporary Thought*. Chicago: Aldine.

   Original Italian edition: *Matematica e logica nella storia e nel pensiero contemporaneo*, Torino: Gheroni 1958.

   "The history of mathematics, understood in this sense, should as far as possible be studied directly from documents and from originals; what is required is not so much erudition as an effort to enliven the texts by interpretation and by relating them to their own times. The field which the historian of mathematics should cover in tracing the development, ancient and modern, of the subject, and its relationship with other aspects of life and culture, is broad enough to daunt the student; but while obviously no one can cover the whole of it in detail, each student must choose what best suits his own intellectual interests.

   The subjects treated in this book have been chosen mainly to show the development of the most important fundamental concepts of mathematics, and particularly the contribution made by mathematical thought to the evolution of logic. This will allow us to cover the entire history of mathematics from ancient times to our -own day, observing the changes that have taken place in the conception of the structure of a rational theory, until we reach the delicate, and often lively and disconcerting,

   problems of contemporary logic. Though narrowed down like this, our field of enquiry is still too vast to be treated all in one

piece. Yet, as our object is essentially formative rather than informative, we prefer to leave occasional gaps, in order to emphasize subjects which seem fundamental in the training of those who will do research in the history and philosophy of mathematics.

At this point the reader may wish for a precise definition of what we mean by the terms 'mathematics' and 'logic'. But the meaning of the terms themselves, as we shall see, keeps changing in the course of the history of thought. To understand adequately what thinkers have meant by these terms we need, therefore, a broad idea of the historical development of mathematics and logic. To understand clearly what is meant by such terms today we need too, I think, a knowledge of the evolution of the ideas in question, and it is this evolution that we shall follow in this book." (pp. 10-11)

9. Church, Alonzo. 1956. *Introduction to Mathematical Logic*. Princeton: Princeton University Press.

   Third reprint 1996. See in particular the *Historical notes*: Chapter II. *The propositional calculus (continued)* § 29 pp. 155-166; Chapter IV. *The pure functional calculus of First Order* 49 pp. 288-294.

10. Cresswell, Max, Mares, Edwin, and Rini, Adriane, eds. 2016. *Logical Modalities from Aristotle to Carnap: The Story of Necessity*. Cambridge: Cambridge University Pres.

    Contents: List of Figures and Tables VII; List of Contributors IX, List of Abbreviations XIII; Max Cresswell, Edwin Mares, and Adriane Rini: Introduction 1; 1Adriane Rini: Aristotle on the Necessity of the Consequence 11; 2 Marko Malink: Aristotle on One-Sided Possibility 29; 3 Robin Smith: Why Does Aristotle Need a Modal Syllogistic? 50; 4 Vanessa de Harven: Necessity, Possibility, and Determinism in Stoic Thought 70; 5 Paul Thom: Necessity in Avicenna and the Arabic Tradition 91; 6 Christopher J. Martin: Modality without the *Prior Analytics*: Early Twelfth Century Accounts of Modal Propositions 113; 7 Calvin G. Normore: Ockham and the Foundations of Modality in the Fourteenth Century 133; 8 Jack MacIntosh: Theological and Scientific Applications of the Notion of Necessity in the

Mediaeval and Early Modern Periods 154; 9 Peter R. Anstey: Locke and the Problem of Necessity in Early Modern Philosophy 174; 10 Brandon C. Look: Leibniz's Theories of Necessity 194; 11 Jonathan Westphal: Leibniz and the Lucky Proof 218; 12 Nicholas F. Stang: Divine Necessity and Kant's Modal Categories 232; 13 Catherine Legg and Cheryl Misak: Charles Sanders Peirce on Necessity 256; 14 Edwin Mares: The Development of C. I. Lewis's Philosophy of Modal Logic 279; 15 Max Cresswell: Carnap's Modal Predicate Logic 298; Bibliography 317; Index 339-348.

"Interest in the metaphysics and logic of possible worlds goes back at least as far as Aristotle, but few books address the history of these important concepts. This volume offers new essays on the theories about the logical modalities (necessity and possibility) held by leading philosophers from Aristotle in ancient Greece to Rudolf Carnap in the twentieth century. The story begins with an illuminating discussion of Aristotle's views on the connection between logic and metaphysics, continues through the Stoic and mediaeval (including Arabic) traditions, and then moves to the early modern period with particular attention to Locke and Leibniz. The views of Kant, Peirce, C. I. Lewis and Carnap complete the volume. Many of the essays illuminate the connection between the historical figures studied and recent or current work in the philosophy of modality. The result is a rich and wide-ranging picture of the history of the logical modalities." (p. I)

1. Drucker, Thomas, ed. 2008. *Perspectives on the History of Mathematical Logic*. Boston: Birkhäuser.

   Contents: Acknowledgments VII; Contributors XIII; Irving H. Anellis: Jean van Heijenoort (1912-1986) XIII; Thomas Drucker: Introduction XV; Judy Green: The Problem of Elimination in the Algebra of Logic 1; Nathan Houser: Peirce and the Law of Distribution 10; Irving H. Anellis: The First Russell Paradox 33; Daniel J. O'Leary: *Principia Mathematica* and the Development of Automated Theorem Proving 47; William Aspray: Oswald Veblen and the Origins of Mathematical Logic at Princeton 54; Irving H. Anellis: The L6wenheim-Skolem Theorem, Theories of Quantification, and Proof Theory 71; John W. Dawson Jr.: The Reception of G6del's Incompleteness Theorems 84; Hao Wang: G6del's and Some Other Examples of Problem Transmutation 101; C. Smorynski: The Development of Self-Reference: Löb's Theorem 110; Wim Ruitenburg: The Unintended Interpretations of Intuitionistic Logic 134; Stephen C. Kleene: The Writing of *Introduction to Metamathematics* 161; Jomathan P. Seldin: In Memoriam: Haskell Brooks Curry 169; Drtag Siefkes: The Work of J. Richard Büchi 176; Index Nominum 191-195.

"The chapters included in this volume range broadly in time and subject, but they are all dedicated to unraveling the thoughts and the circumstances that have contributed to the evolution of mathematical logic. They involve technical details and philosophical underpinnings, support of colleagues and establishment of chairs. Some of the chapters give an insider's view of a particular development in the field, while others are detailed critical analyses of influential pieces of work. Their common feature is making sense rather than magic out of advances, binding together a community of contributors rather than leaving the impression of isolated wonder-workers. As the motto of the international chess federation has it, *Gens una sumus*. (We are one people.)" (p. XVI)

(...)

"These chapters put together do not give a history of mathematical logic over the last century. Even on individual logicians they do not claim to be exhaustive. The collection does, however, indicate some of the richness of ideas that are involved in studying the history of logic and the variety of materials which can be pressed into service. National and chronological boundaries are not respected by the development of the field." (p. XXII)

2. Dumitriu, Anton. 1977. *History of Logic. Volume I*. Tunbridge Wells: Abacus Press.

   Revised, updated, and enlarged translation from the Roumanian of the second edition of "*Istoria logicii*".

   Contents: Foreword IX; Historical note on works on the history of logic XIII-XVI;

   Part I: Logic in Non-European Cultures

   Chapter I. The logical structure of primitive mentality 3; Chapter II. Logic in ancient China 12; Chapter III. Indian logic 39;

   Part II: Logic in ancient Greece

   Chapter IV: The beginning of Greek logic 69; Chapter V: The sophists 95; Chapter VI: Socrates' reaction. Plato 103; Chapter

VII: The lesser Socratics 128; Chapter VIII: Aristotle's logic 141; Chapter IX: The Peripatetic School 207; Chapter X: The logic of the Stoics 216; Chapter XI: The Epicurean School. Scepticism and the New Academy 284;

Part III: Rhetors and commentators

Chapter XII: Logic and rhetoric in rome 273; Chapter XIII: Commentaries and commentators 261;

Index of names 323; Index of subjects 335-342.

"The potential author of a history of logic should not depend on any preconceived point of view. The formalistic option, for example, requires logic to be treated in a purely symbolic way, as a logical syntax of meaningless signs; obviously the historian who adopts such a view, hoping to achieve an absolute objectivity by eliminating any philosophical hypothesis, will be bound by it.

Such a logic is a logic without any philosophical content, and surely its history will have to adopt the same line. But is it possible to deal with logic without having any philosophical point of view? It is evident that such an intention is not realistic, and even in the formalistic point of view a certain philosophy is understood. Aristotle's statement "he who philosophizes, philosophizes, and he who does not philosophize, philosophizes too, so everybody philosophizes" is very significant.

A history of logic based on such a view would have to leave out of the list of logicians names like Thomas Aquinas, Kant, Hegel, Husserl, and many others. Is it possible to explain the development of logic without commenting on thinkers of great influence, who actually moulded the whole frame of human thought in their time? Obviously such a point of view is inadmissible.

A history of logic without philosophical references leads to very important consequences, to wide mutations and alterations of the very concept of logic and philosophy. After two and a half millennia, logic is taken from philosophy, and belongs

henceforth to another domain, that of mathematics. In this way, logic has escaped from the jurisdiction of philosophy, but philosophy has remained independent of logic. In the past logic was, on the contrary, closely connected to philosophy, whether it was conceived as a part of philosophy, or an introduction to it, or as an organon, or even as the philosophy itself." (Foreword, pp. IX-X)

3. ———. 1977. *History of Logic. Volume II*. Tunbridge Wells: Abacus Press.

   Contents: Foreword V;

   Part IV: Scholastic logic

   Chapter XIV: Scholasticism 3; Chapter XV: The formation of the Scholastic logic 11; Chapter XVI: The place of logic among the other sciences 50; Chapter XVII: The problem of universals 62; Chapter XVIII: Scholastic terminology 100; Chapter XIX: Parva logicalia 124; Chapter XX: The properties of terms 130; Chapter XXI: Syncategoremata 142; Chapter XXII: The theory of consequences 151; Chapter XXIII: Insolubilia 162; Chapter XXIV: General conclusion on Scholastic logic 173;

   Part V: Renaissance logic

   Chapter XXV: The Renaissance 183; Chapter XXVI: Renaissance Aristotelianism 189; Chapter XXVII: The logic of Humanism 220;

   Index of names 251; index of subjects 263-265.

   "Foreword

   The first volume of this book showed the development of the two great logical systems of Aristotle and Chrysippus. In this volume we look at the third great system of logic, that of the Scholastics. They studied the teachings of the Greeks, of the Arab and Jewish commentators, and from them evolved a *logica perennis* based on a single, well-founded philosophical doctrine. We shall see the crystallization of Scholastic logic into a well defined system, the contributions of the Scholastic logicians and the subsequent decline of the philosophical and logical doctrines to mere didactics.

At the dawn of the Renaissance the opponents of Scholastic logic were searching for new logical systems. But the Renaissance failed to achieve a unitary doctrine which could provide an adequate critique of the old logic as well as an independent, valid, logical system. The Renaissance produced new ideas and trends which though interesting failed to make any major contribution to logic comparable to other great conceptions such as Scholasticism.

Both periods have been studied in the past, but not with special reference to the logic of the period. The historian has very great problems in his attempt to sort and classify the enormous amount of material available. In order to deal with this material synthetically and avoid repetition we have adopted a synchronous and diachronous approach.

4. ———. 1977. *History of Logic. Volume III*. Tunbridge Wells: Abacus Press.

   Part VI: Methodological logic

   Chapter XXVIII: The beginnings of experimental science 3; Chapter XXIX: Francis Bacon 11; Chapter XXX: Descartes 32; Chapter XXXI: Post-Cartesian methodological researches 46; Chapter XXXII: Contemporary sciences and their problems 62; Chapter XXXIII: New dialectics 68; Chapter XXXIV: Science as language 77; Chapter XXXV: Induction and probability 99; Chapter XXXVI: Logic of research 112;

   Part VII: Development of modern logic

   Chapter XXXVII: Logic from Leibniz to Kant 135; Chapter XXXVIII: Transcedendental logic 163; Chapter XXXIX: Hegel's logic 205; Chapter XL: Reactions to the philosophy of Romanticism. Late trends 235; Chapter XLI: Materialist dialectic 260; Chapter XLII: Psychologism in logic and related trends 311; Chapter XLIII: Phenomenology and pure logic 353;

   Index of names 373; index of subjects 387-393.

   "Foreword

   The third volume of the “History of Logic deals with the evolution of logic since Renaissance.

Two great issues faced the modern epoch, the meaning of the most important scientific attainments being contingent upon the solutions found. These were:

(a) how to make scientific discoveries and

(b) what is the logico-theoretical basis of the truths discovered by science?

The first query gave rise to much methodologic research the principal aim of which was to establish an *ars inveniendi*, establishing rules which would enable anyone to discover scientific truths. With the development of contemporary science, however, the classical concept of method underwent a fundamental change and the solutions found are to be taken as the hypotheses of possible methods.

The second query provoked a widespread critical reevaluation of all those principles and concepts of logic, improperly designated “philosophy of logic".

Recent critical analysis is explained by the need to establish the logical foundations of science.

These are the problems that the present volume will attempt to pursue."

5. ———. 1977. *History of Logic. Volume IV*. Tunbridge Wells: Abacus Press.

   Contents: Foreword IX,

   Part VIII: Mathematical logic

   Chapter XLIV: Logic and mathematics 3; Chapter XLV: Raymundus Lullus' system 8; Chapter XLVI: Leibniz's logic 15; Chapter XLVII: The algebra of logic 39; Chapter XLVIII: Gottlob Frege 51; Chapter XLIX: Peano and the Italian School 64; Chapter L: Principia Mathematica 87; Chapter LI: The logico-mathematical paradoxes 113; Chapter LII: The development of mathematical logic 118; Chapter LIII: Many-valued logics 145; Chapter LIV: The decision problem 182; Chapter LV: Formal technique (systems and metasystems) 196;

Chapter LVI: General considerations on mathematical logic 224; Chapter LVII: Reactions to mathematical logic 239;

Part IX: Conclusion

Chapter LVIII: General conclusions 259;

Index of names 267; index of subjects 273-275.

"Foreword

This volume (the last) of the “History of Logic" is devoted to mathematical logic. It will show that mathematical logic did not appear suddenly but as a natural consequence of the advancement of the sciences and of the crisis they went through at the turn of the century.

We will focus on the following points:

(a) philosophical theories from Boole to Husserl provide a theoretical basis to the concept of a formal symbolic-mathematical logic;

(b) such is the prestige of the mathematical methods which have now pervaded every area that logic could not call itself a science, had it not also clad itself in a mathematical garb;

(c) finally, many fundamental problems of mathematics and the logical elucidation of its basic concepts (such as number, set etc.) have made it necessary to develop a mathematical tool which could be rigorously applied to such problems.

We shall follow the historical development of symbolic logic systems. It is apparent that mathematical logic has been developed in response to logical, philosophical and purely mathematical problems.

A history of logic cannot cover all three areas, pure mathematics, in particular, being of little relevance here. They will be dealt with only when explaining certain developments in symbolic logic, though making it clear that they are separate sciences. Certain critical remarks have been made in an attempt to delimit the nature of issues which may appear paradoxical."

6. Filkorn, Vojtech. 1963. *Pre-Dialectical Logic*. Bratislava: Publishing House of the Slovak Academy of Sciences.

   "This work is the first part of Pre-Dialectical Logic in two volumes. We deal in it with some periods of the history of this logic. Pre-dialectical logic has also its own systematic-methodologic aspect which we investigate in the second volume.(1) Both volumes are conceived as a preparation for further studies in which we want to investigate dialectical logic from its historical and systematic aspects. This is also the reason why the definition of logic and the description of its properties which the first part deals with are only preliminary; such is also the investigation of the relation between formal and dialectical logic. We shall have to return to this problem once more when we shall investigate dialectical logic." (Preface, p. 5)

   (1) 1 In the *O vod do melodologie vied* (Introduction to !he Methodology of Sciences), Bratislava 1960.

7. Gensler, Harry. 2006. *Historical Dictionary of Logic*. Lanham: Scarecrow Press.

   Also titled *The A to Z Logic*.

   Contents: Editor's Foreword by Jon Woronoff IX; Preface XI; Notation XIII; Chronology XV; Introduction XXIX-XLIV; The Dictionary 1; Bibliography 255; About the Author 307.

   This book is an encyclopedia of logic. It introduces the central concepts of the field in a series of brief, nontechnical "dictionary entry" articles. These deal with topics like logic's history, its various branches, its specialized vocabulary, its controversies, and its relationships to other disciplines. While the book emphasizes deductive logic, it also has entries on areas like inductive logic, fallacies, and definitions -- and on key concepts from epistemology, mathematics, and set theory that are apt to arise in discussions about logic. Following the series guidelines, Historical Dictionary of Logic tries to be useful for specialists (especially logicians in areas outside their subspecialties) but understandable to students and other beginners; so I avoid topics or explanations that are so technical that only math majors would understand.

The major part of this book is the dictionary section, with 352 entries. While these are arranged alphabetically, there is also an organization based on content. Four very general entries start with "logic:" and serve mainly to point to more specific entries (like "propositional logic"); these in turn often point to related topics (like "negation," "conditionals," "truth tables," and "proofs"). So we have here a hierarchy of topics. Here are the four "logic:" entries:

* logic: deductive systems points to entries like propositional logic, modal logic, deontic logic, temporal logic, set theory, many-valued logic, mereology, and paraconsistent logic.

* logic: history of is about historical periods and figures and includes entries like medieval logic, Buddhist logic, twentieth-century logic, Aristotle, Ockham, Boole, Frege, and Quine.

* logic: and other areas relates logic in an interdisciplinary way to other areas and includes entries like biology, computers, ethics, gender, God, and psychology.

* logic: miscellaneous is about everything else (including technical terms) and includes entries like abstract entities, algorithm, ad hominem, inductive logic, informal/formal logic, liar paradox, metalogic, philosophy of logic, and software for learning logic.

The entries vary in length from a sentence or two to several pages. The front of the book has three important parts:

A short notation section gives the main logical symbols that I use in the book, along with alternative symbols that others sometimes use.

A chronology lists some of the main events in the history of logic.

An introduction tries to give an overall view of logic, the big picture, in order to give a broader context for the dictionary entries.

The back of the book has a substantial bibliography on related readings." (from the Preface).

8. Haaparanta, Leila, ed. 2009. *The Development of Modern Logic*. New York: Oxford University Press.

   Contents: Preface V-VI; 1. Leila Haaparanta: Introduction 3; 2. Tuomo Aho and Mikko Yrjönsuuri: Late medieval logic 11; 3. Saha, Amita Chatterjee, Tushar Kanti Sarkar, Sibajiban Bhattacharyya: Indian logic 903; Index 963-994.

   "This volume is the result of a long project. My work started sometime in the 1990s, when Professor Simo Knuuttila urged me to edit, together with a few colleagues, a volume on the history of logic from ancient times to the end of the twentieth century. Even if the project was not realized in that form, I continued with the plan and started to gather together scholars for a book project titled *The Development of Modern Logic,*

thus making a reference to the famous book by William and Martha Kneale. Unlike that work, the new volume was meant to be written by a number of scholars *almost as if* it had been written by one scholar only. I decided to start with thirteenth-century logic and come up with quite recent themes up to 2000, hence, to continue the history written in *The Development of Logic*. My intention was to find a balance between the chronological exposition and thematic considerations. The philosophy of modern logic was also planned to be included; indeed, at the beginning the book had the subtitle "A Philosophical Perspective," which was deleted at the end, as the volume reached far beyond that perspective. The collection of articles is directed to philosophers, even if some chapters include a number of technical details. Therefore, when it is used as a textbook in advanced courses, for which it is also planned, those details are recommended reading to students who wish to develop their skills in mathematical logic." (From the Preface by Leila Haaparanta)

9. Kneale, William Calvert, and Kneale, Martha. 1962. *The Development of Logic*. Oxford: Clarendon Press.

   Reprinted 1975 with corrections.

   "As its name indicates, this book is an account of the growth of logic, rather than an attempt to chronicle all that past scholars, good and bad, have said about the science. For the sake of continuity, and in order to give historical perspective to our story, my wife and I have included some references to work which does not deserve to be remembered for its own sake; and occasionally we have allowed ourselves to indulge an antiquarian curiosity, when we thought that the result might be of some interest to others. But our primary purpose has been to record the first appearances of those ideas which seem to us most important in

   the logic of our own day. Such a programme is based on judgements of value, and we realize that our selection of material and still more our comments, especially in the later chapters, may seem eccentric to some readers. In defence of our undertaking we can only say that we have followed the plan

which our interests suggested, and that we could not have written in any other way." (Preface, p. V)

(...)

"For the fifth impression we have corrected some surviving mistakes and misprints, re-worded some passages in the hope of achieving greater clarity, and added some references. But the chief novelty is an appendix in which we translate the Latin quotations of Chapter IV. Many of these improvements, like those in earlier impressions, are due to the suggestions of readers, whom we thank for their kindness in writing to us." (Preface, p. VI, May 1971)

10. Knuuttila, Simo, ed. 1988. *Modern Modalities: Studies of the History of Modal Theories from Medieval Nominalism to Logical Positivism*. Dordrecht: Kluwer.

    Contents: Simo Knuuttila: Introduction VII-XIV; Lilli Alanen and Simo Knuuttila: The foundations of modality and conceivability in Descartes and his predecessors 1; Ilkka Patoluoto: Hobbes's system of modalities 71; Jaakko Hintikka: Was Leibniz Deity an *Akrates*? 85; Martin Kusch and Juha Manninen: Hegel on modalities and monadology 109; Pascal Engel: Plenitude and contingency: modal concepts in Nineteenth century French philosophy 179; Leila Haaparanta: Frege and his German contemporaries on alethic modalities 239; Ilkka Niiniluoto: From possibility to probability: British discussions on modality in the Nineteenth century 275; Hans Poser: The failure of Logical Positivism to cope with problems of modal theory 311; Index of names 329; Index of subjects 341.

    "The word "modern" in the title of this book refers primarily to post-medieval discussions, but it also hints at those medieval modal theories which were considered modern in contradistinction to ancient conceptions and which in different ways influenced philosophical discussions during the early modern period. The medieval developments are investigated in the opening paper, 'The Foundations of Modality and Conceivability in Descartes and His Predecessors', by Lilli Alanen and Simo Knuuttila.

Boethius's works from the early sixth century belonged to the sources from which early medieval thinkers obtained their knowledge of ancient thought. They offered extensive discussions of traditional modal conceptions the basic forms of which were: (1) the paradigm of possibility as a potency striving to realize itself; (2) the "statistical" interpretation of modal notions where necessity means actuality in all relevant cases or omnitemporal actuality, possibility means actuality in some relevant cases or sometimes, and impossibility means omnitemporal non-actuality; and (3) the "logical" definition of possibility as something which, being assumed, results in nothing contradictory. Boethius accepted the Aristotelian view according to which total possibilities in the first sense must prove their mettle through actualization and possibilities in the third sense are assumed to be realized in our actual history. On these presumptions, all of the above-mentioned ancient paradigms imply the Principle of Plenitude according to which no genuine possibility remains unrealized. (For the many-faceted role of the Principle of Western thought, see A.O. Lovejoy, *The Great Chain of Being. A Study of the History of an Idea,* Harvard University Press, Cambridge, Mass. 1936, and S. Knuuttila (ed.), *Reforging the Great Chain of Being. Studies of the History of Modal Theories* (Synthese Historical Library 20), Dordrecht, Reidel 1981.)

Boethius sometimes says that there can be opposite diachronic possibilities vis-à-vis future moments of time, but even in these cases unrealized alternatives cease to be possibilities when one of them is actualized. The idea of spelling out the meaning of modal notions with the help of synchronic alternative states of affairs hardly played any role in ancient thought; after having been suggested by some Patristic thinkers, it became a systematic part of modal thinking only in the twelfth century. It was realized that even if the traditional philosophical conceptions might be applicable to the phenomenal reality, possibilities of God, acting by choice, refer to alternative providential plans or histories. Although there were not many twelfth or thirteenth century figures who, like Gilbert of Poitiers or Robert Grosseteste, would have understood the

theoretical significance of the idea of modality as referential multiplicity, the doctrine of special theological modalities motivated new kinds of discussions of the nature of natural necessities and the relations between the notions of possibility, conceivability, and knowability.

In ancient metaphysics, modality and intelligibility were considered real moments of being. A Christian variant of this doctrine can be found in such thirteenth century Parisian scholars as Thomas Aquinas, Bonaventura, and Henry of Ghent. They thought that God's infinite act of understanding contains the ideas of all conceivable kinds of beings. Ideas as possibilities have an ontological foundation, however, because God's act of thinking consists of understanding the infinite ways in which his essence could be imitated by finite beings. Because the ontological foundation of possibilities remains as such unknown to men, it is claimed that we usually cannot decide whether an alleged unrealized possibility really is a possibility or not.

In Duns Scotus's modal theory, the ontological foundation of thinkability is given up. The area of logical possibility is characterized as an infinite domain of thinkability which, without having any kind of existence, is objective in the sense that it would be identical in any omniscient intellect thinking about all thinkable things. This theory of the domain of possibility as an absolute precondition of all being and thinking was accepted by Ockham and many other medievals, and through Suárez's works it was commonly known in the seventeenth century, too. Another historically important feature of Scotus's modal theory is that it systematically developed the conception of modality as referential multiplicity. The domain of possibility as an a priori area of conceptual consistency is partitioned into equivalence classes on the basis of relations of compossibility. One of them is the actual world." (pp. VII-IX)

11. Lejewski, Czeslaw. 1981. "Logic and Ontology." In *Modern Logic. A Survey. Historical, Philosophical, and Mathematical Aspects of Modern Logic and its Applications*, edited by Agazzi, Evandro, 379-398. Dordrecht: Reidel.

"My discussion of the topic prescribed by the title of the paper will consist of two parts. In Part I, I propose to discuss, in very general and informal terms, the nature of logic and ontology, and the relationship that seems to connect these two disciplines. In Part II, I intend to examine, in some detail, a certain specific problem, which concerns logicians as well as ontologists, a problem which has been with us for about forty years, and which lacks a generally acceptable solution." (p. 379)

12. Lewis, Clarence Irving. 1918. *A Survey of Symbolic Logic*. Berkeley: University of California Press.

    Reprinted New York: Dover Publishing 1960.

    Chapter I: The development of symbolic logic.

    Section I. The Scope of Symbolic Logic. Symbolic Logic and Logistic. Summary Account of their Development 1; Section II. Leibniz 5; Section III. From Leibniz to De Morgan and Boole 18; Section IV. De Morgan 37;

    Section V. Boole 51; Section VI. Jevons 72; Section VII. Peirce 79; Section VIII. Developments since Peirce 107-117.

    "The historical summary in Chapter I attempts to follow the main thread of development, and no reference, or only passing mention, is given to those studies which seem not to have affected materially the methods of later researches. In the remainder of the book, the selection has been governed by the same purpose. Those topics comprehension of which seems most essential, have been treated at some length, while matters less fundamental have been set forth in outline only, or omitted altogether." (Preface, p. VI)

    "The presentation of the subject matter of logic in this mathematical form constitutes what we mean by symbolic logic. Hence the essential characteristics of our subject are the following: (1) Its subject matter is

    the subject matter of logic in any form that is, the principles of rational or reflective procedure in general, as contrasted with principles which belong exclusively to some particular branch of such procedure. (2) Its

medium is an ideographic symbolism, in which each separate character represents a relatively simple and entirely explicit concept. And, ideally, all non-ideographic symbolism or language is excluded. (3) Amongst the ideograms, some will represent variables (the "terms" of the system) having a definite range of significance. Although it is non-essential, in any system so far developed the variables will represent "individuals",

or classes, or relations, or propositions, or "propositional functions", or they will represent ambiguously some two or more of these. (4) Any system of symbolic logic will be developed deductively that is, the whole

body of its theorems will be derived from a relatively few principles, stated in symbols, by operations which are, or at least can be, precisely formulated." (pp. 3-4)

    Part IV Twentieth- Century Logic

    11 P.D. Welch: Gödel 269; 12Benedict Eastaugh: Tarski 293;

    Index 315-322.

"*The History of Philosophical and Formal Logic* was conceived as a way for undergraduate students with little training in formal logic to discover the roots of logical concepts. However, we also hope that it provides a starting point for anyone with an interest in this wonderful discipline to become acquainted with its history. By producing an introductory book whose chapters span the entire history of the discipline, we aim to show how the elements of the standard undergraduate logic curriculum took their current form only relatively recently, emerging from a long development by many hands whose interests and motivations varied widely. Moreover, by shedding light on a few topics that have not been given as much attention in standard histories of logic, such as the contributions of Leibniz and Bolzano, as well as the diagrammatic logics of C.S. Peirce, we hope to play a part in encouraging a broader view of the history of logic, which as a discipline surely has much to gain in being more inclusive of other fi gures and traditions. We only regret not having been able to contribute more in this regard ourselves." (p. VIII)

14. Marciszewski, Witold, and Murawski, Roman. 1995. *Mechanization of Reasoning in a Historical Perspective*. Amsterdam: Rodopi.

    "Table of Contents: Acknowledgement 7; 1, From the Mechanization of Reasoning to a Study of Human Intelligence 12; 2. The Formalization of Arguments in the Middle Age 45; 3. Leibniz's Idea of Mechanical Reasoning at the Historical Background 77; 4. Between Leibniz and Boole: Towards the Algebraizatlon of Logic 113; 5. The English Algebra of Logic in the 19th Century 129; 6. The 20th Century Way to Formalization and Mechanization 161; 7. Mechanized Deduction Systems 209; References 231; Index of Subjects 253; Index of Names. 257; Extended Table of Contents 261-267.

    "This volume is written jointly by Witold Marciszewski, who contributed the introductory and the three subsequent chapters, and Roman Murawski who is the author of the next ones - those concerned with the 19th century and the modern inquiries into formalization, algebraization and mechanization of reasonings." (p. 7)

"There are no bare facts in history, be it political history, be it a story of ideas. Historical narration tells about past facts, but there a.re as many stories as are persputives into which we put data found in sources. The choice of a perspective may depend on axiological assumptions, as well as the position in time assumed by a historian. The latter obviously divides into (i) the standpoint of the past under study (e.g., an attempt to read Aristotle in the light of Aristotle), (ii) the standpoint of the present state of affairs (as, e.g., in Lukasiewicz 1951), and (iii) the standpoint of an envisaged future development.

It was Jan Lukasiewicz who was the pioneer of approach (ii), as expressed in the title of his *Aristotle's Syllogistic from the Standpoint of Modem Formal Logic*, 1951. Among his seminal achievements in this field there was an interpretation of Stoic logical writings in the light of modern propositional logic.

Approach (iii) highlights those facts which one deems relevant to a forecasted course of events. The forecast to be substantiated in this chapter, and to shed light at the content of this volume, is as follows. There starts a process of merging logic with cognitive science, the latter being the theory of perception and intelligence advanced in terms of information-processing; this is not to mean any loss of autonomy on either side, rather the emergence of a new research area to which both sides essentially contribute. When seen in this perspective, the development of logic leads in the direction which was hardly expected by the founding fathers. In their intention, logic should have been an indispensable tool of research. In fact, though, discoveries do not happen to result from a conscious use of logical inference rules. Instead, logic made it possible to create artificial reasoners, and these prove apt models to help us in a better understanding of natural reasoning (even if they function as negative models to yield a contrastive background); and once we see reasoning as a method of problem-solving, we enter on a study of intelligence.

This volume is to show how the main stream of development of logic has led to that result.

(...)

Within that formalization trend there was the result of the utmost importance for the mechanization of reasoning, namely the algebraization of logic in the form of binary algebra (claimed by Leibniz and effected by Boole and others), the latter having been combined with binary arithmetical notation and with the two-states functioning of electrical circuits; to that came methods of arithmetizing syntax and, moreover, methods of reducing the whole of logic to the binary algebra (the elimination of quantifiers). That development resulted in the present state of logic and essentially contributed to the rise of computers. Those, in turn, made it possible to mechanize deductive reasoning which proves a suitable base to start with an inquiry into the nature of intelligence.

In such a historical perspective the development of logic is viewed from the position taken in this volume. This is the standpoint of the present relations between logic and cognitive science, the present being seen as pregnant with an expected future development - according to Leibniz's dictum *praesens gravidum est futuro*." (pp. 11-12)

15. Mates, Benson. 1965. "A Brief Outline of the History of Logic." In *Elementary Logic*, 205-230. New York: Oxford University Press.

    Second revised edition 1972.

    Chapter 12: *A brief outline of the history of logic*, pp. 205-230.

    "In approaching the history of logic one must keep in mind that the term 'logic' and its cognates have been applied to many subjects other than the one presently under consideration, and, conversely, that the latter has been denoted by many terms other than 'logic'. Even if our competence permitted it, there would seem to be little point in undertaking a simultaneous history of all those topics in epistemology, metaphysics, psychology, sociology, and philology that at one time or another have been discussed under the heading 'logic'. The goal here is only to set forth the history of what we call 'logic' -roughly characterizable, perhaps, as the general theory of the consequence relation-by whatever names this subject may be known to other authors, past or present.

For the sake of clarity it should also be borne in mind that the proper business of a logician is the investigation and formulation of general principles concerning what follows from what; whether particular examples of his own reasoning are valid or not is essentially irrelevant. By the same token, correct reasoning, however praiseworthy it may be, does not of itself constitute a contribution to logic; men were giving valid arguments long before there was any such thing as the science of logic, just as stones were no doubt efficiently pried up long before anyone formulated the principle of the lever." (p. 205)

16. Nidditch, Peter H. 1962. *The Development of Mathematical Logic*. London: Routledge & Kegan Paul.

    Contents: 1. Purpose and language of the Book 1; 2. Aristotle's syllogistic 3; 3. The idea of a complete, automatic language for reasoning 14; 4. Changes in algebra and geometry, 1825-1900 23; 5. Consistency and metamathematics 30; 6. Boole's algebra of logic 33; 7. The algebra of logic after Boole: Jevons, Peirce and Schroeder 44; 8. Frege's logic 59; 9. Cantor's arithmetic of classes 66; 10. Peano's logic 73; 11. Whitehead and Russell's 'Principia Mathematica' 77; 12. Mathematical logic after 'Principia Mathematica': Hilbert's metamathematics 79; Further reading 86; Index 87.

    "1.1. Purpose of book. The purpose of the present book is to give such an account of Mathematical Logic as will make clear in the framework of its history some of the chief directions of its ideas and teachings. It is these directions, not the mass of detail forming the theory and its history, which are important for the rest of philosophy and are important, in addition, from the point of view of a general education. In the limits of our space we are able to give attention only to what has been, or seems as if it may be, fertile or of special value in some other way. More than this, Mathematical Logic having no small number of important developments, a selection of material is necessary, the selection being guided by the rule to take up the simpler questions, other things being roughly equal. Facts have to be looked at in the light of one’s purpose. Though they may all have the same value simply as facts, they are not at all equal as

judged by the profit and the pleasure that thought, and not least the thought of the learner, is able to get from them." (p. 1)

17. Nuchelmans, Gabriel. 1973. *Theories of Proposition. Ancient and Medieval Conceptions of the Bearers of Truth and Falsity*. Amsterdam: North-Holland.

    Contents: Preface V; 1. Introduction 1; 2. Plato 13; 3. Aristotle 23; 4. The Stoic *lekton* 45; 5. The Stoic *axioma* 75; 6. Later developments in Greek antiquity 89; 7. The transition to the Latin West 105; 8. Boethius and the beginning of the Middle Ages 123; 9. Abelard 139; 10. The doctrine of the *dictum* in the century after Abelard 165; 11. Preliminaries to the fourteenth century debate 177; 12. The *complexum* theory of Ockham and Holkot 195; 13. Some reist opponents of Ockham and Holkot 209; 14. The theory of the *complexe significabile* 227; 15. The oppositions against the theory of the *complexe significabile* 243; 16. The significate of a true *propositio* 273; Selective bibliography 281; Indices 289-309.

    "This book is intended as the first part of a history of those problems and theories in the domain of philosophical semantics which nowadays are commonly referred to as problems and theories about the nature and the status of propositions. Although the conceptual apparatus and the terminology by means of which questions concerning propositions were asked and answered have considerably varied from period to period, the main types of disputes and solutions have remained remarkably constant. One of the aims of this study is precisely to trace the vicissitudes of the vocabulary in which this refractory topic was treated in the remote past. As is evident from the Bibliography, many parts of the field have been explored by predecessors. Guided by their results, I have tried to fill in more details and to design a provisional map of the area as a whole." (From the Preface).

18. ———. 1980. *Late-Scholastic and Humanist Theories of Proposition*. Amsterdam: North-Holland.

    Contents: Part One: Late-Scholastic theories of the proposition. 1. Introduction 3; 2. Different kinds of propositions and their ways of signifying 9; 3. The tie between the principal parts of a

proposition 27; 4. The adequate signification and the adequate significate of a proposition 45; 5. Disguised propositions 74; 6. Judgment 90; 7. The object of judgment 103; 8. Propositions as bearer of truth-values 114; Part Two: Humanist theories of proposition. 9. Introduction 143; 10. The first attempt at reorientation 146; 11. The Melanchtonian treatment of a theme 159; 12. Peter Ramus 168; 13. The diffusion of Ramist terminology 180; 14. Eclectics 189; Epilogue 204; Bibliography 209; Indices 224-237.

"After publishing, more than six years ago, my *Theories of the Proposition. Ancient and Medieval Conceptions of the Bearers of Truth and Falsity*, I initially intended to cover the remaining phases of the history of the semantics of declarative sentences in one volume. As the material proved more abundant and unwieldy than I had anticipated, I decided to limit the next instalment to the period between 1450 and 1650. Accordingly, the present book treats the theories of the proposition put forward by late-scholastic and humanist philosophers. It will be followed, in the not too distant future, I hope, by a third volume which will continue the account until the first decades of the nineteenth century.

In making my way through the intricate mass of sources, which are often works that are completely forgotten and extremely hard to obtain, I was greatly assisted by Professor Ashworth's pioneering book on *Language and Logic in the Post-Medieval Period*. Moreover, when I had practically finished my manuscript, she was kind enough to send me the draft of an article entitled 'Theories of the Proposition: Some Early Sixteenth Century Discussions'. As this article is based on a corpus of texts which is slightly different from mine, it enabled me to check some of my results against the findings of a very competent collaborator in this lonely field of research. I can only advise the reader to do the same when the article will have been published (in Franciscan Studies [38, 1978 pp. 81-121])."

19. ———. 1983. *Judgment and Proposition. From Descartes to Kant*. Amsterdam: North-Holland.

Contents: 1. The legacy of scholasticism and humanism 9; 2. Idea and judgment in Descartes 36; 3. Repercussions of Descartes' theory of judgment 55; 4. Arnauld and the Port-Royal *Logic* 70; 5. Some eighteenth-century critics of the Port-Royal view 88; 6. Geulincx's contribution to Cartesian philosophy of logic 99; 7. Ideas and Images. Gassendi and Hobbes 121; 8. The heyday of British empiricism 139; 9. Sensationalism and its critics in France 174; 10. Common sense philosophy and nominalism in Great Britain 194; 11. Leibniz's logical realism 214; 12. The German enlightenment 233; 13. Some problems in Kant and his contemporaries 246; Epilogue 257; Bibliography 262; Indices 280-295.

"This volume completes -- for the time being -- a series of investigations that were undertaken with the purpose of tracing in some detail the development of that field of logico-semantic research for which the foundations were laid in the first chapters of Aristotle's *De interpretatione* and which, in honour of that pioneer, might perhaps be called apophantics. The first part -- *Theories of the Proposition. Ancient and Medieval Conceptions of the Bearers of Truth and Falsity* -was published in 1973, followed by a second part -- *Late-Scholastic and Humanist Theories of the Proposition* -- in 1980. The last instalment takes the account from the beginning of the modern period to roughly that point in the nineteenth century from which on discussions of the subject in the recent past and contemporary systematic treatment tend to coalesce. " (From the Preface).

20. Nye, Andrea. 1990. *Words of Power: A Feminist Reading of the History of Logic*. New York: Routledge.

Index 187-190.

"I attempt here a different kind of validation of the feminist indictment of logic, one not based on any theory of language or logic, whether transactional, structuralist, poststructuralist, or psychoanalytic. In my view, there is no one Logic for which such a theory can account, but only men and logics, and the substance of these logics, as of any written or spoken language, are material and historically specific relations between men, between men and women, and between them and objects of human concern.

Unlike either the logician or theorist I make no pretense at anonymity. I am a woman reading logic. I am also a philosopher who, like many other women philosophers, has often felt uneasy claiming that title. Perhaps only a woman would undertake such a project, would do such a thing as try to read logic, a woman uncomfortable in the world of men, involved in the physical details of family life, births, marriages, the keeping of houses, a woman too intent on emotional commitments to be capable of purely abstract thought. Perhaps only a woman would not make even the pretense of disinterested scholarship, but would admit to believing that involvement and commitment can lead to an understanding that logical analysis bound to consistency and univocality cannot.

You cannot ask of such readings that they reveal any absolute or complete truth about logic. There is never only one reading. You can ask that they be sensitive, accurate, attentive, revealing, and informed by an aspiration to a better life for

women and for men. These are the standards by which I ask my reader to judge what follows."

21. Prior, Arthur Norman. 1962. *Formal Logic*. Oxford: Clarendon Press.

    Second edition (First edition 1955).

    "This book is designed primarily as a textbook; though like most writers of textbooks I hope it will prove to be of interest to others beside Logic students. Part I covers what I would regard as the 'fundamentals' of the subject-the propositional calculus and the theory of quantification. Part II deals with the traditional formal logic, and with developments which have taken that as their starting-point. I do not regard this as covering different ground from that covered in Part I under quantification theory, but rather as covering the same ground in a different way. Both ways seem to me to have their merits, and to throw light on one another and the subject. I would say the same of the logic of classes and relations in extension, discussed in Part III, Ch. III ; but the other chapters of this last Part deal with what I take to be genuine extensions of the subject-matter opened up in Part I, in two different directions - modal logic, and `non-classical' systems of propositional calculus. Negatively, I have attempted to keep within the range indicated by my title: I have touched hardly at all upon `scientific method', and have indulged in a minimum of metaphysical reflection (avoiding, for example, such topics as the relations between 'propositions' and sentences).In the greater part of the book the symbolic notation used is that of Lukasiewicz, with minor modifications. This seems to me unquestionably the best logical symbolism for most purposes, and I should like to have helped to show that it is. In Part III, Ch. III, however, I have used the notation of Principia Mathematic a (referred to throughout this work as PM) ; in the particular field there covered, there is no other as fully developed or as deservedly well known. It does students no harm to learn to use two different notations, and to employ the one that is best for whatever they may have in hand at the time.Other innovations beside the symbolism are these: (i) throughout the book, a fairly frequent setting out of formal

proofs (something to which the Polish notation particularly lends itself) ; (ii), in Part I, the devotion of particular attention to completeness proofs, and to forms of the propositional calculus not yet widely studied, especially to varieties of it which use the 'standard false proposition' 0, and variable operators as well as propositional variables; (iii), in Part II, considerable use of scholastic material and of material from the writings of de Morgan. I have included these items from a sense of their importance rather than of their novelty, and have placed them where their appearance seems to me most rational and economical; but if any teacher wishes to use this book for a more orthodox type of logic course, there are various ways in which he may do so. If, for example, he wishes to introduce the traditional logic at an early stage, he could pass to Part II immediately from Part I, Ch. I, Ch. II, § 1, and Ch. IV, §§ and 2. (This procedure would have in any case the advantage of giving the student an interval of rest from pure symbolism before passing to the more interesting but more difficult aspects of the propositional calculus.) If he wishes to give the more usual sort of 'modern' course, he could pass immediately on from the same portions of Part I to Part III, Ch. I, § 2 and Ch. III." (from the Preface to the first edition).

"Apart from one or two very small corrections, I have in this edition left the body of the work just as it was, but have completely revised the two original appendixes and placed a wholly new appendix (the present Appendix II) between them. These alterations and additions will, I hope, make the appendixes much more valuable both for general reference and for pedagogical use. In the latter connexion I would particularly recommend that what I have said in the body of the book on quantification theory - which has met with some just criticisms - be read in conjunction with § 4 of Appendix I. There is also abundant material for exercises in simply verifying some of the relations asserted to hold between postulate-sets in this Appendix, using to this end the techniques sketched in the one that follows it." (from the Preface to the Second edition).

22. ———. 2006. "Logic, History of." In *Encyclopedia of Philosophy. Second Edition*, edited by Borchert, Donald M.,

397-484. New York: Thomson Gale.

The first edition of the *Encyclopedia of Philosophy*, edited by Paul Edwards, was published in 1967.

The editor of the article *Logic, history of* in the first edition was Arthur Norman Prior.

"The mainstream of the history of logic begins in ancient Greece and comes down through the Arabian and European logic of the Middle Ages and through a number of post-Renaissance thinkers to the more or less mathematical developments in logic in the nineteenth and twentieth centuries. In the period after the fall of Rome many of the ancient achievements were forgotten and had to be relearned; the same thing happened at the end of the Middle Ages. Otherwise this Western tradition has been fairly continuous. Indian and Chinese logic developed separately. Today logic, like other sciences, is studied internationally, and the same problems are treated in the Americas, western and eastern Europe, and Asia and Australasia. The story of the development of logic will be told here under the following headings:

Susanne Bobzien: Ancient logic; Brendan S. Gillon: Logic and inference in Indian philosophy; A. C. Graham (1967): Chinese logic (Bibliography updated by Huichieh Loy); Nicholas Rescher (1967): Logic in the Islamic world (with an Addendum by Tony Street); Christopher J. Martin: Medieval (European) logic; Ivo Thomas (1967): The Interregnum (between medieval and modern logic); Precursors of modern logic: Ivo Thomas (1967): Leibniz; Ivo Thomas (1967): Euler; Ivo Thomas (1967): Lambert and Ploucquet; Yehoshua Bar-Hillel (1967): Bolzano; Modern logic: the Boolean period; P. L. Heath (1967): Hamilton; P. L. Heath (1967): De Morgan; John Corcoran: Boole; P. L. Heath (1967): Jevons; P. L. Heath (1967): Venn; Francine F. Abeles: Carroll; A. N. Prior (1967): Peirce; A. N. Prior (1967): A. N. Prior (1967): Keynes; A. N. Prior (1967): Johnson; The heritage of Kant and Mill; A. N. Prior (1967): From Frege to Gödel; Ivo Thomas (1967): Nineteenth century mathematics; Bede Rundle (1967): Frege; Bede Rundle (1967): Whitehead and Russell; Bede Rundle (1967): Ramsey; Bede

Rundle (1967): Brouwer and Intuitionism; Bede Rundle (1967): Hilbert and Formalism; Bede Rundle (1967): Löwenheim; Bede Rundle (1967): Skolem; Bede Rundle (1967): Herbrand; Bede Rundle (1967):Gödel; John P. Burgess: Since Gödel: Bede Rundle (1967): Gentzen; Bede Rundle (1967): Church; Herbert B. Enderton: Turing and computability theory; Wilfrid Hodges: Decidable and undecidable theories; Wilfrid Hodges: Model theory; Grahan Priest: The proliferation of nonclassical logics; Peter Cholak and Red Solomon: Friedman and revers mathematics." (from the Second Edition)

23. Rastogi, Maharaj Narain. 1983. *The Theories of Implication in Indian and Western Philosophy. A Critical Study*. Delhi: Bharatiya Vidya Prakashan.

    Contents: Irving Copi: Foreword VII; Preface IX-X; I Introduction: Inference and implication 1; II Liner Implication: Aristotle 8; III Linear Implication: Nyāyā 24; IV Absolute Systematic Implication 43; V Material and Formal Implication 57; VI Strict implication 68; VII Implication and Meaning 85; VIII Implication and Facts100; IX Implication and Necessity 115; X Conclusion: Systematic Intensional Implication 136; Appendix: Implication and Arthāpatti 153; List of Symbols 159; Bibliography 160; Corrigenda 164.

    "This work presents an original conception and analysis of implication in the sense of entailment. It proceeds in both historical and critical fashion. After distinguishing the relation of implication from the process of inference, the author examines the relevant ideas of Aristotle and those involved in the Nyāyā Syllogism. The logical doctrines of Absolute Idealism are next considered with special reference to the writings of Bosanquet. They are criticized primarily for their connection with the unsatisfactory coherence theory of truth. The notion of material implication is examined carefully and found not to be a satisfactory model of what we mean by implication as the relation between premises and conclusion in a valid argument. C.I. Lewis's strict implication is considered with some sympathy, but is also ultimately rejected for good cause. The analyses of a number of other contemporary writers on logic are examined, including E.J. Nelson, J. Bennet, Strawson,

Geach, Hampshire, and Körner. From the shortcomings of earlier treatments we are led to the new definition of implication in terms of systems of thought and their constituents. The new conception of implication does indeed seem to be free from the difficulties connected with earlier treatments of it. The work represents a considerable amount of research and hard, careful thinking." (Foreword by Irving Copi)

24. Scholz, Heinrich. 1961. *Concise History of Logic*. New York: Philosophical Library.

    Translated from the German edition "*Abriss der Geschichte der Logik*" (1931) by Kurt F. Leidecker.

    Translated in Italian as: "*Breve storia della logica"* Milano, Silva Editore 1967.

    Contents: Preface to the first edition (1931) V; Introduction by Kurt F. Leidecker IX; Abbreviations XIII-XIV; Types of logic 1; The Classical type fof formal logic 24; The Modern type of formal logic 50; Bibliographic appendix 76; Supplementary observation 86; Notes 89; Index of names 137-140.

    "The reader of this *Concise History of Logic* is entitled to know what the objections to this book are and why it was nevertheless published.

    Carl Prantl (1820-1888) produced between 1855 and 1870 a standard work and source book for the history of logic from Aristotle to the end of the 15th century in which it is possible even now to appreciate an admirable mastery of the material, an exemplary punctiliousness in presenting the sources, and a nearly equally perfect intuitive certainty with which the material has been selected. For the history of modern logic there simply does not exist any work which could remotely be compared with Prantl's. Indeed, such a work will be written only when more shelf footage of monographs is available and each monograph can be considered on a par with the one Louis Couturat (1868-1914) wrote on the logic of Leibniz. (1)

    It is, therefore, incumbent on us to state boldly that the present concise history is a hazardous enterprise. For, it is impossible to summarize knowledge which does not even exist as yet, and

which cannot since his time. However, in our endeavor we must never lose sight of the fact that the logic of antiquity, and to a considerable degree the logic of the middle ages, have come down to us in heaps of fragments.

A third and very great flaw is the multiplicity of forms in which logic manifested itself, particularly in three stages; when it was raised to the first power in the days after the Logic of Port Royal (1662); when it was raised to the second power after Kant; and finally when it was raised to the third power after Hegel, a stage in which we have witnessed a plethora of forms right down to the present where we are no longer able to survey them.

I have risked writing this brief history nevertheless, supported by my belief in the new logic, a belief that has aided me in conquering my inhibitions. This belief has encouraged me again and again in the difficult task of condensing the vast material into the limited space available. I owe thanks to my publisher for the understanding which prompted him to acknowledge the necessity of my going beyond the limits which. I had agreed to at the outset. This made it possible to produce a little volume in which not merely beliefs could be stated, but knowledge could be spread out; knowledge, I might add, which I can back up completely by my own researches. Nothing has been referred to or touched upon in this concise history which has not passed through my fingers or which has not been thoroughly studied by me. All dates, likewise, were checked so that I have been able to correct, and that without much ado, not a few of the errors in Eisler's indispensable Philosophen Lexikon as well as other, older, reference works." (From the Preface).

25. Shenefelt, Michael, and White, Heidi. 2013. *If A then B: How the World Discovered Logic*. New York: Columbia University Press.

    "There are excellent histories of logic already in circulation (including the magisterial *Development of Logic* by William and Martha Kneale, Oxford University Press, 1962). And thanks to online sources, there are also

many able accounts of the latest work in the field, including nonclassical symbolic logic. Nevertheless, we believe our book to be fundamentally different from previously published works. Earlier histories of logic have focused on the specific stories of individual logicians, relating their discoveries, their intellectual influences, and their personal predicaments. But logic is the work of more than logicians alone; logicians, like other writers, need readers, and the forming of a readership is just as vital to the survival of a logician's insights as the logician's individual circumstances.

In logic, as in other departments of intellectual history, a readership is a consequence of social forces—forces that affect large numbers of people, quite apart from individual will. As a result, if one then leaves out of consideration the forces shaping such a readership (or the forces shaping a logician's audience), one is in danger of missing much of the explanation of why logical discoveries show up when and where they do.

(...)

"More broadly, to treat logic's history as if it were only a matter of individuals, without considering the larger forces shaping the audience and the logician alike, would be like treating political history as if it were only a matter of individuals—as a tale of specific rulers or rebels but with no account of why large numbers of contemporaries reacted to their actions in any particular way. It would be like treating political history as only a story of the insights, villainies, and sacrifices of particular persons, with no social analysis.

In making these claims for the importance of social forces in the development of logic, we in no way deny the significance of the individual in history; rather, we contend that historical changes can have many different causes. The social process can be an important force—just as important as the individual. And in stressing this point, we see ourselves not as contradicting earlier work in the history of logic but as offering a further level of explanation." (Preface, pp. XI-XIII)

26. Styazkhin, N. I. 1969. *History of Mathematical Logic from Leibniz to Peano*. Cambridge: The M.I.T. Press.

Contents: Preface V-VI; Chapter One. The Development of Mathematical Logic During the Middle Ages in Europe 1; Chapter Two. Leibniz, The Founder of Symbolic Logic 56; Chapter Three. The Development of Symbolic Logic After Leibniz; the Seventeenth and Eighteenth Centuries 93; Chapter Four. Forerunners of the Algebra of Logic of George Boole 137; Chapter Five. George Boole's Calculus of Classes 170; Chapter Six. The Development of the Algebra of Logic After Boole at the End of the Nineteenth Century 203; Conclusions 283; References 285; Index 315-333.

"Two basic approaches have been used by researchers in studying the history of logic: the philological and the "retrospective- logical." The first approach entails careful terminological examination of source materials, comparison of different variants of the same documents, and clarification of the relationships between the logical facts and the data from the science of language. The second approach reduces to analysis of older logical concepts in order to find elements of contemporary viewpoints, using contemporary logical apparatus as a thread of Ariadne for guidance through the labyrinth of past logical investigations.

While both these approaches have undeniable advantages, they also have disadvantages. Historians who use the philological approach risk reducing their study to a history of terminological innovation, while researchers using the retrospective-logical method run the risk of modernizing the material under investigation. This book attempts to combine both approaches to avoid undesirable excesses. In considering older logical theories, the author has tried to explain how they have affected the corresponding modern viewpoints and simultaneously to devote the requisite attention to philological aspects.

This book deals with the development of a number of ideas and attitudes in mathematical logic, covering the period from the Middle Ages to the beginning of the twentieth century.

Throughout its entire history, mathematical logic has been closely related to development of other sciences, and its own

development has been affected by the state of scientific methodology (primarily mathematics)." (Preface, p. V)

General Works on the History of Logic in Western Thought

Studies in French

1. Auroux, Sylvain. 2008. "Brève histoire de la proposition." *Les Cahiers de l'ILSL (Institut des langues et des sciences du langage)* no. 25:15-34

   Résumé : "La notion de proposition apparaît dès le *Sophiste* de Platon : pour le philosophe, il n'y a *logos* que si sont assemblés un *onoma* et un *rhema*. Cette découverte sera doublement réinterprétée. D'abord par Aristote et les logiciens, qui réduiront la notion de proposition à celle de discours susceptible d'être vrai, dont ils définissent la forme canonique, ensuite par les grammairiens, qui l'identifieront par la complétude du sens sans utiliser des notions comme sujets et prédicats. La généralisation de la notion de proposition (et l'apparition de notions comme «propositions incidentes», «propositions subordonnées») provient de la nouvelles logique des idées clairement formulée par les Messieurs de Port-Royal et de la grammaire générale. Les limitations de la conception traditionnelle (aristotélicienne) de la structure de la proposition ne seront clairement dépassées que par la conception fonctionnelle de Frege/Russell. Les linguistes ont majoritairement conservé, jusqu'à Benveniste, la conception traditionnelle et la prééminence du rôle de la copule."

2. Belna, Jean Pierre. 2014. *Histoire de la logique*. Paris: Ellipses

   Table des matières : Introduction 3; Chapitre 1 : La logique grecque 7; Chapitre 2 : Les logiques orientales 39; Chapitre 3 :

La logique au Moyen Âge 51; Chapitre 4 : L'âge classique 67; Chapitre 5 : La naissance de la logique moderne 81; Chapitre 6 : Logique(s) au xxe siècle 117; Conclusion 159; Bibliographie 161; Index des noms 163-165.

"Il nous a semblé légitime, bien qu'inévitablement en partie arbitraire, de découper cette introduction à l'histoire de la logique en six chapitres, dont le deuxième est à part puisque les logiques chinoise et indienne, aussi anciennes que la logique occidentale, n'ont eu historiquement aucun contact avec elle. Pour ce qui concerne cette dernière, après sa naissance en Grèce, qui est l'objet du premier chapitre, la fin de l'Antiquité n'a fait que poursuivre l'oeuvre entreprise. À la logique médiévale, qui culmina au XIVe siècle et dont traite le troisième chapitre, succédèrent les critiques de l'âge dit « classique » (XVIe-xviie siècles) et un sommeil relatif de près de deux siècles, dont nous parlons au quatrième chapitre. Ce qu'on peut appeler la « logique moderne » est née au XIXe siècle, ce dont le cinquième chapitre rend compte. Le dernier, consacré pour l'essentiel à la première moitié du xxe siècle, prolonge le précédent, car la logique n'a alors cessé de se développer, dans diverses directions." (p. 4)

3. Biard, Joël, and Mariani, Zini Fosca, eds. 2009. *Les lieux de l'argumentation. Histoire du syllogisme topique d'Aristote à Leibniz*. Turnhout: Brepols

Sommaire : Joël Biard et Fosca Mariani Zini : Avant-propos 7; Michel Crubellier : Y a-t-il un « syllogisme topique » chez Aristote ? 11; Juliette Lemiare : Contradiction et topos dans le syllogisme dialectique 33; Clara Auvray-Assayas : Les *Topica* de Cicéron : réévaluation d'un projet philosophique 53; Fosca Mariani Zini : Les topiques oubliées de Cicéron 65; Karlheinz Hülser : The Topical Syllogism and Stoic Logic 93; Roberto Pinzani : Prove e sillogismi topici in Boezio 119; Giulio D'Onofrio : Topica e sapere teologico nell'alto Medioevo 141; Henri Hugonnard-Roche : Syllogisme topique et logique hypothétique dans la tradition arabe (Fārābî et Averroès) 171; Ahmad Hasnawi : Topique et syllogistique : la tradition arabe (Al-Fārābî et Averroès) 191; Christophe Grellard : Argumentation topique et production de la croyance chez Jean

de Salisbury 227; Christopher J. Martin : The Development of Abaelard's Theory of Topical Inference 249; Andrea Errera : Aristotele, i Topica e la scienza giuridica medievale 271; Laurent Cesalli : Logique et topique chez Gauthier Burley 293; *annexe* 313; Costantino Marmo : La topique chez les modistes 335; Joël Biard : Le lieu de la croyance : le traité sur les Topiques de Jean Buridan 359; Lutz Dannenerg : Die eine Logik des Petrus Ramus 385; Earline Jennifer Ashworth : Le syllogisme topique au XVIe siècle : Nifo, Melanchthon et Fonseca 409; *annexe* 424; Riccardo Pozzo : Le syllogisme topique chez Agricola 431; Pol Boucher : La fonction des topiques dans la théorisation juridique au XVIe siècle 447; Alexandre Thiercelin : Ce que la logique fait au droit, ce que le droit fait à la logique : conditionnels et droits conditionnels dans la doctrine des conditions juridiques de Leibniz 467; Bibliographie 481; Index nominum 511-518.

"En publiant ce volume sur l'histoire du « syllogisme topique », qui a été préparé par deux séries de journées d'études, nous poursuivons deux buts : renouveler l'enquête sur les frontières entre les arts du discours qui, de l'Antiquité à la Renaissance, ont connu divers tracés, et nous interroger à nouveaux frais, sur la longue durée, sur les rapports controversés entre le modèle analytique du syllogisme et d'autres modalités d'inférence, impliquant des considérations sémantiques ou renvoyant à d'autres logiques, que les hommes exercent dans des domaines qui sont déterminés par l'horizon épistémique du crédible ou du plausible.

Pour répondre à ces objectifs, nous avons pris le parti de nous laisser guider par les vicissitudes de ce que l'on peut désigner comme le « syllogisme topique »." (p. 7, une note omise)

(…)

"Le choix du syllogisme topique vaut donc par sa transversalité. L'expression porte en elle les problèmes qu'on se proposait de traiter de manière collégiale. D'une part, le déterminant topique indique les bords et les recoupements entre les disciplines à partir d'Aristote, chez qui le *topos* ou lieu est défini dans la *Rhétorique*, bien qu'il caractérise l'argumentation

dialectique traitée dans les *Topiques*. Compris comme un schème d'argumentation, le *topos* semble donc appartenir aux stratégies dialectiques et rhétoriques. Qui plus est, selon que la dialectique est considérée comme un exercice ou comme entretenant un rapport privilégié avec la philosophie et les sciences, on est en droit de se demander si des procédés topiques sont à l'oeuvre dans ces disciplines." (p. 8)

6. Gardies, Jean-Louis. 1989. "La definition de l'identité d'Aristote a Zermelo." *Theoria.Revista de Teoria, Historia y Fundamentos de la Ciencia* no. 4:55-79

   Abstract: "This paper sketches a history of definition of identity from Aristotle's "Tpics" down to the modern set theory. The author tries to explain particularly, first, how the transformation of the concept of predicate at the end of the Nineteenth century made it necessary to revise the Leibnizian definition of the identity of individuals; secondly, why Dedekind, Peano, Schroder, etc., made, between two possible definitions of identity of predicates or of sets, a choice which later made it necessary to postulate in set theory the axiom of extensionality."

7. Graffi, Giorgio. 2008. "*Subiectum* et *praedicatum* de l'antiquité classique à Port-Royal." *Cahiers de l'ILSL (Centre de linguistique et des sciences du langage de Lausanne)* no. 25:51-68

   Résumé : "Les notions grammaticales de «sujet» et «prédicat» sont déjà présentes dans le *De Interpretatione* d'Aristote, et peut-être même dans le *Sophiste* de Platon, mais elles sont nommées, respectivement, *ónoma* et *rhêma*, tandis que les mots *hypokeímenon* et *kategoroúmenon*, qui littéralement correspondent à «sujet» et «prédicat», désignent plutôt des notions ontologiques. L'origine du couple terminologique *subiectum / praedicatum* se trouve dans le commentaire de Boèce au *De Interpretatione*. Au Moyen-Age, ce couple est redoublé par celui de *suppositum* et *appositum* : on a soutenu que la notion de *suppositum* dans le sens grammatical a son origine chez Priscien, et qu'au Moyen-Age le couple *suppositum / appositum* remplace chez les grammairiens le couple *subiectum / praedicatum*, réservé à l'usage des logiciens. On soutiendra ici au contraire que ces deux thèses ne sont pas fondées : s*uppositum* n'a pas de sens grammatical chez

Priscien, les notions de *suppositum* et *suppositio* semblent plutôt dériver d'un usage «métadiscursif» du verbe *supponere*, et l'examen attentif des textes montre que les deux couples reviennent dans les travaux des grammairiens aussi bien que dans ceux des logiciens. L'emploi exclusif de l'un et de l'autre couple respectivement par les grammairiens et les logiciens,

semble caractériser plutôt l'époque de la Renaissance. Pourtant, dès le milieu du XVIIe siècle, les notions de «sujet» et «prédicat» redeviennent des mots-clés de la grammaire, grâce surtout aux Messieurs de Port-Royal, qui ont probablement fixé la signification et l'usage de ces termes jusqu'à aujourd'hui."

3. Blanché, Robert. 1973. *La logica e la sua storia da Aristotele a Russell*. Roma: Ubaldini Editore

   Indice: Prefazione 7; Introduzione 9; 1 - I precursori15; 2 - Aristotele 28; 3 - Teofrasto 96; 4 Megarici e stoici 104; 5 - La fine dell'antichità 139; 6 - La logica medievale 149; 7 - Il rinascimento e l'esordio dell'era moderna 193; 8 - Leibniz 216; 9 - Progressi 253; 10 - Il risveglio della logica 310; 11 - L'avvento della logistica 348; Indicazioni bibliografiche 411.

   "Ogni storia, è stato detto, è contemporanea. Ingenuamente o consapevolmente proiettiamo sul passato, per interpretarlo o semplicemente per percepirlo, non soltanto le nostre nuove cognizioni, ma anche e soprattutto i nostri interessi presenti e la nostra attuale attrezzatura concettuale. Ciò è chiaramente illustrato, come si vedrà, dalla storia della logica. Il rinnovamento di questa disciplina nell'epoca nostra ha modificato il nostro sguardo, e oggi non è più possibile vedere la logica di Aristotele, quella degli stoici quella dei medievali, e perfino quella moderna da Leibniz a Boole compreso, con lo stesso occhio con cui la si guardava ancora al principio del secolo. La storia della logica va riscritta, e da più parti ci si industria a farlo da qualche decennio.

Ma è parimenti vero, è stato anche detto, che nessuna storia è contemporanea, e lo è tanto meno quanto più è ricco, nel campo studiato, il periodo contemporaneo, come avviene appunto per la logica.

Ci perdiamo nel groviglio dei particolari, difficilmente riusciamo a far emergere le linee maestre, e quelle che discerniamo s'intrecciano e s'accavallano fastidiosamente. Inoltre, a mano a mano che ci si avvicina al presente, la storia deve cedere il posto al quadro: a un quadro che si sa essere provvisorio, giacché l'importanza storica di un fatto o di un'idea non si riconosce che successivamente, dalle sue conseguenze. Non ci si dovrà perciò meravigliare se l'ultimo capitolo di questo libro ha uno stile differente da quello dei precedenti. Il quadro della logica contemporanea qui abbozzato non potrebbe in alcun modo sostituire lo studio diretto di un trattato. Il lettore al quale ci rivolgiamo idealmente è anzi colui che, approfondito già sufficientemente tale studio, desiderasse ora completare la propria conoscenza della logica d'oggi con uno sguardo al suo passato, pensando che, come diceva A. Comte, si capisce bene una scienza solo attraverso la sua storia." (Prefazione)

4. Bochenski, Joseph. 1972. *La logica formale*. Torino: Einaudi

5. Buzzetti, Dino. 1976. "Cronaca, preistoria e storia della logica." *Rivista di Filosofia*:484-496

   English Abstract: "The author surveys recent contributions to the history of logic and develops methodological reflections aiming to show that a proper treatment of the discipline requires a wide-scope investigation taking into account not only formal theories acceptable by present-day standards of adequacy, but also the relationship between formalization and ordinary language, the philosophical, and the material heuristic motivations."

6. Carruccio, Ettore. 1958. *Matematica e logica nella storia e nel pensiero contemporaneo*. Torino: Gheroni

"In particolare la scelta degli argomenti da trattare nel presente volume è stata effettuata secondo il seguente criterio: ricostruire lo sviluppo dei motivi fondamentali concettualmente più significativi della ricerca matematica, mirando particolarmente a porre in evidenza il contributo offerto dal pensiero matematico all'evoluzione della logica.

Questo piano di lavoro ci permetterà di spaziare attraverso tutta la storia della matematica, dall'Antichità ai nostri giorni, osservando le trasformazioni verificatesi nel corso della storia, nella concezione della struttura di una teoria razionale, fino a porre i delicati problemi spesso vivi e sconcertanti della logica contemporanea.

Pur cosi delimitato, il campo delle nostre indagini, è ancora troppo ampio perchè ci sia possibile coltivarlo integralmente.

Tuttavia essendo lo scopo del presente volume essenzialmente formativo, più che informativo, si preferisce lasciare qua e là qualche lacuna, pur di dare rilievo agli argomenti considerati fondamentali per la preparazione dei ricercatori futuri nel campo della storia e della filosofia della matematica." 3. Prantl, Carl. 1855. *Geschichte der Logik im Abendlande*. Leipzig: S. Hirzl

   Anastatic reprint of the original edition printed in four volumes (1855-1867), Hildesheim: Goeg Olms 1997.

   " It is a remarkable fact, unique perhaps in the writing of history, that Carl Prantl, the first to write a comprehensive history of western logic, on which task he spent a lifetime, did it precisely to prove that Kant was right, i.e. that formal logic has no history at all.

   His great work contains a collection of texts, often arranged from a wrong standpoint, and no longer sufficient but still indispensable. He is the first to take and discuss seriously all the ancient and scholastic logicians to whom he had access, though mostly in a polemical and mistaken spirit. Hence one can say that he founded the history of logic and bequeathed to us a work of the highest utility.

   Yet at the same time nearly all his comments on these logicians are so conditioned by the prejudices we have enumerated, are written too with such ignorance of the problems of logic, that he cannot be credited with any scientific value. Prantl starts from Kant's assertion, believing as he does that whatever came after Aristotle was only a corruption of Aristotle's thought. To be formal in logic, is in his view to be unscientific. Further, his interpretations, even of Aristotle, instead of being based on the texts, rely only on the standpoint of the decadent 'modern' logic. Accordingly, for example, Aristotelian syllogisms are misinterpreted in the sense of Ockham, every formula of

propositional logic is explained in the logic of terms, investigation of objects other than syllogistic characterized as 'rank luxuriance', and so of course not one genuine problem of formal logic is mentioned.

While this attitude by itself makes the work wholly unscientific and, except as a collection of texts, worthless, these characteristics are aggravated by a real hatred of all that Prantl, owing to his logical bias, considers incorrect. And this hatred is extended from the teachings to the teachers. Conspicuous among its victims are the thinkers of the Megarian, Stoic and Scholastic traditions. Ridicule, and even common abuse, is heaped on them by reason of just those passages where they develop manifestly important and fruitful doctrines of formal logic." (From: I. M. Bochenski, *A History of Formal Logic*, Notre Dame: University of Notre Dame Press, 1961, pp. 6-8)

Bibliographies on the history of logic

1. Rabus, Leonhard. 1868. "Logische Literatur. Erste Abtheilung. Bis zum Bekanntwerden der byzantinischen und arabischen Logik im Abendlande." In *Logik und Metaphysik. I. Erkenntnislehre, Geschichte der Logik, System der Logik* , 453-518. Erlangen: Andreas Deichert.

   "... the best bibliography of logic (*Neuzeit*) has been, before Risse's work, the impressive list printed in the year 1868 by Verlag von Andreas Deichert (Druck der Universitäts-Buchdruckerei von E. Th. Jacob in Erlangen) as appendix to Rabus' *Logik und Metaphysik* . And even with respect to Risse's *Bibliographia Logica* one may assert that Rabus has not been completely defeated; there are in fact some authors (such as N. Wallerius and S. Hasenmüller) mentioned by Rabus but not by Risse.

(...)

It is curious to observe how the *Logische Literatur* of G.L. Rabus has been so much overlooked. (...) It occupies pages 443 to 518 and provides more than 1200 authors. This enormous list is distributed in six chronological sections. Rabus' bibliography is a remarkable and original contribution: almost 1000 authors are recorded from the Aufkommen des Protestantismus until the year 1865. In this sense it is a necessary complement to Prantl's unfinished work. But, in contrast with Prantl, Rabus offers to the XXth century reader a pure masterpiece of historical research, free from subjective interfering commentaries. The seventh section of the bibliography: *Hülfsmittel zum Studium der Geschichte der Logik* shows the very wide frame in which Rabus conducted his work although it is not clear whether the quoted sources were exhaustively investigated.

Rabus' bibliography from the Renaissance onwards is also a remarkable supplement to I. M. Bochenski's bibliography (*Formale Logik* , first ed. 1956) and offers to contemporary logicians interested in the history of logic, the possibility of exploring a wide terra incognita. In fact, until now historical research from the point of view of contemporary logic has concentrated on centuries previous to the Renaissance (see I. M. Bochenski, *Formale Logik* , p. 297 and W. and M. Kneale, *The Development of Logic* , p. 298)."

From: Ignacio Angelelli, *The "Logische Literatur" of L. Rabus,* in: W. Arnold, H. Zeltner (Eds.), *Tradition und Kritik. Festschrift für Rudolf Zocher zum 80. Geburtstag,* Frommann Verlag: Stuttgart, 1967, pp. 39-42.

2. Church, Alonzo. 1936. "A Bibliography of Symbolic Logic (First part)." *Journal of Symbolic Logic* no. 1:121-216.

Current bibliographies regularly thereafter.

"There is presented herewith what is intended to be a complete bibliography of symbolic logic for the period 1666-1935 inclusive.

In the compilation use has been made of existing bibliographies, including those in Venn's *Symbolic logic* , Schröder's *Vorlesungen Über die Algebra der Logik* (vol. 1 and vol. 2 part 2), Lewis's *A survey of symbolic logic* , the Royal Society index, the International catalogue of scientific literature, and the bibliographical journals, *Jahrbuch Über die Fortschritte der Mathematik* and *Zentralblatt für Mathematik und ihre Grenzgebiete* , as well as many bibliographies of special authors or special subjects. In addition many titles have been included as a result of search through bound volumes of journals, or from references found in the literature, or from information supplied by authors themselves or others. So far as possible the original work (or a reprint of it) has been consulted in each case before its inclusion in the bibliography. In a number of cases where it has proved to be very difficult to obtain a copy of the original work, titles have been included on the basis of what was believed to be good authority as to existence and content, checking, however, one source of information against another in order to avoid the reproduction of typographical and other errors.

It has been the intention to confine the bibliography to symbolic logic proper as distinguished from pure mathematics on the one hand and pure philosophy on the other. The line is, of course, difficult to draw on both sides, and perhaps has not herein always been drawn consistently, but the attempt has been necessary in order to keel) within reasonable limits of length.

By symbolic logic is understood the formal structure of propositions and of deductive reasoning investigated by the symbolic method." (p. 121)

3. ———. 1938. "A Bibliography of Symbolic Logic (Second part)." *Journal of Symbolic Logic* no. 3:178-212.

4. ———. 1952. "Brief Bibliography of Formal Logic." *Proceedings of the American Academy of Arts and Sciences* no. 80:155-172.

5. Risse, Wilhelm. 1965. *Bibliographia logica. I. Verzeichnis der Druckschriften zur Logik mit Angabe ihrer Fundorte (1472-1800)* . Hildesheim: Georg Olms.

"No other branch of philosophy presently possesses a bibliography quite so extensive and comprehensive as this one for logic, which is a by-product, as the *Vorwort* explains, of Risse's systematic history of the development of logic, *Die Logik der Neuzeit* .

Volume 1 (1965, 293p.) lists in chronological arrangement monographs published from 1472 to 1800. Volume 2 (1973, 494p.) does the same for the period 1801-1969. Both volumes cite holding libraries (mainly European but also some American) for most of the works listed. Volume 3 (1979, 412p.) lists articles published both in periodicals and in anthologies, arranged according to a detailed classification system outlined in the front. Volume 4 (1979, 390p.) is a catalogue of 3,006 manuscripts, arranged by author if known and by title if anonymous, with separate sections for medieval and more recent manuscripts. Holding libraries or archives are indicated.

All volumes are thoroughly indexed."

6. ———. 1973. *Bibliographia logica. II. Verzeichnis der Druckschriften zur Logik mit Angabe ihrer Fundorte (1801-1969)* . Hildesheim: Georg Olms.

7. ———. 1979. *Bibliographia logica. III. Verzeichnis der Zeitschriftenartikel zur Logik* . Hildesheim: Georg Olms.

"Preface: The third volume of the "Bibliographia Logica" lists papers on logic and the history of logic which have appeared in periodicals and anthologies. The list is incomplete for two reasons: (1) Numerous works were inaccessible to me, particularly earlier periodicals and those published outside Germany; (2) applications of logic in other disciplines are included only if logical themes are mentioned in the titles.

The variety of themes and conceptions of logic led to an arrangement of titles in three categories:

A: Logic ("traditional logic", "classical logic"), starting with Aristotle;

B: Logistics ("symbolic logic", "mathematical logic"), representations of logic in the mathematical tradition and using mathematical means;

C: History of logic.

The criterion used in categorizing the individual titles is the theme dealt with, not the point of view of the author.

The three categories are indicated by letters; sub - categories by numbers. The arrangement of material is given in the table of contents in German, English, and French (p. 9*). Titles of frequently quoted periodicals are abbreviated (Table of symbols p. 401)."

8. ———. 1979. *Bibliographia logica. IV. Verzeichnis der Handschriften zur Logik* . Hildesheim: Georg Olms.

9. Ashworth, Earline Jennifer. 1974. "Some Additions to Risse's *Bibliographia Logica* ." *Journal of the History of Philosophy* no. 12:361-365.

   "One of the greatest contributions to the history of logic in recent years was the publication in 1965 of Wilhelm Risse's *Bibliographia Logica* , Vol. I, which covers the years from 1472 to 1800. However, despite the fact that Risse's monumental work lists an estimated 8,000 logical works, it is still far from comprehensive, as Mr. Hickman pointed out in an earlier article in this journal.(1) Why this should be the ease immediately becomes apparent when one starts to work in a library such as the Bodleian at Oxford with its handwritten catalogue of books printed before 1920 and its lack of any specialized bibliographies such as the British Museum has provided for early printed books. Even in well catalogued libraries such as the University Library at Cambridge it can be difficult to locate texts, and one often stumbles across a new logical work through the accident of its being bound in the same volume as better known works. As a result of my researches over the last few years, I have put together a list of works which do not appear in Risse in the hope that other

historians of logic may benefit from my discoveries. I cannot, however, claim that I have exhausted the resources of the libraries which I have visited. Doubtless there are still not only new editions but new authors left to be discovered." (p. 361)

"This paper concerns logic texts published between 1472 and 1800. I list 20 items whose authors do not appear in Risse, 12 items whose authors appear in Risse in connection with another title or other titles, and 58 items which appear in Risse in another edition or in other editions. I indicate the libraries in which all these items are to be found, and I also list some useful bibliographical works."

(1) L. Hickman, "Late Scholastic Logics: Another Look," *Journal of the History of Philosophy* , IX (1971), 226-234.

10. ———. 1978. *The Tradition of Medieval Logic and Speculative Grammar from Anselm to the End of the Seventeenth Century. A Bibliography from 1836 Onwards* . Toronto: Pontifical Institute of Medieval Studies.

Contents: Preface VII; Part One. Anselm to Paul of Venice (items 1-632) 1; Part Two. After Paul of Venice (items 633-879) 73; Index of Names 101; Index of Texts 105; Index of Translations 107; Index of Subjects 109.

"My main interest in drawing up this bibliography was to list all the books and articles which have to do with formal logic and semantics from the time of Anselm to the end of the seventeenth century. I see this area as including such topics as consequences, syllogistic, supposition theory, and speculative grammar, but as excluding such topics as the categories, the struggle between nominalism and realism, and pure grammar. It is not, of course, always easy to draw a line between works which are concerned with formal logic and semantics and works which are not so concerned, and inevitably my choice of borderline cases will seem too restrictive to some and too liberal to others. However, my hope is that I have not excluded any book or article which obviously falls into the area I have delimited.

I have used the phrase "the tradition of medieval logic" in the title in order to indicate that although I include the seventeenth century, I am not concerned with the contributions of modern philosophy. The work of men such as Pascal, Descartes, Arnauld, Leibniz and Locke carries us far indeed from medieval discussions of logic and semantics. Moreover, there is already such an extensive literature on these figures that to include them in my bibliography would completely change its character. On the other hand, I do include humanist logic and renaissance Aristotelianism, since they involve a reaction to the medieval tradition which can only properly be understood in the light of that tradition.

This is a bibliography of secondary works and of modern editions of early texts. Accordingly I have excluded those nineteenth century reprints of earlier works such as Aldrich's *Artis Logicae Compendium* which were produced merely as text books, and I have also excluded modern facsimile editions of early printed texts unless they are accompanied by substantial editorial material. In addition, I have omitted a list of the various editions of Milton's *Artis Logicae Plenior Institutio* , since printings of his complete works are both numerous and easily found. The earliest book I list is Victor Cousin's 1836 edition of Abelard, since this can properly be viewed as the starting point of modern scholarly work on medieval logicians.

I do not refer to short edited or translated passages in books of readings. I have included only the more lengthy book reviews, and only a few unpublished dissertations. I have not included biographical and general historical works unless they have some specific contribution to make to the history of logic. I have tried to include all relevant material published before 1977, but the listing of 1976 publications is inevitably incomplete, given the delays which so often occur in the printing of books and journals.

I have endeavoured to look at each item personally, and to include as much information as possible. In those cases where I have failed to locate an item, or have located it in a place where

I could not conveniently see it, I have made a note of my failure. The reader should bear in mind that these entries may be quite inaccurate. Where I have only been able to see a copy of an article, I have added the note: "Journal not seen."

Works which deal with the period as a whole will be found in Part One.

Where an author has more than one book or article, the items are arranged chronologically.

Below each item I list the headings under which it is indexed and, where relevant, cross-references to reviews, discussions, translations and reprints. The ordering of the headings corresponds to the four indexes I have provided: (1) an index of names; (2) an index of texts; (3) an index of translations; (4) an index of subjects. Only substantial texts and translations are indexed. In the few cases where a book review is not crossreferenced, the reason is that only the review contains material relevant to my purposes. It is my hope that these indexes, which are based on my knowledge of a work's contents rather than its title alone, will prove one of the most valuable aspects of my bibliography.

Readers who wish to find articles dealing with related fields or published after 1976 are recommended to consult two bibliographical sources in particular. They are:

1. *Repertoire Bibliographique de la Philosophie* . Publié par l'Institut supérieur de philosophic de l'Université catholique de Louvain.

2. *The Philosopher's Index* . An International Index to Philosophical Periodicals.

Readers who wish to remedy the omissions I describe in my first three paragraphs are also recommended to consult the following:

Risse, Wilhelm. *Bibliographia Logica* . Band II. 1801-1969. Hildesheim-New York: Georg Olms Verlag, 1973.

Risse's work is far more comprehensive than my own, since he includes not only formal logic, but what might be described as the logic of ideas.

On the other hand, his bibliography is arranged chronologically rather than alphabetically; and inevitably, given the scope of his work, he does not give full publication details and his indexes are minimal. Volume II contains only books, and it is to be hoped that the volume listing journal articles will appear before too long. (*)

I owe a great debt of gratitude to those people who went through an earlier version of this bibliography and provided me with a large number of extra references. In particular I would like to thank William McMahon, Jan Pinborg, Charles Schmitt, and Paul Vincent Spade. I would also like to thank the editorial staff of the Pontifical Institute of Mediaeval Studies for their helpful advice on organization and presentation, the staff of Inter-Library Loan at the University of Waterloo for their unfailing help, and the Canada Council for various grants which have enabled me to work in British libraries. Finally, I should like to thank the Humanities Research Council of Canada for aiding the publication of this book." (*Preface* , pp. VII-IX)

(*) [Bibliographia logica. III. *Verzeichnis der Zeitschriftenartikel zur Logik*. Hildesheim-New York: Georg Olms Verlag, 1979].

11. Pironet, Fabienne. 1997. *The Tradition of Medieval Logic and Speculative Grammar. A bibliography (1977-1994)* . Turnhout: Brepols.

    This book is a continuation of Earline Jennifer Ashworth's bibliography, *The Tradition of Medieval Logic and Speculative Grammar from Anselm to the End of the Seventeenth Century: A Bibliography from 1836 Onwards* , that is the reason why the title is partly adopted from it.

    The aim and the general principles are the same as Ashworth's ones, but I have broadened the field: this bibliography itemizes books and articles written between 1977 and 1994 on logic and grammar from Boethius to the end of the seventeenth century,

not excluding topics as the categories and, in some extension, the struggle between nominalism and realism nor works of or on men such as Pascal, Descartes, Arnauld, Leibniz and Locke. Of course, main topics are still consequences, syllogistic, supposition theory, insolubles, obligations, semantics, speculative grammar, etc., but I think that the extension to subjects and authors mentioned above corresponds to the way researches in that field evoluted last years. First, we note that the number of editions, translations and studies on medieval logic and grammar has considerably increased: about 1000 items from 1836 to 1976, about 2000 from 1977 to 1994. Second, we see that it is difficult to make a clear distinction between different branches of knowledge, this is why many people work on the relations between logic or grammar and related matters, such as metaphysics, physics, theology, etc. Third, always more people working on modern philosophy tend to go back to medieval philosophy to search for the roots of the texts they study, while medievalists are interested to know which influence medieval philosophers have had on their successors.

With a very few exceptions, book reviews and articles from general works are not included.

I have tried to check each item personally or, at least, to ask the author to check the references I collected. The note “Not seen” means that I can not guarantee the accuracy of given informations.

When an author has more than one book or article, the items are arranged chronologically.

Informations in square brackets below each item indicate headings in the indexes or, if necessary, give cross-references. Most collective works have been listed under the name of the (main) editor, and articles published in such works refer to them.

Four indexes are provided: index of names, index of texts, index of translations and index of subjects:

102 refers to item 120;

S: 120 refers to item 120 in the supplement to Ashworth's bibliography.

Items 231, 649, 780 are not forgotten. After last minute changes, they disappeared while others have been added (e.g. 1486b or 1602b).

I can not pretend that this bibliography is exhaustive, especially for its second part, I just hope that I have not forgotten important items that should have been included in. I thank here all the colleagues who accepted to help me, some of them went through the first version of this work, others checked or sent me references. In particular, I would like to thank Jennifer Ashworth for the special attention she turned to this work. She also furnished me most of the informations for the supplement to her bibliography." (*Preface* , pp. VII-VIII)

    Six volumes: 1. Classical logic edited by Wolfgang Rautenberg; 2. Non-classical logics edited by Wolfgang Rautenberg; 3. Model theory edited by Heinz-Dieter Ebbinghaus; 4. Recursion theory edited by Peter G. Hinman; 5. Set theory edited by Andreas R. Blass; 6. Proof theory; Constructive mathematics edited by Jane E. Kister, Dirk van Dalen, Anne S. Troelstra.

    "This collection of six hefty, orange volumes is a dream come true for anyone interested in mathematical logic and its history. It contains a remarkably complete bibliography of the field, from 1879, the year of Frege's *Begriffsschrift,* through 1985.

    (...)

    Each volume has a number of introductory sections, including a general survey of work in the volume, and useful appendices of various sorts.

    However, the core of each volume consists of three indices: Subject Index, Author Index, and Source Index." (p. 524)

    Jon Barwise, Review, in: *Bulletin of the American Mathematical Society* , Vol. 19, 1988, pp. 524-528.

13. Anellis, Irving A. 1995. "Studies in the Nineteenth-Century History of Algebraic Logic and Universal Algebra. A Secondary Bibliography." *Modern Logic* no. 5:1-120.

    With the assistance of Thomas L. Drucker, Nathan Houser, Volker Peckhaus and Christian Thiel.

    "This bibliography lists all the nineteenth and twentieth century secondary materials on the history of algebraic logic (03Gxx), universal algebra (08Bxx) and closely related topics, including in particular lattice theory (06-xx), known to the compilers up to the time of printing.

    Also included are secondary studies on such areas as linear and multilinear algebras (15-xx) and what in the early nineteenth century such British algebraists as George Peacock and Charles Babbage called "symbolical algebra." The principle of selection in the latter case was to include studies concerning the work of such researchers as Peacock and Babbage, Benjamin Peirce, James Joseph Sylvester, Arthur Cayley, and Hermann Grassmann since their work significantly influenced the direction of the logical researches of such men as Charles Peirce and Alfred North Whitehead. We exclude studies of researchers such as Camille Jordan, despite the fact that the work of such researchers as Jordan, although relating to linear and multilinear algebra, is not known to have had any significant influence on Peirce, Schröder or any of their colleagues working in algebraic logic." (p. 4)

14. Schüling, Hermann. 1963. *Bibliographie der im 17. Jahrhundert in Deutschland erschienenen logischen Schriften* . Giessen: Universitätsbibliothek.

    Inhaltsverzeichnis: 1. Einleitung 3; 2. Die Ermittlung der Drucke 9; 3. Verzeichnis der im 17.Jh. in Deutschland erschienenen logischen Schriften 12; 4. Nachtrag 135; 5. Register: a. In Buchtiteln erwähnte Personennamen (Herausgeber, Kommentatoren, Verfasser beigedruckter Schriften, Respondenten usw.) 138; b. Deutschsprachige Logiken des 17. Jahrhunderts 142; c. Für bestimmte Schulen geschriebene Lehrbücher der Logik 142-143.

"Die folgende Arbeit versucht, durch ein möglichst vollständiges Verzeichnis der im 17. Jahrhundert in Deutschland erschienenen logischen Schriften die Grundlage für eine Erforschung der Geschichte der Logik in

diesen räumlichen und zeitlichen Grenzen zu geben.

Die außerordentliche Bedeutung der Logik im damaligen System der Wissenschaften, die schon aus der grossen Zahl logischer Bücher erhellt, ist wenig bekannt.

Die Logik ist wichtigste Methodenlehre der Universitätswissenschaften." (s. 3)

15. Redmond, Walter Bernard. 1972. *Bibliography of the Philosophy in the Iberian Colonies of America* . The Hague: Martinus Nijhoff.

    Contents: Preface VII; Abbreviations XIII-XIV; Catalogue of manuscripts and printed works on Philosophy from the Colonial Period in Latin America; Philosophical works from Colonial Latin America 1; Anonymous works 111; Appendix of some Colonial philosophical works which have become lost 134; Bibliography of the secondary literature concerning the philosophy of the Colonial Period of Latin America 139-174.

    "The first part of this bibliography is a catalogue of philosophical writings from colonial Latin America which, on the basis of the secondary literature, are presumed to be extant. It is followed by a short appendix listing some colonial authors whose philosophical works are lost, but which perhaps still exist. The second part of the bibliography contains the secondary literature: studies on the philosophy of colonial Latin America as well as subsequently published texts and translations of the works of the colonial authors. It also contains non-philosophical works to which reference is made in the first section. A brief digest of the content of each philosophical work follows the entry." (p. VIII)

16. Hickman, Larry A. 1971. "Late Scholastic Logics: Another Look." *Journal of the History of Philosophy* no. 9:226-234.

"It was not until the mid-sixties, however, that the importance of the logic of the second scholastics came to be fully appreciated by even a small circle of philosophical historiographers. 1964 marked the publication of Mufioz Delgado's book on nominalistic logic at the University of Salamanca from 1510-1530. This was also the year for the appearance of the first volume (1500-1640) of Risse's work on the history of logic in the Neuzeit. With the aid of these two works one could finally get a feel for the possibilities and subtleties of the period.

The following year was even more important as it brought the publication of not one, but two important bibliographies in the field. Angelelli (1965) published an article on the importance of late Ibero-American scholasticism and provided a critical presentation of a portion of a rare nineteenth-century bibliography he had discovered (Rabus, 1868). In the same year, Risse published his scarcely believable Bibliographia Logica, listing an estimated eight thousand logical titles from the Neuzeit. Highly sophisticated critical studies of Neuzeit scholastic answers to perennial logical problems began to appear (Angelelli, 1967) (Mufioz Delgado, 1966, 1967, 1968)." (pp. 226-227)

Eighty-free additions to Risse's *Bibliographia logica* are listed in pp. 228-232.

The Rise of Contemporary Logic from Boole to Gödel

Introduction

(page under construction)

Great Logicians of the Second Half of the Nineteenth and of the Twentieth Century (1854-1931)

George Boole (1815 - 1864)

Lewis Carroll (1832 - 1898)

John Venn (1834 - 1923)

William Stanley Jevons (1835 - 1882)

Hugh MacColl (1837 - 1909)

Ernst Schröder (1841 - 1902)

Georg Cantor (1845 - 1918)

Francis Herbert Bradley (1846 - 1924)

Giuseppe Peano (1858 - 1932)

Ernst Zermelo (1871 - 1953)

Jan Łukasiewicz (1878 - 1956)

Thoralf Skolem (1887 - 1963)

Frank Plumpton Ramsey (1903 - 1930)

Jacques Herbrand (1908 - 1931)

Kurt Gödel (1906 - 1978)

11. Bochenski, Joseph M. 1981. "The General Sense and Character of Modern Logic." In *Modern Logic: A Survey*, edited by Agazzi, Evandro, 3-14. Dordrecht: Reidel.

    "By 'Modern Logic' (abridged as 'ML') the class of studies is meant which were originated by Leibniz, developed, among others, by Boole, Peirce, Frege, Peano, Lesniewski and their followers; in other term the class of studies listed in Alonzo Church's Bibliography and in *The Journal of Symbolic Logic*.

    The expression 'ML' is sometimes used, it is true, in other ways, e.g. to denote studies in Hegelian dialectics. Those uses are irrelevant for the sake of the present paper which will be exclusively concerned with ML as described above. It may be only said, that no other known sort of contemporary logic can compare with the latter as far as standards of procedures and quality of results are concerned.

    The aim of the paper is to describe - as the title selected by the organizers of the conference indicates - the general sense and character of ML thus understood. In other terms an attempt will be made to find the fundamental characteristics of ML-al studies.

    The method used will be comparative. We are going to ask: How does ML compare with three fields with which it is usually linked: logic, mathematics and philosophy? Is ML Logic and, if so, how does it differ from other types of logic? Is it a mathematical discipline and, if that is the case, what is the difference between it and other mathematical sciences? Is it

philosophy and, this being admitted, what is its place among the other philosophical disciplines?

The present paper will be mostly concerned with the first class of problems, the comparison between ML and the other types of logic; the other two classes of problems will be treated only marginally. As far as the main problems are concerned, the method will necessarily be historical: for, contrary to mathematics and philosophy, all other forms of logic with which ML may be compared belong to the past." p. 3

12. Church, Alonzo. 1951. "A formulation of the logic of sense and denotation." In *Structure Method and Meaning. Essays in Honor of Henry M. Sheffer*, edited by Henle, Paul, Kallen, Horace M. and Langer, Susanne K., 3-34. New York: Liberal Arts Press.

    "The intensional aspects of Frege's logical doctrine, and his distinction between the sense (*Sinn*) and the denotation (*Bedeutung*) of a name, were explained by him informally in his paper, *Uber Sinn und Bedeutung*, (1) and in incidental passages in a number of his other publications, including the first volume of his book, *Grundgesetze der Arithmetik* (Jena, 1893). In his more formal work, Frege's formalized language (*Begriffsschrift*, or *Formelsprache*) has an entirely extensional interpretation, and it may even be that his interest in intensional logic was primarily to clear up certain difficulties regarding its relationship to extensional logic, (2) so as to be able to proceed with development of the latter unhampered. Nevertheless, it seems that Frege would agree that intensional logic also must ultimately receive treatment by the logistic method. And it is the purpose of this paper to make a tentative beginning toward such a treatment, along the lines of Frege's doctrine.

    While we preserve what we believe to be the important features of the theory of Frege, we do make certain changes to which he would probably not agree. One of these is the introduction of the simple theory of types as a means of avoiding the logical antinomies. Another is the abandonment of Frege's notion of a function (including propositional functions) as something

ungesattigt, in favor of a notion according to which the name of a function may be treated in the same manner as any other name, provided that distinctions of type are observed. (But it is even possible that Frege might accept this latter change, on the basis of an understanding that what we call a function is the same thing which he calls *Werthverlauf einer Funktion*.)" pp. 3-4

(1) In *Zeitschrift fur Philosophie und philosophische Kritik*, (1892), 25-50. See English translations of this paper by Black, in *The Philosophical Review*, LVII (1948), 207-230, and by Feigl, in *Readings in Philosophical Analysis* (New York, 1949); and also a discussion of Frege's doctrines by Russell, in Appendix A of *The Principles of Mathematics*. In reading these, it is necessary to make allowance for differences in the translations that are adopted of some of Frege's terms. We shall here translate Frege's *ausdr?cken* as "express" and Frege's *bedeuten* or *bezeichne*n as "denote" or "be a name of," so that a name is said to express its sense and to denote or to be a name of its denotation.

(2) We mention the doctrine of Frege's *Begriffsschrift* of 1879, according to which the relation of identity or equality is a relation between names rather than between the things named, apparently on the ground that identity construed in the latter sense would be too trivial a relation to serve its intended purpose. If use and mention are not to be confused, the idea of identity as a relation between names renders a formal treatment of the logic of identity all but impossible. Solution of this difficulty is made the central theme of *Uber Sinn und Bedeutung* and is actually a prerequisite to Frege's treatment of identity in *Grundgesetze der Arithmetik*.

34. Peckhaus, Volker. 1997. "The way of logic into mathematics." *Theoria* no. 12:39-64.

    "Using a contextual method the specific development of logic between c. 1830 and 1930 is explained. A characteristic mark of this period is the decomposition of the complex traditional philosophical omnibus discipline logic into new philosophical sub-disciplines and separate disciplines such as psychology, epistemology, philosophy of science and formal (symbolic, mathematical) logic. In the 19th century a growing

foundational need in mathematics provoked the emergence of a structural view on mathematics and the reformulation of logic for mathematical means. As a result formal logic was taken over by mathematics in the beginning of the 20th century as is shown by sketching the German example."

    "This work attempts to throw some light on an interesting feature in the development of German logic which has not yet received the attention it deserves. Almost a whole generation of German philosophers did not accept the new mathematical logic at the turn of the 20th century. In this respect development in Germany differs greatly from that in Britain where George Boole's ideas received the attention of philosophers through the work of W.S. Jevons. However, both Gottlob Frege and Ernst Schroder, the main representatives of mathematical logic in Germany, remained isolated figures whose works were either strongly criticized or completely neglected by philosophers. Schroder was able to get some attention to his ideas but the influence of Frege remained very limited for a long time. Frege's ideas started to have an impact in Germany only through the *Principia Mathematica* by Russell and Whitehead.

The fate of mathematical logic in Germany cannot be explained away by saying that German philosophers were not interested in logic. They were. In fact, the landscape of German traditional logic is at that time so rich and varied that it is difficult to give a coherent account of it. What makes the period particularly interesting are the interrelationships between psychology, logic and linguistics. All these disciplines came of age in Germany almost simultaneously. Wilhelm Wundt founded modem experimental psychology during the 1870s. Frege did the same for modem mathematical logic at the end of the same decade. As linguistics underwent a deep change at the turn of the 20th century, the basic concepts of language and linguistics were studied not only by linguists but also by philosophers and psychologists.

In the late 19th century linguistics, philosophy and psychology were seen to be much closer to each other than nowadays. Linguists, philosophers and psychologists alike wrote on logical questions. Particularly interesting is the relationship between logic and psychology. In this period philosophers and psychologists were involved in an intense struggle over the chairs of philosophy. This struggle influenced deeply the logical discussion of the period (the debate over the so-called 'psychologism'). One group of logicians believed that their work could be made easier by the results of the new experimental psychology. In other words, they believed that the new scientific psychology could offer a solid foundation for the new scientific logic. Another group of logicians criticized these attempts and tried to present logic as an independent philosophical science. However, both groups had one thing in common: a negative attitude towards mathematical logic.

The present survey of the critique of mathematical logic at the turn of the 20th century attempts to answer several interesting questions: How did the contemporary German philosophers see the role and significance of logic? What kind of relationships did they claim to exist between logic, mathematics, linguistics and psychology? What exactly were the arguments of the (now) almost forgotten critics? I shall start by giving a historical survey of the development of German logic 1830-1920 as it

appears against the background of German academic philosophy (chapter 1). Next I shall study the interrelationships between logic and psychology (chapter 2), logic and linguistics (chapter 3), and logic and mathematics (chapter 4). After this I shall present the general features of the reception of mathematical logic in Germany between 1880 and 1920 (chapter 5). This is followed by a more detailed account of the arguments of three individual critics: Fritz Mauthner (chapter 6), Heinrich Rickert (chapter 7), and Theodor Ziehen (chapter 8). I have chosen these three for several reasons. Firstly, each represents a different viewpoint: Mauthner was mainly interested in the problems of language, Rickert was one of the most prominent philosophers of the period, and Ziehen was originally a psychologist. Secondly, I have wanted to bring forward previously unknown figures (this is the reason why I did not choose Husserl, for instance, who wrote much on the subject). Thirdly, I have tried to choose critics who presented interesting ideas. And lastly, in order to have a large enough corpus for study I have had to choose writers who wrote much on the subject."

38. Sagüillo, José M. 2002. "Conceptions of logical implication." *Logica Trianguli* no. 6:41-67.

    Abstract: "This is a survey paper of approaches to the concept of logical implication.

    Roughly stated the main motivation of these approaches is to provide a necessary and sufficient condition for a set of propositions to logically imply a single proposition. In regard to their affinities these approaches are grouped into two: the transformational conception and the informational conception. Some approaches in each conception are philosophical and some are mathematical in character, their common assumption being that they reflect a previous intuition – in some cases – already at work in

    classical mathematics. The first part of the paper is devoted to approaches within the transformational conception of logical

implication emphasizing the contributions of Bolzano, Russell, Tarski, Quine and current model – theory. The second part of the paper discusses approaches within the informational conception of logical implication. Carnap and Bar Hillel's extrinsic approach and Corcoran's intrinsic approach developed in his information-theoretic logic are respectively compared and some of their

philosophical underpinnings are brought to light. The paper concludes with some final remarks concerning the ontic question of the nature of logical implication and the epistemic question of the human access to this relation in both conceptions of logical implication. The article also attempts to connect the views of these representative thinkers with the current philosophical debate on the nature of logical consequence and the role ofset-theoretic model theory in philosophy of logic."

45. ———. 2003. "The Achievements of the Polish School of Logic." In *The Cambridge History of Philosophy 1870-1945*, edited by Baldwin, Thomas, 401-416. Cambridge: Cambridge University Press.

"In the most narrow sense, the Polish school of logic may be understood, as the Warsaw school of mathematical logic with Jan Lukasiewicz, Stanislaw Lesniewski, and Alfred Tarski as the leading figures. However, valuable contributions to mathematical logic were also made outside Warsaw, in particular by Leon Chwistek. Thus, the Polish school of logic *sensu largo* also comprises logicians not belonging to the Warsaw school of logic. The third interpretation is still broader. If logic is not restricted only to mathematical logic, several Polish philosophers who were strongly influenced by formal logical results, for example Kazimierz Ajdukiewicz and Tadeusz Kotarbinski, can be included in the Polish school of logic *sensu largissimo*. Polish work on logic can therefore encompass a variety of topics, from the 'hard' foundations of mathematics (e.g. inaccessible cardinals, the structure of the real line, or equivalents of the axiom of choice) through formal logic, semantics, and philosophy of science to ideas in ontology and epistemology motivated by logic or analysed by its tools. Since the development of logic in Poland is a remarkable historical phenomenon, I shall first discuss its social history, especially the rise of the Warsaw school. Then I shall describe the philosophical views in question, the most important and characteristic formal results of Polish logicians, their research in the history of logic, and applications of logic to philosophy. My discussion will be selective: in particular I will omit most results in the 'hard' foundations of mathematics." p. 401

Ancient Chinese Logic. A Survey of Contemporary Studies

Theories about language in Classical China

"Technically, classical China had semantic theory but no logic. Western historians, confusing logic and theory of language, used the term 'logicians' to describe those philosophers whom the Chinese called the 'name school'. The best known of these were Hui Shi (380-305 b. C.) and Gongsun Lung (b. 380 b. C.?). This group now also includes the Later Mohists and the term 'distinction school' (translated as 'dialecticians') has become common.

The importance of the more detailed Mohist work came to light in modern times. The Confucian tradition had lost access to it. Rescuing that text rekindled a long-lost interest in Chinese theories of language. The restored Mohist texts give us a general theory of how words work. A term picks out part of reality. Some terms are more general than others; terms like 'dobbin' or 'horse' or 'object' might pick out the same thing. When we use a term to pick something out, we commit ourselves to using the name to pick out similar things and 'stopping' with the dissimilar. Thus, for each term we learn an 'is this' and an 'is not'. 'Is not' generates an opposite for each name and marks the point of distinction or discrimination.

Chinese doctrine portrays disagreements as arising from different ways of making the distinctions that give rise to opposites. The word *bian* (distinction/dispute) thus came to stand for a philosophical dispute. The Mohists argued that, in a 'distinction/dispute', one party will always be right. For any descriptive term, the thing in question will either be an 'is this' or an 'is not'. Mohists were realistic

about descriptions and the world. Real similarities and differences underlie our language. They rejected the claim that words distort reality; to regard all language as 'perverse', they noted, was 'perverse'. The Mohists failed, however, to give a good account of what similarities and differences should count in making a distinction. Mohists also found that combining terms was semantically fickle. In the simplest case, the compound picked out the sum of what the individual terms did. Classical Chinese lacked pluralization so 'cat-dog' works like 'cats and dogs'. Other compound terms (such as 'white horse') worked as they do in English. The confusion led Gongsun Long to argue, on Confucian grounds, that we could say 'white horse is not horse'." (pp. 694-695)

From: Chad Hansen, "Logic in China", in: Edward Craig (ed.), *Routledge Encyclopedia of Philosophy*, London/New York: Routledge 1998, Vol. 5, pp. 693-706.

"Systematic argument in Chinese philosophy began with the Moist school, founded in the fifth century b. C. by the first anti-Confucian thinker Mo Tzu (c. 468 - c. 376 b. C.). He laid down three tests for the validity of a doctrine: ancient authority, common observation, and practical effect. At first the controversies of the various schools over moral and political principles led to increasing rigor in argument; then to an interest in dialectic for its own sake, as evidenced in Hui Shih's paradoxes of infinity and in Kung-sun Lung's sophism "A (white) horse is not a horse"; and still later to the antirationalism of the Taoist Chuang Tzu (born c. 369 B.C.), who rejected all dialectic on the grounds that names have only an arbitrary connection with objects and that any point of view is right for those who accept the choice of names it assumes.

Logic of Mohism. In the third century b.C. the Mohists responded to Chuang Tzu's skepticism by systematizing dialectic in the "Moist Canons" and the slightly later Ta-ch'ü and Hsiao-ch'ü.

Moist Canons. The "Canons" confined dialectic to questions of the form "Is it this or is it not?" or, since they assumed that the proposition is merely a complex name for a complex object, "Is it or is it not the case that . . . ?" (The form is distinguished in Chinese by a verbless sentence with a final particle, not by a verb "to be.") In

true dialectic the alternatives are paired ("Is it an ox or not?") so that one and only one fits the object. Dialectic excludes such questions as "Is it an ox or a horse?" (it may be neither) and "Is it a puppy or a dog?" (it may be both). Its solutions are absolutely right or wrong; being or not being "this," unlike being long or short, is not a matter of degree, since nothing is more "this" than this is. The Mohists further argued that it is self-contradictory to deny or to affirm all propositions: the statement "All statements are mistaken" implies that it is itself mistaken, and one cannot "reject rejection" without refusing to reject one's own rejection.

Names are of, three types, distinguished by their relations to "objects," which are assumed to be particular. "Unrestricted" names (such as "thing") apply to every object. Names "of kinds" (such as "horse") apply to every object resembling the one in question. "Private" names (for example, the proper name "Tsang") apply to one object. Whether a name fits an object is decided by appeal to a "standard." There may be more than one standard for an object; for "circle" the standard may be a circle, one's mental picture of a circle, or a compass. Some standards fit without qualification: a circle has no straight lines. Some fit only partially: in deciding whether someone is a "black man" it is not enough to point out his black eyes and hair. The "Canons" began with 75 definitions, evidently offered as "standards," of moral, psychological, geometrical, and occasionally logical terms. An example of a definition of a logical term is "'All' is 'none not so' " (supplemented in the Hsiao-ch'ü by " 'Some' is 'not all' "). The first of the series is "The 'cause' is what is required for something to happen." ("Minor cause: with this it will not necessarily be so; without this it necessarily will not be so. Major cause: with this it will necessarily be so.") The "Canons" also distinguish the senses of 12 ambiguous terms. Thus, "same" is (1) identical ("two names for one object"), (2) belonging to one body, (3) together, and (4) of a kind ("the same in some respects").

"Ta-ch'ü" and "Hsiao-ch'ü." The Moist Ta-ch'ü further refined the classification of names. Names indicating "number and measure" cease to apply when their objects are reduced in size; when a white stone is broken up it ceases to be "big," although it is still "white." Names indicating "residence and migration" do not apply when the population moves, as in the case of names of particular states ("Ch'i")

or of kinds of administrative divisions ("country"). The claim that one knows X only if one knows that an object is X applies only to names indicating "shape and appearance" ("mountain," but not "Ch'i" or "county").

The Ta-ch'ü, and still more the Hsiao-ch'ü, also showed a shift of interest from the name to the sentence and to the deduction of one sentence from another. The Chinese never analyzed deductive forms, but the Mohists noticed that the formal parallelism of sentences does not necessarily entitle us to infer from one in the same way as from another, and they developed a procedure for testing parallelism by the addition or substitution of words. For example, "Asking about a man's illness is asking about the man," but "Disliking the man's illness is not disliking the man"; "The ghost of a man is not a man," but "The ghost of my brother is my brother." In order to reconcile the execution of robbers with love for all men some Mohists maintained that although a robber is a man, "killing robbers is not killing men." Enemies of Mohism rejected this as sophistry, on the assumption that one can argue from "A robber is a man" to "Killing robbers is killing men," just as one can argue from "A white horse is a horse" to "Riding white horses is riding horses." The Hsiao-ch'ü replied that there are second and third sentence types of the same form, which do not allow such an inference-for example, "Her brother is a handsome man," but "Loving her brother is not loving a handsome man"; "Cockfights are not cocks," but "Having a taste for cockfights is having a taste for cocks." A four-stage procedure was used to establish that "A robber is a man" belongs to the second type:(1) Illustrating the topic ("robber") with things ("brother," "boat") of which formally similar statements may be made.

(2) Matching parallel sentences about the illustrations and the topic-for instance, "Her brother is a handsome man, but loving her brother is not loving a handsome man"; "A boat is wood, but entering a boat is not entering [piercing?] wood"; "A robber is a man, but abounding in robbers is not abounding in men, nor is being without robbers being without men."(3) Adducing supporting arguments for the last and most relevant parallels by expanding them and showing that the parallelism still holds: "Disliking the abundance of robbers is not disliking the abundance of men; wishing to be without robbers is not wishing to be without men."(4) Inferring, defined as "using its [the

topic's] similarity to what he [the person being argued with] accepts in order to propose what he does not accept": "Although a robber is a man, loving robbers is not loving men, not loving robbers is not loving men, and killing robbers is not killing men." (pp. 415-416)

From: Angus C. Graham, "Chinese Logic", Third section of "Logic, History of" in: Paul Edwards (ed.), *The Encyclopedia of Philosophy*, New York: Macmillan 1967, Vol. IV pp. 523-524; Second edition: Donald M. Borchert (ed.), New York: Thomson Gale 2006, vol. 5, pp. 415-417.

4. Alt, Wayne E. 1991. "Logic and Language in the Chuang Tzu." *Asian Philosophy: An International Journal of the Philosophical Traditions of the East* no. 1:61-76.

   "It is difficult to deny that there are passages in *Chuang Tzu* that seem to suggest mystical themes. Yet it cannot be denied that many, if not most, of the passages from this work, have nothing to do with mysticism. By attending to some of these passages, I will argue for an alternative interpretation of *Chuang Tzu*. My alternative runs contrary to the predominant mystical interpretation. Instead of discussing transcendental unities, it emphasises the efforts of thoughtful men to understand the ways of the world in which they live, and to enrich their daily lives by perfecting the practice of the arts.

   One of Chuang Tzu's major concerns was to unravel and expose the fallacies of the learned, especially those whose conclusions threatened to undermine principles requisite for the practice of the arts. To discredit the theories of men like Hui Tzu required that Chuang Tzu develop remarkably sophisticated methods of reasoning and analysis.

   As such, he has frequently been misunderstood, even by twentieth century commentators, as drawing conclusions which refer to a dimension that transcends ordinary human understanding. Indeed, since his antagonists sometimes disregarded the constraints of normal discourse and challenged fundamental principles of reason and good sense, Chuang Tzu's philosophical critiques themselves sometimes appear to transcend these limits. A. C. Graham has even argued that

Chuang Tzu "abandoned reason" and "rejected logic"." (pp. 62-63)

6. Andrš, Dušan. 1998. "Gongsun Long's *Baima lun*: a Semiotic Argument." *Tamkang Review* no. 26:47-75.

   Abstract: "The article offers re-reading of one of the most prominent writings on logic in ancient China notorious for its ambiguous and evasive nature - Gongsun Long's *Baima Jun* - from the logical semantics and linguistic semiotics point of view. Previous interpretations of *Baima Jun*, which attributed to its alleged author either bringing in of abstract universals or introducing of nominalistic speculations into the philosophical debate of the day, serve as a point of departure for the interpretative theory based on re-examination of the two

debating points in the contemporary philosophical discussion-Doctrine of Rectification of Names and Debate of Name and Substance. Present rereading suggests that Gongsun Long's dialogue effectively challenges the Neo-Mohists' non-problematic assessment of conditions needed for a successful logical discourse by stressing the key importance of a semiotic aspect of the logical reasoning.

Moreover, the possibility of restating Gongsun Long's arguments in the wording of Saussurean semiotics indicates the conceivability of *Baima Jun*'s interpretation as an implicit theory of linguistic signs."

7. Assandri, Friederike, and Meisterernst, Barbara. 2019. "Chinese Philosophy, Religions and Language." In *The Routledge Handbook of Chinese Linguistics*, edited by Huang, Chu-Ren, Jing-Schmidt, Zhuo and Meisterernst, Barbara, 9-27. New York: Routledge.

   "The pre-Qin philosophers' preoccupation with language focused on the question of designations, 名 míng 'names', and their relation to referents as things in the world, 實 shí 'actualities'. The issue was the pragmatic assertability and acceptability (Tanaka 2004: 192) of terms, rather than the question of whether language represents reality in a way that is "true". Thus, the focus of philosophizing was on how to establish acceptable relations between names and actualities, with a view to the normative functions and the pedagogical and epistemological effectiveness of language.

   Confucius (Kongzi 孔子) and Laozi 老子, both major reference points for later thinkers, developed two fundamentally different approaches to the relation of names and their referents, contingent with their respective direction of philosophical inquiry. Preoccupied with questions relating to social order, Confucius focused on the normative function of names in establishing and ordering social relations, while Laozi's philosophical inquiry was directed at questions about the relation of humans to an ultimate reality he called Dao. Thus, Laozi focused on the epistemological question of whether

language and names are a viable means to understand, or “grasp”, this ultimate reality."

8. Bao, Zhiming. 1987. "Abstraction, *Ming-Shi*, and Problems of Translation." *Journal of Chinese Philosophy* no. 14:419-444.

   "This paper is divided into four interrelated sections. First, I shall discuss the thesis that Chinese cannot express abstraction. This I shall refer to as the no-abstraction thesis. I will argue that this no-abstraction thesis is misconceived, and stems from a naive assumption that there is a one-to-one correspondence between the structure of language and the structure of thought, whence comes the belief that the expression of abstract entities must depend on certain grammatical devices. A lack of such devices has been taken as evidence for a nominalistic language and a philosophy that has no abstract entities. This assumption also seems to presuppose that for each linguistic sign, *redness* for example, there exists some entity such that the sign stands in the relation of naming to that entity.

   Related to the no-abstraction thesis is the contention that Chinese philosophy, especially pre-Han, is nominalistic. Gongsun Long's thought, for example, entertains no abstract entities. And the Neo-moists do not talk about any intermediary between *ming* and *shi* commonly translated as 'name' and 'object', respectively. Some attention will be paid to this translation, to see whether it contributes to labeling Neo-Moist semantics as nominalistic. Throughout the paper, I will analyse briefly some classical texts, mainly *Pai ma lun*, the white horse dialogue of Gong sun Long (in Ill) and the Neo-Moist Canons (in IV). If we carefully analyse a few grammatical points in the Gongsun Long text, which have hitherto been overlooked, we will arrive at an interpretation which calls for abstract entities. As for the Canons, it will be argued, speculative though the argument may be, that a Fregean interpretation of Neo-Moist semantics is, with some

qualification, also consistent with the text." (pp. 419-420, a note omitted)

9. ———. 1990. "Language and World View in Ancient China." *Philosophy East and West* no. 40:195-219.

   "My main objective in this article is to demonstrate that a common conception of language, which I will call the classical conception of language, serves as a thread which runs across the various theories of language advanced by these thinkers. The classical conception of language does not view language as a mere descriptive tool that is a separate entity independent of the world which it describes. Rather, language and the world are inseparably bound up.

   Language is able to describe the world by virtue of an isomorphic fit between them. By "isomorphic" or "isomorphic fit" I mean this: A is isomorphic with B if, for each event E_i which affects A, there is a corresponding event E_j which affects B, and E_i and E_j may, but need not, be the same event.(1) As anillustration, let us consider a hypothetical belief that the anger of heavenly spirits may have as its consequence the fall of a particular kingdom. An event E_i in heaven (the spirits getting angry) corresponds to an event E_j in human society (the fall of the kingdom). Within that belief system, heavenly affairs (among them the anger of the spirits) and human affairs (among them the fall of the kingdom) have an isomorphic fit." (p. 195)

   (1) The definition of "isomorphic fit" is rather strong, since to show that two systems are isomorphic one must show that for each event which affects one system there is a corresponding event which affects the other system. This involves the notion of sets of all events, which is untenable within the context of our inquiry. In other words, it may be impossible to construct a set of all events or other entities relevant to the exposition of the relationship between language and the world. The intuition behind the definition is clear. It strikes home the property of interdependence between language and the world in the conception of language in ancient China.

10. Beaney, Michael. 2021. "Swimming Happily in Chinese Logic." *Proceedings of the Aristotelian Society* no. 121:355-379.

    "The *Zhuangzi* is the richest and most intellectually challenging of all the texts of ancient Chinese philosophy, and it is full of stories which have been interpreted in a wide variety of ways over the subsequent two millennia. It is one of the founding texts of Daoism, but it is also central to the entire landscape of ancient Chinese thought. In this paper I want to explore some of the logical features of this landscape by focusing on the happy fish dialogue and addressing what we can call the problem of Chinese logic. Are there distinctive forms of argumentation and analysis in ancient Chinese thinking and/or distinctive logical conceptions and theories? Or can Chinese reasoning be analysed and entirely explained by modern forms of logic, such as propositional logic and quantificational theory? What implications does this have for how we interpret historical texts?

    In what follows, I will first say more about the problem of Chinese logic (§ii) before introducing the *Zhuangzi* and the happy fish dialogue (§iii). I will then elucidate the key concepts involved in this dialogue (§iv) and discuss selected interpretations of it (§v). I conclude by returning to the Chinese logic dialogue, which frames my analysis of the happy fish dialogue, in drawing out the hermeneutic implications (§vi)." (pp. 355-356)

11. Benesch, Walter. 1991. "The Place of Chinese Logics in Comparative Logics: Chinese Logics Revisited." *Journal of Chinese Philosophy* no. 18:309-331.

    "It was my intt!rest as a philosopher in the assumptions and origins of logics, and then my concern as a teacher in developing a cross-cultural approach that first led me into comparative logics.· I have since come to realize that the understanding of any particular logic must involve the ability to view that logic from the questions, problems and perspectives of other systems. Thus my paper represents both my experiences and my recommendations as an educator "in the

field of logics. I shall offer four theses for consideration." (p. 309)

(...)

"My fourth thesis is that there is indeed a "Chinese logic," and that it is not only possible to clearly identify it, but it can and will prove an indispensible part of the thinking techniques and methodologies that we use to explore ourselves and the world." (p. 319)

(....)

"Chinese logics are inferential vehicles for accommodating different and changing aspects of human thought and experience. Meaning is a perspective upon change and process. Being arises from non-being through change. *Aspect logic presupposes a synthesis of being and non-being, the changing and change*."

"Contextual vs. Formal Approaches to Reason and Logics"

An Approach to Comparative Philosophy & Logics.

"In the spirit of the three-legged Chinese chicken and the Euclidean egg, I will begin my paper with the suggestion that there are at least three positions on the question as to which came first, the chicken or the egg. . . ?

The first assumes the chicken. Thls is the Aristotelean view that any actual entity is the fulfilment of a potential which is determined and defined by a prior actuality.

(...)

The second assumes the egg. This reflects a contemporary view in biology and genetics.

(...)

The third assumes the question itself must come first for its very asking presupposes sets of temporal, spatial, and linguistic

interpretations, distinctions and contexts - none of which either is or isn't a chicken or an egg."

(...)

"I believe this third position reflects a fundamental difference in the locus of the thinker in the world about which she/he thinks. It is sharedin common by a number of philosophers East/West, but since the three legged chicken is a specifically Chinese paradox, I should like to explore it with a number of Chinese philosophers as I understand them. I also believe this position is the essence of what I would call Chinese *aspect/perspective* logic. It is the exploration of this third position on the chicken/egg uestion and its contrast with the presuppositions of both the chicken and the egg schools in philosophy and science that is the substance of my paper, an argument for and a demonstration of a comparative approach to philosophy and logic." (pp. 109-110)

13. Benesch, Walter, and Wilner, Eduardo. 2002. "Continuum Logic: A Chinese contribution to knowledge and understanding in philosophy and science." *Journal of Chinese Philosophy*:471-494.

"In the following analysis, we shall offer two propositions for consideration:

1. There is a continuum logic implicit in traditional Chinese philosophy.

2. This continuum logic has particular relevance for the pursuit of knowledge and understanding in philosophy and the sciences in contemporary “participant/spectator” views of the universe.

We have divided our discussion of the above propositions into three sections: The first considers contemporary philosophical perspectives in the sciences, especially biology; the second presents various approaches to logics, and proposes viewing logics and consciousness as related aspects of a mind and nature continuum; the third offers an exposition of Chinese continuum logic and its applications in the acquisition of knowledge and understanding." (p. 471)

14. Benická, Jana, and Hubina, Miloš. 2013. "Gongsun Long— A Somehow Aristotelian Reading." In *Talking Literature: Essays on Chinese and Biblical Writings and Their Interaction*, edited by Findeisen, Raoul David and Slobodnik, Martin, 21-31. Wiesbaden: Harrassowitz.

"Regarding the previous treatment of the Discourse on the White Horse (especially its key sentence—bai ma fei ma ‘a white horse is not a horse’), two basic interpretative approaches have been assumed so far: abstract and nominalistic." (p. 12)

(...)

"Our ‘Aristotelian’ reading of the text, based on our own translation, is an attempt to suggest an interpretation under which the text, taken as a whole, makes sense and is logically consistent, not a historical reconstruction of the original intentions of the author. We argue that the logical consistency of the text is perfectly maintained if we read it as an example of the standard problem of predication, a central issue with ontological relevance for Aristotle. It can be described as a pondering over what do we do when we say that something is something (else)? And how the two things that in sentence

assume places of subject and predicate exist in the world? Obviously, in an assertive statements we (1) strip the subject of the quality we are to ascribe to it (otherwise it would be indistinguishable from the attribute) and we set it apart as a subject of predication only to (2) claim, in the assertion, that the attribute actually belongs to it or is identical with it. This process of separating the subject and attribute for the very sake of claiming their connection invokes the question of the status of the 'disjoined' abstract entities (substance–attribute, subject–predicate) and the relation between them. Since there is no explicit denial of substance or essence(9)

in the text and, contrary to it, the Master and Disciple alike clearly differentiate between essential and accidental qualities, we feel free to presuppose that substance-attribute (container—content) structure the basic cognitive structure determining not only Aristotelian or 'Western' but human thinking about the world is not denied here. No theoretically costly Buddhist-like attack on substance is apparent. Hence no 'non-Western' philosophical footing." (pp. 13-14)

(9) Substance as a carrier of all qualities and essence as a 'core' determining 'what thing really is'.

15. Bloom, Alfred H. 1981. *The Linguistic Shaping of Thought: A Study in the Impact of Language on Thinking in China and the West*. Hillsdale: Laurence Erlbauim Associates.

"The question of whether the language we speak may shape the way we think rarely fails to excite the imagination of anyone who considers it for the first time and rarely fails to hold, from that point on, at least a lingering fascination and intuitive appeal. When bilingual speakers of two linguistically unrelated languages are asked whether they think they think differently when using each of their languages, they almost invariably answer "yes." When English speakers, who have extensive experience with monolingual speakers of non-Indo-European languages, are asked whether it is their impression that speakers of the non-Indo-European languages think differently from the way they themselves think, as a result of language, they likewise just about invariably answer "yes." When

translators of works drawn from literary traditions of unrelated languages are asked whether there is a language/thought barrier to overcome in translation, they usually find it hard to surpress a smile at so "naive" a question. Yet when psychologists are asked whether they think languages shape thought, they are as likely as not to say "no." When linguists are asked whether they think languages shape thought, they are as likely as not to respond that the question is not one with which the discipline of linguistics should concern itself; and when the work of the dominant empirical traditions of psychology, philosophy, and linguistics for the past fifty years is scanned for treatments of the question of whether or not languages shape thought, it quickly becomes evident that within these traditions that question, for one reason or another, never seemed to be a legitimate one or a relevant one to ask." (pp. 1-2)

16. Bodde, Derek. 1939. "Types of Chinese Categorical Thinking." *Journal of the American Oriental Society* no. 59:200-219.

    "One of the criticisms levelled by westerners against Chinese philosophy is that it has failed to develop a system of logic. Like most sweeping criticisms, this is not absolutely true, for during the fourth and third centuries B. C., the followers of the Mohist school do appear to have experimented with methods of thinking in many ways comparable to our western logic.' The statement remains true, however, to the extent that this school did not long survive, and that it failed to leave a lasting impression on Chinese thought." (p. 200)

    (...)

    "The consequence of this very fundamental Chinese feeling for order and harmony is the extraordinary development, both in speech and in literature, of what may be called numerical categories.

    Under the numeral three, for example, there are such categories as the Three Rituals, Three Sacrificial Animals, Three Auspicious Stars, etc.; under four, the Four Seas, Four Great Rivers, Four Cardinal Points, etc.; under five, the Five Punishments, Five Forms of Taxation, Five Supernatural

Creatures, etc.; and so on up to the Ten Thousand Things,(5) which is a generic term signifying all things in the universe.(6)

Among these numerical categories, those in five and nine are the most important." (p. 201)

17. Boltz, William G. 2000. "Logic, Language, and Grammar in Early China." *The Journal of the American Oriental Society* no. 120:218-229.

    Reviewed work: *Science and Civilisation in China*, Volume 7, Part 1: *Language and Logic in Traditional China* by Christoph Harbsmeier.

    Abstract: "In examining what he calls the "logical features" and "logical concepts" of the Classical Chinese language Christoph Harbsmeier has shown in this volume of *Science and Civilisation in China* that "logic is logic" and that, like mathematics, physics, and chemistry, for example, logic in China is no different from logic in the West in its primary, fundamental nature. Whatever differences there may appear to be are secondary matters of how logical propositions are expressed in the language and of the accidental fact of the particular concerns of extant texts. An analysis of the logical features of Classical Chinese becomes a useful and revealing part of a comparative study of grammar in Classical Chinese and in the principal Western classical languages, Greek and Latin, and in English. Grammars may differ; the meanings of words and of syntactic constructions may differ, and as a consequence logical propositions may appear to be formulated in different ways in Chinese and English (or other Western languages), but the underlying premises and conclusions of logical reasoning are language independent, and the logical

features of the Classical Chinese language reflect linguistic universals."

18. Bosley, Richard. 2005. "The Emergence of Concepts of a Sentence in Ancient Greek and in Ancient Chinese Philosophy." *Journal of Chinese Philosophy* no. 24:209-229.

    "The emergence of an explicit concept of a sentence in a developing philosophical tradition is of considerable significance. The concept is necessary for developments in logic and metaphysics. For without the

    concept it is impossible to pursue an inquiry into logical inference and various fallacies and sophistries. The point of this paper is to discuss the two developments as they emerge in the writings of Plato and Aristotle, in the West, and in the East, in the fragments of the Later Mohists. There are interesting differences which may reflect different concerns and assumptions of the two philosophical traditions. It will also be suggested just how differences between Classical Chinese and Classical Greek influence philosophical concerns.

    A.C. Graham(2) has helped us understand the emergence of a notion of a sentence in ancient Chinese philosophy. Before considering Graham's statement of the difficulty which ancient Chinese thinkers must have had in coming to articulate a notion of the sentence, let us briefly consider the situations which ancient thinkers were in as they began to enrich philosophical consciousness." (p. 209)

    (2) The source of my quotations from and my summaries of Graham's work is *Later Mohist Logic Ethics and Science*.

19. Brons, Lajos L. 2016. "Recognizing "Truth" in Chinese Philosophy." *Logos and Episteme* no. 7:273-286.

    Abstract: "The debate about truth in Chinese philosophy raises the methodological question How to recognize ‘truth’ in some non-Western tradition of thought? In case of Chinese philosophy it is commonly assumed that the dispute concerns a single question, but a distinction needs to be made between the property of *truth*, the concept of TRUTH, and the word ·truth·. The property of *truth* is what makes something true; the

concept of TRUTH is our understanding of *truth*; and ·truth· is the word we use to express that understanding. Almost all human beings over the age of 2 have the concept of TRUTH, and therefore, the question whether some tradition has the concept of TRUTH is moot, but that doesn't imply that every language has a (single) word for ·truth·. Furthermore, recognizing ·truth· is complicated by the conceptual neighbors of TRUTH. What distinguishes ·truth· from its neighbors is disquotationality. Theories of *truth* similarly need to be distinguished from theories about adjacent notions. If a theory is more plausibly interpreted as a theory of *justification*, then it is not a theory of *truth*."

20. Butzenberger, Klaus. 1993. "Some General Remarks on Negation and Paradox in Chinese Logic." *Journal of Chinese Philosophy* no. 20:313-347.

    "In different periods of Chinese philosophy, statements may be encountered that have traditionally been considered paradoxical, their impact on research into Chinese logic having been quite stimulating" (p 313, a note omitted)

    (...)

    "Let us conclude our remarks with focusing on the Chinese logicians' and philosophers' reactions towards paradoxical propositions. As we have seen, in older Chinese logic and linguistics, a certain system of metatheoretical assumptions concerning linguistic analysis was presupposed. Incidentally, this system was proven inconsistent by the dialecticians who were able to deduce an NFI [Normal Form of an Invariance proposition] together with its negation. Thus, the system became unreliable and necessitated further clarification of principles stated but implicitly. Hsün Tzu seems to have been the first to accurately describe such an evolution towards explicit formulation and clarification.

    In their heptapartite distinction of arguments referred to above, the Mohists were the first to create a new system of linguistic analysis accounting for the problems forwarded by the dialecticians. So, paradoxical propositions reinforce the development and improval of systems.

This attitude towards paradoxes might be called a negative one: If, in a system, a paradoxical proposition emerges, the system has to be altered to such an extent that the paradoxical proposition cannot be deduced any more. This alteration is considered an improval of the system.

This is, however, not the only attitude concerning paradoxical propositions.

As it is well known, some ramifications of Taoism, and, quite similarly, Buddhism, subscribe to the point of view that no possible system at all is adequate for describing reality. Systems, on the other hand, are but based on artificially engendered distinctions and divisions of reality which do not correspond to anything real. Hence, there can be no final system that is adequate in any case, and any confidence in having found such a system is but a tremendous error. According to this point of view, logic must be able to metatheoretically cope with the necessary transitions from one system to another without ever being confined to one single and fixed system. As a formal device for ad infinitum reinforcing such transitions, paradoxical propositions are used. In exchange, different types of negation have to be used in order to prevent this type of logic from becoming inconsistent." (pp. 336-337)

21. Cai, Zong-qi. 2011. "The Early Philosophical Discourse on Language and Reality and Lu Ji's and Liu Xie's Theories of Literary Creation." *Frontiers of Literary Studies in China* no. 5:477-510.

    Abstract: "This paper is an attempt to investigate how Lu Ji and Liu Xie develop their theories of literary creation on the foundation of the early philosophical discourse on language and reality. The first part of the paper examines various key terms, concepts, and paradigms developed in the philosophical discourse.

    The second part pursues a close reading of Lu's and Liu's texts to demonstrate how ingeniously they adapt and integrate those terms, concepts, and paradigms to accomplish two important tasks: to establish a broad framework for conceptualizing

literary creation and to differentiate the complex mental and linguistic endeavors at different stages of the creative process. The paper ends with some general reflections on the impact of the two essays on the subsequent development of Chinese literary and aesthetic thoughts."

22. Cantor, Lea. 2016. "Zhuangzi on 'happy fish' and the limits of human knowledge." *British Journal for the History of Philosophy* no. 28:216-230.

    Abstract: "The "happy fish" passage concluding the "Autumn Floods" chapter of the Classical Chinese text known as the Zhuangzi has traditionally been seen to advance a form of relativism which precludes objectivity. My aim in this paper is to question this view with close reference to the passage itself. I further argue that the central concern of the two philosophical personae in the passage – Zhuangzi and Huizi – is not with the epistemic standards of human judgements (the established view since Hansen, "The Relatively Happy Fish"), but with the more basic problem of species-specific perspectives. On my reading, Zhuangzi's emphatic *positionality* in the passage – on the dam, accompanied by his friend Huizi – plausibly suggests a circumspect reflection on the limitedness of human knowledge. It is significant that Zhuangzi's knowledge of fish happiness is avowedly *from a certain place*, and not absolute. But there is still a sense in which this view is objective: namely, insofar as it adequately accounts for an inherently human perspective on the world. I call this modest form of relativism 'Species Relativism', which, crucially, leaves room for objectivity, even though a fully objective (i.e. absolute) view of the world is not accessible to humans."

23. Cao, Feng. 2008. "A return to intellectual history: A new approach to pre-Qin discourse on name." *Frontiers of Philosophy in China* no. 3:213-228.

    Abstract: "Discussions of name (*ming*) during the pre-Qin and Qin-Han period of Chinese history were very active. The concept *ming* at that time can be divided into two categories, one is the ethical-political meaning of the term and the other is the linguistic-logical understanding. The former far exceeds the

latter in terms of overall influence on the development of Chinese intellectual history.

But it is the latter that has received the most attention in the 20th century, due to the influence of Western logic. This has led to the result of a bias in the contemporary studies of *ming*. Changing course by returning to the correct path of intellectual history can providing an objective and thorough ordering of the pre-Qin discourse on *ming*."

24. Ch'ien, Edward T. 1984. "The Conception of Language and the Use of Paradox in Buddhism and Taoism." *Journal of Chinese Philosophy* no. 11:375-399.

    "Both the Buddhists and the Taoists advocate a form of linguistic skepticism, according to which the ultimate reality is mute in the sense of being not only prescriptive but also unsayable." (p. 375)

    (...)

    "To be sure, neither the Buddhists nor the Taoists did away with language entirely. To say that the ultimate reality is unsayable is already a form of saying. In fact, Lao Tzu, Chuang Tzu and Virnalakirti all said a good deal more than that. In doing so, however, they were not necessarily contradicting themselves, for, as will be shown in the following, the mode of language that they each used and affirmed not only is consistent with but actually articulates their linguistically skeptical belief that the ultimate reality is ineffable." (p. 376)

25. Chan, Chi-ching. 1998. "The Rhetorical and the Grammatical in Early Chinese Logic." *Tamkang Review* no. 28:31-45.

    Abstract: "Early Chinese logic often seems puzzling because it is deeply rooted in an interplay of rhetoric and grammar. As logic in ancient China was more of persuading kings and dukes than of reasoning in epistemological terms, catching rhetoric seemed to be a short cut to instant fame. The elliptical Chinese syntax and semantic shift in word play often found in the logical texts underlie the perplexity. One of the logicians' strategies is to employ a mutual interference of, in Jakobsonian terms, the metaphorical and metonymical axes, stopping the operation of

each other to create bizarre statements. Another strategy is what Paul de Man would call the rhetoricization of grammar and the grammatization of rhetoric, which leaves the reader dangling between a literal and figural reading of the logical texts. New lights should be shed on early Chinese logic if one tries to look at it not in strictly logical, but in rhetorical and grammatical, terms."

26. Chang, Chih-wei. 1998. "The Road Not Taken: The Convergence/Divergence of Logic and Rhetoric in the Mohist "Xiaoqu"." *Tamkang Review* no. 28:77-94.

    Abstract: "Modern scholarship on *Mozi* has established an interpretative tradition of equating *Mobian* with logic. The present study takes issue with this tradition, criticizing its failure to locate the tension between logic and rhetoric in the Mohist art of disputation.

    Indeed, when modern scholars draw a parallel between the Mohist practice of debate and Western logic, they generally do not take into account the tension between logic and rhetoric, either in the West or in *Mobian*. Overlooking this tension, Hu Shi thus reads the "Xiaoqu" chapter in *Mozi* as a treatise on logic.

    Drawing upon the history of logic and rhetoric's development in the West, the present paper attempts to reveal Hu's bias in emphasizing the elements of logic in his explication of "Xiaoqu." To counterbalance Hu's reading of "Xiaoqu" in logical terms, this paper further highlights the rhetorical function of *pi, mou, yuan, tui*, four strategies of argument discussed in "Xiaoqu." *Pi, mou, yuan, tui* are actually four methods of analogy that take advantage of superficial resemblance to influence one's judgment of the argument's logical validity. Exploring the convergence and divergence of logic and rhetoric in the Mohist "Xiaoqu," it is hoped that we can arrive at a better understanding of Mobian."

27. Chang, Han-liang. 1998. "Controversy over Language: Towards Pre-Qin Semiotics." *Tamkang Review* no. 28:1-22.

Abstract: "Semiotic thinking in general can be born when people become aware of the discrepancy and tension among different uses of language. This awareness and its expression are often enacted dramatically in the controversy of discourse.

The discursive polemics in Pre-Qin China centers around the contention of logic and rhetoric, quite similar to the fortune of the trivium in the medieval West.

Traditionally known as the Great Debate on Name and Substance, the controversy should be understood as a phenomenon of language pragmatics.

Those who participate in the Debate fail to communicate with one another because there is a discrepancy between encoding and decoding. Their polemics helps to create a textual space that includes the hidden agenda of semiotics."

28. ———. 2003. "The Paradox of Learning and the Elenchos: Plato's *Meno*, Augustine's *De Magistro*, and Gongsunlong's *Jianbailun*." In *Comparative Literature in the Cross-cultural Context*, edited by Yue, Dalyun and Qian, Linsen, 185-201. Nanjing: Yilin Press.

    "Under the assumption that the elenchos is a universal strategy of argumentation, this paper proposes to study three ancient dialogues, two in Western classical antiquity, one in Pre-Qin China. Of the three texts, Plato's *Meno* and Augustine's *De Magistro* are already separated by a temporal gap of almost eight hundred years, but they can be united by the common theme of paradox of teaching/learning and the dialogic structure in which disputation is performed. As to Gongsunlong's *Dialogue on Hardness and Whiteness* (hereinafter referred to as *Jianbai*), it can be linked mysteriously to the two Western texts from both an epistemological and a pragmatic point of view." (p. 185)

29. ———. 2007. "Persuasion in Pre-Quin China. The Great Debate Revisited." In *Traditions of Controversy*, edited by Dascal, Marcelo and Chang, Han-Liang, 85-100. Amsterdam: John Benjamins.

"This essay attempts to present a major controversy in classical Chinese intellectual history, commonly called the Great Debate on *ming* (name) and *shi* (substance), and to interpret that debate in the light of the contention between logic and rhetoric, similar to the one that has characterized Western philosophy since Plato's early dialogue *The Gorgias*. The English rendition of the "Great Debate", being at once accurate but imperfect, is so popular that its source is hardly traceable. The added qualification of "great" suggests the importance of the issue, but the word debate unfortunately fails to transmit the double denotation of "differentiation" and "debate", imposed on the homophone by modern usage.(1) Thanks to contemporary scholars like Chmielewski (1962–1969), Graham (1989), Defoort (1997), Chang [Han-liangh] (1998, 2003), Lu (1998), Reding (2004), Cui (2004), we have become aware of the contention of logic and rhetoric and, to a lesser extent, the relation between logic and grammar suggested by these ancient texts." (p. 85)

(1) The Chinese word for *bian* in its original form is double denotative; it means at once debate and distinction, but two different words (graphic forms or graphemic signifiers) are used for the two senses (signifieds) in modern Chinese. However, the semantic differentiation and identification denoted by the original form are important to our understanding of the complex relationship between semantics and pragmatics, i.e., clarifying nuances of meaning and engaging in debate.

(2) Whilst Aristotle begins his *The Art of Rhetoric* with the statement "Rhetoric is the counterpart of dialectic" ([*The Art of Rhetoric*] 1991: 66), he subsumes the enthymeme or "rhetorical demonstration" under dialectic and stresses its difference from "logical syllogisms" (68, [Topics]).

30. Chao, Yuen Ren. 1946. "The Logical Structure of Chinese Words." *Language* no. 22:4-13.

    Presidential address, read at the regional meeting of the Linguistic Society of America in New York, December 31, 1945.

    Reprinted in: Yuen Ren Chao, *Aspects of Chinese Sociolinguistics*, Essays selected and introduced by Anwar S. Dil, Stanford: Stanford University Press, 1976, pp. 260-274.

    "At a previous meeting of this society, I read a paper on Word Conceptions in Chinese. There I dealt chiefly with the size-of-unit problem. I recognized two word-like units in Chinese. One is the monosyllable, which is almost always a morpheme.(2) It is not always a free form, but, partly because it is written with one character, it is very much talked about. It occupies the same social position of being the common linguistic small change of everyday life and is therefore called a 'word' by most of those who speak in English on Chinese.(3) The Chinese name for this is *tz'ŭ*[4]. On the other hand, there is the free form consisting of one, two, or more syllables, which may enter into what we should call syntactical relations with other similar units. Linguistically, this would be much more like what we call a word in other languages than the monosyllable. But it has no everyday name in Chinese,(4) because it is not talked about every day.

    In the present paper, I propose to consider the other aspect of the problem, the identity-of-unit problem: What constitutes one and the same word? Since a large part of this discussion will consist of tertiary statements concerning secondary statements about language, and the monosyllabic *tz'ŭ*[4] will play a major part in such secondary statements, we shall take the *tz'ŭ*[4] as our unit of reference, rather than the syntactical word. Any one who does not accept this use of the word 'word' as applied to Chinese may, wherever the word 'word' occurs, simply substitute the word *tz'ŭ*[4], or rather the*tz'ŭ*[4] '*tz'ŭ*[4]', and will still be able to follow the discussion." (p. 4)

(2) mes, an ancient Chinese morpheme with an initial consonant cluster became a dissyllabic morpheme through the appearance of an extra vowel between the parts of the cluster. But the separate syllables thus resulting usually acquired the status of separate morphemes, with separate meanings. Seec P. A. Boodberg, Some proleptical remarks on the evolution of Archaic Chinese, *Harvard Journal of Asiatic Studies* 2.329-72, esp. 336 ff.

4 The learned term for it is tz'ŭ^{2} not related etymologically to tz'ŭ^{4}).

31. ———. 1955. "Notes on Chinese Grammar and Logic." *Philosophy East and West* no. 5:31-41.

Reprinted in: Yuen Ren Chao, *Aspects of Chinese Sociolinguistics*, Essays selected and introduced by Anwar S. Dil, Stanford: Stanford University Press, 1976, pp. 237-249.

"This paper is not concerned with Chinese logic as a part of technical Chinese philosophy, but, rather, with the ways in which some elementary logical notions find expression in the Chinese language. Therefore, I shall not touch upon the numerous paradoxes found in the *Canon of the Way and Virtue* (*Tao-tê Ching*) of Lao Tzŭ, or such questions as to whether the whiteness of a white horse is the same as the whiteness of white snow, as raised by Mencius,(2) or the series of problems with which the school of Mo Tzŭ was much concerned. On the contrary, I shall consider such universal logical constants - apparently universal constants for all human thought-as "and," "or," "all," "if ... then," "not," etc., and ask what forms, especially grammatical forms, they take in Chinese thought and speech. To put it in another way: instead of negation, I shall consider "not"; instead of implication, I shall consider "if ... then"; instead of existence, I shall consider "there is." In short, instead of metalogic and Chinese grammatics, I am primarily concerned here with logical notions and grammatical forms. Terms like *foouding*,(3) "negation";

minqtyi, "proposition"; *chyantyi,* "premise"; *tueiluenn*, "infer (ence)"; etc., are not very well known to many Chinese - not even to those who read and write. On the other hand, all Chinese, whether literate or illiterate, will argue and reason in prose without realizing that they have been doing so all their lives." (p. 31)

32. ———. 1959. "How Chinese Logic Operates." *Anthropological Linguistics*:1-8.

    Reprinted in: Yuen Ren Chao, *Aspects of Chinese Sociolinguistics*, Essays selected and introduced by Anwar S. Dil, Stanford: Stanford University Press 1976, pp. 250-259.

    "Like the logic of other cultures, Chinese logic operates by ways of affirmation and negation, particular and universal assertion, categorical conclusion and hypothetical implication, etc., but unlike the logic of other cultures, Chinese logic must of course operate with the degree of freedom that is possible within the operational possibilities of the Chinese language itself. Thus, while aiming at finding out how Chinese logic operates, we shall probably end up with finding out how logic operates in Chinese. The tool with which, or, what amounts to the same thing, the form in which, Chinese logic operates is the Chinese language. More specifically, the chief operative elements in Chinese are the use of words, especially functional words, word order and hierarchical structure and suprasegmental elements. Since all such elements enter also into non-logical functions of the Chinese language, such as influencing action, expressing and producihg feeling, presenting linguistic objects of beauty, it follows that there is no element of the language which is exclusively concerned with logical operations." (p. 1)

33. Chen, Bo. 2006. "The debate on the yan-yi relation in Chinese philosophy: reconstruction and comments." *Frontiers of Philosophy in China* no. 1:539-560.

    Abstract: "The debate on the yan-yi relation was carried out by Chinese philosophers collectively, and the principles and methods in the debate still belong to a living tradition of Chinese philosophy. From *Yijing* (Book of Changes), *Lunyu* (Analects), Laozi and Zhuangzi to Wang Bi, "yi" which cannot

be expressed fully by *yan* (language), is not only "idea" or "meaning" in the human mind, but is also some kind of ontological existence, which is beyond *yan* and emblematic symbols, and unspeakable. Thus, the debate on the *yan-yi* relation refers firstly to metaphysics, secondly to moral philosophy, and then to epistemology and philosophy of language. Guided by this view, this paper recalls the source of the debate on the *yan-yi* relation to *Yijing* and *Lunyu*, distinguishes four meanings of "yi" in Chinese philosophy, and reconstructs three arguments. These arguments are the "*yan* cannot express *yi* fully" argument, "forget *yan* once you get *yi*" argument, and "*yan* can express *yi* fully" argument. Finally, this paper exposes and comments on those principles, methods and the general tendency shown in the debate from the following five aspects: starting point, value-preference, methodology, texts (papers and books), and influences."

34. ———. 2009. "Xunzi's Politicized and Moralized Philosophy of Language." *Journal of Chinese Philosophy* no. 36:107-139.

    "In "Rectifying Names" (*Zhengming*) and other articles, Xunzi (313–238 BCE)1 developed a systematic theory ofnames, in which we can find some illuminating insights. These insights are still alive in contemporary philosophy of language, and can be used to broaden and deepen our thinking about names as well as about language generally. In this article, I will present Xunzi's theory of names, and compare it to some ancient and contemporary theories, Chinese and Western, and then explore some characteristics of Xunzi's theory, its strengths and its internal limitations." (p. 107)

35. ———. 2014. "Six Groups of Paradoxes in Ancient China: From the Perspective of Comparative Philosophy." *Asian Philosophy* no. 24:363-392.

    Abstract: "This paper divides the sophisms and paradoxes put forth by Chinese thinkers of the pre-Qin period of China (before 221 BCE) into six groups: paradoxes of motion and infinity, paradoxes of class membership, semantic paradoxes, epistemic paradoxes, paradoxes of relativization, other logical contradictions. It focuses on the comparison between the

Chinese items and the counterparts of ancient Greek and even of contemporary Western philosophy, and concludes that there turn out to be many similar elements of philosophy and logic at the beginnings of Chinese and Greek civilizations."

36. Cheng, Chung-ying. 1965. "Inquiries into Classical Chinese Logic." *Philosophy East and West* no. 15:195-216.

    "For the purpose of elucidating the nature of Chinese logic, we may suggest that the goal of study and research in classical Chinese logic should be en visaged as a critical analysis of the explicit logico-methodological issues in Chinese classical discourses, on the one hand, and a synthetic reconstruction of implicit logico-scientific theories, on the other. We may, indeed, conduct our examination in the light of an adequate understanding of modern logic, history, and the philosophy of logic and science. First, let us pose the following important questions: whether or not Chinese philosophers used logic, or reason and arguments, in their discussions of problems; whether the logic (or reason and arguments) thus used differed essentially from that of the West; and, finally, if there is something which can be called Chinese logic, what constitutes its particular features? The first step to adequate replies to these questions consists in testifying to the existence of logical and scientific ideas in classical Chinese writings. The importance of this testimony can scarcely be overstated, because this is where we can collect our evidence and evolve our explanations." (p. 200)

37. ———. 1968. "Logic and Language in Chinese Thought." In *La Philosophie contemporaine. Métaphysique, phénoménologie, langage et structure. Vol. III*, edited by Klibansky, Raymond, 335-347. Firenze: La Nuova Italia.

38. ———. 1971. "Aspects of Classical Chinese Logic." *International Philosophical Quarterly* no. 11:213-235.

    "In the rest of this article I will discuss some of the recent developments under the following topics: (1) the nature and structure of the Chinese language and its significance for Chinese logic and thought, (2) patterns of Chinese reasoning in

early philosophical writings; and (3) the nature and problems of explicit formalization of Chinese logic." (p. 215)

(...)

"Conclusion. In the above, we have discussed, first, the relation of the Chinese grammatical structure to logic and thought in Chinese philosophy, second, the logical modes of reasoning as contained in classical Chinese philosophical writings, and finally, the explicit Chinese logical consciousness and inquiries into forms of reasoning and problems of language in relation to reality and truth. We have seen many aspects

of the relationship of Chinese language to Chinese logic and Chinese thought. Among these, a most important one is that both Chinese logic and Chinese thought have their universal characteristics which

are not contingent on Chinese language, whereas Chinese language, in so far as its grammar is concerned, seems to exhibit the basic points of Chinese philosophy, and indeed can be taken as a concrete illustration

of important Chinese philosophical principles such as that the whole is relevant for, and contributes to, the determination of the part in the whole." (p. 234)

39. ———. 1973. "On the Problem of Subject Structure in Language, with Applications to Late Archaic Chinese." In *Approaches to Natural Language: Proceedings of the 1970 Stanford Workshop on Grammar and Semantics*, edited by Hintikika, Jaakko, Moravcsik, J. M. E. and Suppes, Patrick, 413-434. Dordrecht: Reidel.

"In the analysis of the subject-predicate structure of classical Chinese there is want for adequate and well-defined criteria for determining the various types of subject-predicate structures. This is due to the absence of a general theory to explain the purposes of the analysis.

In this paper I shall start with general consideration of the distinction between subject and predicate and proceed to a relevant application of such distinction to any language. Once

we have made this clear, it is only a corollary to show that subject-predicate structures in Late Archaic Chinese(2) may be systematically illustrated and logically explained.

Specifically, I shall confine myself to the analysis of the subject structure in language while leaving the treatment ofthe predicate structure to a separate article." (p. 413)

(2) The use of the term is due to W. A. C. H. Dobson (1959). [*Late Archaic Chinese*, Toronto].

40. ———. 1975. "On Implication (*tse a*) and Inference (*ku b*) in Chinese Grammar and Chinese Logic." *Journal of Chinese Philosophy* no. 2:225-244.

    Abstract: "This article is intended to explain my discovery of two grammatically independent and yet logically interrelated categories, namely implication and inference, in Chinese language and Chinese logic, as conveyed by the terms tse and ku and the concepts they connote. I intentionally refer to tse and ku either as two forms of logical relationship, or as two concepts, or as two terms or two words for these two forms of logical relationship. The uses of tse and ku as two words can be said to constitute the forms of logical relationship for which they stand. Since the contexts of this article will make clear what I actually refer to, this ambiguity of usage is harmless and will not prevent an understanding of my arguments."

41. ———. 1983. "Kung-sun Lung: White Horse and Other Issues." *Philosophy East and West* no. 33:341-354.

    "This is an up-to-date analysis of Kung-sun Lung's thesis "White horse is not horse" and the underlying class logic. Critique is made of the wrong-headedness of the mass-term interpretation (Hansen) and a shallow understanding of classical Chinese grammar in light of modern logic. Neo-mohist canons on identity, difference, separableness and inseparableness are also analyzed for comparison and contrast."

42. ———. 1987. "Logic and Language in Chinese Philosophy." *Journal of Chinese Philosophy* no. 14:285-307.

"Chinese ontology is formulated in the Chinese language and categorized according to Chinese philosophical interests and orientations. How these interests and orientations differentiate and integrate or relate Chinese ontological theses and views is not only an important historical question but is also a question of logical consequence."(p. 286)

(...)

"Thus an inquiry into language and ontology in Chinese philosophy should naturally reveal distinctions peculiarly to Chinese language, Chinese ontology, and Chinese philosophy, but also promises insights into the nature, function, form and substance of some, if not all, logico-linguistic issues.

First, the basic and dominant conception of language as a matter of naming (of formulating and applying names) in Chinese philosophy will be analyzed to clarify how the various schools of philosophy in the

classical period of China developed from their distinctive evaluations of presenting or realizing ontological truths. Then follows an explanation of the types of ontological theses and positions found in Chinese philosophy.

A clearer understanding will be sought through a series of comparisons and contrasts with contemporary Western positions. Finally, the response of Chinese philosophers to logico-linguistic and ontological issues will be discussed." (p. 287)

43. ———. 1997. "Philosophical Significance of Gongsun Long: A New Interpretation of Theory of "Zhi" as Meaning and Reference." *Journal of Chinese Philosophy* no. 24:139-177.

"Although Gongsun Long (GSL) and the *Mingjia* (School of Names) have been frequently studied in the last two decades in both China and the Western world for the purpose of clarifying and explaining the nature of Chinese language and Chinese logic, there is not a single study which has explained the rise of the school of Names and the motivating impetus behind the advancement of reasons and arguments in the school. The method of such studies is very often a matter of analyzing

Gongsun Long's arguments by using modern logic of classes to show why Gongsun Long can be accepted according to modern standards or to show how it has deviated from modern logic and therefore has to be understood on a different line of logic. There is nothing improper in these approaches but these approaches fail to answer two important questions regarding the writings of Gongsun Long and the School of Names, namely which goals did Gongsun Long and the School of Names want to pursue and how did he and the School of Names come to confront their problems and establish their theses and argue for their validity.

Second, we need to have a full view of Gongsun Long in light of his existing writings and we can not simply draw conclusions on one or two chapters from the five essays attributed to him." (p. 139 a note omitted)

44. ———. 2000. "Classical Chinese Philosophies of Language: Logic and Ontology." In *History of the Language Sciences: An International Handbook on the Evolution of the Study of Language from the Beginnings to the Present. Vol. I*, edited by Auroux, Sylvain, Koerner, E.F.K., Niederehe, Hans-Josef and Versteegh, Kees, 19-35. Berlin: Walter de Gruyter.

Summary: 1. Two aspects of language in early Chinese philosophy; 2. Nature and function of non-substantive words in the Chinese language; 3. Five positions (theories) of names and sayings in Classical Chinese philosophy; 4. The Cunfucian doctrine of *zheng-ming* “rectifying names”; 5. The Daoist doctrine of *wu-ming* “no names”; 6. Nominalistic tendencies in Yinwenzi; 7. Platonistic tendencies in Gongsun Long; 8. Empirical (scientific) realism of names and language in the Neo-Moist Canons (Jing/Shuo); 9. Concluding remarks; 10. Bibliography.

"9. Concluding remarks

In the above I have discussed the ontological import of chinese language and the conception of language in various ontological perspectives developed in Classical Chinese Philosophy.

I distinguished names (*ming*) from sayings (*yan*) which are two basic aspects of chinese language. I also distinguished between ontology in and of language and ontology independent of or without language. I

have shown that for the Confucianists the ontological considerations of names are subject to practical, normative considerations of *yan*. For the Daoists, both names and sayings are abolished for ontological and normative, practical reasons, and an ontology without language is tacitly suggested and presented.

For Yinwenzi and Gongsun Long, the ontological import of names dominates the practical, normative ends of *yan*. Finally, for the Neo-Moists ontological considerations are to be regulated by logical and methodological considerations, and language is to be developed and refined by logic and scientific discovery into a tool for expressing objective truth and objective knowledge." (p. 35)

45. ———. 2003. "Language and Logic." In *Encyclopedia of Chinese Philosophy*, edited by Cua, Antonio S., 343-355. New York: Routledge.

"Conclusion

We have discussed the concept and ontological import of language in various perspectives developed in classical Chinese philosophy. Also, we have distinguished names (*ming*) from "saying" (*yan*)—two aspects of Chinese language—and distinguished ontology in and of language from ontology independent of or without language. For the Confucians, the ontological consideration of names is subject to the practical, normative consideration of *yan*. For the Daoists, both *ming* and *yan* are to be abolished; their reasons are ontological, normative, and practical, and they offer an ontology without language. For Yinwenzi and Gongsun Long, the ontological import of names dominates the practical, normative ends of *yan*. Finally, for the neo-Mohists ontological considerations are to be regulated by logical and methodological considerations, and language is to be developed and refined, through logic and

scientific discovery, into a tool for expressing objective truth and objective knowledge." (p. 354)

46. ———. 2006. "From Donald Davidson's Use of 'Convention T' to Meaning and Truth in Chinese Language." In *Davidson's Philosophy and Chinese Philosophy: Constructive Engagement*, edited by Mou, Bo, 271-308. Leiden: Brill.

    "In this article I shall advance in the first part the Donald Davidson's theory of truth interpretation in terms of the Convention T as originally established by Tarski in his formalization of semantics for finite languages. Davidson has expanded the Tarski's formal-semantic notion of truth interpretation and applies to natural languages in order to show how the meaning of a sentence could be given in terms of truth conditions of the sentence. This is an ingenious move.

    But we wish to ask whether the Davidsonian approach to interpretation of truth in terms of the Tarskian Convention T is sufficient to explain meaning and truth in a living natural language like the Chinese and whether it is itself should be further broadened for both semantic and hermeneutical representation of our understanding reality based on experience. In other words, we shall ask whether an ontological re-interpretation and application of Convention T could serve an important purpose of ontological and cross-ontological understanding that I call onto-hermeneutical understanding.

    In the second part of the article I shall advance five basic principles for understanding meaning and truth in Chinese language in view of Chinese philosophy as a theory of truth." (p. 271-272, notes omitted)

47. ———. 2007. "Reinterpreting Gongsun Longzi and Critical Comments on Other Interpretations." *Journal of Chinese Philosophy* no. 34:537-560.

    "In my earlier works of 1969 and 1970,(16) I have suggested that GSL [Gongsun Longzi] is Platonic in the sense that he is an abstract realist. I have considered white as indicating whiteness and horse as indicating horsehood as they are abstract qualities which are abstracted from real experiences and given a status

of independent status apart from the concrete experience of the world. I may even think that the indeterminate (*budingzhe*) could be an abstraction from all our known determinations.

Now I wish to stress the importance of seeing determinations (as *zhi*) as both naturally arising and epistemological recognized with our conceptions which fit with our experiences in totality and as a totality. In this sense I wish now to take the concrete realist position which means: *There are natural qualities in things which require our experiences and cognition. As to how they are to be characterized and related to each other, we need to use our best brains to find out and construe our language in a manner which preserves coherence of experiences and yet reveals our insights into reality and language use in regard to this reality in different modes of reference (experience) and meaning (theories)*." (p. 548)

(16) See my article “Logic and Language in Chinese Thought,” *Contemporary Philosophy: A Survey* 3 (1969): 335–47. See also my article “Logic and Ontology of Kungsun Lung in the Chi-Wu-Lun,” *Philosophy East and West* 20, no. 2 (1970): 137–54. In the latter I have translated the whole essay of GSL’s Zhiwu Lun into English and then formalize it in the first-order predicate logic with identity for the purpose of showing the

validity of the argument. I have succeeded to show the validity of GSL’s argument.

Many later researchers are lack of research and information for these contributions I have made and proceeded. This in a way shows their study of GSL has not made new discovery which enables them move to the positions which are easily untenable or simply evidence-lacking.

48. ———. 2012. "Preface: Chinese Logic as Threefold: Reference, Meaning and Use." *Journal of Chinese Philosophy* no. 39:325-326.

"I believe therefore there are three layers of Chinese logic, the formal or semiformal logic of truth functions, the semantic logic of fixed usages, and the pragmatic logic of nonfixed usages based on contextual and intentional interpretations. One must

see that whereas the Neo-Moist Canons (including some corrupted parts such as the *Daqu*) make efforts to construct a formal logic of truth functions based on formal understanding of reference and inference, the Neo-Moist Xiaoqu has shown its efforts to establish a semantic logic by revealing different forms of inference and hidden restraining factors for uses of our common concepts or predicates in references, which make a difference to inferences. On the other hand, we have to mention Xunzi as a critical-minded logical philosopher who wishes to develop and establish a semantic-referential logic that functions on fixed relations of reference and meaning based on an objective and yet conventional epistemology of objects and concepts. He would like to repudiate both the semantic logic of Neo-Moists and the pragmatic or otherwise realistic logic of Gongsun Long.

In this present issue on Neo-Moist or later Moist logic, our organizer of the special theme, Professor Yiu-ming Fung, and our expert authors have made their new specific explorations into Chinese logic based on early scholarship and their own insights. I thank each of them for their individual achievements." (p. 326

49. Cheng, Chung-ying, and Swain, Richard H. 1970. "Logic and Ontology in the *Chih Wu Lun* of Kung-Sun Lung Tzu." *Philosophy East and West* no. 20:137-154.

"One of the most disputed texts of classical Chinese philosophy is the *Chih Wu Lun* of Kung-sun Lung. Conflicting translations and interpretations have been offered by Fung Yu-lan,(1) A. C. Graham,(2) Janusz Chmielewski,(3) Wing-tsit Chan,(4) and others. It seems to us that each of these scholars, by concentrating almost exclusively on establishing a meaning for the term *chih*[e], has overlooked the fundamental importance of both the structure of Kung-sun Lung's argument and the meaning of the term *wu*[d]. Taking into account all three of these factors, we hope to show that Kung-sun Lung has presented a tight, logical argument elucidating the nature and function of reference." (p. 137)

Bibliography on Language and Logic in Ancient China. Second part Chm-Fun

Studies in English (Chm-Fun)

1. Chmielewski, Janusz. 1962. "Notes on Early Chinese Logic. Part I." *Rocznik Orientalistyczny* no. 26:7-22.

   Reprinted in Chmielewski (2009), pp. 175-190.

   "This paper is a short and preliminary report on a more comprehensive study devoted to various aspects of Chinese logic which I hope to, publish in French. Since the final working up and polishing of the rather extensive French text will require some time - while the results so far arrived at seem rather new, and scholars working in the field of Chinese philosophy and logic may be expected to find some interest in them - I have thought it useful to publish a short account in English before the full version of my study is ready for publication [*]. For technical reasons it has turned out to be necessary to divide the paper into several parts. The first one, presently published, offers a summary of the first three chapters of my study; - dealing chiefly with the Kung-sun Lung tsi. Summaries of chapters dealing with problems concerning the calculus of propositions, the calculus of functions, etc. - as they are represented in the reasonings of the early Chinese thinkers - will successively appear in the subsequent issues of this "Roc:znik". (p. 175 of the reprint)

   (...)

   "The task I have set myself may be briefly stated in the following terms: Without losing sight of the philological and historical background (which, I believe, is always the necessary prerequisite in sinological research) I propose to single out some more or less typical forms of reasoning (whether already interpreted by others, or not) occurring in early Chinese philosophers; to define them from the standpoint and in terms

of elementary symbolic logic; to find out general logical laws and notions underlying them; and, as far as possible, to compare them with the ancient logical theory of the West." (p. 176 of the reprint)

* [The French study was never published]

2. ———. 1963. "Notes on Early Chinese Logic. Part II." *Rocznik Orientalistyczny* no. 26:91-105.

Reprinted in Chmielewski (2009), pp. 191-206.

"IV. On the so-called "Chinese sorites".— The first serious attempt to analyse early Chinese reasoning in one of its most typical forms is due to P. Masson-Oursel, *Esquisse d'une théorie comparée du sorite*, "Revue de Métaphysique et de Morale" XX, Paris 1912, pp. 810-824 (cf. also his *La démonstration confucéenne — Note sur la logique chinoise préboudhique* "Revue de FHistoire des Religions" LXVII, 1913, pp. 49—54, which, in fact, reproduces the first chapter, *Le sorite chinois,* of the *Esquisse*). A good and comparatively short example of the form here in question is, for instance, *Lao-tsi* LIX: 重積德則無不克，無不克則莫知其極，莫.知其資［則］可以有國 "If one repeatedly agglomerates one's Virtue, there is nothing one cannot overcome; if there is nothing one cannot overcome, one knows no bounds; if one knows no bounds, one is able to keep the kingdom'. Masson-Oursel, as is seen from the very title of his study, defines the form as a sorites, although he remarks that "Ce n*est pas, ou du moins, ce n'est pas essentiellement d'un rapport entre idées qu'il s'agit; l'extension ou la compréhension des concepts ne sont pas, ou du moins ne sont pas les seuls principes que régissent ces argumentations ; elles consistent bien plutôt à noter des rapports entre des conditions objectives" (*Esquisse*, p. 810)." (p. 191 of the reprint)

(...)

"Thus, contrary to Masson-Oursel, we are entitled to state that early Chinese philosophers had quite a number of formal means at their disposal and that they actually used various types of reasoning. The so-called sorites, important and typical

as it is, is far from being the only logical form to be met with in early Chinese philosophical thinking.

(...)

Before proceeding to an investigation of both the distinction of the alleged sub-forms ('progressive' and 'regressive') of the 'Chinese sorites' and Bodde's criticism of the form as a whole, it is necessary to analyse the form itself from the standpoint of modern formal logic. On. closer inspection, the alleged 'Chinese sorites' can be proved to belong to the propositional calculus (that is to say, the part of logic operating with whole propositions, or propositional variables, non-analysed into members smaller than a proposition), and it turns out to be based on valid formulae of this calculus. On the other hand, the very notion of sorites is inadequate and misleading in reference to the form under discussion." (p. 193 of the reprint)

"V. The Mohist *hiao* and some related problems.

The logic of terms (as opposed to the logic of propositions) embraces the calculus of classes and the calculus of functions. After having briefly dealt with the role and the main features of the propositional calculus as actually used in early Chinese reasoning (ch. IV of the present study) and the Chinese theory of classes as represented in the *Kung-sun Lung tsï* (chapters II-III of my study), it is now time to turn to the calculus of functions which - at least in some of its subdivisions - is also not without a specific role in early Chinese logic." (p. 207 of the reprint)

(...)

"It must be said in advance that the calculus of functions as thus delimited does not play any very important role in early Chinese logic. But since traces of it appear to subsist even in the Chinese logical theory (poor as it was) and, on the other hand, are certainly discoverable in some actual reasonings (even if these are neither numerous nor typical), the problem cannot be omitted from the present investigation. By the way, as we shall see later, the analysis of the samples of Chinese material in which the elements of the calculus now in question are involved will at the same time yield marginal results which themselves are not without interest from both the logical and the linguistic point of view."    "VI. An instance of reasoning in *Mo-tsi* 26 and the problem of relationships between language and the logic of funxtions in Chinese.

   As has been shown in the preceding section (see RO XXVII, 1; pp. 103 - 121), there are sufficient reasons to interpret the so-called Mohist hiao as a specific logical formula belonging to the simple calculus of functions, - even if there is in neither *Mo-tsi* nor another Chinese philosophical text any example of reasoning qualified as *hiao* and corresponding to the formula in question. On the other hand, there are in the body of the *Mo-tsi* instances of reasoning logically valid, which can: be adequately analysed (formalised) by means of different and comparatively complicated formulae of the calculus of functions - formulae which have no counterpart in the logical theory of the Mohists.

   In other words: what appears in the logical theory (that is, explicit logic) does not appear in actual practice of philosophical reasoning (implicit logic), and vice versa.

   This seems paradoxical enough, but we must remember that the early Chinese thinkers were much more sophisticated in actual reasoning than in theoretical reflection on logical problems. In their philosophic;al practice they were able

intuitively to reason according to valid formulae (or inferential patterns) which were sometimes astonishingly complicated. At the same time their logical theory, poor as it was, was necessarily limited to much more elementary logical problems which - precisely on account of their simplicity - played little role, if any, in actual philosophical speculation. This, I think, explains the seeming paradox just mentioned." (p. 227 of the reprint)

   "VII. The principle of double negation, the law of contradiction and some related problems in early Chinese thought.

   First I wish to apologise for a change in the original plan of the present series of Notes. As was previously announced (see RO XXVII, 1, p. 104), the present chapter VII should continue to deal with the calculus of functions in Chinese reasoning. Contrary to this announcement, it has turned out to be necessary to discuss at this point the problem of contradiction in early Chinese logic together with some corollary problems closely associated with this main topic. The present chapter (which will comprise two sections) is devoted to this discussion.

   I shall revert to the analysis of Chinese reasoning involving the calculus of functions (and the calculus of relations in particular) in later chapters." (p. 253 of the reprint)

   (...)

   "The technical Modern Chinese term for 'contradiction' is *mao-tun* (= *rnao shun*) literally 'spear (and) shield ', and it is convenient to start the discussion of the explicit references to (non-)contradiction in pre-Han philosophical texts with a story - better known to linguists and etymologists than historians of Chinese philosophy - which besides being closely connected with our main problem at the same time explains the origin of the unusual Chinese term. In the body of pre-Han literature the passage appears more than once. In the *Han-fei-tsi* it is quoted twice, in ch. 36 (*Nan-i*) and (in a slightly different wording) ch.

40 (*Nan-shï*); moreover, another version of the story has been preserved in *Yang Shï-hün*' s commentary (of the T 'ang period) to the *Ku-liang chuan*, Ai kung, 2nd year, where the story itself is put forward as a quotation from the *Chuang-tsï*. Curiously enough, the passage which is of undeniable logical import and is, in fact, a kind of rather sophisticated definition of contradiction together with the explicit rejection of self-contradictory

statements, has so far remained unnoticed by nearly all historians of Chinese philosophy, both Chinese and Western.

(...)

"In translation:

"In Ch'u there was a man selling shields and spears; he praised (his shields) saying: "(My) shields are so strong that nothing can pierce them". And again he praised his spears saying: "My spears are so sharp that there is nothing they do not pierce". Somebody asked him: "How about your spear piercing your shield?" The man was not able to reply. *Now, a shield which cannot be pierced and a spear for which there is nothing it does not pierce cannot stand at the same time*".

It is clear that the story involves contradictory statements about 'spears and shields', - which latter expression actually came to be used for 'contradiction' in Chinese. But in spite of its intuitive clarity, the passage involves a very specific case of contradiction, yields a fairly complicated formalisation, and certainly gives evidence of the logical keenness of the early Chinese mind." (pp. 272-273 of the reprint, notes omitted)

6. ———. 1966. "Notes on Early Chinese Logic. Part VI." *Rocznik Orientalistyczny* no. 30:31-52.

   Reprinted in Chmielewski (2009), pp. 275-296.

   "VII. The principle of double negation, the law of contradiction and some related problems in early Chinese thought (*Continued*).

   As has been shown in the preceding section, the *Han Fei tsi* story [*] about the weapon-dealer involves a conjunction of

self-contradictory propositions, a conjunction which was explicitly rejected by the compiler of the text (see *RO* XXIX, 2, pp. 136-138). Thus, the story can rightly be considered, first, a good illustration (and one fairly sophisticated at that) of what contradiction is, second, a specific formulation of the principle of non-contradiction." (p. 275 of the reprint)

(...)

"Explicit references to (non-)contradiction made by the Mohist dialecticians and preserved in the 'canonical' chapters (40-43) of the *Mo-tsï* are of a still greater importance, since they, first, are put forward in connection with the practice of dialectic discussion; second, they are concerned with direct contradiction, *(p · p'); and consequently, third, they necessarily involve the problem of excluded middle.

All these points are entirely absent from the *Han Fe tsǐ* story just discussed, and this is perhaps one of the reasons why the story itself has escaped the notice of nearly all historians of Chinese thought, including those pretending to deal with Chinese logic. The Mohist aspect of our problem has, on the contrary, been discussed rather frequently by sinologists, even if not always in adequate terms." (p. 277 of the reprint)

(...)

"In Western sinology, the first statement that the Mohists "recognise the principle of the excluded middle in practice if not in theory" is due to A. C. Graham(6) who - inversely - left out of consideration the law of non-contradiction." (p. 278 of the reprint)

7. ———. 1967. "Linguistic Structure and Two-Valued Logic: the Case of Chinese." In *To Honor Roman Jakobson: Essays on the occasion of his seventieth birthday*, 475-482. The Hague: Mouton.

   "In the present article which is respectfully dedicated to Roman Jakobson I propose to deal at some length with what I consider one of the fundamental problems of the relationships between linguistic structure and logic. The linguistic basis of the article has been deliberately limited to Archaic Chinese (roughly 10th through 3rd cent. B.C.) not only because the writer himself is a sinologist rather than a general linguist, but also for less subjective reasons. Although the problem of the logical aspects of Chinese has been badly mishandled by many philosophically minded traditional sinologists, Chinese is, in fact, a remarkably logical language which perfectly suits our present purpose. It also appears that the results arrived at in relation to Chinese are of no small comparative and general importance." (p. 475, note omitted)

   (...)

   "In sum, from the point of view of two-valued logic Chinese is remarkably logical and presumably is unique among the great langues de civilisation. In this respect it is certainly superior to many Indo-European languages, the logical aspects of which are vitiated by the so-called cumulative negation.(14) These conclusions appear to be rather striking, the more so as Chinese traditionally has been accused of an alleged illogicality (or recently praised for its prelogicality). What use the early Chinese thinkers actually made of their language in their explicit and implicit logic is another matter which lies beyond the scope of the present paper. However, it is perhaps useful to emphasize here that at an early date they arrived at a fairly sophisticated formulation of the principle of non-contradiction and that the dialectical procedure of the Mohists was based on the laws of non-contradiction and of excluded middle." (p. 482, anote omitted)

   (14) Latin appears to be an important exception. It is not without reason that Couvreur's Latin renderings of our Chinese

examples have been cited as both most literal and most adequate. [S. Couvreur, *Les Quatre Livres* (1895)]

8. ———. 1968. "Notes on Early Chinese Logic. Part VII." *Rocznik Orientalistyczny* no. 31:117-136.

   Reprinted in Chmielewski (2009), pp. 297-316.

   "VIII. Some logical aspects of the problem of 'similarity and difference'.

   I briefly alluded to the problem of 'similarity and difference' in connection with a Mohist fragment discussed for another reason in the preceding section, cf. *RO* XXX, 1; p. 42 and footnote 25.[*] In the present chapter I propose to deal at some length with this problem which itself constitutes an important topic of the Mohist dialectics and which is also not without practical implications for the interpretation of some passages in pre-Han texts of non-Mohist origin. As a matter of fact, it may safely be assumed that the notions of 'similarity' (*t'ung*) and 'difference' (*i*) had been widely — but arbitrarily and rather vaguely — used in some philosophical circles, especially among the Taoists and the non-Mohist dialecticians, some time before the compilation of the Mohist 'dialectical chapters', and that the Mohists must have taken these notions from outside their own philosophical tradition(1). Then, in line with their rationalist trend of thought and probably in response to the confusion arising from the use and misuse of these notions by non-Mohist philosophers, the Mohists themselves restated the problem of 'similarity and difference' in their own terms and gave it a prominent place in their dialectical method. Unfortunately, some of the surviving Mohist fragments dealing with (or alluding to) the *tung-i* problem are obscure because of their terseness or corruption (or both) — while others must have been entirely lost from the *textus receptus* (cf. infra, p. 128) — and we are bound to say that the Mohist standpoint together with the specific role of 'similarity and difference' within the whole of the Mohist dialectics cannot be safely reconstructed in detail(2). But on the other hand, some of the fragments concerned, especially those in the 'canonical' chapters, are of such a clarity as to permit us to deal with them in terms of

formalisation. In other words, some of the Mohist ideas about 'similarity and difference' can be safely reconstructed without too much speculation and at the level of formalisation at that, — and these, fragmentary and incomplete as they are, appear to constitute an important Mohist contribution to the elucidation of the notions involved. Furthermore, it appears that the results arrived at through the analysis of the Mohist fragments in question, together with the exegetical notes on the *t'ung-i* problem by some later (pre-T'ang and T'ang) commentators, can throw a new light on the rather obscure non-Mohist passages involving this problem. Accordingly, in the present chapter I am going to deal, first, with the problem of 'similarity and difference' as can be seen in the Mohist fragments (that is, the 'canonical' chapters and, to a lesser extent, the *Ta-ts'ii* chapter of the *Mo-tsi*); second, in connection with the results arrived at in the first part I will try to solve the still controversial problem of Huei Shi's 't'ung-i paradox' recorded in *Chuang-tsi* XXXIII. The discussion of these main topics, however, must be preceded by a few semantic and linguistic considerations on the Chinese terms involved and on the very notions of 'similarity' and 'difference' as well." (pp. 297-298 of the reprint)

(1) There is no mention of or allusion to the *t'ung-i* problem in the extensive body of the *Mo-tsi* except for its (later) dialectical chapters.

(2) Some purely conjectural and far-fetched interpretations of 'similarity and difference' in the Mohist dialectics will be referred to later.

[*] footnote 25: "Fot the time being, cf. the best extant account of the *t'ung-i* problem in GFUng-Bodde, *Ahistory of Chinese Philosophy*, I pp. 262-265)

Reprinted in Chmielewski (2009), pp. 317-338.

"VIII. Some logical aspects of the problem of 'similarity and difference'(*Continued*).

"The main conclusion of the present discussion is clear: the Mohists must have been at a complete loss if they ever tried to deal with class similarity in a way parallel to the one they so successfully resorted to in the case of class difference, and this time their confusion must have been due not only to the limitations imposed on them by the structural and idiomatic peculiarities of their ordinary language, but also to the logical aspect of the problem itself. This also explains why the second definition of class similarity has been omitted from my previous account. Even if in the case of difference the Mohists emphasised the 'feature aspect' of their problem (and in this case they could do so for both linguistic and logical reasons), their intuitive concept of class similarity mufet necessarily have been connected with the 'identity aspect' rather than the hopelessly confused 'feature aspect' of this particular problem." (pp. 336-337 of the reprint)

10. ———. 1979. "Concerning the Problem of Analogic Reasoning in Ancient China." *Rocznik Orientalistyczny* no. 40:64-78.

    Reprinted in Chmielewski (2009), pp. 339-352.

    Review article of John S. Cikoski, *On Standards of Analogic Reasoning in the Late Chou,* "Journal of Chinese Philosophy" II/3, 1975; pp. 325-357.

    "Probably all sinologists agree that reliance on analogy, whatever this may mean, constitutes one of the salient features of the philosophical thinking of the Chinese. On the other hand, the problem itself has so far not been investigated beyond a few occasional contributions(1), and even the very notion of analogy which is implied in statements about the 'analogical thinking' of the Chinese remains vague. Cikoski's original and stimulating paper is, in fact, the first attempt to deal more thoroughly with analogy and its role in Chinese thought of the Late Chou period, and as such it deserves careful attention. It is most unfortunate that the author's unconventional approach to the problem together with the unnecessarily involved presentation of his contentions make the paper hard reading and are likely to deter many sinologists from giving it the attention it deserves.

The paper has two different levels which should be clearly distinguished. The first of these, which I shall call methodological, is concerned with the author's own mathematical conception of analogy. The second is sinological in the sense that it is intended to constitute an application of the author's theoretical ideas to Chinese source materials. In my opinion, both these levels call for critical remarks.

Roughly one third of the paper deals with the author's conception of analogy, according to which a concept is "the sort of entity called Boolean algebra" (p. 355, footnote 2)(2) and an analogy between concepts is "a homomorphism between Boolean algebras" (*ibid*.). Cikoski also claims "to have demonstrated the mathematical possibility of a calculus of analogies quite independent of, and quite equivalent to, a calculus of propositions" (*ibid*.). As can be seen from these quotations, it would be better for the methodological part of the paper to be reviewed by a professional mathematician rather than a sinologist. It is only fair to emphasize that my remarks concerning the methodological level are merely those of a sinologist who cannot claim competence in what Cikoski calls "a rather abstruse and quite recently-developed branch of modern mathematics" (p. 351)." (pp. 339-340 of the reprint, anote omitted)

11. ———. 1979. "Quantification Logic and Chinese Grammar." In *A Semiotic Landscape: Proceedings of the First Congress of the International Association for Semiotic Studies, Milan 1974*, edited by Chatman, Seymour, 382-383. The Hague: Mouton.

"As a sequel to my earlier papers concerned with the logical analysis of Chinese, I propose to deal with the problem of how Quantification Logic (QL) operates in Classical Chinese (CC), that is, the written Chinese language of the pre-Christian and early Christian era. For obvious reasons only explicit quantification, that is, actual lexical units which correspond to

a logical quantifier (Q), whether universal (U) or existential (E), and syntactic constructions which contain such explicit Q-terms are considered." (p. 382)

(...)

"Conclusions. The grammatical procedures of quantification in CC constitute a very close 'natural' counterpart to the classical bivalent QL, and an adequate 'quantification grammar' for Chinese must necessarily be based on that part of the logical calculus. This, of course, runs against the traditional opinion that the Chinese language is 'illogical'." (p. 3838)

14. Concerning the problem of analogic reasoning in ancient China [Review article] (1979) 339-352.

"The present volume of the series „Prace Orientalistyczne” contains selected papers on ancient Chinese language and logic by JANUSZ CHMIELEWSKI (1916-1998), an eminent Polish Sinologist and linguist, professor of the University of Warsaw. The selection covers all main contributions of Professor Chmielewski.

All papers are reproduced from the originals published in the journal *Rocznik Orientalistyczny*.

The volume is divided into two parts. In the first part, the Editor gathered five most important papers of Professor

Chmielewski on ancient Chinese language, including his “The typological evolution of the Chinese language” from 1949. In the second part, on ancient Chinese logic, the reader will find the complete set of Professor Chmielewski’s “Notes on early Chinese logic” I-VIII, which won him acclaim of the academia, and, in addition, a paper on the problem of analogic reasoning in ancient China." (From the Editor's Preface)

13. Chong, Chaehyung. 1999. "The Neo-Mohist Conception of "*bian*" (Disputation)." *Journal of Chinese Philosophy* no. 26:1-19.

    Abstract: "In this paper, I challenge previous attempts to allocate Neo-Mohist *bian* into either an art of inference or an art of description. I claim that Neo-Mohist *bian* has both aspects of inference and description. Theories of *lei*[b] (classification, kinds) play a central role in such an interpretation. In this regard, an interpretation emphasizing one aspect without the other fails to catch the real nature of Neo-Mohist *bian*."

    "1. *General Conception of Bian in Ancient China*

    Bian[a] in Classical Chinese literally means both 'fluency in language' and 'discrimination'. Therefore in its ordinary use, it is interchanged with the term *bian*[c] (discrimination). However, in Classical Chinese philosophy especially in the 4th and 3rd centuries B. C., *bian* is a technical term to refer to an art of disputation or argumentation. As the *zhouli*[d] (the rituals of Zhou dynasty), which had been regarded as the received moral system, weakened at that time, most Chinese philosophical schools freely participated in heated disputations in order to defend their respective moral claims and defeat rival claims." (p. 1)

14. ———. 2013. "Xunzi’s Sanhuo (Three Types of Cognitive Delusions)." *Journal of Chinese Philosophy* no. 39:424-435.

    Abstract: "This article explicates Xunzi’s three types of cognitive delusions in *Xunzi’s Zhengming Pian*. The followings are my conclusions: first, general names such as “a white horse,” “a horse,” “a thief,” and “a

man" are thought of as proper nouns because the classic Chinese theory of language concerned pragmatics rather than semantics.

Second, classic Chinese epistemology does not address conceptual (logical) knowledge or knowledge based on argumentation distinguished from the art of description.Third, Gongsun Long believes in an extreme form of one-name-one-thingism. Fourth, Neo-Moists' theory of inference is based on intensional contexts. Fifth, Hui Shi's position presupposes the art of knowing objects before any verbal expression and suggests the arbitrariness in the expressions of known objects. Sixth, Xunzi's logic and semantics are extensional. "

15. Chong, Kim-chong. 2006. "Metaphorical Use versus Metaphorical Essence: Examples from Chinese Philosophy." In *Davidson's Philosophy and Chinese Philosophy: Constructive Engagement*, edited by Mou, Bo, 229-246. Leiden: Brill.

"In the present essay, I shall do the following. First, I develop further thoughts about Davidson's view of metaphor. In one respect, Davidson's conception of metaphor is too narrow. Davidson stresses that a metaphor cannot be paraphrased wholly without remainder.

But this conception is unnecessary to Davidson's position, because it easily leads to an essentialist view of metaphor, one that holds that there must be an inherent meaning to metaphor. At the same time, however, Davidson maintains that the way to understand metaphor is through its use, not through the idea of its meaning. This claim liberates us from the narrow conception, which includes what I shall refer to as essentialist conceptions of metaphor. Thus, the second thing I shall do in this essay is to argue against such essentialist conceptions and their application to the understanding of some aspects of Chinese philosophy. I have already discussed one such conception in my earlier essay on the *Zhuang-Zi* [*], namely, Robert Allinson's.

While I shall briefly repeat what I have said there, the main focus of the present paper will be a more extended discussion of the Lakoff and Johnson model. In particular, I shall discuss the

application of the model by Edward Slingerland to philosophical texts such as the *Zhuang-Zi,* the *Xun-Zi* and the *Analects*." (p. 230)

16. ———. 2020. "Analogical and Metaphorical Thinking in the *Mencius, Xunzi* and *Zhuangzi*." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 351-367. Cham, Switzerland: Springer.

    "We mentioned D. C. Lau's [*] remarks about the indispensable and wide use of the method of argument by analogy for philosophical problems in the fourth and third centuries BCE in China, to the extent that the Mohist Canons deals with it in some detail. There is therefore a history and a context for debates about these problems.

    We have focused in this essay on debates about human nature and the nature of human agency. Someone unfamiliar with the contexts of debate may not be alert to the arguments, thinking perhaps that a particular writer is only giving a lively description with his analogies. For instance, someone who reads Zhuangzi's fanciful description of the heart-mind in the Qiwulun without an understanding of the Confucian model of the heart-mind as ruler will miss the critical nature of his description. Similarly, there is a critical context for Xunzi's distinction between capacity and ability as seen in the light of Mencius's statements about their equivalence in terms of an organic model of the heart-mind." (p. 367)

17. Chunpo, Zhang, and Jtalong, Zhang. 1997. "Logic and Language in Chinese Philosophy." In *Companion Encyclopedia of Asian Philosophy*, edited by Carr, Brian and Mahalingam, Indira, 562-575. New York: Routledge.

    "To sum up, logical investigations in ancient China achieved excellent results. Chinese logic runs parallel to Greek and to Indian logic, and so is one of the three great traditions of logic

in the world. On the other hand, we must recognize that Chinese logic did not develop after the Warring States Period. *Hetuvidyā* (Indian syllogistic logic) spread to China in the sixth century, but research in *hetuvidyā* declined before long. The underlying causes of the lack of development of Chinese logic were that the feudal rulers enjoyed cultural autocracy, which strangled the development of logic, and that the Chinese written character is not alphabetic so it is difficult to introduce logical variables in Chinese.

Classical logic spread to China in the seventeenth century, and modern logic in 1920. Now there is a contingent of modern logicians in China." (p. 575)

18. Cikoski, John S. 1975. "On Standards of Analogic Reasoning in the Late Chou." *Journal of Chinese Philosophy* no. 2:325-357.

    Abstract: "A theory of analogic reasoning is established in which concepts are equated with boolean algebras and analogies with homomorphisms. The functional equivalence of analogic reasoning thus defined to propositional logic is shown. Chinese philosophers of the late Chou are shown to have been well acquainted with the rules governing the rigorous use of analogic reasoning."

19. Cua, Antonio S. 1985. *Ethical Argumentation: A Study in Hsün Tzu's Moral Epistemology*. Honolulu: University of Hawaii Press.

    "This study is a philosophical reconstruction of an aspect of Hsün Tzu's ethical theory by way of an attempt to set forth a Confucian conception of argumentation. After presenting a profile of the fundamental elements of ethical argumentation (Chapters 1 and 2), I turn to the problems of ethical reasoning and the use of quasi-definitional formulas for explanation of meaning and enunciation of standards for assessing ethical judgments (Chapter 3). The study concludes with a discussion of Hsün Tzu's diagnosis of erroneous ethical beliefs, as exemplified in different types of linguistic confusions (Chapter 4)." (Preface, p. XIII)

    (...)

"Hsün Tzu's essay "Rectifying Terms"[*] (*cheng-ming pen*) is justly considered a work of "great logical interest,"(1) because, in this essay, one finds a remarkably modern concern with such topics as the rationale for having terms, the empirical and pragmatic bases for the classification of terms, the formation of generic and specific terms, the importance of observing established linguistic practices, the necessity of complying with proper standards for the institution and ratification of the uses of language (*chih-ming*), the nature of argumentative discourse (*pien-shuo*), and the problems inherent in successful linguistic communication. A careful examination of some passages in other essays also suggests an awareness of the distinction between deductive, inductive, and analogical inferences." (p. 1, a note omitted)

Abstract: "This essay is meant to shed light on a discourse that spans centuries and includes different voices. To be aware of such trans-textual resonances can add a level of historical understanding to the reading of philosophical texts. Specifically, we intend to demonstrate how the notion of the ineffable Dao 道, prominently expressed in the Daodejing 道德經, informs a long discourse on incongruent names (*ming* 名) in distinction to a mainstream paradigm that demands congruity between names and what they designate. Thereby, we trace the development of the idea of the ineffable Dao quite differently from modern mystical interpretations. We show how, in an early Chinese context, it first gives rise to a

sociopolitical critique of the incongruity underlying socially constructed names in the Zhuangzi 莊子, then to a discourse on the incongruity between moral virtues and names in Xuanxue 玄學philosophy, and eventually to Sengzhao's 僧肇claim that a perceived congruence of names with things does not entail actual congruence between names and reality."

21. Daor, Dan. 1974. *The Yin Wenzi and the Renaissance of Philosophy in Wei-Jin China*, London.

    Unpublished Ph.D thesis available at https://eprints.soas.ac.uk/33991/1/11015786.pdf

    Abstract: "This thesis is an attempt to bring together three main themes: 1.The authorship of the YWz. 2. The renaissance of philosophical activity in Wei-Jin China.And 3. Problems related to the Chinese view of "naming" and the relation of words to things.

    The first part deals exclusively with the dating of the YWz and reaches the conclusion that the beginning of the third century A.D. is the most likely date. Seen against the philosophical background of the period the importance of the YWz is made clear, and the book id shown to be the work of an original and independent philosopher .A comparison is drawn with other books of the time, mainly Wang Bifs LWL, and its theory of "names and shapes" is discussed.This is shown to be a major step in the elucidation of the Confucian dictum on the "correct use of names" and the articulation of the pre-Han "names and actualities" problem.Together with the distinction between names and referers serves to clarify the question of "words and meanings" which leads to an interpretation of Wang Bi's LWL. The third and fourth chapters are translations of the YWz and the LWL respectively."

    YWz = Yin Wenzi

    LWL = Laozi weizhi lilue

22. De Reu, Wim. 2006. "Right Words Seem Wrong: Neglected Paradoxes in Early Chinese Philosophical Texts." *Philosophy East and West* no. 56:281-300.

"Well-known versus Neglected Paradoxes

Almost all well-known early Chinese paradoxes can be found in a mere three chapters of literature. They appear in short lists compiled by intellectual opponents. First, the chapter "Tianxia" (*Under heaven*) of the *Zhuangzi* gives a description of the philosophies of some Warring States thinkers and ends with a discussion of the thought of Hui Shi. The author of this chapter enumerates ten paradoxical statements ascribed to Hui Shi, followed by a list of twenty-one paradoxes used by the *bianzhe* (disputers) in debate with Hui Shi. Further, the chapter "Zhengming" (Rectifying names) of the *Xunzi* presents a threefold classification of paradoxes.

It includes, among others, paradoxes propounded by the Later Mohists as well as by Song Xing, Hui Shi, and Gongsun Long Finally, another chapter of the *Xunzi*, "Bugou" (Nothing indecorous), attributes a short list of five paradoxes to Hui Shi and Deng Xi." (p. 281, Chinese text and notes omitted)

(...)

"There is no reason to suppose that the number of ancient Chinese paradoxes is limited to the statements found in the ready-made lists. Scrutinizing the early philosophical writings, one readily discovers that quite a few paradoxes appear outside these lists. In contrast to their more famous counterparts, these paradoxes are often found embedded in their original contexts. While this contextual information opens the way to a better-founded interpretation, up to now the paradoxes have been marginalized and treated in an unsystematic way that does not take into account the immediate contexts in which the paradoxes are uttered. As a result, these paradoxes constitute a relatively new field of study. The present article makes a first attempt in exploring this field of neglected paradoxes." (p. 282)

23. Dubs, Homer H. 1956. "Y. R. Chao on Chinese Grammar and Logic." *Philosophy East and West* no. 5:167-168.

"Professor Y. R. Chao's "Notes on Chinese Grammar snd Logic" (1) demonstrate to Occidental philosophers that much of their logic is merely a restatement of what is implicit in the grammar

of the Indo-European languages spoken by these logicians. Since the languages spoken in Europe and America are genetically related, all possess fundamentally similar grammatical characteristics. Hence, Occidental logicians, who know only Indo-European languages, have come to think of these grammatical characteristics as necessary in any logical reasoning. If these logicians had also spoken an African or non-Aryan Asiatic language, they might have reached quite different conclusions." (p. 167)

(...)

"The conclusion appears inescapable that language has played a very large part in philosophy, and that the characteristics of Indo-European languages have been determinativein the formation and development of certain features in symbolic logic and in European philosophy, since thinking follows the patterns of speech and its grammar. How, then, can those who speak only Indo-European languages formulate a philosophy that will avail for non-Indo-EuropeaN speaking peoples?" (P. 168)

24. Duyvendak, J. J. L. . 1924. "Hsün-tzŭ on the Rectification of Names." *T'oung Pao* no. 23:221-254.

"The 16th chapter of the work known as *Hsün-tzü* which forms the 22nd book, is called *Cheng-ming- p'ien* "On the rectification of names", or, as it might perhaps be better rendered, "On the correct use of terminology"." (p. 221, Chinese terms omitted)

(...)

Hsün-tzü would not have been a Chinese philosopher, had not ethics held his primary interest. Yet, as one of the few attempts to found a Chinese logic, his chapter deserves our attention. More than once, it seems to me, he surprizes us by remarkable definitions. His view as to the origin and the nature of language, his theory of knowledge, his attempt to establish classifications, to fix individuality, and even the end of the chapter, which shows that only a mind which is free from the

bias of uncontrolled desires can find truth, - and with it, happiness -, are well worthy of consideration. As Hu Shih has pointed out [*], it is a matter of great regret that these beginnings of logic, attempted by *Hsün-tzü*, the Neo-Mohists and some others, have not been continued. The history of Chinese thought might then have been very different from what it is now." (pp. 223-224)

25. Feng, Cao, and Harroff, Joseph E. 2008. "A Return to Intellectual History: A New Approach to Pre-Qin Discourse on Name." *Frontiers of Philosophy in China* no. 3:213-228.

    Abstract: "Discussions of name {*ming*) during the pre-Qin and Qin-Han period of Chinese history were very active. The concept *ming* at that time can be divided into two categories, one is the ethical-political meaning of the term and the other is the linguistic-logical understanding. The former far exceeds the latter in terms of overall influence on the development of Chinese intellectual history. But it is the latter that has received the most attention in the 20th century, due to the influence of Western logic. This has led to the result of a bias in contemporary studies of *ming*. Changing course by returning to the correct path of intellectual history can providing an objective and thorough ordering of pre-Qin discourse on *ming*."

26. Feng, Youlan (Fung Yu-lan). 1947. *The Spirit of Chinese Philosophy*. London: Kegan Paul, Trench, Trubner & Co.

    First Chinese edition 1947; second edition Boston: Beacon Press 1962.

    Translated by E. R. Hughes.

    Chapter III: *The Dialecticians and Logicians* 45-58.

    "The above is an exposition of what we mean by " transcending shapes and features ".[*] In the history of Chinese philosophy, the first philosophy really of this kind of transcendence was the philosophy of the Logicians [*Ming Chia*, lit. Name School), the

title given to the earliest specialists in logic in the fourth and third centuries B.C.

The Ming Chia logicians followed after the Dialecticians (Pien Che) , of whom the greatest teachers were Hui Shih and Kung-sun Lung." (pp. 47-48).

(...)

"Kung-sun Lung also wrote a *Discussion on Chih* (*Universals*) and Things, His main proposition there was, " There are no things which do not entail universals, but a universal is not universal."

Thus things and universals are opposites. He also said, " Heaven and Earth and what it brings into existence are things. A thing is no more than a thing (i.e. a concrete actuality). It is also no less than a concrete actuality. It has a position." {*Ming Shih Lun*.)

To use the terminology of Western philosophy, things are particulars, having position in space and time. A *chih* is a universal, a thing is a particular. A thing may be analysed into a number of universals. It is a number of universals put together.

But a universal cannot be split up into a number of universals.

Therefore, as was said, " There are no things which are not universals, but a universal is not universal." Examine a universal and it is but one universal. Each universal is separate from any other. This is what is said in Kung-sun Lung's " In the world each stands alone and is true." {Chien Pai Lun.)" (p. 57)

[*] " Shapes and features " is a literal translation of Dr. Fung's Chinese, which, it should be noted, is a common term in Chinese philosophy. One's first impulse was to translate by " the phenomenal ". It may be thought that, as " phenomenal " is antithetical to noumenal this is correct. But there is no such antithesis in Chinese philosophy. Further " shapes and features " has a vivid quality of its own ; and who can tell whether some useful train of thought may not arise from the Western reader being reminded that the world of the phenomenal is a world of shapes and features ? (E. R. Hughes.) Note at p. 45.

27. ———. 1948. *A Short History of Chinese Philosophy*. New York: Macmillan.

Edited by Derk Bodde. Reprinted in *Selected Philosophical Writings of Fung Yu-lan*, Beijing: Foreign Languages Press 1991, pp. 191-567.

Chapter 8: *The School of Name*s 80-92.

"The term *Ming chia* has sometimes been translated as "sophists," and sometimes as "logicians" or "dialecticians." It is true th.at there is some similarity between the *Ming chia* and the sophists, logicians,

and dialecticians, but it is also true that they are not quite the same.

To avoid confusion, it is berter to translate *Ming chia* Iiterally as the Schoof of Names. This translation also helps to bring to the attention of Westerners one of the importanr problems discussed by Chinese philosophy, namely that of the relation between *ming* (the name) and *shih* (the actuality)." (p. 80)

Chapter 11: *The Later Mohists* 118-128.

"In the *Mo-tzu,* there are six chapters (chs. 40-45) which differ in character from the other chapters and possess a special logical interest.

Of these, chapters forty to forty-one arc titled "Canons" and consist of definitions of logical, moral, mathematical, and scientific ideas.

Chapters forty-two to forty-three are titled "Expositions of the Canons," and consist of explanations of the definitions contained in the preceding two chapters. And chapters forty-four and forty-five are titled "Major illustrations" and "Minor Illustrations" respectively.

In them, several topics of logical interest are discussed. TIle general purpose of all six chapters is to uphold the Mohist point of view and refute, in a logical way, ilie arguments of the School of Names. The chapters as a whole are usually known as the "Mohist Canons"."

(...)

"The Mohists as well as some of the Confucianists, on the other hand, were philosophers of common sense. Though the two groups differed in many ways, they agreed with one another in being practicaL

In opposition to the arguments of the School of Names, they developed, almost along similar lines of thought, epistemological and logical theories to defend common sense. These theories appear in the "Mohist Canons" and in the chapter titled "On The Rectification of Names" in the Hsün-tzü, the author of which, as we shall see in chapter thirteen, was one of the greatest Confucianists of the early period." (pp. 118-119)

28. ———. 1952. *A History of Chinese Philosophy: Vol. I. The Period of the Philosophers (from the Beginning to circa 100 b.C.)*. Princeton: Princeton University Press.

Translated by Derk Bodde with introduction, notes, bibliography and index. First Chinese edition 1931; first English edition 1937.

"Save for the present added section, the text of this edition remains unchanged from that of the first edition as published by Henri Vetch in Peiping in 1937." *Revisions and Addtions*, [to the second edition] pp. XXI-XXXIV.

Chapter IX: *Hui Shih, Kung-sun Lung and the Other Dialecticians,* pp. 192-220.

"There was one group of philosophers which was known as the School of Names (*ming chia*) by Han scholars, but which during the Warring States period was generally known as the School of Forms and Names (*hsing ming chia*) or as the ' Dialecticians' (*pien che*).

Thus the *Chuang-tzü* (ch. 12) says: "The Dialecticians speak about the ' separateness of hard and white,' as if these could be hung up on different pegs" (p. 144). Again (ch. 33) : " Through such sayings Hui Shih II made a great show in the world, and taught them to the Dialecticians. The Dialecticians in the world were delighted with them .... Huan T'uan and Kung-sun Lung

were followers of the Dialecticians " (pp. 451-452). These quotations are evidence of the prominence of this philosophic group during the period, and of the general application to it of the term, ' Dialecticians. '

The works of the Dialecticians, with the exception of the partially preserved *Küng-sun Lung-tzü,* have all been lost. What we know to-day about the doctrines of Hui Shih and the other Dialecticians is mostly derived from the paradoxes recorded in Chapter XXXIII of the *Chuang-tzü*. These paradoxes represent only the final conclusions arrived at by the Dialecticians, leaving us with no means of knowing the steps of reasoning by which they reached their conclusions. Logically speaking, one and the same conclusion may be arrived at from different premises, so that if we know only the conclusion, it is impossible to know from which of the many possible premises it was reached. Therefore, a strictly historical study of the paradoxes of Hui Shih and the other Dialecticians is impossible, since we are left wholly free to supply our own premises and explanations for these conclusions, quite independent of the ones which were actually used."

Chapter XI: *The Later Mohist School*, pp. 246-278.

29. Fleming, Jesse. 2009. "A Set Theory Analysis of the Logic of the *Yijing*." *Journal of Chinese Philosophy* no. 36:37-47.

The original version of this article was published in *Journal of Chinese Philosophy* 20, no. 2 (Jun 1993): 133–146

"To many Western academic philosophers, the ancient Chinese text known as the *Yijing* (the *Book of Changes*) is merely a mosaic of images arbitrarily arranged, with no discernible “logic.” The novice student of the *I* often feels he is in a dreamlike world, a maze where ordinary canons of reason do not apply. In order to further the demystification begun long ago by the great German sinologues Richard and Hellmut Wilhelm, we may take as our point of analytic entry into the *I* the question, “In what ways do the *I*’s logical structure and implied logical postulates conform/contribute to modern theories of modal logic, multi-value logic, and set theory?”(1) Our initial methodological premise will be that, as the *I* is a

unique blend of proto-Confucian and proto-Daoist ideas, the logic of the *I* incorporates many of the alogical axioms and assumptions that permeate Daoist thinking. By elaborating on the "Taoistic logic" found in the *I*, and by comparing it with Western set theory, modal logic, and so on we may clarify the profound, but obscure, philosophy of the *I* by identifying some interesting parallels and paradigms shared by the ancient *Yijing* and modern Western philosophy of logic; we may even discover that the *I*'s logical structure offers something new to Western theorists of logic." (p. 37)

(1) Following Wilhelm, I will use "*I*" as the phonetic transliteration of (rather than the common alternative *yi*); also following Wilhelm, I will frequently abbreviate *Yijing* as simply *I*, as this is what the Chinese commentaries themselves do; and finally, I will usually cite the Wilhelm/Baynes translation (with accompanying page reference to the English text published by Princeton University Press, 1978—for ease of reference), unless I think their translation is misleading, in which case I note that the translation is mine.

30. Forke, Alfred. 1902. "The Chinese Sophists." *Journal of the North China Branch of the Royal Asiatic Society* no. 34:1-100.

"In the 4th and 3rd centuries B.C. we can distinguish five different schools of thought in China. Their founders are Confucius, the moralist and ritualist, Chuang Tse, the mystic and pantheist, Mê Ti, the philanthropist and optimist, Yang Chu, the Epicurean and pessimist, and the sophists Hui Shih and Kung Sun Lung(1). The two latter schools must have had a very ephemeral existence. They left scarcely a trace behind them(2). Of the three former that of the Mihists [Mohists] for a long time held its own against the orthodox school of Confucius which at last succeeded in supplanting it.

The technical Chinese term for Sophist is pien shih, literally a disputant, a debater, a controversialist." (p. 6)

(...)

"In the interesting catalogue of ancient works contained in the *Han-shu* [Cap. XXX] the sophists are very appropriately classed together with the Dialecticians(3) of which altogether seven are enumerated : Têng Hsi, Yin Wên Tse, Kung Sun Lung Tse, Chêng Kung Shêng, Hui Tse, Huang Kung, and Mao Kung. The works of the three first-named are still extant, the others lost. Of these dialecticians Têng Hsi, Kung Sun Lung, Hui Tse, and perhaps Mao Kung, are looked upon as sophists. Mao Kung is said to have lived contemporaneously with Kung Sun Lung, of whom I am going to speak more in detail, and to have professed very similar views. Of Cheng Kung Shêng and Huang Kung we learn that they flourished about the time of Li Sse, the famous minister of Chin Shih Huang Ti [C. B.C. 208]. Huang Kung was a great scholar in Ch'in and wrote poetry which was incorporated in the Collection of Poetry of the Ch'in dynasty published in the Han dynasty." (p. 8)

2 On Yang Chu [cf. my paper in the *Transactions of the Peking Oriental Society*, Vol. III, No. 3].

(3) Mayers' rendering of [Manual, p. 343] as the school of writers on official station is not correct. The discussions of the dialecticians have a much wider scope than official station, which, it is true, is very frequently touched upon by them.

31. Fraser, Chris. 2003. "Introduction to Graham, Later Mohist Logic, Ethics and Science." In, XVII-XXXIV. Hong Kong: Chinese University Press.

Introduction to the reprint of 2003.

"A. C Graham's *Later Mohist Logic, Ethics and Science* was a landmark in the study of classical Chinese thought. By far the most thorough, discipJined, and systematic reconstruction and interpretation of the later Mohist texts ever published,

Graham's work opened up new vistas in the study of ancient Chinese philosophy and science." (p. XVII)

(...)

"In praising Graham's many interpretive achievements, I have been focusing on the numerous details of his account lhat are convincing or clearly make so!id contributions to our understanding of the later Mohists.

I have not yet mentioned the most prominem aspect of his interpretive work. his account of the overall aims of the text and the fundamental nature of later Mohist ethics. semantics, logic. and epistemology.* This, unfortunatelv,, must be considered the area in which further study is least likely to corroborate his conclusions." (p. XXIV)

* For a concise, accessible summary of Graham's interpretation, see pp. 137-170 of his *Disputers of the Tao* {Open Court, 1980). much of which is a revised version of *Later Mohist Logic* § 1.1. Students of the canons should note that Graham there modifies his interpretation of Canons A 50 and A 51 {see pp. 142-143 where the canons labeled A 40-41 are in fact A 50-51).

32. ———. 2007. "Language and Ontology in Early Chinese Thought." *Philosophy East and West* no. 57:420-456.

"In *Language and Logic in Ancient China* (1983), Chad Hansen proposes that the semantics of Classical Chinese nouns is similar to that of English mass nouns, a view he calls the "mass noun hypothesis."

(...)

"In this article, I review critical responses to Hansen and present a new critique of my own."

(...)

"Section 2 summarizes the two-core interpretive hypotheses that Hansen presents in chapter 2 of *Language and Logic* and distinguishes them from two distinct, less plausible claims with which they are run together. The next two sections lay the groundwork for my subsequent arguments by explaining the

distinction between word class and word function (section 3) and clarifying key features of mass nouns and their semantics (section 4). Section 5 presents and evaluates Hansen's argument from mass nouns, concluding that it is unsound. Sections 6 and 7 review critical responses to Hansen, attempting to clear up several misunderstandings and clarify where his critics were on the mark and where not. Section 7 also briefly rebuts two competing accounts of the nature of Classical Chinese nouns. Section 8 summarizes the Mohists' and Xunzi's accounts of the relation between things and the kinds to which they belong, showing that the considerations Hansen cites in fact play no role in their theories. Section 9 reviews textual evidence for attributing mereological views to early Chinese thinkers, concluding that the evidence is limited but credible." (pp. 420-421)

33. ———. 2007. "More Mohist Marginalia: A Reply to Makeham on Later Mohist Canon and Explanation B 67." *Journal of Chinese Philosophy and Culture* no. 2:227-259.

    Abstract: "A new interpretation is presented of Mohist Canon and Explanation B 67 that clarifies the grarnrnar and significance of these difficult passages while critiquing and building on previous work by Graham, Hansen, and Makeham. A novel feature of the interpretation is that it reads a pair of verbs in the second sentence of the Explanation putatively, instead of declaratively. A consequence of the interpretation is that on the Mohist theory of disputation (*bian*), it is undecidable whether a fusion (*jiān*) of two things falls within the extension of the term for either constituent of the fusion. The Mohists' view seerns motivated by an irnplicit attitude that, although a fusion of two kinds of things can be regarded as a single object, it nevertheless fundamentally remains a sum of different kinds of objects. Canon and Explanation B 67 thus irnplicitly place a lirnitation on the Mohist's conception of a fusion (*jiān*) and highlight a conceptual gap in their theory of disputation."

34. ———. 2009. "The Mohist School." In *History of Chinese Philosophy*, edited by Mou, Bo, 137-163. New York: Routledge.

"The Mohist school was among the most influential philosophical and social movements of pre-Han China. It was devoted to practicing and promulgating the teachings of a man named Mo Di (墨翟) (fl. ca 430 BCE), who became known as Mo Zi (墨 子), or Master Mo. Mo Zi and his followers were the originators of philosophical argumentation in China." (p. 137)

(...)

"The first two sections of this essay sketch the historical background to and sources for Mohist thought. Section 4 summarizes the ten doctrines that make up the heart of the Mohists' reform agenda. Section 5 describes the fundamental aim and orientation of their social and philosophical project. Sections 6 and 7 introduce their political and ethical theories, while the next two sections give a brief overview of their epistemology, philosophy of language, and logic. The concluding section describes the decline of the Mohist movement during the Qin and Han dynasties. (p. 138)

(...)

"9 Language and Logic

The Mohist *Dialectics* presents a naturalistic semantic theory on which referential relations between general terms and objects are explained by speakers' associating names (*ming*, words or terms) with kinds (*lei*) of similar things. As in the *Analects* of Confucius, the other parts of the Mo-Zi, and the Xun-Zi, theoretical attention focuses on the issue of applying names to things correctly, and not on the structure or truth of sentences. Unlike traditional Western theories of language, such as Lockean conceptualism, the Mohists do not explain the relation between language and the world by appeal to mental ideas or meanings that words stand for. Instead, speakers communicate by mastering practices for distinguishing the referents of names for various things. By virtue of these practices, members of the same language community know that each general term stands for all similar things of a certain kind." (p. 158)

35. ———. 2012. "Truth in Mohist Dialectics." *Journal of Chinese Philosophy* no. 39:351-368.

    Abstract: "The article assesses Chad Hansen's arguments that both early and later Moist texts apply only pragmatic, not semantic, terms of evaluation and treat "appropriate word or language usage," not

    semantic truth. I argue that the early Moist "three standards" are indeed criteria of a general notion of correct *dao* 道(way), not specifically of truth. However, as I explain, their application may include questions of truth. I show in detail how later Moist texts employ terms with the same expressive role as ". . . is true." Thus, *contra* Hansen, the Moists can justifiably be said to have a concept of semantic truth."

36. ———. 2013. "Distinctions, Judgment, and Reasoning in Classical Chinese Thought." *History and Philosophy of Logic* no. 34:1-24.

    Abstract: "The article proposes an account of the prevailing classical Chinese conception of reasoning and argumentation that grounds it in a semantic theory and epistemology centered on drawing distinctions (*biàn*) between the similar and dissimilar kinds of things that do or do not fall within the extension of 'names' (*míng*). The article presents two novel interpretive hypotheses. First, for pre-Hàn Chinese thinkers, the functional role associated with the logical copula is filled by a general notion of similarity or sameness (*tóng*). Second, these thinkers' basic explanation of reasoning is that it is a process of moving from a comparison of whether something is similar to a 'model' or 'standard' (*fˇa*) to a judgment about whether that thing is part of a certain kind (lèi). Classical texts treat judgment as the attitude of predicating a 'name' of something, or, equivalently, of distinguishing whether something is the kind of thing denoted by a certain term. Reasoning is treated as a process of considering how some acts of term predication, or drawing distinctions, normatively commit one to making further, analogous predications or drawing further, analogous distinctions. Inference is thus understood as the act of distinguishing something as a certain kind of thing as a result

of having distinguished it as similar to a relevant ‘model’ or ‘standard’. The article concludes by summarizing the consequences of the proposed account of early Chinese semantic and logical theories for the interpretation of other areas of classical Chinese thought."

37. ———. 2016. "Language and Logic in the Xunzi." In *Dao Companion to the Philosophy of Xunzi*, edited by Hutton, Eric L., 291-321. Dordrecht: Springer.

    "The Xunzi is among our most valuable sources for early Chinese philosophy of language and logic. Xunzi’s views on language and dialectics are of great interest in their own right, but they also form an integral part of his broader ethical, political, epistemological, and metaphysical theories.

    (…)

    Xunzi’s semantic and logical theories are largely consistent with those of the path-breaking Mohist “Dialectics,” (2) suggesting that their shared features, along with those of relevant discussions in the Confucian *Analects* and *The Annals of Lü Buwei*, represent the prevailing, mainstream approach to language and logic in classical China. Xunzi adopts much the same conceptual apparatus as the Mohists but develops and extends it in several respects. His semantic theory in particular complements the Mohist treatment by filling an important explanatory gap concerning the basis for kind distinctions and by helping to resolve certain conceptual puzzles that emerge from Mohist thought. This semantic theory is intertwined with a theory of perception that presents an intriguing counterpart to representational theories familiar from the Western tradition. Xunzi’s views on language and logic present interpretive and justifi catory problems of their own, however, which as we will see are in some respects indicative of fundamental diffi culties in his ethical and political philosophy." (pp. 281-292)

    (2) The Mohist “Dialectics” (“Mo Bian”) are six books of the Mozi that present an extensive treatment of language and logic, among other topics. For detailed discussions, see Graham (1978), Hansen (1992), or Fraser (2005a).

Chapter 2: *Epistemology and Logic: Drawing Distinctions,* pp. 49-76.

"Mohist epistemology is also of special interest as part of an intriguing network of views on language, mind, and action that constitute a shared background for much classical Chinese thought. This epistemology had a major influence - both as a constructive resource and as a target of criticism - on other classical schools of thought, especially those represented in the *Xúnzǐ*, a collection of Ruist writings, and the *Zhuāngzǐ,* an anthology of Daoist texts.

This chapter presents an interpretation of early Mohist epistemology and logic and explains how their assumptions in these areas shape their ethics and psychology. For brevity, the chapter treats only the "Triads" and "Dialogues."(2)

I argue that Mohist epistemology and logic are built around four core notions: *shì* ("this" or "right") versus *fěi* ("not" or "wrong"), *biàn* (drawing distinctions), and *fǎ* (models). I first introduce these basic notions and then discuss how the Mohists apply them to treat knowledge and reasoning." (p. 50)

39. ———. 2020. "Paradoxes in the School of Names." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 285-307. Cham (Switzerland): Springer.

"Any discussion of early Chinese paradoxes must acknowledge a pair of important caveats. First, since the extant sources provide little or no context for most of the paradoxes, interpretation is often partly conjectural and in some cases highly speculative. Accordingly, I will try to make explicit which aspects of the interpretations presented here seem well grounded and which are open to doubt. Second, unsurprisingly, given the obscurity of the texts, for any one paradox a plurality of divergent interpretations can be found in the literature. Indeed, in the case of Gongsun Long, scholars disagree not only about how to interpret the texts but also about which texts to interpret, some researchers accepting all five discourses attributed to Gongsun Long as authentic pre-Han writings, some rejecting half as apocryphal.

This brief survey cannot attempt to do justice to every significant interpretation of each paradox. Instead, I will try to present a coherent set of reasonably plausible interpretations while using the notes and bibliography to call readers' attention to other important readings." (p. 288)

41. ———. 2021. "Realism about Kinds in Later Mohism." *Dao. A Journal of Comparative Philosophy* no. 20:93-114.

    Abstract: "In a recent article in this journal [*], Daniel Stephens argues against Chad Hansen's and Chris Fraser's interpretations of the later Mohists as realists about the ontology of kinds, contending that the Mohist stance is better explained as conventionalist. This essay defends a realist interpretation of later Mohism that I call "similarity realism," the view that human-independent reality fixes the similarities that constitute kinds and thus determines what kinds exist and what their members are. I support this interpretation with a new, detailed account of the Mohist conception of a kind on which kind relations lie in inherent similarities between the intrinsic features of objects. This account distinguishes kind relations from "uniting together" and part-whole relations, both

of which, unlike kind relations, may be determined by convention. I argue that Stephens's critique of realist interpretations fails because it confuses the ontological issue of what determines the existence of kinds with the semantic issue of what fixes the names for kinds."

[*] *Realism and Conventionalism in Later Mohist Semantics*, Dao Vol. 16, 2017, pp. 521–542.

42. ———. 2021. "Representation in Early Chinese Philosophy of Language." *Philosophy East and West* no. 71:57-78.

"For the purposes of this discussion, I will understand linguistic representation as the use of linguistic expressions to stand for objects, situations, or events, "re-presenting" them in the medium of linguistic symbols. Representational content is the property of expressions by which they represent what they do. Representation is intertwined with reference in complex ways. The use of a linguistic expression to refer to something may (partly) determine its representational content, for example, while the content a speech community customarily associates with some linguistic expression may in some contexts determine its reference. The two concepts are distinct, however. Reference is a relation between expressions and objects by which expressions purport to indicate or identify things. This relation provides a means to form linguistic representations, which, as the Mohists would say, "model" things for some audience.

Section 2 below surveys Mohist views about the functions of language as presented in the early Mohist Triads (books 8–37 of the Mozi) and the Mohist Dialogues (books 46–49). The Mohists depict yan 言(statements or utterances) as indeed having a reporting and so probably a representational function. However, the most prominent function of yan for them is its role in guiding conduct. They seem to see reference as fixed at least partly through the use of language to guide action. Speakers who fail to act appropriately in response to utterances demonstrate a failure to grasp the correct reference of the terms they use.

The ensuing section surveys the detailed account of the representational role of language presented in the Later Mohist Canons." (p. 59)

43. Fung, Yiu-ming. 2007. "A Logical Perspective on 'Discourse on White-Horse'." *Journal of Chinese Philosophy* no. 34:515-536.

"With respect to the issue of reference in the book of *Gongsun Longzi*, especially in “Discourse on White-Horse” *(Baima Lun*), there has been no consensus in the field about the logical function of the name, what

kind of reality denoted by the name, and the mode of reference.

However, some of the famous or influential interpretations based on different theoretical considerations for analyzing and explaining the issue in the Discourse can be found in the literature. As I know, there

are at least four representative interpretations which address different opinions on the issue from different perspectives. The first one is Hu Shi’s “Description-Theoretical Interpretation” which seems to be an

application of Bertrand Russell’s theory of definite descriptions, or, more accurately, is an interpretation which is unconsciously based on the theory.The second one is FungYu-lan’s “Realistic Interpretation,” an application of the Platonic “Idea” to the text in a quite consistent way.The third one is Janusz Chmielewski’s “Set-Theoretical Interpretation” which assigns a logician status to Gongsun Long in terms of a

particular notion of set. The last one is Chad Hansen’s “Nominalistic Interpretation,”which is based on a bold hypothesis of mass noun and is considered by him as a replacement of the above three and other

kinds of abstract interpretations.

In the next section I shall discuss the main points of these four old interpretations and demonstrate their theoretical characteristics and difficulties in dealing with the issue inside or outside the Discourse. In

the third section, I shall use the first-order predicate logic to analyze the logical structures of both Gongsun Long's and his opponent's arguments, and then borrow Saul Kripke's and other theorists' direct theory of reference to explain the issue of reference in the Discourse.

Based on these analysis and explanation, I think, I can provide not only a comprehensive and coherent interpretation for the Discourse, but also a solid base for the interpretation and explanation of the remaining chapters in the book of *Gongsun Longzi,* a project of which cannot be done by the old interpretations." (pp. 515-516)

44. ———. 2009. "The School of Names." In *History of Chinese Philosophy*, edited by Mou, Bo, 164-188. New York: Routledge.

"In his treatise entitled 'Lun-Liu-Jia-Yao-Zhi' (論六家要指, On the Essential Ideas of the Six Schools), Sima Tan has classified the thinkers of the preceding centuries into six major schools, including the Yin-Yang school (陰陽 家 Yin-yang-jia), Confucianism (儒家 Ru-jia), Mohism (墨家 Mo-jia), the school of Names (名家 Ming-jia), Legalism (法家 Fa-jia), and Daoism (道德家 Dao-de-jia). In regard to this classification of Sima Tan, modern philologist and historian Hu Shi (胡 適) has rightly demonstrated that it should not be understood as a factual description of reality in history. Nevertheless, I think it is still significant to use this classification as a prescriptive framework to understand the similarities and differences between various thinkers of the pre-Qin China in a sensible and systematic way. A group of thinkers was identified as the school of Names by the scholars of the former Han, but its members had been generally recognized as the school of Forms and Names (刑名之家 Xing-ming-zhi-jia), or as 'sophists', 'disputers', or 'dialecticians' (辯者 Bian-zhe) during the Warring States (戰國 Zhan-guo) period. According to the records in the literature of the Warring States and former Han period, this group includes such main figures as Deng Xi (鄧析), Yin Wen (尹文), Hui Shi (惠施 350–260 BCE), and Gongsun Long (公孫龍 320–250 BCE). With the exception of the partially preserved Gong-Sun-

Long-Zi (公孫龍子), the works of the sophists have all been lost." (p. 164)

45. ———. 2010. "On the Very Idea of Correlative Thinking." *Philosophy Compass* no. 5:296-306.

    Abstract: "This article aims at providing a general picture of the idea of correlative thinking developed by sinologists and philosophers in the field of Chinese and comparative studies, including Marcel Granet, Joseph Needham, A. C. Graham, David Hall and Roger Ames. As a matter of fact, there is no exactly the same view among these scholars when they use the term "correlative thinking" to describe the Chinese mode of thinking; but they all recognize, more or less, the term's implication as "non-logical" or "pre-logical", "non-rational" or "irrational", "intuitive-associative" or "beyond analytic thinking". Based on this presumption, some of them think that there is "irreducibility" from the root level of (correlative) thinking to the upper level of (analytic) thinking or that there is "incommensurability" between correlative and analytic thinking.

    Based on the contemporary philosophy of language and philosophy of mind, especially Donald Davidson's holism of the mental and the principle of charity, I shall argue that the thesis of "prelogical", "illogical" or "non-logical" is self-refuting. I shall also demonstrate that the view of "incommensurability" between correlative and analytic thinking and the thesis of "unanalyzability" of correlative thinking shared by most of these scholars are not well-argued but taken as a primary fact. The conclusion of this article is that there is no thinking by correlation and analogy which cannot be understood in terms of analytic concepts and which can escape from the logical or rational space."

46. ———. 2012. "Introduction: Language and Logic in Later Moism." *Journal of Chinese Philosophy* no. 39:327-332.

    "In this special theme,we have four articles that deal with a set of related topics, that is, definitions,names, truth and reasoning, in later Moism. In terms of philosophical language, different ideas of naming and different definitions of names

and other linguistic entities can be used to express different theses in philosophy." (p. 327)

(...)

"In contrast with the nonanalytic approach in Confucianism and Daoism, later Moism is much more analytic in the sense that the Moists tend to theorize their philosophical arguments with an analytic language. In this special theme, some of the articles will argue that there is a kind of semantic notion of truth and a schematic idea of argument explicitly or implicitly expressed in the text of later Moism.

Moreover, the names and definitions reflectively used in the text also indicate that the language of ancient Chinese philosophy is significantly comparable with that of Western philosophy." (pp. 327-328)

47. ———. 2012. "A Logical Perspective on the Parallelism in Later Moism." *Journal of Chinese Philosophy* no. 39:333-350.

Abstract: "A. C. Graham thinks that the parallelism in the Neo-Moist Canons is about the deduction of sentences. On the contrary, Chad Hansen thinks that they are not plausibly treated as inference of deductive

forms since the later Moists are at pains to show that they can "go wrong." In this article, I shall try to provide a logical analysis and a constructive rather than defeatist interpretation of parallelism in the text. I argue that the Moists tend to express their ideas in the "material mode of speech" to build up their semantic and pragmatic sensibility in philosophical thinking."

"The major aim of this *Dao Companion to Chinese Philosophy of Logic* is to produce a source book for people in the English world to understand the logical thought and logical thinking in China. In this volume, we will comprehensively and analytically introduce the basic logical ideas and theories in Chinese thought for students and scholars who are interested in the field. We also hope it could be helpful for further

studies of Chinese philosophy of logic." (p. 4)

49. ———. 2020. "Logical Thinking in the Gongsun Longzi." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 309-327. Cham, Switzerland: Springer.

    1. Hu Shih's Interpretation and Analysis 309; 2. Fung Yulan's Interpretation and Analysis 314; 3. Janusz Chmielewski's Interpretation and Analysis 317; 4. A New Logico-Philosophical Interpretation 322-326.

    "I think we should elaborate its form as: ~(a = b). This can be proved validly from his premises. Of course, Gongsun Long does not notice very well the distinction between use and mention and thus sometimes uses these words such as "horse," "white" and "white-horse" not to refer to entity but to refer to itself, i.e., to mention the name itself. However, his thesis can be proved to be valid based on his premises whether "white-horse is not horse" means "white-horse is not the same [entity] as horse" or "The name 'white-horse' is not [referring to] the same [thing] as the name 'horse'." The consequence of this arrangement is that the arguments provided by both sides can be formulated in an intelligible way and nothing has to be explained away." (p. 326)

50. ———. 2020. "Introduction: Chinese Philosophy of Logic." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 1-11. Cham, Switzerland: Springer.

    "Comparatists like David Hall and Roger Ames (1995: 230) and Chad Hansen (1985: 492, 1992: 238), are skeptical of the idea that there is a similar kind of logic used or thought by ancient Chinese thinkers. Some others, including Marcel Granet (1934), Joseph Needham (1956: 280), A. C. Graham (in his study of the

thought in Han 漢 dynasty) (1992: 61–2), and also Roger Ames and David Hall (1995: 141), even adopt a thesis of “special mode of thinking” to identify Chinese philosophical thinking. They sometimes use the term “correlative thinking” or “associative thinking” to describe the Chinese mode of thinking. They all recognize, more or less, the term’s implication as “non-logical” or “pre-logical,” “non-rational” or “irrational,” “intuitive-associative” or “beyond analytical thinking.”

(…)

"In contrast, some sinologists and philosophers in the field Chinese philosophy, including Shen Youding 沈有鼎 (1954, reprinted in 1980), Janusz Chmielewski (1962–69, reprinted in 2009), Cheng Chung-ying 成中英 (1965), A. C. Graham (in his study of Later Mohism 墨家) (1978), and Christoph Harbsmeier (1998), have demonstrated that the thinking in most philosophical views and arguments in ancient Chinese philosophy, especially in Later Mohism and the School of Names, is comparable to that in the Western tradition. This view of comparability is counter to the thesis of incommensurability." (pp. 2-3)

51. ———. 2020. "Sentences (Ci 辭, Ju 句) and Propositional Attitudes." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 71-95. Cham, Switzerland: Springer.

    "Although there was no systematic theory of grammar or syntax in ancient China, some philologists or interpreters of ancient classics in the Han 漢 dynasty or earlier did use grammatical devices to recognize or construct meaningful expressions, including full-fledged or condensed sentences. Based on these devices, they were able to identify or make simple sentences or complex sentences for expressing propositional

    attitudes, including expressing beliefs, desires, emotions, judgments and evaluation, etc., in ancient texts. Without using these devices, these scholars cannot understand any meaningful expression in ancient texts and also cannot communicate with each other." (p. 71)

52. ———. 2020. "Reason (*Gu* 故) and Principle (*Li* 理)." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 181-202. Cham, Switzerland: Springer.

    "In addition to the senses mentioned above, there are some other uses of the word [Reason (Gu 故)] with logical significance. One of them is used as a conjunction to connect an expression of a causal factor or an expression of a logical condition (including necessary and sufficient conditions) with an expression of a phenomenon and to treat the former as an explanan and the latter as an explanadum for the whole series of connected sentences. It can be formed as a causal explanation if the explanan is about a causal factor of the explanadum. It can also be formed as a logical explanation if the explanan is about a logical reason of the explanadum. Just like the English words “therefore,” “hence” and “thus,” the Chinese words “gu” and “guyue” 故曰 (so I say that) can be used to make a causal explanation or a logical explanation." (p. 182)

    (...)

"In ancient Chinese texts, the word “li” 理 also have different uses and senses. If it is a verb, it can be used to mean (A) the action of management, adjustment or arrangement.

If it is a noun, it can be used to mean (B) the texture or pattern of a material object such as wood and jade, (C) the property of an object or event, (D) the structure or order of physical events or human affairs, (E) the principle or theory of natural phenomena or human events, and (F) the reasonableness of taking verbal and non-verbal actions." (pp. 187-188)

53. ———. 2020. "Counterfactual Conditionals." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 97-111. Cham, Switzerland: Springer.

"In classical Chinese, I don’t think there is no counterfactual marker or other linguistic device to express counterfactuals which can be used to make counterfactual arguments. In this chapter, I will argue for this point with textual evidence in the coming sections. In this section, I would like to demonstrate that the hypothesis of linguistic relativity together with its consequential thesis of incomparability or incommensurability is

not sustainable." (pp. 99-100)

54. ———. 2020. "Sameness (Tong 同) and Difference (Yi 異)." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 213-231. Cham, Switzerland: Springer.

"In dealing with the topics of *tong* 同 (sameness, similarity or unity) and *yi* 異 (difference, dissimilarity or disunity), Later Mohists’ view is much more sophisticated than other ancient Chinese thinkers’ in the sense that they distinguish different senses of *tong* and *yi,* including the sameness and difference of classes or the similarity and dissimilarity of kinds." (p. 213)

55. ———. 2020. "Reference and Ontology in the Gōngsūn Lóngzi˘." In *The Gongsun Longzi and Other Neglected Texts: Aligning Philosophical and Philological Perspectives*, edited by Suter, Rafael, Indraccolo, Lisa and Behr, Wolfgang, 119-168. Berlin: De Gruyter.

"As a dialectician, Gōngsūn Lóng was famous in his time due to his provocative thesis “white horse is not horse”. As stated in the first chapter of the Gōngsūn Lóngzi˘ 公孫龍子, ‘Collected Notes’ (‘Jìfu˘’ 跡府), “he wished to extend this disputation to rectify names and reality and to spread his influence over the whole world” (欲推是辯以正名實而化天下焉). But his idea of the “rectification of names” (zhèng míng 正名) is basically different from that of the Confucians.

(…)

As I have argued elsewhere,(3) Gōngsūn Lóng’s arguments in ‘An Essay on White Horse’ (‘Báima˘ lùn’ 白馬論) are based on his special theory of reference, which, in turn, is grounded in his special theory of onto-cosmology." (p. 119)

(…)

"To support his arguments for the theses of white horse and hard white, he provides a special theory of reference which is, in turn, supported by a peculiar theory of onto-cosmology. Gōngsūn Lóng’s theories of reference and onto-cosmology in general are revealed in ‘Zhi˘wù lùn’ 指物論 (An Essay on Zhi˘wù), ‘Tōngbiàn lùn’ 通變論 (An Essay on UnderstandingChange), and ‘Míngshí lùn’ 名實論 (An Essay on Names and Reality) and in particular in ‘Jiānbái lùn’ 堅白論 (An Essay on Hard and White). In the remainder of this chapter, I try to give a coherent and comprehensive interpretation and analysis of these essays, which is also consistent with my interpretation and analysis of ‘Báima˘ lùn’." (pp. 121-122)

Bibliography on Language and Logic in Ancient China. Third part Gal - Luc

Studies in English (Gal - Luc)

1. Galante, Davide. 2001. "Classical Logic and Chinese Language Structure." *Metalogicon* no. 14:141-170.

   "Is the Classical Logic, with its bivalency, atemporality, connective interdefinability, acceptance of third excluded law, valid for all the languages, or is it worth only inside the Indo-European group which produced it? Given its connection with the language, how much is it influenced from it? In other words, the formal logic is something dealing with the language, or with a language (or group of languages)?

   The link between thought and language is something that cannot be left out of consideration; as it is said, with every new language you get a new soul. But do we get a new logic too?

   In order to answer our question, we have to compare to a language the most different (structure, grammar, phonetic) from the Indo-European languages which discovered and set the formal logic. As we will see later, the Chinese language is perfect for our purpose, being one of the most representative examples of isolating language." (p. 141)

   (...)

   "I hope I have showed, in this work, a comprehensive view on basic concept and functions of Classical Logic in the Chinese writers (and language). I have tried not to force the quotations in order to get what I was looking for, making, at the same time, myself sure not to violate the rigour of Classical logic.

   No one, I suppose, would dare to say that maths is not transcultural for the difference in writing the numbers in different civilizations. The same, I think, is true for what concerns Logic: there's one Logic, expressed in different ways.

Although grammatical structures may vary (that's why I compared to Chinese Language, cfr. introduction) Logic itself looks exactly the same." (p. 168)

2. Garrett, Mary M. 2001. "Language and Logic in China: A Guide for Argumentation Scholars." *OSSA Conference Archive* no. 34:1-6.

   "In this essay I'll be commenting on a book that should be of special interest to scholars who are interested in argumentation and informal logic in non-Western contexts, that being Christoph Harbsmeier's *Language and Logic in China* (Cambridge: Cambridge University Press, 1998). Harbsmeier notes that China deserves special attention as the only non-Indo-European culture that preserves extensive records of argumentation and of reflections on logic, language, and reasoning, and thus deserves serious study.. Harbsmeier comes highly recommended as a guide here; a professor of Chinese at Oslo University who has written on the Chinese language, he is comfortable with symbolic logic and also is familiar with the Classical Greek philosophical tradition. However, even though Harbsmeier announces on p. 1 that one of his central questions will be "What (if any) were the strategies of argumentation and proof employed by the ancient Chinese?" his approach is actually much narrower, and it will help the sinologically innocent reader to understand why this is so." (p. 1)

   (...)

   "Lastly, let me caution potential readers that although this book appeared in 1998, Harbsmeier did not revise the manuscript after he submitted it in 1989. The work is thus less up-to-date than one might expect." (p. 6)

4. Geaney, Jane. 1999. "A Critique of A. C. Graham's Reconstruction of the "Neo-Mohist Canons"." *Journal of the*

American Oriental Society no. 119:1-11.

"A. C. Graham's *Later Mohist Logic, Ethics, and Sciences* (1978) is the only Western-language translation of the obscure and textually corrupt chapters of the Mozi that purportedly constitute the foundations of ancient Chinese logic. Graham's presentation and interpretation of this difficult material has been largely accepted by scholars. This article questions the soundness of Graham's reconstruction of these chapters (the so-called "Neo-Mohist Canons"). Upon close examination, problems are revealed in both the structure and the content of the framework Graham uses to interpret the Canons. Without a more reliable framework for interpreting the text, it seems best to remain skeptical about claims that the Canons represent evidence for the study of logic in early China."

"In this chapter, I survey a broad range of early Chinese texts to undermine the apparent self-evidence of translating ming as a unit of “language” (or “word”) and its correlates as “reality.” While leaving ming untranslated, I show that ming often functions somewhat like the term “name.” Names point to, pick out, or indicate referents, but names do not have “meanings.” That is, whereas words have a conceptual aspect, names do not. Through emphasizing these distinctions between “word” and “name,” my overview of the usage of ming foregrounds features

of early Chinese philosophical discussions that are unusual in relation to the larger history of philosophy of language and logic. Their special significance lies in the nature of both the unit of analysis (ming) and that of its correlates (shi 實, shi 事, xing 形, xing 行, and shen 身)." (p. 17)

    Abstract: "The happy fish episode from the outer chapters of the *Zhuangzi* poses enormous difficulty for interpreters. While it may appear to surprisingly resemble the dialectic in Western philosophy, any attempt to analyse it in terms of the patterns of

inference familiar to the West is often frustrated by the ostensible queerness that defies such treatment. The following examination of the dialogue in the episode is intended to address the difficulty and to provide a reasoned explanation for both the surface resemblance and apparent queerness. I suggest that the dialogue becomes perfectly intelligible, if it is read against the backdrop of the disputations practiced in ancient China. My contention is that the real purpose of the dialogue is to expose the fundamental unreliability of the logic of the disputers by means of the logic itself."

    "Four presupposed philosophical attitudes toward language are taken to characterize the major Schools of the pre-Han period. These are: 1) emotivism, 2) distinction marking -- the view that language and names, in their descriptive function, divide reality (or the Tao) into parts roughly analogous to distributive individuals, 3) conventionalism, and 4) behavioral nominalism -- that most or all "ordinary" thinking consists of entertaining names or strings of names (sentences). No clear reference to abstract ideas, classes, senses, platonic universals, etc., is found in this period nor is any necessary in understanding and interpreting the major thinkers of the period."

47. ———. 1976. "Mass Nouns and "A white horse is not a horse"." *Philosophy East and West* no. 26 (2):189-209.

    "The most famous paradox in Chinese philosophy, Kung-sun Lung's "White horse not horse" has been taken as evidence of Platonism, Aristotelian essentialism, class logic, etc., in ancient Chinese thought. I argue that a nominalistic interpretation utilizing the notion of "stuffs" (mass objects) is a more plausible explanation of the dialogue. It is more coherent internally, more consistent with Kung-sun Lung's other dialogues, and the tradition of Chinese thought which is usually regarded as nominalistic. The interpretation is also strongly suggested by

striking parallels between all Chinese classificatory nouns and English mass nouns."

    Abstract: "I begin this paper with some autobiographical reflections of my own journey in Chinese languages and philosophy not only in order to demonstrate how Chinese philosophy can change one’s attitudes toward Western philosophy, but also to suggest that the shift in philosophical perspective that occurs—when viewed through a Chinese lens—is reasonable.

    The second half of this paper consists of interpretative hypotheses about the content of Chinese philosophy vis-à-vis the West. I reflect more specifically how the different structure of the Chinese language seems to have worked in Chinese philosophical reflection and contrast that with the way intentional idioms did in Western philosophy. Looking mainly

at theory of language, the key similarity between the two traditions is expressed in the current “pragmatic” view that “meaning” is irreducibly normative. The differences that attend to this formulation between Chinese and Western thought will also be discussed."

56. ———. 2003. "Mohism: Later (Mo Jia, Mo Chia)." In *Encyclopedia of Chinese Philosophy*, edited by Cua, Antonio S., 461-469. New York: Routledge.

    "We use “later Mohists” to refer to the wing of the school of Mozi whose central work is known as the Mohist Canon. This and two later writings make up Chapters 40–45 of the Mozi. Some accounts also refer to these thinkers as neo-Mohists or dialectical Mohists.

    They focused on theory of language, though their writings also contain fragments on ethics and embryonic scientific reflections on economics, geometry, and optics.

    Traditional scholars sometimes include them in a pseudo school called the “school of names”—a cluster of thinkers who analyzed names (*ming*) in conflicting ways. Their reconstructed motivations reflect three differing trends in social political thought: Confucianism, Mohism, and Daoism. The usual additional members of this school included Gongsun Long and Hui Shi.

    The later Mohist Canon was continuously extant in library collections. However, a freak textual accident rendered it virtually unintelligible, and traditional Confucian orthodoxy effectively lost all access to its content. Its importance came to light only in comparatively modern times. Rescuing the text rekindled a long-lost interest in Chinese theories of language and revealed hitherto unappreciated links with the thought of Xunzi, Laozi, and Zhuangzi. Confucian orthodoxy, however, still tends to treat their sophisticated linguistic theories as “un-Chinese.” (p. 461)

57. ———. 2003. "The Relatively Happy Fish." *Asian Philosophy: An International Journal of the Philosophical Traditions of the East* no. 12:145-164.

Abstract: "Zhuangzi and Hui Shi's discussion about whether Zhuangzi knows 'fish's happiness' is a Daoist staple. The interpretations, however, portray it as humorous miscommunication between a mystic and a logician. I argue for a fine inferential analysis that explains the argument in a way that informs Zhuangzi philosophical lament at Hui Shi's passing. It also reverses the dominant image of the two thinkers. Zhuangzi emerges as the superior dialectician, the clearer, more analytic epistemologist. Hui Shi's arguments betray his tendency (manifest elsewhere) to misstate the conclusions of their shared relativism leading him but not Zhuangzi to intuitive mysticism."

58. ———. 2003. "Philosophy of Language." In *Encyclopedia of Chinese Philosophy*, edited by Cua, Antonio S., 569-575. New York: Routledge.

"Theory of language is a key part of classical Chinese thought. It provided the crucial insights that informed the original, indigenous philosophy of China. It shaped discussions of metaphysics, moral psychology, normative and applied ethics, and political theory. Classical debates about language produced progressively more tenable theories whose surprising distinctiveness reflects features of Chinese language.

Partly because these pre-Han theories of language represent a high-water mark and the most rigorously developed thought, this article will focus only on them.

Comparatively crude linguistic theory characterized the philosophical "dark age" that followed. The break in the transmission of reflective analysis accompanied a substitution of superstitious and manipulative religious cosmology for philosophy. A countervailing trend produced a scholastic Confucianism that dominated Chinese thinking until early modern times."

(...)

"The original Chinese theories have many interesting background assumptions about language. First, they seldom

remarked on the use of written characters, probably regarding these as a normal way of writing.

Their use did not incline writers to draw strong distinctions between writing and speaking. Key terms like ming (names) and *yan* (language, words) seem to function much as our English translations do, i.e., referring to abstract types of which both written or spoken items are tokens. Modern Chinese distinguishes between *wen* (literature) and hua (speech)." (è. 569)

69. ———. 2020. "Paradoxical Language in Chan Buddhism." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 389-404. Cham, Switzerland: Springer.

    "Chinese Chan or Zen Buddhism is renowned for its improvisational, atypical, and perplexing use of words. In particular, the tradition's encounter dialogues, which took place between Chan masters and their interlocutors and are recorded in its *koan* ("public case") literature, abound in puzzling, astonishing, and paradoxical ways of speaking. In this chapter, we are concerned with Chan's use of paradoxical language.

    In philosophical parlance, a linguistic paradox comprises the confluence of opposite or incongruent concepts in a way that runs counter to our common sense and ordinary rational thinking.1 One naturally wonders about Chan masters' rationales for their use of paradox. There are also concerns about whether the use violates the logical law of noncontradiction to the effect that nothing can be both P and not-P all over in the same way at the same time." (p. 389)

70. Hou, Richard W. T., and Wang, Linton. 2020. "When the Other-Mind Skepticism Encounters the Happy Fish." *The Philosophical Forum* no. 51:127-142.

    Abstract: "In this paper, we reconstruct the debate between Zhuangzi 莊子 and Hui Shi 惠施 that took place on the bridge over the Hao River 濠水 as a substantive debate concerning the epistemic other-mind skepticism according to which no one

mind knows the mental states of the other. We demonstrate how this reconstruction leads to substantive conclusions of the viability of Hui Shi's position in particular and of the other-mind skepticism in general. This demonstration is accomplished by means of the contemporary philosophical development regarding, for example, whether asserting a proposition implies that the asserter knows the proposition, whether the closure principle of epistemic logic should be held, and whether knowing something is a mental state. We hold that this debate's resolution is substantively entangled with contemporary philosophical concerns."

72. Huang, Chu-Ren. 2015. "Notes on Chinese grammar and ontology: the endurant-perdurant dichotomy and Mandarin D-M compounds." *Lingua Sinica* no. 1:1-22.

    Abstract: "Y. R. Chao's (1955) 'Notes on Chinese Grammar and Logic' illustrated how logical relations are encoded in Chinese Grammar and his Chinese grammar (Chao 1968) introduced the grammatical category of Measure (M) in Determiner-Measure (D-M) Compounds. Subsequent studies of Chinese typically adopt the general linguistic term of classifier (Aikenvald 2003) and either refer to Chao's M as a classifier (e.g. Li and Thompson 1981) or assume that it can be further subdivided into two categories: classifiers and measure words (Tai 1994). Many later studies tried to account for the classifiers/measure words contrast via semantic or syntactic tests without reaching a definite conclusion. This paper adopts and merges two lines of Chao's research to show that the ontological concept of endurant vs. perdurant is elegantly instantiated in Chinese grammar, and by the category of M in particular. By doing so I hope to follow Y. R. Chao's (1955) giant leap in studying logical relations in Chinese and to take the further step of exploring the significance of the Chinese language for ontological studies, including issues such as

whether Quality should be ontologically dependent on entities or instead subsumed by them."

Unpublished dissertation.

Abstract: "The present work aims at shading new light on the structure and content of the Gongsun Longzi, focusing in particular on the so-called “original chapters”, those who are considered more truthful to an hypothetical original formulation – written and/or oral – of the topics discussed, the *Baima Lun* and the *Zhiwu Lun*. After taking into consideration the pseudo-historical figure of the putative author, the persuader Gongsun Long, an analysis of the overall structure of the text is provided, comprehending an accurate study of

textual variants existing between the two most ancients versions available of the received text (the *Shuofu* and the *Daozang* edition). Finally, an exhaustive treatment of the philosophical contents of the *Baima Lun* and *Zhiwu Lun*, accompanied with a commented translation, concludes the work."

75. ———. 2016. "The "White Horse", the "Three-Legged Chicken", and Other Paradoxes in Classical Chinese Literature." *Antiquorum Philosophia: A International Journal* no. 10:67-88.

    "According to pre-imperial and early imperial Classical Chinese received literature (ca. 4th cent. b.c.e. - 2nd cent. c.e.), paradoxes and language jokes seem to have been widespread in early Chinese rhetorical practice. Such stratagems are part of a rich shared repertoire mastered by the persuaders of the time that also includes narrative anecdotes, didactic stories, maxims, and authoritative quotes drawn from the most revered texts of antiquity. These diferent kinds of materials mostly had a rhetorical function. They were conveniently quoted to illustrate or strengthen a particular point in a discussion, or to allude obliquely to an implicit message or moral teaching by establishing meaningful connections between the tradition and the contemporary situation in an analogical way.

    Despite the apparent success paradoxical statements enjoyed at the time, only a handful have been preserved and handed down. Some of the most famous arguments that have been transmitted are discussed at length in individual texts that later came to be included in the Gongsun Longzi 公孫龍子(Master Gongsun Long), a composite collection of heterogeneous materials including dialogues and short treatises. However, in most cases Classical Chinese paradoxes survive only in the form of dry and rather enigmatic lists of obscure sentences or ‘theses’ deprived of any further extra-textual information, nor any proper explanation. These materials are mostly – though not exclusively – associated with a group of thinkers, (in)famous for being skilled in the art of rhetoric, the so-called Logicians." (p. 67)

76. ———. 2017. "The ‘White Horse is Not Horse’ Debate." *Philosophy Compass* no. 12:1-11.

    Abstract: "The so-called “white horse is not horse” (bái maˇ fēi maˇ 白馬非馬) debate, or “white horse” (bái maˇ白馬) dialogical argument, is beyond doubt the most famous case of argumentation (biàn辯) in the history of Classical Chinese philosophy. The somewhat disorienting statement at the center of this debate is discussed at length by two anonymous fictive characters, a persuader and their opponent, in the ‘Báimaˇ lùn’ 白馬論(Disquisition on White and Horse). The ‘Báimaˇ lùn’ usually appears as the first chapter in the received text Gōngsūn Lóngziˇ 公孫龍子(Master Gongsun Long). The Gōngsūn Lóngziˇ is a composite collection of heterogeneous materials in six chapters.

    The collection includes an anecdotal preface, three partially incomplete and/or corrupted dialogues, and two short and extremely intricate treatises. In particular, the dialogues included in the collection are structured in a fairly similar way and focus on what have been defined as paradoxes or sophisms belonging to the repertoire of a rather loose group of thinkers, the so-called Logicians or Chinese “Sophists” (míngjiā名家, literally “experts on names”), allegedly active during the Warring States period (475–221 B.C.E.)."

77. ———. 2020. "Argumentation (Bian 辯)." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 171-180. Cham, Switzerland: Springer.

    "In Classical Chinese polemico-philosophical texts, argumentation is often understood as one of the two poles in a pair of binary opposites together with its dialectical counterpart, the technique of persuasion (shui 說).(3) Despite the fact that no proper handbook nor manual on Classical Chinese rhetoric has been handed down, it is still possible to claim with a certain degree of certainty that argumentation and persuasion are two opposite, though complementary and

closely interconnected skills that a persuader has to acquire and master as part of their repertoire." (p. 172)

    Abstract: "The yin yang model of thinking is most essential to the Chinese cosmology, ontology and outlook on life. This paper is a systematic discussion of such a dialectical way of thinking and its significance.

    It starts with investigating the origin and the meaning of terms "yin" and "yang", and explains the later developed yin yang doctrine; it then shows how greatly and profoundly the yin yang model of thinking has influenced Chinese philosophy and Chinese character. It concludes that Chinese naturalistic, dialectical, and optimistic attitudes toward the world and life are all based on the yin yang model of thinking and that the yin yang doctrine is the starting point for anyone to understand Chinese people and their philosophies."

    The author's name for this article was mistakenly printed as "Xinyan Xinyan" when it was published.

80. Jiang, Xiangdong. 2020. "A New Interpretation of 'Baimalun' (Discourse on White and Horse)." In *The Gongsun Longzi and Other Neglected Texts: Aligning Philosophical and Philological Perspectives*, edited by Suter, Rafael, Indraccolo, Lisa and Behr, Wolfgang, 289-308. Berlin: De Gruyter.

"The lack of a theory of knowledge or epistemology in traditional Chinese culture has resulted in a severely inadequate understanding of the pre-Qín “School of Names” (míngjiā 名家) for over two millennia. In view of this shortcoming, I try to reinterpret the Gōngsūn Lóngzi˘ 公孫龍子 precisely from the perspective of a theory of knowledge. The scope of the present chapter is limited to the discussion of ‘Báima˘lùn’ (Discourse on White and Horse; henceforth BML): the first part consists of an annotation of the original text, the second part concentrates on its theoretical gist, and the third part presents my comments and evaluation of other scholars’ interpretations." (p. 289, a note omitted)

81. Jiang, Xinyan. 2020. "Contradiction." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 129-142. Cham, Switzerland: Springer.

"In ancient Chinese philosophy, although the law of non-contradiction is acknowledged in some way by some Chinese philosophers such as Han Fei 韓非and Moists,(7) the majority of Chinese thinkers seem to even have never paid attention to it, not alone treated it as the most basic principle of logic. Moreover, some paradoxical propositions that well fit “s is P and not-P” are asserted and even taken for granted by some Chinese philosophers." (p. 130)

(...)

"Although, from a pure logical point of view, “s cannot be P and not-P” is true, it is an abstraction that does not take the context of the utterance and multidimension of things into consideration. On the contrary, a proposition like “s is P and not-P,” though paradoxical, reflects reality better since dialectical relations present in everything and everywhere. In short, Chinese dialectical thinking not onlyviolates none of laws of Aristotelian formal logic such as that of non-contradiction, but also captures and highlights real dialectical relations in the universe and life that the latter does not." (p. 131)

(7) Some scholars have argued that the law of non-contradiction has been explicitly recognized and formulated in

classical Chinese philosophical writing. For more details, see Cheng 1971: 226–27.

Abstract: "The Warring States, Ch'in, and Han periods witnessed a remarkable growth in the influence of the arts of disputation and rhetoric on the lives of the ancient Chinese. Disputation affected the form and content of philosophical arguments, provided common forms for communication between various thinkers and schools of thought, and, mainly during the Han dynasty, contributed to the processes of ideological synthesis. Along with rhetoric (as represented in the *Chan-kuo ts'e*) , disputation also helped define the style and nature of a wide variety of other literary endeavors, especially the *Fu* and historiographical works of Han times. Debate and argumentation came to play a central role in how the society and government of the time resolved difficulties and determined proper policy. In what follows I both chart the course of this development and outline some of its causes." (p. 118, notes omitted)

"Instead of the classical two truths theory of Nagarjuna, Chinese Buddhists came up with three truths: reality as real, as empty and as both (i.e., middle). The essay, one in a series, traces the origin to Chou Yung's essay on three Schools (of two truths). There, Chou set up a School that failed to negate provisional reality (the real-ist), the School that succeeded (the empty-ist), the School that realized the real as the empty (the middle-ist). All later theorists, Chih-tsang, Chi-tsang and Chih-i were indebted to this essay painstakingly reconstructed here."

"Gongsun Long (b. 380 B.C.E.) is considered a member of the school of names. A logician or sophist, he is best-known for a theoretical essay called “Pointing and Thing” and for his thesis “white horse is not horse.”

Xunzi (fl. 298–238) accused him of abusing names to the extent of creating havoc: since a horse with the color white is very much a horse, Gongsun was twisting words and flying in the face of what is obvious when he said that it is not. A number of modern scholars, however, have come to Gongsun Long’s defense." (p. 270)

(...)

"In classical China, logical debates on name and reality were also ethical debates. Logic aside, Gongsun Long has a moral agenda. Coming after Yang Zhu and Mozi, he sided more with Yang and less with Mozi.

He safeguards the sanctity of the self by showing how each of us (as X) is distinct and valuable by virtue of not being like any other (any non-X). He doubts the reality of the Mohist “whole”; we cannot point to the whole. Thus we find him preaching “nonaggression” (against any party), but not “universal love” (for all).

The reason is that to love X and benefit X, one must not love and not benefit a non-X. Since loving all leaves none not to love, loving all amounts to benefiting none. In this, Gongsun Long was the reverse of Hui Shi, the other logician, who sided with the whole and extended Mohist love to its maximum, to loving all things generously." (p. 271)

98. ———. 2003. "Hui Shi (Hui Shih)." In *Encyclopedia of Chinese Philosophy*, edited by Cua, Antonio S., 309-311. New York: Routledge.

"Hui Shi (380–305 B.C.E.), one of the two major logicians of the school of names, was the chief minister to King Hui of Wei. Ideologically, Hui was the reverse of the logician Gongsun Long but was a like-minded friend of Zhuangzi, who mourned when Hui died.

Whereas Gongsun Long was known for “separating hard and white,” Hui Shi was remembered for “equalizing semblance and dissemblance.” Gongsun had uncovered very clear, logical differences (X is not like non-X); Hui Shi would reverse or erase them. As scholars of names (*ming*), they had both rejected the correspondence theory of language, which assumes that the name “horse” describes the animal horse (i.e., is a sign serving as a direct reference); instead, they chose to explore a sign pointing to or networking with other signs (intralinguistic sense). But Gongsun Long came up with a good logic of sense, while Hui Shi exposed that as the “non-sense” of logic." (p. 309)

105. ———. 2021. "Truth in Chinese Philosophy. A Commentary on Bo Mou's Semantic-Truth Approaches in Chinese Philosophy." *Comparative Philosophy* no. 12:134-146.

    "Studies of Chinese philosophy have been overwhelmingly on ethics and social philosophy. Bo Mou's book is significant because it is squarely on semantic truth, a topic which has

seldomly been brought up in studying Chinese philosophy (Mou 2019).

That alone makes his book worthy of our attention. Mou's book contains many insights and breaks new grounds for further study. His pluralist account of semantic truth in Chinese philosophy is highly original and pioneering in the field. Here I will not

attempt to make a comprehensive review or assessment of this important book. Instead, I focus on two points, for the sake of further explorations on the topic. The first is on the general topic of truth in Chinese philosophy. While I do not deny that there is

semantic truth in Chinese philosophy, I believe the main orientation of Chinese philosophy on truth is pragmatic, in that the concept of truth is understood and functions in the context of the human condition; the nature and the value of truth lies with its

service for the good life. Second, I will offer an alternative to Bo Mou's characterization of Xun Zi's concept of truth and show why Mou cannot dismiss a broadly characterized pragmatic interpretation of Xun Zi's epistemology. In this commentary, I will try to quote Mou's relevant passages in their entirety to ensure as much accuracy as possible in presenting his argument" (p. 134)

"From ther above discussion, we can make the following conclusions:

(a) Gongsun Long's theory is a theory of semiosis. He observed the differences among symbols that are used in the process of human speech. So the problems he discussed are matters of metalanguage, not object language.

(b) Gongsun Long's use of the word FEI „is not" can only be interpreted as set equality, which corresponds to the English phrase „is not equal to". It does not indicate subset-superset relationship between sets.

(c) Gongsun Long was the first scholar in ancient China to use analytic methods fully to treat linguistic and philosophical phenomena. His proposition „White horse is not horse" is not a petty intellectual game that goes against common sense. On the contrary, it is a very insightful theoretical discovery.

We may achieve a better understanding of Gongsun Long's arguments by looking at his works as a whole (only six texts have been preserved). In his other texts, he explicitly stated the purpose of his work: through this kind of discussion, he intended to clarify the issues on the relationship between words and the things that are represented by those words. He believed that everything would be in place if they were named appropriately. He asked people to pay attention to this name-substance relationship and be cautious in naming things. In „A Discourse on White Horse", he exemplified his idea by analyzing the relationship between „horse" and „white horse" in great depth. In so doing, he made a great contribution to his own time." (pp. 219-220)

107. Li, Yu. 2015. What is *N P*? - Interpretation of a Chinese paradox white horse is not horse. *Arxiv.org*: 1-9.

Abstract: "The notion of *nondeterminism* has disappeared from the current definition of *N P*, which has led to ambiguities in understanding *N P*, and caused fundamental diculties in studying the relation *P versus N P*. In this paper, we question the equivalence of the two definitions of *N P* the one defining *N P* as the class of problems solvable by a nondeterministic Turing machine in polynomial time, and the other defining *N P* as the class of problems verifiable by a deterministic Turing machine in polynomial time, and reveal cognitive biases in this

equivalence. Inspired from a famous Chinese paradox white horse is not horse, we further analyze these cognitive biases. The work shows that these cognitive biases arise from the confusion between different levels of nondeterminism and determinism, due to the lack of understanding about the essence of nondeterminism. Therefore, we argue that fundamental diffculties in understanding *P* versus *N P* lie firstly at cognition level, then logic level."

Sigla: *N P* = Nondeterministic Polynomial time.

    Abstract: "In this paper, a selection of arguments encountered in a pair of canonical classical Greek and Chinese literary and philosophical works are analyzed and compared. The works in which the passages selected for analysis occur are the *Histories* of Herodotus and the *Fei Gong* section in the *Mozi*. The present research focuses on three respective passages in these canonical classical Greek and Chinese works containing early examples of normative argumentation of an internally critical kind (‘internal critique’). So-called deontic logic is then applied in order to formally analyze the argumentative content of the selected sections. It is shown that each of the Herodotean and

Mohist examples of internal critique may be assigned a formally equivalent Chinese *vis-à-vis* Greek partner. Based on these similarities, the question of the origins of internal critique in the ancient Greek and Chinese cultural spheres is reconsidered."

117. Liu, Fenrong, and Zhang, Jialong. 2008. A Note on Mohist Logic. 1-25.

    Available on line on Academia.edu.

    Abstract: "The paper is an exploration of the old Chinese texts called the *Mohist Canons* from a modern logical perspective. We mainly explain what the Mohists have contributed to logic in the following aspects: Theory on names, structures of propositions, patterns of reasoning, and theories on disputation and paradoxes. A comparative perspective is taken throughout the investigation. We compare Mohist logic and Western traditional and modern logic. We provide our new interpretations of the issues discussed in the *Canons* by applying the modern logical theories."

119. Liu, Shu-hsien. 1974. "The Use of Analogy and Symblism in Traditional Chinese Philosophy." *Journal of Chinese Philosophy* no. 1:313-338.

    "When we review the Chinese history of philosophy, we find that the Chinese did not develop any formal systems of logic. There was a conspicuous lack of discussion of forms of inference, as the Chinese failed to develop anything either like an Aristotelian syllogism or a Nyaya syllogism. The so-called Logicians(1) in ancient China were really dialecticians like the Greek Sophists who were being looked down upon by serious scholars, as Chuang Tzu said of them, “They are able to subdue other people’s mouths, but cannot win their hearts.”(2) This situation, however, does not mean that the Chinese did not pay any attention to the problem of methodology. It is precisely because they were convinced that empty talks would lead us nowhere so they decided to concentrate their effort on finding appropriate expressions for their experience of reality.

This explains why they made such extensive use of analogies and symbolisms, as these were regarded as the only effective means to approach the Way (*Tao*), or rather Ultimate Reality understood in a dynamic sense.

In this article, I would like to contend that as a general trend the Chinese are moving away from an analogical way of thinking toward a symbolic way of thinking through metaphorical expressions. In the following I shall try to outline this development and discuss its significance on the Chinese way of doing philosophy." (p. 313)

120. Liu, Tisheng. 2020. "A New Interpretation of the Gongsun Longzi's 'Zhiwu lun' (Discourse on Pointings and Things) and 'Mingshi lun' (Discourse on Names and Actualities)." In *The Gongsun Longzi and Other Neglected Texts: Aligning Philosophical and Philological Perspectives*, edited by Suter, Rafael, Indraccolo, Lisa and Behr, Wolfgang, 241-288. Berlin: De Gruyter.

"The 'Zhi ˇ wù lùn' 指物論chapter of the Gōngsūn Lóngzi ˇ 公孫龍子 is arguably one of the most difficult pre-imperial Chinese texts. The obvious reason for its inaccessibility is its repetitive structure. The central terms, zhi ˇ 指 (which literally means 'finger', but also, in a verbal reading, 'to point') and wù 物 ('thing'), together make up for roughly one-quarter of the entire word count. As the treatise itself does not provide any definition for these crucial terms, there have been a great number of extremely divergent interpretations of the meaning of the term zhi ˇ and an abundance of proposals on its relationship to wù. In spite of this sheer variation of interpretations, there are still more or less clear lines along which they can be classified. The most basic distinction I suggest here is between traditional Chinese approaches and

analyses by modern scholars inspired by Western methods. Traditional interpretations attempt to arrive at an analysis of the terms and their relationship on the basis of the inherited pre-Qín masters literature, and thus resort to an autochthonous hermeneutical approach.

What I call “Western” interpretations, by contrast, base their analyses on relevant theoretical literature from outside China, e.g. on Marxist theories. Since the May Fourth Movement in the late 1910s and the subsequent impact of Western theories, the latter approach has become the dominant interpretive framework. Within both of these broadly defined groups, one can further distinguish various smaller trends with specific features." (p. 241)

121. Lloyd, Geoffrey E.R. 2007. "Towards a Taxonomy of Controversies and Controversiality: Ancient Greece and China." In *Traditions of Controversy*, edited by Dascal, Marcelo and Chang, Han-Liang, 3-15. Amsterdam: John Benjamins.

"Following up Marcelo Dascal’s emphasis on the importance of controversy as the locus of critical activity and innovation, and building on his triadic classification of polemics into “discussion”, “dispute” and “controversy” (Dascal 1998b), I shall raise a number of questions concerning the specificities of the controversies for which we have evidence in ancient Greece and China. What typically were the controversies and disputes about? Between whom were they held? Who were the participants, who constituted the audiences, and what are the relations between those two groups? How do the contenders come to agree, if and when they do, to their resolution? What, in the final analysis, is at stake, and for whom?

There are important similarities, as well as differences, between the controversies and disputes of ancient Greece and China, and (as I argued already in Lloyd 1996) these already tell against any simple thesis of a global psychological contrast between adversarial Greeks and irenic Chinese. Rather, an exploration of the patterns of controversies in these two cultures can throw important light on the implicit and explicit

values characteristic of the societies in question and so also on the different ways in which science developed in each." (p. 3)

122. López-Astorga, Miguel. 2021. "School of Names and mental possibilities: Is a white horse a horse?" *Studii de lingvistică* no. 11:167-175.

Abstract: "According to the ‘white horse’ paradox, a horse that is white is not a horse: it is a white horse, but not a horse. Though logical arguments can be adduced in support of the proposition, people tend to reject the paradox. Individuals often regard a white horse as a horse and therefore usually ignore the arguments from logic. This paper attempts an explanation of their behaviour. The theory of mental models offers a cognitive explanation for the habitual rejection of the paradox. Within this framework, the key is the way that people reason – a way that does not necessarily coincide with logic."

124. ———. 2020. "Correcting Names in Early Confucianism." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 329-349. Cham, Switzerland: Springer.

"According to a widely held conventional wisdom, the doctrine of *zhèngmíng* 正名, “rectification of names”, or perhaps “correcting names”, appears to be central to the tradition that springs from the thought of Confucius (Kǒngzǐ 孔子). But whether *zhèngmíng* really is central to early Confucianism, what the doctrine itself amounts to remains the subject of continuing controversy.(1) This paper aims to present an account of the *zhèngmíng* doctrine in Early (i.e., Pre-Imperial)

Confucianism, especially as it is presented in the *Analects* (Lúnyu ˇ 論語), and secondarily, the “zhèngmíng” essay of the Xúnzi ˇ (荀子).

(1) useful collation of traditional opinions on *zhèngmíng* in the *Analects* can be found in Liu Zhenghao 劉正浩 1978. See also Makeham 2003: 333–340. Hu Shih 胡適 is likely the source of the modern conventional wisdom—for him, Confucius saw *zhèngmíng* as “the heart of the problem of social and political reformation,” while “the reform of society” as itself, the “central problem of Confucius”, thus implying that *zhèngmíng* is central to the thought of Confucius (Hu 1963: 22). This notion, however, probably has much to do with Hu’s idiosyncratic concerns rather than completely based upon an accurate assessment of the tradition.

128. ———. 2010. "The Logic of Mohist Reasonings; Leis and Structured Sorts." *Universitas: Monthly Review of Philosophy and Culture (Taipei)* no. 37:65-93.

    Abstract: "It is well-known that some Mohist reasonings of the final portion of the Xiao qu 〈小取〉 are paradoxical: “a robber is a man, but to kill a robber is not to kill a man”. In this paper, we analyze and formalize the different groups of Mohist reasonings using concepts of contemporary western logic: classes, sorts, structured sorts as they appear in the mathematical theory of categories. We solve those paradoxes by using sorts and more generally arrive at the conclusion that those reasonings are based on structured sorts, a notion which, in our opinion, is fundamental to clarify the notion of lei (類)."

129. ———. 2011. "Basic Concepts of Mohist Logic." *Studies in Logic* no. 4:82-108.

    Abstract: "The following text has been presented with minor modifications to the colloquium “The History of Logic in China” which took place in Amsterdam on November 24-26, 2010. It will briefly recall the historical and intellectual context of later Mohist Logic and will mainly discuss its basic logical concepts in relation with contemporary logic: disputation; name, object and their relation; proposition; “lèi” (class or sort or kind); inference. Other notions such as a priori, necessary and sufficient condition, quantification, necessity, time, space, infinity, ... will also be mentioned."

130. ———. 2012. "Why White Horses are not Horses and Other Chinese Puzzles." *Logique et Analyse* no. 55:185-203.

"The aim of this paper is on the one hand to remind the Western reader some aporias of Chinese antiquity, and on the other hand to show that a logic of sorts or of types similar to that which has been proposed to explain the relation between categories (in the mathematical sense of the term) and logic brings much light on these aporias. This should be contrasted with older traditional explanations using conventional syllogistics or feeling satisfied with too simple explanations such as the confusion between inclusion and identity. The article is based on preceding papers of mine (see [LUC], [LUCa], [LUCb]), but stresses the basic unity of the solutions which I proposed there, a unity which is probably not apparent to the casual reader and which is shown here by sketching a very simple formal system and its semantics. I apologize for overlappings with some of my previous publications, but it seemed to me that the present paper would be unreadable if I just presented the final part without repeating the basic motivations."

131. ———. 2012. "Definitions in the Upper Part of the Moist Canons." *Journal of Chinese Philosophy* no. 39:386-403.

Abstract: "The purpose of this article is to evaluate the Moist Canons from the point of view of logic, as a system of definitions.We concentrate more specifically on the formal organization of the upper part of the Moist Canons.This method leads us to a globally positive evaluation of the system

of definitions but also to the less expected conclusion that a few very basic concepts are undefined and form the background of the Moist concrete, realist, and pragmatic philosophical system: *ran*, to be so; *de*, to obtain; *ming*, illumination; *zuo*, to initiate; and *wei*, to act."

132. ———. 2013. "Parallelism in the Early Moist Texts." *Frontiers of Philosophy in China* no. 8:289-308.

    Abstract: "Parallelism is present everywhere in the early Moist texts: at the syntactic level, at the semantic level, between sentences, between sets of sentences, between argumentative structures. The present article gives many examples of the phenomenon: parallelism of insistence, insistence from top to bottom, insistence from bottom to top, parallelism with symmetry, parallelism involving negation, subcontraries and negation at deeper levels, parallelism of the argumentative structures. Logic is particularly applied to the study of parallelism involving negation. From the point of view of argumentation, it is shown that many of those constructions have an important role in supporting arguments such as: arguments of generalization, *a fortiori* arguments, arguments of exemplarity, consequentialist arguments, arguments by comparison. This study draws the attention to the importance of argumentation in the study of Moism and gives a new light on the argument by parallelism (*mou*) in the "Xiaoqu": It is a natural extension of what we call "parallelism involving negation," already very common in the early Moist texts."

133. ———. 2018. "Limits of Logic in Moism." *Journal of Chinese Philosophy* no. 45:239-251.

    Abstract: "We are trying to answer the following question, using the distinctions of contemporary logic: why did the Moists stop at some points on their otherwise remarkable way to logic? We argue that they did not explicitly discover negation because of their insistence on linguistic parallelism; they did not recognize logical conjunction nor logical disjunction because of juxtaposition or prefixation; they did not identify the notion of sufficient condition; negation of quantifiers was treated as a problem of extension; their notion of proposition

was limited; they discovered some intensionality phenomena but did not explore them very deeply; they insisted more on argumentation than on logic. However our exploration of these limitations shows that the Moists had discovered many logical phenomena and that their attention to the structure of the proposition and to their parallelism reveals a real interest in formal methods."

134. ———. 2020. "Definitions in Pre-Qin Texts." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 233-249. Cham, Switzerland: Springer.

"With these preliminaries at hand, we will track definitions in a few typical pre-Qin texts and judge them by looking at some of the characteristics which we have hinted at. For the ease of the reader, we present them under four headings, which are natural from a logical point of view:

1. syntactic questions: Is the definition clearly announced as such? What is the background language and the background theory? Is the definition clear? Is it compact enough?

2. semantic questions: Is the definition adequate? Is it complete?

3. relation of the definition with other definitions: Is the definition part of a system of definitions? Is that system free of vicious circles?

4. pragmatic questions: What is the purpose of the definition?

In relation with the last question, it is good to remind the reader that pre-Qin thinkers were mainly motivated by ethical and political questions. However, language was an important part of their reflections, in a complex sense, depending from author to author, for which the reader can consult (Willman 2018)." (pp. 235-236)

135. ———. 2020. "The Logical Style of Confucius' *Analects*." *Frontiers of Philosophy in China* no. 15:167-197.

Abstract: "Considered from a logical point of view, Confucius' *Analects* contain many implicit forms of reasoning and argumentation. This is shown first by analyzing the phenomenon of parallelism: direct parallelism is often a way of hinting at a general assertion, whereas anti-parallelism hides dilemmas, generalizations and modal notions of "moral preference." *The Analects* also have various types of conditionals, ranging from material implications, to modalized implications, and counterfactual conditionals, which are the germs of implicit reasoning, concluding with a moral recommendation. Analogies are particularly abundant and a presentation of three examples suggests that, beyond their explicative role, they also involve moral recommendations. The implicit logic of *The Analects* requires an active, albeit unconscious participation of the reader, which could be an important element in explaining the enduring influence of the text."

137. ———. 2020. "Logically Significant Words in the *Gōngsūn Lóngzi*ˇ." In *The Gongsun Longzi and Other Neglected Texts: Aligning Philosophical and Philological Perspectives*, edited by Suter, Rafael, Indraccolo, Lisa and Behr, Wolfgang, 313-346. Berlin: De Gruyter.

"The "School of Names" (Míngjiā 名家) has brought logical considerations into the field of Chinese philosophy. The present contribution aims to give a 'measure' of the 'logicity' of the texts, more particularly of the texts of the Gōngsūn Lóngziˇ 公孫龍子. The chapter looks at some logically significant words, such as yoˇu 有, wú 無, kě 可, fēi 非, bù 不, gù 故, and suoˇ yiˇ 所以, trying to make the analysis as objective as possible. To

accomplish this, I pay special attention to the occurrences of these words: their numbers, their immediate contexts, and their non-controversial variations of meaning. I am confident that this type of inquiry brings out some features of the logical structure of the texts of the Gōngsūn Lóngzi˘ and demonstrates their similarities and differences. It is hoped that this approach will help to confirm, invalidate, or at least qualify the hypothesis of their different origins." (p. 313)

   "In this paper the author advances the thesis that by the late Third century b.C., discussions of the name and actuality/object, *iming-shid*, relationship by classical Chinese thinkers evidence a shift from nominalist theories of naming to essentialist theories of naming. According to the former, it is man who arbitrarily or conventionally determines which *imingd* should be applied to which *ishid*. According to the latter, there is a proper or correct correspondence between a given *imingd* and a given *ishid*, determined, variously, by what is ordained by 'heaven' or by what is 'naturally so'/'so of itself' (*izirand*)."

"The members of the ming jia (mingjia), or “school of names”—like the ancient Greek sophists after whom they are sometimes called (they are also, variously, called dialecticians, nominalists, and logicians)—were not an actual school of thinkers bound by a common philosophy or having a common founder. Rather, they were individual thinkers who have been retrospectively identified as a school by virtue of a perceived common eristic approach to disputation or discrimination (*bian*).

It was for their skills in disputation that in pre-Qin times they were sometimes known as *bian zhe*, “those who argue out alternatives.” The Mohist Summa explains proper disputation in the following terms:

One calling it “ox” and one calling it “not ox”; this is to contend over “that.” This being the case, they are not both appropriate. Since they are not both appropriate, one is necessarily appropriate. (Explanation A.74)" (p. 491)

13. Meynard, Thierry. 2019. "What the “Failure” of Aristotelian Logic in Seventeenth Century China Teaches Us Today: A Case Study of the Mingli Tan " *Frontiers of Philosophy in China* no. 14.

    Abstract: "The Mingli Tan is recognized as the first Chinese-language treatise introducing Western logic in China. First published in the final years of the Ming dynasty, the work was presented to Emperor Kangxi in 1683. Despite its sophisticated thought and innovation, the work failed to gain support among intellectuals and court officials. By analyzing the objectives of the Mingli Tan in tandem with its companion work, the Coimbra commentary, this paper explores some of the important philosophical, pedagogical, and historical reasons that can help to explain this failure. Through this historical failure, we can gain some insights about the nature of logic and its current position in China."

17. Mou, Bo. 1998. "An Analysis of the Ideographic Nature and Structure of the Hexagram in "Yijing": From the Perspective of Philosophy of Language." *Journal of Chinese Philosophy* no. 25:305-320.

"I present an analysis of the ideographic nature and semantic structure of the hexagrams of the "Yijing" ("the book of changes") from the perspective of the philosophy of language. My purpose is twofold: first, i take this as a good case for analysis leading to an understanding of the ideographic semantic structure of an ideographic language like Chinese; second, I take this understanding as a significant aspect in comprehending the "Yijing" philosophy. In the paper, I first examine the ideographic construction of the hexagrams, then suggest an interpretation of the triple ideographic semantic structure, and finally discuss the denotational meaning of the hexagrams in terms of a collective-noun hypothesis."

18. ———. 1999. "The Structure of the Chinese Language and Ontological Insights: A Collective-Noun Hypothesis." *Philosophy East and West* no. 49:45-62.

    "Through a comparative case analysis regarding the Chinese language, it is discussed how the structure and functions of a natural language would bear upon the ways in which some philosophical problems are posed and some ontological insights shaped. Disagreeing with Chad Hansen's mass-noun hypothesis, a collective-noun hypothesis is argued for: (1) the denotational semantics and relevant grammatical features of Chinese nouns are like those of collective nouns; (2) their implicit ontology is a mereological ontology of collection-of-individuals with both part-whole and member-class structure; and (3) encouraged and shaped by the folk semantics of Chinese nouns, classical Chinese theorists of language take this kind of mereological nominalism for granted."

21. ———. 2007. "Introduction: Methodological Notyes." *Journal of Chinese Philosophy* no. 34:465-470.

Abstract: "The theme of this special issue is to discuss Gongsun Long's "whitehorse-not-horse (*bai ma fei ma*)" thesis and his relevant thoughts in view of their relevance and significance to contemporary philosophy.

This introduction consists of two parts. In the first part, I will briefly introduce the basic views of four contributors' distinct accounts of Gongsun Long's thesis and arguments; I then will briefly explain the engaged approaches adopted by this volume. In the second part, I shall draw readers' attention to the two emphases as a whole and their related methodological orientations and reflective purposes. My focus is on the second part when making some methodological notes concerning the reflective examination of Gongsun Long's philosophy and its relevance and significance to contemporary philosophy."

25. ———. 2020. "How Gōngsūn Lóng's Double-Reference Thought in His "White Horse Not Horse" Argumentation Can Engage with Fregean and Kripkean Approaches to the Issue of Reference." In *The Gongsun Longzi and Other Neglected Texts: Aligning Philosophical and Philological Perspectives*, edited by Suter, Rafael, Indraccolo, Lisa and Behr, Wolfgang, 169-204. Berlin: De Gruyter.

    "The purpose of this chapter is to explore how Gōngsūn Lóng's double-reference approach in his argument in support of the "white horse not horse" (bái maˇ fēi maˇ 白馬非馬) thesis (which I will refer to below as the "white horse not horse" argumentation, for short) can contribute to our understanding

and treatment of the issue of how reference is possible. It will engage with two approaches which are representative of the discussion of this problem in contemporary philosophy of language, namely the Lockean-Fregean and the Millian-Kripkean approaches. My basic view is this: first, it is philosophically significant that, through his “white horse not horse” argumentation, Gōngsūn Lóng applies the double-reference character of a referring name in the (declarative) subjectpredicate sentential context of what I call “the basic employment of language” to the effect that something is said of an object; second, his double-reference thought4 allows us to engage with the two major approaches to reference in contemporary philosophy of language. It shows how the convincing aspects of both can be brought together, while other issues neglected by both can be constructively complemented.

This chapter will address the issue as follows: In part 1, I will present a double-reference account of Gōngsūn Lóng’s “white horse not horse” thesis. In part 2, I will explain how a double-reference account of Gōngsūn Lóng’s “white horse not horse” thesis can complement current approaches to reference and enhance our understanding of how reference is possible." (pp. 169-170, notes omitted)

26. ———. 2020. "Naming, Reference and Truth." In *Dao Companion to Chinese Philosophy of Logic*, edited by Fung, Yiu-ming, 33-70. Cham, Switzerland: Springer.

"With the foregoing notes, my strategy is this. First, in Sect. 1, I will explain several basic points as revealed by the rich resources in the classical text *Gong-Sun-Long-Zi*, focusing on the relevant points in the “*Bai-Ma-Lun*” [*The White Horse Dialogue*], “*Zhi-Wu-Lun*” ["Discourse on Pointings and Things", chapter 3 of *Gong-Sun-Long-Zi*] and “*Ming-Shi-Lun*” ["Discourse on Names and Actualities", chapter 6 of *Gong-Sun-Long-Zi*]. Second, in Sect. 2, I will analyze how, essentially in line with Gongsun Long’s relevant point in the *“Bai-Ma-Lun*”, the Later Mohists significantly show their semantic sensitivity to the due identities of the referents in reasoning, as primarily suggested in the Later Mohist text *Xiao-Qu*) [the “Small Selection” of the Mozi], Third, in Sect. 3, I will look at how,

essentially in line with Gongsun Long's general point on the due-place actuality in the "*Ming-Shi-Lun*", Confucius' account of name rectification (as suggested in the *Analects*) together with Xun Zi's and Wang Chong's further developments addresses the issue of reference in moral reality. Fourth, in Sect. 4, I will explain how Lao Zi makes interesting and engaging points concerning the relationship between language engagement and the ultimate concern and between the "speakable" and the "unspeakable" as suggested in the *Dao-De-Jing*. Fifth, in Sect. 5, I will briefly examine a relatively recent debate on the relation of the structure of Chinese nouns to Chinese thought from the referential point of view: I will focus on how the mass-noun-semantics part of Hansen's mass-noun hypothesis are challenged by some competing accounts in view of the referential relation between Chinese nouns and referents. Sixth, in Sect 6, I will address the intrinsic connection between the two basic semantic notions, reference and truth and briefly explain to what extent the content of this essay on the issue of reference is intrinsically related to an account of how (semantic) truth is possible in any intellectual inquiries into "how things are", generally speaking, and in logic, specifically speaking."     Abstract: "Confucius, one of the most important educationalists, thinkers and philosophers in the Chinese history, has great impacts on Chinese people's life and is gaining increasing popularity worldwide. A great number of researches into the thoughts of Confucius have been conducted at home and abroad, most of which are from the perspectives of philosophy, culture, religion, etc. But his views on language, especially on the role of language in social life, have not been paid due attention to. This paper aims to examine thoroughly Confucius' thoughts on language functions and make a comparison between Confucius' views on language functions and some western theories of language functions. We find that language functions mainly fall into three categories including communicative function, ethical function and political function. We also find that both Confucius and Western scholars share

the view that language bears a close relationship with politics while they still hold some different opinions. Confucius places more emphasis on a higher and more specific level of language functions while western scholars focus more on the general and objective level."

Abstract: "This article is a study of the Later Mohists' 'Lesser Selection (*Xia˘oqu˘*)', which, more than any other early Chinese text, seems to engage in the study of logic. I focus on a procedure that the Mohists called *mo´u* . Arguments by mo´u are grounded in linguistic parallelism, implying perhaps that the Mohists were on the way to a formal analysis of argumentation. However, their main aim was to head off arguments by *mo´u* that targeted their own doctrines, and if their argument succeeds then it entails that linguistic parallelism can never ground a cogent argument. In a way, this committed them to the view that formal logic cannot work, but the fact that they did not pursue this line of investigation was by no means inevitable. One consequence of this study is that the Later Mohists conducted their logical work by studying the behaviour of terms and verb phrases, and did not identify the sentence as a significant linguistic unit. This tends to confirm Chad Hansen's generalisation that early Chinese philosophers did not posit sentences or other sentence-like entities such as propositions, beliefs, or laws. Focusing on subsentential expressions did not stop the Mohists from addressing genuinely logical issues, but it may help explain the fact that they never developed a conception of logical structure. This study includes the complete Chinese text of the 'Lesser Selection' and a translation in English."

56. ———. 2014. "Specific Features of Chinese Logic: Analogies and the Problem of Structural Relations in Confucian and Mohist Discourses." *Synthesis Philosophica* no. 57:23-40.

Abstract: "The article follows the presumption according to which analogical inferences in Chinese tradition followed a structure that connected all elements within a particular kind. This structure functioned as the basic element of analogies. Another crucial characteristic of classical Chinese analogies is the method of combining meanings. The composition of classical Chinese sentences tends towards the intrinsic connection among the individual parts of the sentence, and rarely applies morphological signs. This particular feature of the Chinese language also influenced the prevailing methods of thought that manifested themselves

in the processes of inferences, based upon proximity, similarity and identity. Focusing uponearly Confucian and Mohist philosophy, the author shows how and why these methods could lead to the creation of a specifically Chinese type of analogism.""

57. ———. 2015. "Classical Chinese Logic." *Philosophy Compass* no. 19:301-309.

Abstract: "The present article provides an introduction to classical Chinese logic, a term which refers to ancient discourses that were developed before the arrival of significant external inf luences and which flourished in China until the first unification of China, during the Qin Dynasty (221 BC). Taking as its premise that logic implies both universal and culturally conditioned elements, the author describes the historical background of Chinese logic, the main schools of Chinese logical thought, the current state of research in this area and the crucial concepts and methods applied in classical Chinese logic. The close link between

Chinese logic and the Chinese language is also stressed."

58. ———. 2017. "Structural Relations and Analogies in Classical Chinese Logic." *Philosophy East and West* no. 677:841-863.

"The present article aims to expose some aspects of the specific features of classical Chinese analogisms. First, it exposes the supposition that this type of analogism did not focus exclusively on forms without considering their content, that is, that it was linguistically and semantically determined. Second, it also aims to show that classical Chinese analogies are based on structural relations between the objects in question,

which constitute the similarity of two types (or kinds) of things that share certain attributes. This article additionally sheds light on the question of how and why the structure underlying these relations represents a semantic and axiological referential framework that functions as the methodological foundation of the tight connection between logic and ethics in ancient China." (p. 841)

59. ———. 2021. *Interpreting Chinese Philosophy: A New Methodology*. New York: Bloomsbury Academic.

    Chapter 3: *Chinese Logic as a Basis of Classical Chinese Theory*, pp. 73-99.

    "3.1 Semantic Nature of Chinese Logic

    In China, logical reasoning was closely connected to language, especially with respect to semantic issues and was determined by its tight relation to ethics (e.g., Mozi s.d., Jing xia, 155). However, this does not mean that in classical texts which are not immediately identifiable with metaphysical and ethical discourses there were not also forms of logical and methodological thought.

    Although Chinese philosophy developed in connection with ethical ideas and metaphysical concepts, there was a close relationship between moral and metaphysical thought, on the one hand, and logical reasoning, on the other.(3)

    Classical Chinese logical thought never neither elaborated any explicitly systematic and comprehensive formulation of the laws of reason nor produced a coherent system of symbolism for abstract reasoning. Prior to the eighteenth and early nineteenth centuries, Chinese thinkers had rarely encountered a systematic and well-formulated logical work. But as Cheng

Chung-Ying (1965, 196) points out, this does not mean that classical Chinese thought lacked logical depth or consistency." (p. 74)

(...)

"3.2 Chinese Analogies

The present chapter aims to expose some aspects of the specific features of classical Chinese analogisms, which form a very important thought pattern prevailing in the entire Chinese intellectual tradition.(27)

Firstly, I would like to reveal that this type of analogism did not focus exclusively on forms without considering their content, that is, that it was linguistically and semantically determined. Secondly, it also aims to show that the classical Chinese analogies are based upon structural relations between the objects in question, which constitute the similarity of two types (or kinds) of things that share certain attributes. This chapter additionally sheds light upon the question of how and why the structure underlying these relations represents a semantic and axiological referential framework that functions as the methodological foundation of the tight connection between logic and ethics in ancient China." (p. 83)

(3) The reasons for the decline of the latter in early medieval China are multiple and linked mainly to complex historical events and processes that shaped specific social conditions that proved to be unfavorable for the evolution of scientific thought and methodologies.

(27) This chapter includes a reworked version of my article “Structural Relations and Analogies in Classical Chinese Logic,” which was originally published in *Philosophy East & West*, Vol. 67, No. 3 (2017), 841–3.

Problem”." *Asian Studies* no. X (XXVI):299-312.

Abstract: "This article addresses some basic methodological problems in the field of transcultural post-comparative studies of ancient logic by comparing the famous flying arrow paradox of Hui Shi (370–c. 310 BCE) with an apparently similar paradox attributed to Zeno of Elea (495–430 BCE). The article proceeds from a general introduction to the basic framework of semantically determined classical Chinese logic, to an illumination of Hui Shi’s specific contributions to the field, and finally to a preliminary explanation that emerges from a contrastive analysis of Zeno’s and Hui Shi’s respective views on the problem of motion and stasis as manifested in their corresponding paradoxes. The contrastive analysis, based on an exposition of some basic problems in the field of transcultural methodology and a description of the so-called sublation method, points to the importance of considering different paradigms and frames of reference in identifying differences between apparently similar theses."

In *The Gongsun Longzi and Other Neglected Texts: Aligning Philosophical and Philological Perspectives*, edited by Suter, Rafael, Indraccolo, Lisa and Behr, Wolfgang, 207-239. Berlin: De Gruyter.

    "The 'Treatise on Name and Reality' (Míngshí lùn 名實論, hereafter the Treatise)(1) opens with a categorical schema that aims to expose the principle of "rectifying names" (zhèng míng 正名) – that is, the correct usage of names. The application of these conditions for designations becomes the subject of further treatment in the subsequent passages. The schema first introduces the categories "to be a 'thing'" (wù 物, here denoting to the name 'thing') and "to be solid" (shí 實), then presents the category "to be in a place" (wèi 位), and finally leads to the judgment "to be right" (zhèng 正).

    [Chinese texct omitted]

    [1] 'Heaven' and 'earth' and what is born by them inside are 'things'.

    [2] [The name] 'thing' is solid as [it applies the name] 'thing' [to] what is [named] 'thing' and does not go beyond that.

    [3] A 'solid' (i.e. the name applied to the object) is in a place as [it] fills out what is [named to be] filled out without leaving a void inside.

    [4a] [Names] that step out where they [should] be placed do not constitute a place.

[4b] [Names] that are placed where they [should] be placed are right.

A very short, general summary of these four statements could proceed as follows: Names are related to things. Naming things makes names ‘solid’, as they become visible and recognizable for us in objects. And finally, naming places objects in positions relative to other positions, which enables us to evaluate their realization. ‘Names’ and ‘naming’ (míng 名) are the overall topic of the schema even though the word míng is not mentioned directly. Yet names appear in different forms in reality at the same time: a name can be a designation (‘thing’), an expression of meaning (‘solid’), and an assignment (‘place’). These forms are interrelated, and the schema exposes their various relations. I use the term ‘category’ to refer to these relations, since they are constitutive for making a predication (wèi謂)." (pp. 208-209, some notes omitted)

Abstract: "This paper has attempted to characterize “Zhiwu lun” as the presentation of the incapacity of object-oriented knowledge to represent the realm of “things”, highlighting Gongsun Long’s epistemological and ontological value beyond a logical one. This paper proposes that only based upon this assumption does “Zhiwu lun” allow a thorough interpretation of “Mingshi lun”, whereby the intuitive function of “names” provides a better solution to the cognitive limits imposed by object-oriented (self-)consciousness. Methodologically, this

paper mainly considers the Heidelberg School's interpretation of Hölderlin's critique of

judgment in "Judgment and Being" to be both a complementary justification and reconstruction of the implicit structures of Gongsun Long's view. This paper has presupposed the interpretation of Gongsun Long's key concept of 指 as "judgment" in Hölderlin's sense, in contrast to "things" (物) and "name" (名), then verified this hypothesis, as well as the relationships amongst these translations, by a close textual analysis and new translation of "Zhiwu lun"."

Abstract: "In this essay, I argue in favor of a novel interpretation of the semantic theory that can be found in the Later Mohist writings. Recent interpretations by Chad Hansen and Chris Fraser cast the Later Mohist theory as a realist theory; this includes attributing to the Later Mohists what we can call “kind-realism,” the idea that there is some correct scheme of kind-terms that carves the world at its joints. While I agree with Hansen and Fraser that the Later Mohist theory is realist in various ways, I offer challenges to their kind-realist interpretations, and argue instead for a kind-conventionalist interpretation on which there is no fixed, correct set of kinds, leaving schemes of kind terms to be determined by conventional decisions that occur during disputation (bian 辯)."

    Abstract: "In this essay, I examine the nature of Chinese logic and Chinese sciences in the history of China. I conclude that Chinese logic is essentially analogical, and that the Chinese did not have theoretical sciences. I then connect these together and explain why the Chinese failed to develop theoretical sciences, even though they enjoyed an advanced civilization and great scientific and technological innovations. This is because a deductive system of logic is necessary for the development of theoretical sciences, and analogical logic cannot provide the deductive connections between a theory and empirical observations required by a theoretical science. This also offers a more satisfactory answer to the long-standing Needham Problem."

79. Sun, Zhongyuan. 2007. "Meta-research in Chinese logic." *Frontiers of Philosophy in China* no. 2:50-69.

Abstract: "This paper discusses the topics, goals, values and methods of Chinese logic. It holds that the goal of the research in Chinese logic is to reveal its structure, content, rules, and essential character, as well as to reveal both similarities and differences between Chinese and foreign logic. The value of the research is to carry forward and develop the outstanding heritage of Chinese logic. Its method is to annotate original works of Chinese ancient logic with the tools of modern language and logic in order to reveal both the particular nature and the universal qualities of Chinese logic. The method also explores the differences and similarities between Chinese and foreign logic. In recent years, research in Chinese logic has developed considerably; it has also logged many important achievements.

But there are many different views about the complexity and long-term goals of the research. Future research will build on the merits of different kinds of logic, promote Chinese logic, and increase communication between Chinese logic and foreign logic."

Philological Perspectives, edited by Suter, Rafael, Indraccolo, Lisa and Behr, Wolfgang, 429-558. Berlin: De Gruyter.

"This chapter follows the research of A. C. Graham (1919–1991) and Shěn Yo ̌udi ̌ng 沈有鼎 (1908–1993) on the textual history of the Gōngsūn Lóngzi ̌ 公孫龍子(hereafter GSLZ). After a few introductory remarks in the first section, the second section illustrates the secondary nature of the GSLZ by giving a concise overview of the various ways its compilers drew on the "dialectical chapters" of the Mòzi ̌ (Mohist 'Canons'). In the third section, I gather evidence for the medieval renaissance of Mohist dialectics, which was closely associated with the figure of Gōngsūn Lóng from its beginning, in order to suggest that it was in the light of this renewed interest in language and argument that the extant GSLZ was composed.

If the GSLZ is indeed as late as this, its compilation would coincide with a period during which Buddhist scholastics enjoyed increasing influence in China. Thus the main part of the chapter is dedicated to disclosing traces of a Buddhist impact on the argument, structure, and compilation of the GSLZ, or some of its parts." (p. 429)

Texts: Aligning Philosophical and Philological Perspectives, edited by Suter, Rafael, Indraccolo, Lisa and Behr, Wolfgang, 1-19. Berlin: De Gruyter.

"The Gōngsūn Lóngzi˘ 公孫龍子(Master Gongsun Long) is traditionally attributed to the so-called “School of Names”. It stands out in the intellectual landscape of early China due to its marked interest in the relation between language and reality and its overall neglect of moral and political issues that are usually so characteristic of the thought of its time. Since the late nineteenth century, this philosophical orientation has invited modern scholars to study the text from the perspective of academic disciplines such as logic and philosophy. To the present day, most of the – increasing, yet still comparatively scarce – publications on the text appear in journals on Chinese and comparative philosophy, and thus continue this tendency." (p. 1)

(...)

"The contributions to this volume are grouped thematically, according to the three broad categories of history, philosophy, and philology. It goes without saying that their boundaries are not clear-cut, nor are the categories themselves mutually exclusive or uncontested in a sinological context. They are merely descriptive and serve the practical purpose of facilitating the reader’s orientation." (p. 11, a note omitted)

    Abstract: "The paper is concerned with the development of the paradoxical theme of Daoism. Based on Chad Hansen’s interpretation of Daoism and Chinese philosophy in general, it traces the history of Daoism by following their treatment of the limit of language. The Daoists seem to have noticed that there is a limit to what language can do and that the limit of language is paradoxical. The ‘theoretical’ treatment of the paradox of the

limit of language matures as Daoism develops. Yet the Daoists seem to have noticed that the limit of language and its paradoxical nature cannot be overcome. At the end, we are left with the paradoxes of the Daoists. In this paper, we jump into the abyss of the Daoists' paradoxes from which there is no escape. But the Daoists' paradoxes are fun!"

    Abstract: "The anecdote of Zhuangzi and Hui Shi's brief discussion on a bridge above the Hao river gives us a nice piece of reasoning in ancient Chinese texts that may serve as a platform for a productive philosophical exchange between the East and the West. The present study examines Hansen's inferential analysis of Zhuangzi and Hui Shi's discussion in this spirit. It is argued that Hansen's analysis founders. To do justice to both Hui Shi and Zhuangzi, the present study proposes that we apply the logic developed in the later Mohist text, the *Lesser Pick*, to an analysis of their discussion. The re-analysis shows that the intricate dialectic of the reasoning in which Zhuangzi and Hui Shi engage, neatly accords with the pattern of discourse expounded in the *Lesser Pick,* and gives us global insight into Zhuangzi's final statement in the anecdote, which is notoriously recondite, or confusing."

"Is the White Horse Paradox just a sleight of hand, or is it indicative of some truths about words, language, and logic? The paradox underscores some differences in the significance and implications of terms when considered in the context of mention rather than use. Moreover, the paradox shows that insights into how words and phrases operate in language can be gained by considering them in the context of mention. The paradox also causes us to think of the instrumental value of words, as opposed to thinking of their roles just in referring and in judgments and inferences."

100. Vierheller, Ernst-Joachim. 1993. "Object Language and Meta-Language in the Gongsun Long Zi." *Journal of Chinese Philosophy* no. 20:181-209.

"The Gongsun Long Zi is a text of the ancient Chinese School of Logicians. An attempt is made to provide a coherent interpretation of the logical content of the chapter "bBi ma lun". The analysis based on a new look on the logical function of

the negated copula "Fei" yields a reading of the text as being directed toward elucidating the distinction of meta-/object-language and of extension/intension of a concept. This fact could enhance the appreciation of the level of language analysis reached at an early premodern state of Chinese philosophy. "

In *The Gongsun Longzi and Other Neglected Texts: Aligning Philosophical and Philological Perspectives*, edited by Suter, Rafael, Indraccolo, Lisa and Behr, Wolfgang, 399-428. Berlin: De Gruyter.

    "In the collection of texts dealing with the logic of language and compiled under the name of the logician Gōngsūn Lóng 公孫龍 (c. 320–250 BCE), one of the chapters is 'Zhi˘ wù lùn' 指物論, which roughly translates as: "On Classifying Things". The text opens with an enigmatic statement which literally says: "No thing is not a finger, but a finger is not a finger" (物莫非指而指非指). This statement has been the object of many studies which aim to establish its meaning. Another text of approximately the same era, 'Qíwù lùn' 齊物論, which roughly translates as: "On Equalizing Things", is the second chapter of the Taoist anthology Zhuāngzi˘ 莊子, compiled under the name of Zhuāng Zhōu 莊周(c. 370–285 BCE). In this text, the statement quoted above is not only alluded to, but actually applied to support a line of argument. This chapter shows how the author of the Zhuāngzi˘ is making use of the statement from the Gōngsūn Lóngzi˘ and establishes the meaning he attributes to it. Given the two texts' proximity in time, the interpretation thus arrived at may have a sufficient measure of authority to add a conclusive perspective to the study of the text of the Gōngsūn Lóngzi˘, of which an annotated translation is provided as an appendix."     Abstract: "This article aims at providing a general overview of the development of interpretational discourse on *Gongsun Longzi* (公孫龍子) as a text in Chinese logic in the timeframe between the May Fourth events in 1919 and the outbreak of the Sino-Japanese war in 1937. In my attempt to highlight the main interpretational approaches to the text and philosophy of Gongsun Long (公孫龍, 320 BC-250 BC) I will, on one hand, focus on the question whether or how the Western philosophies and notions of logic, such as for instance that of pragmatism, analytic philosophy and dialectical materialism, influenced the above-mentioned interpretations. On the other hand, aside from its contextual evolution I will also try to cast some new light on the main milestones of its textual re-emergence and development in the early Republican period."

Dordrecht: Kluwer.

    On the history of logic see Section III, pp. 468-471.

"Since China is historically one of the three sources of logic, the history of Chinese logic is a very important subject. It is generally recognized that the "Mo-Jing" (Mohist Canon) logic is the high point in the development of logic in ancient China. So research into the history of Chinese logic is mainly that of "Mo-Jing". There have been a great number of books and papers published in this field over the past twenty years. In my view it can be divided in two periods: before and after the end of the eighties. In the first period great effort was devoted to sorting out the material, digging out the logical problems, and making scientific assessments. In the second period, a reflection is made on the conclusions of the first period, including sharp criticism. In order to make

the introduction easier, I will concentrate on the argumentation in this field.

"Mo-Jing" logic is said to be the first scientific and complete system of logic in ancient China, to be as good as Aristotle's logic, and to have achievements comparable to that in Greek Antiquity, etc. There are also some people querying these points of view. There are two problems here. One is about the interpretation of Mo-Jing logic; the other is about the comparison between Mo-Jing logic and Aristotle's logic." (pp. 468-469)

109. Wang, Ping, and Johnston, Ian. 2020. "The Gōngsūn Lóngzi˘: A Historical Overview." In *The Gongsun Longzi and Other Neglected Texts: Aligning Philosophical and Philological Perspectives*, edited by Suter, Rafael, Indraccolo, Lisa and Behr, Wolfgang, 25-44. Berlin: De Gruyter.

"The Gōngsūn Lóngzi˘ 公孫龍子(GSLZ), attributed to the late Warring States scholar Gōngsūn Lóng公孫龍(330–242 BCE, hereafter GSL), is one of the more remarkable works in the history of early Chinese literature. As it has been preserved in the Dàozàng 道藏(DZ, Daoist Canon), it is a short text comprising five brief essays or arguments plus an introduction, presumed to be a later addition. There is, we would argue, an overall thread identifiable in the five essays; it is an examination of the relationship between names (míng 名) and

entities (shí 實, actuality/reality) with the purpose of establishing the correct relationship between the two – the program of zhèng míng正名. This is taken to be the central and defining interest of the Míngjiā (名家) or “School of Names”. In pursuing this central interest, the GSLZ necessarily touches upon some of the ontological and epistemological ramifications of such an endeavor. Along with the other works of the School and related texts,1 it is comparable in focus to aspects of the more or less contemporary

“Organon” of Aristotle and some of the Stoic writings on logic, now lost." (p. 25)

(1) The writings of the “School of Names” and important related texts (including the Later Mohist dialectical chapters, the ‘Qíwù Lùn’ 齊物論in the Zhuāngzi˘ 莊子, and the ‘Zhèng Míng’ 正名 chapter in the Xúnzi˘荀子) have been collected and translated in Johnston/Wang 2019.

Name and Corresponding Object (mingshi, 名实), pp. 307-315.

"Name and corresponding object are a key conceptual pair in traditional Chinese philosophy.

Name means designation and concept. Corresponding object means reality, things and affairs or the object situation of the thing or affair. The relationship between name and corresponding object is roughly equivalent to the concept and the objective reality that the concept reflects. In Chinese philosophy, the issue of name and corresponding object contains the following four main contents. One, that which the name is based on, two, the rule for producing names, three, the categorization of names and four, the relationship between

names and corresponding object. With regard to the relationship between names and reality, it can be further divided into question of whether the name or the object came first. This means whether the name determines the object or vice versa, as well as whether names accurately reflect reality, that is, whether names and objects can correspond with each other."

Language and Meaning (yanyi, 言意). pp. 413-424.

"“Yanyi” is a key concept is Chinese epistemology. “Yan” refers to one’s words (言辞), nouns (名词), concept (概念), exposition and argument (论说) and writings (著述). In traditional Chinese philosophy, “yi” contains two dimensions of meaning, one means intention and the other means ideal (理想), the argument of a speech or essay (义理) and purpose (宗旨). When the two terms are united, “yi” refers to idea, argument and purpose. Key to the concept of “yanyi” is the relationship between “yan” and “yi,” and this relationship differed throughout different historical epochs and at the hands of different philosophers. Due to their different understandings of “yanyi,” therewere also differences in their understanding of the relationship between “yan” and “yi.”"

    Proceedings of the 29th International Wittgenstein Symposium 2006, Kirchberg am Wechsel, Austria.

    "This article focuses on two questions. One is about the so-called Sapir-Whorf hypothesis, which says that language plays a role in how we perceive and understand the world. To put it strongly: Language determines thought. The other question is more specific. It is about the Chinese language. Is Chinese, with its grammar and its writing system, fundamentally different

from Western languages such as Greek, Latin, German, Spanish or English? And does this difference account for cultural differences in perception and understanding? We all live in one world. But individually and culturally, we also live in different worlds. One easily notices this when one lives abroad. What is the role of language in this? What is its influence on perception, thought and culture? I am interested in influences that are due not just to vocabulary (which should be obvious), but, more fundamentally and systematically, to grammar and writing system. Words can easily be added to a language, one by one and step by step, and they do indeed reflect thought and culture. But grammar goes deeper. In what ways it reflects thought and culture is a more difficult but more interesting question, so it seems to me."

113. Williams, John R. 2018. "Two Paradigmatic Strategies for Reading Zhuang Zi's "Happy Fish" Vignette as Philosophy: Guo Xiang's and Wang Fuzhi's Approaches." *Comparative Philosophy* no. 9:93-104.

    Abstract: "One of the most beloved passages in the Zhuang-Zi text is a dialogue between Hui Zi and Zhuang Zi at the end of the “Qiu-shui”chapter. While this is one of many vignettes involving Hui Zi and Zhuang Zi in the text, this particular vignette has recently drawn attention in Chinese and comparative philosophy circles. The most basic question concerning these studies is whether or not the passage represents a substantial philosophical dispute, or instead idle chitchat between two friends. This vignette has not only received much attention as of late, but commentators from at least Guo Xiang onward have taken the conversation as substantial rather than merely charming. Of the traditional readings that take the passage as substantial, there are two main strategies for taking Zhuang Zi as “winning” a substantial dispute: (1) One that argues Zhuang Zi is undermining Hui Zi’s position without offering a positive position, and (2) another that argues that Zhuang Zi is undermining Hui Zi’s position by offering a positive position. Guo Xiang’s “official commentary” is paradigmatic of the first “negative” strategy, while Wang Fuzhi’s reading is paradigmatic of the second “positive”

strategy. The goal in the present article is to present these two strategies for reading the passage by translating and analyzing Guo's and Wang's annotations, thereby showing how the passage might be and has been taken as more than frivolous chitchat."

115. ———. 2010. "Logical Analysis and Later Mohist Logic: Some Comparative Reflections." *Comparative Philosophy* no. 1:53-77.

Abstract: "Any philosophical method that treats the analysis of the meaning of a sentence or expression in terms of a decomposition into a set of conceptually basic constituent parts must do some theoretical work to explain the puzzles of intensionality. This is because intensional phenomena appear to violate the principle of compositionality, and the assumption of compositionality is the principal justification for thinking that an analysis will reveal the real semantical import of a sentence or expression through a method of decomposition.

Accordingly, a natural strategy for dealing with intensionality is to argue that it is really just an isolable, aberrant class of linguistic phenomena that poses no general threat to the thesis that meaning is basically compositional. On the other hand, the later Mohists give us good reason to reject this view. What we learn from them is that there may be basic limitations in any analytical technique that presupposes that meaning is perspicuously represented only when it has been fully decomposed into its constituent parts. The purpose of this paper is to (a) explain why the Mohists found the issue of

intensionality to be so important in their investigations of language, and (b) defend the view that Mohist insights reveal basic limitations in any technique of analysis that is uncritically applied with a decompositional approach in mind, as are those that are often pursued in the West in the context of more general epistemological and metaphysical programs."

    "The main task of this paper is an exposition of some subtle common traits of Chinese thought through an examination of some major characteristics of the Chinese language. First, the author presents the main structures of the Chinese written characters and some notable syntactical features of the classical Chinese. Second, he exposes some essential characteristics of Chinese thinking as revealed by the nature of the language. In the conclusion, he justifies the thesis that the Chinese language is a language for poetry."

118. Xie, Yun. 2019. "Argument by Analogy in Ancient China." *Argumentation* no. 33:323-347.

    Abstract: "Argument by analogy has long been regarded as the characteristic way of arguing in ancient Chinese culture. Classic Chinese philosophers not only prefer to use analogy to argue for their own views, but also take efforts to theorize it in a systematic way. This paper aims to provide a careful study on the relevant ideas in ancient China in order to reconstruct the ancient Chinese theory of argument by analogy,

    and then to reveal some of its distinctive features through a comparison with the Western counterpart account as developed by Aristotle. It is indicated that in ancient China analogical argument was conceived primarily as a way of arguing based on classification, with a unique mechanism of taking and giving according to kind.

On that basis, it is argued that although such a characterization captures the logical structure of analogical argument in a similar way to Aristotle, the ancient Chinese theory stresses the foundational role of a particular notion of kind, thus makes the construction and application of analogical arguments become highly flexible and context-sensitive. Moreover, it is also contended that in ancient China the rationale of analogical arguments is explained from a general perspective of kind, relying upon the universal knowledge pertaining to the forming of kinds. Then it is further revealed that, unlike Aristotle who emphasizes the causal links between attributes in the physical world, ancient Chinese thinkers justify analogical argument by appealing to some normative metaphysical and epistemological principles."

    Abstract: "In this article, I introduce a new interpretation of the puzzling thesis “bai 白 (white) ma 馬 (horse) fei 非 (is not) ma 馬 (horse)” argued by Gongsun Long 公孫龍 in his essay “On

White Horse (Bai Ma Lun 白馬論).” I argue that previous interpretations, which can be grouped under the name of “attribute-object interpretations,” are not satisfactory, and that the thesis on the new interpretation is not about attributes or objects, but about names. My argument focuses on the disagreement over inseparability of white (shou bai zhi zheng 守白之爭) between Gongsun Long and his interlocutor in the text of “On White Horse.” On my interpretation or the name interpretation, the disagreement is about whether constituents of a syntactically complex or multi-term name are separable or have their contextually independent meanings. Gongsun Long’s thesis makes perfect sense on my interpretation, and is supported by the text and other preserved texts collected in GongsunLong Zi 公孫龍子. The name interpretation can also make sense of some puzzling expressions of sophists in the classic period."

"The text known as Yi˘nwénzi˘ 尹文子has traditionally been attributed to the Warring States philosopher Yi˘n Wén 尹文 (traditionally c. 360–280 BCE), who lived in the state of Qí and was active in the environment of the so-called Jìxià academy. Generally, it is among the most neglected ancient texts, even in comparison with the Gōngsūn Lóngzi˘ 公孫龍子." (p. 347, a note omitted)

(...)

"Conclusion

The linguistic evidence I have presented in this chapter provides many good reasons to doubt that the extant transmitted version of the Yi˘nwénzi˘ can be a Warring States composition. The combination of some important syntactic evidence and certain lexical phenomena support the hypothesis of a later date of composition. As I argued in the introduction to this survey, it is self-evident that one can always try to dismiss these findings out of hand with reference to the influence of a post-classical editor. I will not repeat the discussion here – suffice it to say that in such a case, one would have to carefully explain how and why the editor happened to revise and transmit the text in a style characterized by a noticeably

colloquial and, at the time, modern flavor instead of preserving its original ancient appearance, as was the case with practically all genuinely pre-Qín texts in the course of their transmission." (p. 387)

"Gōngsūn Lóng's 公孫龍(c. 325–250 BCE) 'Discourse on the White Horse' ('Báimaˇ lùn', 白馬論; henceforth BML) has always been considered an example of sophistry. But just as the tracks of single particles in an aerosol chamber can only be recognized by an expert physicist, so it is only with a full grasp of its analytical philosophy of language and its epistemological nature that one is able to realize the essence of BML: its character as a concrete analytical philosophy of language. At the same time, this insight presupposes a solid understanding of the spirit and the atmosphere of the time, of the thought and scholarly culture from which this theory has emerged – namely, the point which the Zhuāngziˇ 莊子has characterized as the splitting up of the unified "Art of the Way" into the "Hundred Schools" of thought. And only together with firm evidence from ancient books and records, including bibliographical lists, are we able to evaluate and ascertain the authenticity of the received Gōngsūn Lóngziˇ (henceforth GSLZ), in which BML has been transmitted."     "The Mohist School's logical study focuses mainly on the following inference rule: suppose that N and M are coextensive terms, or N a subset of M; it follows that if a verb can appear in front of N, it can also appear in front of M. That is, if 'VM' then 'VN', where V is some extensional verb. Such an approach to logical inference necessitates the study of logical relations among nouns, verbs, and the relations between these two types of words. Evidence is offered here that the Mohists clearly distinguished extensional verbs from intensional verbs, and that this insight enabled them to say, among other things, that VN does not follow from VM, even in cases where N is M or contained in M, as long as the V in question is an intensional verb."

Ancient Indian Logic and Ontology. A Survey of Contemporary Studies

The meaning and scope of Indian philosophy

"Indian philosophy denotes the philosophical speculations of all Indian thinkers, ancient or modern, Hindus or non-Hindus, theists or atheists. 'Indian philosophy' is supposed by some to be synonymous with 'Hindu philosophy.' This would be true only if the word 'Hindu' were taken in the geographical sense of 'Indian.' But if 'Hindu' means the followers of a particular religious faith known as Hinduism, the supposition would be wrong and misleading. Even in the ancient writings of the orthodox Hindu philosophers, like the Sarva-darsana-sangraha of Mädhâvacârya which tries to present in one place the views of all (sarva) schools of philosophy, we find in the list of philosophies (darsanas) the views of atheists and materialists like the Cärväkas, and unorthodox thinkers like the Bauddhas and the Jainas, along with those of the orthodox Hindu thinkers.

Indian philosophy is marked, in this respect, by a striking breadth of outlook which only testifies of its unflinching devotion to the search for truth. Though there were many different schools and their views differed sometimes very widely, yet each school took care to learn the views of all the others and did not come to any conclusion before considering thoroughly what others had to say and how their points could be met. This spirit led to the formation of a method of philosophical discussion. A philosopher had first to state the views of his opponents before he formulated his own theory. This statement of the opponent's case came to be known as the prior view (purvapaksa). Then followed the refutation (khandana) of this view. Last of all came the statement and proof of the philosopher's own position, which,

therefore, was known as the subsequent view (uttarapaksa) or the conclusion (siddhänta).

This catholic spirit of treating rival positions with consideration was more than rewarded by the thoroughness and perfection that each philosophical school attained. If we open a comprehensive work on the Vedanta, we will find in it the statement of the views of all other schools, Cärväka, Bauddha, Jaina, Sänkhya, Yoga, Mimämsa, Nyäya and Vaisesika, discussed and weighed with all care; similarly any good work on the Bauddha or Jaina philosophy discusses the other views. Each system thus became, encyclopaedic in its grasp of ideas. Naturally we find that many of the problems of contemporary Western philosophy are discussed in Indian systems of philosophy. Besides, we find that indigenous scholars with a thorough training, exclusively in Indian philosophy, are able to deal even with abstruse problems of Western philosophy with surprising skill.

If the openness of mind - the willingness to listen to what others have to say has been one of the chief causes of the wealth and greatness of Indian philosophy in the past, it has a definite moral for the future. If Indian philosophy is once more to revive and continue its great career, it can do so only by taking into consideration the new ideas of life and reality which have been flowing into India from the West and the East, from the Aryan, the Semitic and the Mongolian sources." (pp. 4-6)

From: Satischandra Chetterjee and Dhirendaramohan Datta, *An Introduction to Indian Philosophy*, Calcutta: University of Calcutta, 1954 (Fifth edition).

The Schools of Indian philosophy

According to a traditional principle of classification, most likely adopted by orthodox Hindu thinkers, the schools or systems of Indian philosophy are divided into two broad,classes, namely, orthodox (ästika) and heterodox (nästika). To the first group belong the six chief philosophical systems (popularly known as sad-darsana), namely, Mimämsä, Vedanta, Sänkhya, Yoga, Nyäya and Vaisesika. These are regarded as orthodox (ästika), not because they believe in God, but because they accept the authority of the Vedas.(1) The Mimämsä and the Sänkhya do not believe in God as the creator of the

world, yet they are called orthodox (ästika) because they believe in the authoritativeness of the Vedas.

The six systems mentioned here are not the only orthodox systems; they are the chief ones, and there are some other less important orthodox schools, such as the Grammarian school, the medical school, etc., also noticed by Mädhaväcärya. Under the other class of heterodox systems, the chief three are the schools of the Materialists like the Cärväkas, the Bauddhas and the Jainas. They are called heterodox (nästika) because they do not believe in the authority of the Vedas."

Notes

(1) In modern Indian languages. 'astika' and 'nâstika' generally mean 'theist' and 'atheist', respectively. But in Sanskrit philosophical literature, 'àstika' means 'one who believes in the authority of the Vedas' or 'one who believes in life after death. ('Nâstika' means the opposite of these.) The word is used here in the first sense. In the second sense, even the Jaina and Bauddha schools are 'âstika', as they believe in life after death. The six orthodox schools are 'âstika', and the Carvâka is 'nâstika' in both the senses." (pp. 6-7)"

From: Satischandra Chetterjee and Dhirendaramohan Datta, *An Introduction to Indian Philosophy*, Calcutta: University of Calcutta, 1954 (Fifth edition).

The Nyāya-Vaiśeṣika School

"Historically the Nyâya and Vaisesika schools are different. They had separate origins and developed differently in the early phases of their existence and also had different spheres of interest and expertise. However, on account of their common philosophical standpoints and methodology a link seems to have existed between the two quite early in their history which during the course of their development brought them closer, resulting in their subsequent amalgamation into a single syncretic system.

Roughly speaking the history of the Nyâya-Vaisesika system extends over a period of twenty-four centuries, i.e. from about the fourth century BC, till modern times. Like Vedânta, it has been one of the living systems of philosophy. Redaction of the Nyâya doctrines in the

form of sutras was done by Gautama around the fourth century BC. He was succeeded by an array of illustrious commentators and exponents like Vatsyayana (about AD 400), Uddyotakara (about AD 650), Väcaspati (about AD 840), Bhâsarvajna (about AD 860), Udayana (about AD 984), Jayanta (about the tenth century AD) and many others. The sutras of the Vaisesika school were formulated by Kanâda, about one century prior to Gautama, and he was followed by thinkers like Prasastapada (about the sixth century AD), Sridhaka (about AD 990 and Sarirkara Misra (about the fifteenth century AD).

As stated above, the Nyâya and Vaisesika schools had more or less the same sort of philosophical orientation and presuppositions; however, their interests were most pronounced in the fields of epistemology and metaphysics respectively. They borrowed from and leaned upon each other so heavily that they could not afford to remain separate for long. Though the synthesis of the two schools began appearing in Udayana, it was Gangesa (about the twelfth century AD) who is to be given the credit of forging the unity of the two schools. He is regarded as the founder of the syncretic school known as the Navya-Nyâya (Neo-Nyâya) school." (p. 132)

Indian Logic

"The term "Indian logic" may be used to refer to the system of logic (Nyāya) that forms one of the six principal schools of Hindu philosophy. In a wider sense it denotes Buddhist and Jaina logic as well. In a still wider sense it refers to any logical doctrine propounded by Indian scholars. In this article the term is used in the last sense, although Jaina logic is omitted and only some representative doctrines and techniques from other sources are discussed.

The history of Indian logic covers at least 23 centuries, and the number of works by Indian logicians, published and unpublished, is vast. Those available in Western languages or accessible in good editions constitute only a fraction of this material. Attention here is confined to material from some of the published Sanskrit texts. For

the study of Buddhist logic translations into Tibetan or Chinese from Sanskrit originals, many of which are lost, must also be utilized.

This survey falls into five parts: (1) Grammar, which was well developed by the time of the Sanskrit grammar of Panini. Its sophisticated logical rules and techniques influenced almost all later scholarly developments in India. (2) Mimamsa, the most orthodox of the six philosophical schools of Hinduism. It dealt largely with problems of textual interpretation and faced a variety of logical problems in the course of its history. (3) Vaisesika and Old Nyāya. Vaisesika, which also embodied a system of natural philosophy, provided a list of categories that set the framework within which logicians of the Old Nyāya school developed their systematic analyses of perception and inference. (4) Buddhist logic, partly a reaction against the old Nyāya. Some branches of Buddhist logic laid a foundation for formal logic and began to exclude extraneous considerations of ontology, epistemology, and psychology. (5) New Nyāya, the final phase of Hindu logic, both challenged by Buddhist logic and substantially enriched by it. The New Nyāya began with the work of Gangesopadhyàya (thirteenth century A.D.) and continues to the present day.

Lack of space prevents discussion of the role of logic in the sciences and of the philosophical schools of the Vedanta, which dealt with logical topics, especially in the later developments within Advaita and Dvaita.

Since more attention will be paid to doctrines than to individual logicians and their works and dates, a chronological table may be helpful in providing a rough outline of their historical context. (In the table, names of writings are in italic.) The table makes it clear that some of the schools which developed simultaneously were in a position to influence each other." (pp. 529-521)

INDIAN LOGICIANS AND LOGICAL WORKS

CENTURY	GRAMMAR	MĪMĀṂSĀ (Vedas)	VAIŚEṢIKA AND OLD NYĀYA	BUDDHIST LOGIC	NEW NYĀYA

Indian Ontology

"All Indian philosophical traditions are deeply engaged with ontology, the study of being, since clarity about the nature of reality is at the heart of three intimately connected goals: knowledge, proper conduct and liberation from the continued suffering that is part of all human existence. The formulation of a list of ontological categories, a classification of reality by division into several fundamental objective kinds, however, is less widespread. There is little room for a doctrine of distinct, if related, ontological categories in a philosophical school that takes reality as one, even less if that one lies beyond description. If the phenomenal world is but illusory appearance, as, for example, in the Vedanta of Sankara, then a determination of kinds of entities does not recommend itself as a means to adequate analysis of the world. Even the Sankhya tradition's realism reduces the world to an evolution from two fundamental entities, spirit and matter. Categories make sense within the context of a pluralistic realism, an analysis of the world that finds it to be composed of a multiplicity of real entities. Such a view is found to some extent in Jaina philosophy,

but is primarily defended and developed in the Nyāya-Vaiśeṣika school.

The Nyāya- Vaisesika categories are seven: substance, quality, motion, universal, particular, inherence and not-being. While all are understood as real entities and objects of knowledge, substance is most fundamental as each of the others in some way depends on substance. Substances are nine: earth, water, fire, air, ether, time, space, self and mind. The first four are atomic: they may combine to form macroscopic substance, such as a clay pot, but in incomposite form they are indestructible atoms, as are the last two. Ether, time and space, likewise indestructible, are unitary and pervade all. In its irreducible parts, all substance is eternal; every composite whole is a destructible substance.

A relation of containment, called inherence, structures the categories. The qualities, actions and universals by which we might characterize a pot inhere in it. They are distinct entities from the pot, yet cannot exist apart from their underlying substrate. Composite substances like a pot are also contained in their parts by inherence, but the smallest parts, eternal substances, exist independently as receptacles that contain nothing A whole, greater than the sum of its parts, is said to inhere in the parts while the parts are the inherence cause of the whole.

Eternal substance, the ultimate substrate of all, is a bare particular. An entity that is nothing but a receptacle for other entities, it furnishes criteria for separability and individuality, but cannot be defined in itself apart from others. This aspect of the concept of substance leads later Nyāya-Vaiśeṣika into extensive analysis of relations and negation." (pp. 118-119)

9. ———. 1988. "The Concept of Contradiction in Indian Logic and Epistemology." *Journal of Indian Philosophy* no. 16:225-246.

   "The article seeks to introduce to the students of philosophy the concept of contradiction in Indian philosophy. contradiction and contrariety fall under the common class of opposition called "Virodha". the former means "pervasion of mutual negation by two predicates," the latter means "pervasibility of two predicates by their mutual negation." Vontradiction is a purely logical relation, while contrariety is semilogical. The author suggests that contradiction and contrariety should better be called, respectively, "absolute contradiction" and "relative contradiction", both being based on contradiction of identity. Some formidable Indian philosophers argue that contradiction (including contrariety) is a purely logical category, for contradiction of facts is impossible."

18. ———. 2010. "On Two Questions of the New Logic of India." In *Logic in Religious Discourse*, edited by Schumann, Andrew, 34-43. Frankfurt: Ontos Verlag.

    Abstract: "Formal logic was born in two – and only two – cultural spheres: the western and the Indian. There was a 'formalism,' too, in Indian logic. The last phase of this logic, the 'new logic,' created a new language which, as with the 'new logic' of the West, became the language of other disciplines as well. But, while the new logic of the West followed the mathematical model, that of India followed the linguistic model: in that they followed two distinct traditions. Unlike the western, the Indian new logic did not construct an 'artificial language,' consisting in a system of symbols, but formulated its definitions and solved various logical problems with different combinations of concepts in natural language. Very little work has been done so far on the subject in western and Indian languages. The present paper deals with two questions which have been the subjects of discussion in recent years."

19. Bhattacharya, Ramkrishna. 2022. "Charvaka (Cārvāka)." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-23. Dordrecht: Delhi.

    Abstract: "The Charvaka (Cārvāka)-s are the last known materialists in India. They appeared in or around the eighth

century CE and, for some unknown reason, disappeared after the twelfth century CE. The earlier materialists flourished at least from the time of the Buddha (6th/5th BCE). They were found both in north and south India, bearing such names as Bhūtavāda, Lokāyata, etc. They believed perception to be the only means of knowledge. The Cārvākas, however, admitted inference to some extent as the second source, insofar as the inference was based on or followed from perception. It was in connection with the materialists' denial of the Other World that their opponents developed their own form of arguments. The materialists were challenged by the opponents with the help of inference by analogy and verbal testimony. The Veda was the ultimate source of such testimony. The Buddhists and the Jains, too, were at one with the materialists in denying the status of the Veda. Thus, the philosophical systems of India were divided into two opposing camps – the āstikas (affirmativists) and the nāstikas (negativists). The contribution of the Cārvākas in particular to the logical thought in India lies in the distinction made by them between two kinds of inference: the first based on perception or verifiable facts, and the second, arguments based on scriptures. Their atheism and satire against vedic sacrificial rites made them stand out as heretics. Their opponents also complained that they were opposed to caste and gender discriminations. These traits also made the Cārvākas appear as the ultimate rationalists in pre-modern India."

24. ———. 1974. "Some Features of Navya-Nyāya Logic." *Philosophy East and West* no. 24:329-342.

    "Navya-Nyāya developed a technical (non-symbolic) language tied to a realistic ontology, but this became the language of all serious discourse in India -- of all philosophies, grammar, law, medicine. The problem is primarily to explain how this was possible. The answer suggested is that Navya-Nyāya developed a language for 'describing' cognitions by stating not merely the objects recognized, but also the 'mode of cognition of the object'. This necessitated the development of special concepts like the concept of limitor (Avacchedaka). in ontology, Navya-Nyāya made extensive use of Occam's razor to decide which abstract terms stood for abstract entities, and which, though abstract grammatically, still denoted entities identifiable as concrete objects."

25. ———. 1990. "Some Features of the Technical Language of Navya-Nyāya." *Philosophy East and West* no. 40:129-149.

    "The technical language of Navya-Nyāya uses concepts like limitor, determiner, etc., to deal with sentences expressing cognition like perception, inference, memory, belief, doubt, supposition. As such sentences are not extensional, Navya-Nyāya distinguishes between what is cognised and the mode under which what is cognised is cognised. Limitor, in the technical language, determines the mode of cognition and is also used to express quantity of cognition, universality, particularity, etc. The concept of determiner is used to show what predicate is asserted of what subject in the same cognition."

26. ———. 1997. "Gadadhara's Theory of Meaning of Pronouns." In *Relativism, Suffering and Beyond. Essays in Memory of Bimal K. Matilal*, edited by Bilimoria, Purusottama and Mohanty, Jitendra Nath, 16-31. New Delhi: Oxford University Press.

    "In order to explain Gadadhara's theory of meaning of pronouns, it is necessary first to briefly state his theory of word meaning. In Indian philosophy in general and in Navya-nyaya in particular, theories of meaning of sentences are regarded as a part of theories of origin of true cognition. Hence in discussing theories of meaning, Indian philosophical systems almost exclusively consider how a hearer acquires information second-hand from what a speaker tells him. Indian theories of meaning refer to the speaker's intention only in so far as it is necessary for the hearer to cognize truly what the speaker says.

    According to Navya-nyaya, a word means an object only under a mode of presentation. Anyone who knows the meaning of the word knows the object under this mode on hearing, remembering, or otherwise cognizing, the word. The problem of meaning of words is the problem of explaining how the hearer knows the object under the particular mode.

    The mode of presentation of an object, according to Navya-nyaya, must be a property of the object. A property is anything which may be said to be *in* the object. According to Navya-nyaya, this is the case if and only if what is to be regarded as a property of an object is related to the object *by an occurrence-exacting relation*. Anything related to an object by such a relation will be its property."

28. Bilimoria, Purusottama. 1985. "Jñāna and Pramā: the Logic of Knowing - A Critical Appraisal." *Journal of Indian Philosophy* no. 13:73-102.

    "The thrust of this paper is to investigate the relative difference between "Jnana" and "Prama", two crucial concepts in Indian epistemology, since more recent treatment of them would seem

to be confused. Utilizing the framework developed by Nyāya and Advaita, it is argued that the former describes a wide range of cognitive processes, such as 'cognition', 'judgment', 'remembering', 'doubting', etc., while the latter defines the bounds of cognition in respect of its truth-value. A theory of knowledge is developed that accounts for the rise of 'true' knowledge in terms of the 'psyche-activity' involved and the set of criteria ("Pramanya") that renders a "Jnana" as a "Prama". The intensional structure of such a judgment, it is argued, involves a complex qualified-qualifier relation in conformity with the property-content relation of the objective correlate."

33. ———. 2000. "Against Immaculate Perception: Seven Reasons for Eliminating *Nirvilkalpaka* Perception from Nyāya." *Philosophy East and West* no. 50:1-8.

    "Besides seeing a rabbit or seeing that the rabbit is grayish, do we also sometimes see barely just the particular animal (not as an animal or as anything) or the feature rabbitness or grayness? Such bare, non-verbalizable perception is called "indeterminate perception" *(nirvikalpaka pratyaksa)* in Nyāya. Standard

Nyāya postulates such pre-predicative bare perception in order to honor the rule that awareness of a qualified entity must be caused by awareness of the qualifier. After connecting this issue with the Western debate concerning the "myth of the given," seven distinct arguments are presented showing that the very notion of such indeterminate perception is epistemically otiose and that the Nyāya theory of perception is better off without it."

37. ———. 1978. "The Nyāya-Vaisesika Theory of Negative Entities." *Journal of Indian Philosophy* no. 6:129-144.

    "The paper consists in three parts. The first part criticizes the attempt of some major Indian and Western philosophers like Plato, Cook Wilson, the Buddhists, the Prabhakaras, etc., to dispense with negative entities and builds up the case for them. The second part is devoted to their classification and contains additional arguments in favour of negative entities of particular kinds. The third part discusses some problems of a specialized nature such as the criteria for distinguishing one negative entity from another."

38. ———. 1985. "Some Remarks on Indian Theories of Truth." *Journal of Indian Philosophy* no. 12:339-356.

    "Some of the points sought to be established are (1) an overly pragmatic reading of the concept of truth in Indian philosophy should be avoided; (2) notions similar to that of knowledge as justified true belief and to the distinction between analytic and synthetic truths are found in Indian philosophy; (3) confirmation of truth through an inferential process, when properly analyzed, does not lead to an infinite regress and that (4) in some cases truth is known immediately."

39. ———. 1989. "Contraposition in European and Indian Loigc." *International Philosophical Quarterly* no. 29:121-127.

Abstract: "This paper consists of five sections. In the first two sections the presence and recognition of the law of contraposition of the universal affirmative categorical proposition (traditionally called an A proposition) is traced in Greek, Latin, and Sanskrit logical writings. In the third section it is pointed out that in both traditional European and Indian logic the universal proposition is understood to have existential import. The fourth section shows that the above law is invalid under the traditional interpretation. The fifth section deals with the views of Uddyotakara, a famous Indian logician, on this subject and takes notice of a number of logical notions introduced by him in this connection."

47. Chatterjee, Amita. 2022. "Logic in India." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-21. Dordrecht: Delhi.

    Abstract: "This chapter aims at providing a broad overview of Indian logic pursued in the classical Indian philosophical systems as well as in contemporary India. It will be seen that traditional systems of logic do share some features, yet diverge from each other due to the differences in their ontology and practice. During the colonial period, logic was pursued mainly within a comparative framework. However, the perception of Indian logicians changed entirely as they came into contact with modern symbolic logic. The chapter is divided into five sections. The first section deals mainly with the distinction

between Western and Indian conception of logic. The second section provides the structure of inference in classical Indian philosophical systems. The third section analyzes the concepts of negation available in the Nyāya, Buddhist, and Jaina logic and links different concepts of negation to the metaphysical presuppositions of the systems. The fourth section lays bare the nature of contradiction as conceived in these systems, and the final section gives a brief account of the developments in Indian logic during the nineteenth and the twentieth centuries."

50. Clavel, Anne. 2022. "Logic of Syād-Vāda." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar, 1-22. Dordrecht: Springer.

    Abstract: "The *syād-vāda* (“doctrine of syāt”), also called “sevenfold predication” (*sapta-bhaṅgī*), constitutes a cornerstone of the Jaina doctrine of multilateralism, since it prevents a predicate from being attributed absolutely to a subject. According to Jainism, in order to consider a single state of affair as exhaustively as possible, one has to submit every predicative relation between a subject and a predicate to a structural rule made up of seven propositions, which are not conceived of as alternative truths but are all endowed with the same truth-value. A thorough understanding of the syād-vāda raises tricky issues, such as the meaning of the adverb syāt in the context of this logical pattern, the compatibility of Jaina logic with basic logical principles, or the oddness of the number of propositions – why seven?"

51. Clerbout, Nicolas, Gorisse, Mari-Hélène, and Rahaman, Shahid. 2011. "Context-Sensitivity in Jain Philosophy: A Dialogical Study of Siddharsigani's "Commentaryon the

Handbook of Logic"." *Journal of Philosophical Logic* no. 40:633-662.

Abstract: "In classical India, Jain philosophers developed a theory of viewpoints (*naya-vāda*) according to which any statement is always performed within and dependent upon a given epistemic perspective or viewpoint. The Jainas furnished this epistemology with an (epistemic) theory of disputation that takes into account the viewpoint in which the main thesis has been stated. The main aim of our paper is to delve into the Jain notion of viewpoint- contextualisation and to develop the elements of a suitable logical system that should offer a reconstruction of the Jainas' epistemic theory of disputation. A crucial step of our project is to approach the Jain theory of disputation with the help of a theory of meaning for logical constants based on argumentative practices called *dialogical logic*. Since in the dialogical framework the meaning of the logical constants is given by the norms or rules for their use in a debate, it provides a meaning theory closer to the Jain context-sensitive disputation theory than the main-stream formal model-theoretic semantics.

52. Croce, Benedetto. 1953. "Benedetto Croce on Indian Logic." *East and West* no. 4:30.

Abstract: "We believe we are paying our tribute of respect to the memory of Renedetto Croce, the great Italian thinkerr who died recently, by reprinting here a passage from his "Logic as the Science of pure Concept" (*Logica come scienza del concetto puro*) taken from his work *La Filosofia dello Spirito* (Tl, Chap. JV), in which he shows a fine intuition of that essential logic, of a superior order, which is at the centre of Indian philosophy. In this case we may well speak of the science of thought rather than of the science of logic, for thought is here taken at its source, springing from the mystery of the forces that support the Universe. Thus understood, the science of thought that comes to us from India may be considered as the logic of every age, the logic superior to all formal

dialectics, and therefore the very logic of all future knowledge."

    "The mainstream Western logico-linguistic assumption that wh-words ("who", "when",...) in constituent questions manifest a wh-quantifier reflects features of Western languages, which position wh-words clause-initially. Languages like Sanskrit, Hindi, and Bangla form indefinite expressions systematically by adding an existential element to interrogative K-words, suggesting that K expresses a variable and not a quantifier. Further probing indicates that existential and universal quantifiers are based respectively on free and bound variables. Independent linguistic arguments show that these proposals work better than the quantifier theory of questions even for Western languages. Frege and Felix Cohen have, on logical grounds, already argued for a variable theory."

    "Following H. T. Colebrooke's 1824 'discovery' of the Hindu syllogism, his term for the five-step inference schema in the Nyāya-Sutra, European logicians and historians of philosophy demonstrated considerable interest in Indian logical thought. This is in marked contrast with later historians of philosophy, and also with Indian nationalist and neo-Hindu thinkers like Vivekananda and Radhakrishnan, who downgraded Indian rationalist traditions in favor of 'spiritualist' or 'speculative' texts. This article traces the role of these later thinkers in the origins of the myth that Indian thought is spiritual and a-rational. The extent to which Nineteenth-century European philosophers were aware of Colebrooke's 'discovery' is documented, and then their criticisms of the Hindu syllogism and its defense by orientalists like Ballantyne and Muller are examined."

65. ———. 1995. "Vyadi and the Realist Theory of Meaning." *Journal of Indian Philosophy* no. 23:403-428.

    "Vyadi, a celebrated Indian linguist, endorses a version of the realist theory of meaning, that the meaning of a word is the object for which it stands. As applied to generic nominals like " (the) cow", Vyadi's thesis faced two much rehearsed objections: 1) if, for each token utterance, a separate meaning rule must be

given, then the number of such rules will be "limitless", and the word will be radically homonymous; 2) if only some finite set is given, use of the word to refer outside this set will be "aberrant". These arguments significantly resemble certain Davidsonian constraints on a theory of meaning. The application of Vyadi's theory to proper names is also examined."

66. ———. 1996. "Meaning and Reference in Classical India." *Journal of Indian Philosophy* no. 24:1-19.

    "In another paper, I discussed the grammarian Vyadi's realist' theory of meaning, and showed how its failure to distinguish between the concepts of meaning' and reference' laid open his theory to a series of powerful objections. Later grammarians and Naiyayikas were forced to seek new, more sophisticated, accounts of the semantics of proper names and nominals, and in doing so introduced important innovations in the theory of meaning. I would like in this paper to discuss the contributions of these authors, especially to our understanding of the relation between the meaning of a term and its reference, and to the semantics of context-sensitive expressions."

    Abstract: "Negative facts have perplexed Western philosophers ever since the time of Plato. But the philosophers of Europe and America have not been the only philosophers to have been perplexed by them; classical Indian philosophers too have pondered their nature. My interest here is to explore how the reflections of these classical Indian philosophers, transposed into the contemporary philosophical idiom, might enrich current metaphysical thinking about negative facts; and what I shall conclude is that at least one of these philosophers has a view of negative facts and knowledge of them, which, when so transposed, is very plausible indeed.

    I shall begin by asking the fundamental ontological question of whether or not negative facts exist and then sketch various replies which European and American philosophers have given to it. Since these replies have not led to any decisive answer to

the question, I shall then ask two other questions: the more specific ontological question of whether or not absences-surely paradigmatic examples of negative facts-exist; and the related epistemological question of what is known when the absence of something is said to be known. Answers to these questions comprise an important part of classical Indian philosophy; and I shall outline their answers to them, concluding that the most plausible answers to these questions are those of Jayanta Bhatta, who maintained that absences do indeed exist and that they are known not only by inference but also by perception."

    "In this paper an attempt has been made to show that the Vaisesika concept of "padartha" as 'a type of object in this world' is not properly applicable to the sixteen terms mentioned by Gautama in Nyāya-Sutra III. Traditionally "artha" (in Gautama's list of "prameyas") was identified with "padartha" of Vaisesika's. But identification of Gautama's "prameya" or "artha" with Vaisesika "padartha" is misleading. The sixteen terms of Nyāya are also not 'categories' in the technical sense. Gautama's definition of 'padartha' has linguistic import rather than ontological."

81. Gorisse, Marie-Hélène. 2022. "The Opponent: Jain Logicians Reacting to Dharmakīrti’s Theory of Inference." In *Handbook*

of Logical Thought in India, edited by Sarukkai, Sundar, 1-22. Dordrecht: Springer.

Abstract: "The goal of this chapter is to present the contribution made by Jaina philosophers in the conception of inference in the classical paradigm of philosophy in India. In this perspective, the attacks and defenses that Jaina philosophers in the lineage of Akalaṅka performed against the Buddhist thinker Dharmakīrti are precious witnesses, not only of the development of the Jaina conceptions but also of their contribution to the general constitution of the framework of debate. This chapter is moreover conceived to clarify the consequences of argumentative, epistemic, and more formal considerations at important transition periods of the development of these conceptions of inference."

82. Gorisse, Marie-Hélène. 2021. "Jain Philosophers in the Debating Hall of Classical India." *Argumentation* no. 35:35-49.

Abstract: "The practice of rational debate between philosophers from different traditions, especially between Hindu—Naiyāyika and Mīmāṃsaka—, Buddhist and Jain philosophers, is unique in classical India. Around the 7th c., a pan-Indian consensus was

achieved on what counts as a satisfactory justification. The core of such discussions is an inferential reasoning whose structure is such that it ensures that its conclusions are recognised as knowledge statements, irrespective of the obedience of the interlocutor. In this line, stories of conversion following those philosophical debates are commonplace in the narratives of the different traditions and regularly involve the conversion of a royal patron. Beside the influence of argumentative practices on social and political changes, theories of argumentation have deeply influenced the whole edifice of philosophy in pre modern India, since no philosopher can claim a thesis without being committed to defend it in this highly regulated dialogical framework. Moreover, the characterisation, as well as the methods to test the validity of this justification, raised the question of the existence of shared principles and was a battlefield for the different traditions to establish their own

conceptions on the constitution of the world and on our ability to know it. The aim of this paper is to provide an overview of the contribution of the minority tradition that is Jainism to the framework of philosophical disputation in India."

83. Gosh, Ragunath. 2022. "Logical Aspects of Grammar: Pāṇini and Bhartṛhari." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-23. Dordrecht: Delhi.

    Abstract: "The present entry addresses the problem that between language and grammar which one is prior and the relation between them with special reference to Indian tradition in order to understand the importance of grammar. Secondly, an address will be made to the chief contributions of the grammarians to the philosophy of language as such. By way of rounding off these questions some evaluative and critical points will be put forth.

    The present entry will deal with the arguments behind the first problem mentioned earlier. Secondly, an address will be made to the reasonings for which they are considered as chief contributions of the grammarians to the philosophy of language as such. Grammar has been taken as an aid to detect corrupt word (*apaśabda*), formation of word, meaningfulness of null-class, *akhaṇḍa-vākyārtha-vāda, anvitābhidhāna-vāda*, division of *Vāk*, *Sphoṭa* theory, and some epistemological reflections of them. It should be borne in mind that all these theories are interrelated. There are certain reasonings which are related to each other. As the grammarians believe in *Sphoṭa* theory of *Vāk*, i.e., the primordial originating point of a word is *Sphoṭ*a, it gives rise to the theory of holistic meaning which again is related to *anvitābhidhāna* theory. By virtue of being originated from one source its meaning comes into existence in one burst which is indivisible. Due to its indivisibility it becomes sentence-related contextualism, i.e., meaning of the sentence comes into being at the first flash giving rise to word-meaning afterwards. The grammarians do not always admit that their job is only to show the path of rectifying or purifying language. Ultimate goal of them is also to direct a man to reach

in the realm of metaphysics which is beyond all cognitions. In Vākyapadīya grammar is taken as the entrance of heaven and also royal road to liberation. That is why they have given much importance to Vedas whether there is no room for corrupt word and misunderstanding of the statement. To Bhartṛhari liberation may not be considered as the ultimate goal to someone yet through the instrumentality of Vāk he attains a great poetic pleasure generated through the light of the lights (*jyotiṣāṁ jyotiḥ*) of sound overcoming darkness (*tamasaḥ parastāt*), which is not at all ignorable in this world."

86. Guhe, Eberhard. 2022. "The Logic of Late Nyāya: A Property-Theoretic Framework for a Formal Reconstruction." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-23. Dordrecht: Delhi.

    Abstract: "Late Nyāya and Navya-Nyāya are renowned for their affinity to Western formal logic. The interest of modern interpreters has especially been sparked by the technical language of the Navya-Naiyāyikas and by their attempt to formulate theorems about properties by means of these peculiar linguistic tools. The aim of the present contribution is to provide a property-theoretic framework for a formal reconstruction of Navya-Nyāya logic. “The Logic of Late Nyāya: Problems and Issues,” published in the same book, demonstrates its utility by referring to some pertinent examples."

87. ———. 2022. "The Logic of Late Nyāya: Problems and Issues." In *Handbook of Logical Thought in India*, edited by Sarukkai,

Sundar and Chakraborty, Mihir Kumar, 1-29. Dordrecht: Delhi.

Abstract: "The purpose of the present chapter is to demonstrate the utility of the property-theoretic framework for a formal reconstruction of Navya-Nyāya logic which was introduced in Guhe 2016 (*Computer Science Journal of Moldova* 24/3 (72): 312–334). Some pertinent examples have been selected, namely the Navya-Naiyāyikas' operations applied to properties and relations, their discovery of theorems related to these operations, their account of the reference of number words, and the definition of the concept of pervasion. Several alternative methods of formalization in secondary sources are noted and critically examined."

    "The first part of the paper examines the "Hetvabhasas" of the Nyāya school. The second part analyzes the differences between Indian and Western conceptions of fallacy and deals with the question whether the Indian account of the "Hetvabhasas" is totally devoid of the notion of formal fallacy as it is understood in the West. I have suggested that though the "completed" Nyāya inference includes the properties of formal validity, the notion of "Hetvabhasa" presents only the necessary conditions for satisfactorily completing such an inferential process. Thus, while the Nyāya inference adequately accounts for the validity of the final "product" of inference, the Nyāya "Hetvabhasas" account for the inferential process leading up to a sound product of inference."

94. Jayaraman, Thanga. 2022. "Logic in Tamil Didactic Literature." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-19. Dordrecht: Delhi.

Abstract: "Demonstrating that there had been an ancient logical tradition native to the Tamil society, Nirmal Selvamony has, in a paper entitled, "The Syllogistic Circle in *tolkāppiyam*" (The syllogistic circle in *tolkāppiyam*. 65th Session of the Indian Philosophical Congress. Madurai-Kamaraj University, Madurai, 27–29 Dec. Unpublished Paper, 1990; *Journal of Tamil Studies* 57 & 58: 117–134, 2000), identified the five-member syllogism central to the tradition. He has also shown that *kāṇṭikai* had perfect application to Tamil didactic texts and was significantly different from the universally adopted Aristotelian three-member syllogism. The early tendency of the Tamils was to identify logic with philosophy and religion. Taking a departure from this tendency, he recovers the original definition of *kāṇṭikai* from *iḷampūraṇār*'s commentary on *tolkāppiyam*. This chapter tries to identify the structure of arguments in Tamil didactic verses employing the *kāṇṭikai* form. The application of *kāṇṭikai* to diverse Tamil texts as an analytic tool has no hermeneutic intent, but the tool gets itself defined in the process. The argument of this chapter is that the efficiency of

the different members of kāṇṭikai can be better appreciated when their correspondence to those of the jurisprudential model of argument, described by Stephen Toulmin, is traced. Taking a clue from Toulmin, it is also argued that many Tamil didactic texts have what Collingwood calls “absolute presuppositions” and that these presuppositions have correspondence to “warrants” in the jurisprudential structure of argument. The ubiquitous analogy and recursive analogical reasoning found in Tamil texts can also be accommodated in this model of argument when the features of an analogy are seen as the “datum” in the jurisprudential model. This helps us overcome the problem in claiming application of logic to didactic texts of preceptorial tone, the arguments of which, though often seen as assertions and affirmations on authority, do have warrants and also backing for their warrants. The arguments of Tamil didactic verses, when cast in the kāṇṭikai form of argument thus eclectically constructed, allow us to clearly see the unstated presupposition of every one of them."

    Abstract: "The Nyāya system, which is one of the six schools of Indian orthodox philosophy, can be broadly classified into *Prācīna Nyāya* and *Navya Nyāya* with respect to chronology. The older school of Nyāya discussed mainly about the objects of a valid cognition, namely *Prameyās*, while the neo-Naiyāyikās shifted their area of focus onto the means of valid cognition, i.e., the *Pramāṇās*. Hence, it is said that *Prācīna Nyāya* is *Prameyā Pradhāna* while Navya Nyāya is *Pramāṇā Pradhāna*.

    During this process of shifting, there evolved a methodology of language which was so technical yet precise that many other streams like grammar, law, and aesthetics adopted it. Words like *avacchedaka, nirūpaka, pratiyogin, anuyogin*, etc. were used frequently during philosophical debates and while defining new concepts.

    The current chapter deals with how such a methodological language evolved over a span of 15 centuries, ever since the Sūtras, the need for the development of such a technical language, and finally some of the unique characteristics of this technical language."

    Abstract: "In this article we describe the computational aspects of the Technical Language of Navya-Nyāya. Navya-Nyaya is an off-shoot of the early Nyāya philosophy. It deviates from the Nyāya philosophy in three major ways. First, instead of prameyas the discussions are centered around the pramāṇas. Second, the Navya-Nyāya has adapted the Vaiseṣika ontology. And finally it has introduced a few concepts expressed through an unambiguous technical terminology that brings in a clarity in the communication removing the inherent ambiguities of a natural language. In this article the syntax of expressions involving this technical terminology is described, followed by a scheme based on Conceptual Graphs of Sowa for their graphical rendering. Finally a computational algorithm is described that renders the graphs corresponding to the Navya-Nyāya expressions semi-automatically."

110. Lawrence, David Peter. 2022. "Pratyabhijñā Inference as a Transcendental Argument about a Nondual, Plenary God." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-30. Dordrecht: Delhi.

Abstract: "The two most well-known and important nondual Śaiva and tantric philosophers are Utpaladeva (c. 900–950 CE) and Abhinavagupta (c. 950–1020 CE). Utpaladeva furthered the initiatives of his teacher Somānanda (c. 900–950 CE) in creating the originary verses and commentaries of the Pratyabhijñā system of philosophical theology. Abhinavagupta is famous for brilliant and extensive commentaries on Utpaladeva's writings as well as for the creation of a vast corpus of philosophical hermeneutics, itself comprising both a poetics and an exegetics of tantric symbolism and ritual.

This chapter clarifies and build upon the interpretations of the overarching Pratyabhijñā inference as a *transcendental argument* in the article, "Tantric Argument: The Transfiguration of Philosophical Discourse in The Pratyabhijñā System of Utpaladeva and Abhinavagupta" (1996) and the book *Rediscovering God with Transcendental Argument* (1999). It considers how the Pratyabhijñā inference may be characterized as transcendental, answering various objections to that characterization, provides translations of key passages for understanding the Pratyabhijñā method (especially, IPV 2.3.17 and a paragraph from IPV 1.17.1 on the identification of cosmogony and teleology), and summarizes some of the author's later research that pertains to this subject."

111. Lloyd, Keith. 2022. "Early Nyāya Logic: Rhetorical Aspects." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-24. Dordrecht: Delhi.

Abstract: "Nyāya philosophy emerged when Akṣapāda Gautama (first century CE), credited with authoring the Nyāyasūtra, redacted ideas originating from Medhatithi Gautama (fifth century BCE). However, many of Medhatithi's ideas were "reproduced" in the Caraka Saṃhitā about 78 CE (Vidyābhūṣaṇa *History* 25), indicating that concepts from both Medhatithi and Nyāya were in circulation well before Akṣapāda's redaction – including elements of the five-part approach to reasoning called "the Nyāya method." The Caraka Saṃhitā, though mostly about Ayurvedic medicine, includes a very focused debate manual bearing profound implications for the history and study of "comparative" rhetoric, which attempts to look beyond ancient Greece for other origins and interpretations of rhetoric. Early studies of Robert Oliver (*Communication and culture in Ancient China and India*. Syracuse: Syracuse University Press. 1971) and George Kennedy (*Comparative rhetoric : An historical and cross-cultural Introduction*. New York: Oxford University Press. 1998) identified Indian forms of rhetorical practice found in ancient literature. However, the presence of rhetorical manuals and terminologies shows that India, though it did not develop a concept exactly like Greek rhetoric, not only practiced debate but created theories about it, leading to an entire school of philosophy. To expand the knowledge of rhetorical terminologies, approaches, and contexts in ancient India, this chapter traces the case-based rhetorical origins and concepts that became Nyāya philosophy, focusing upon the Caraka Saṃhitā, the Nyāyasūtra, and other ancient sources."

112. Łucyszyna, Olena. 2017. "On the Notion of Linguistic Convention (*saṁketa*) in the *Yogasūtrabhāṣya*." *Journal of Indian Philosophy* no. 45:1-19.

Abstract: "The aim of this study is to clarify the meaning of the term *saṁketa*, which is usually translated as '(linguistic) convention', in the *Yogasūtrabhāṣya*, the first and the most authoritative commentary to the *Yogasūtras*. This paper is a contribution to the reconstruction of the classical Yoga view on the relation between word and its meaning, for *saṁketa* is a key

term used by this *darśana* in discussing this relation. The textual analysis of the *Yogasūtrabhāṣya* has led me to the conclusion that its author's understanding of the linguistic convention (saṁketa) is different from the notion of the linguistic convention (*saṁketa/samaya*) of the Vaiśeṣikas and Naiyāyikas and similar to the notion of the linguistic convention (*samaya/saṁketa*) of the Grammarians (as presented in Houben's article "Bhartrhari's samaya/Helārāja's saṁketa. A contribution to the reconstruction of the Grammarian's discussion with the Vaiśeṣikas on the relation between *śabda* and *artha*", published in the "Journal of Indian Philosophy") [*]. These are interpretations of the term *saṁketa* which reflect *Yogasūtrabhāṣya*'s understanding of the linguistic convention: the tradition of the usage of words, established (practice/custom of the) usage of words. *Saṁketa* of the *Yogasūtrabhāṣya*, unlike *saṁketa/samaya* of the Vaiśeṣikas and Naiyāyikas, is not an agreement established by anyone, but an agreement in the sense of tradition, established practice, or established custom.

Unlike the *saṁketa/samaya* of these philosophers, the *saṁketa* of the *Yogasūtrabhāṣya*, having neither beginning nor end, is not re-created (re-established), but only made known (revealed) at the beginning of each cycle of existence of the world."

5. ———. 1970. "Reference and Existence in Nyāya and Buddhist Logic." *Journal of Indian Philosophy* no. 1:83-108.

   "This Nyāya-Buddhist controversy over the empty subject term may well recall to a modern mind the Meinong-Russell controversy about 'existence' and 'denotation'. The Nyāya and the Buddhist logicians worried over the logical and the epistemological problem connected with the issue. The Nyāya interpreted "the rabbit's horn" not as a singular term but as a predicate complex attributing 'hornness' to something that belonged to the rabbit. "The rabbit's horn does not exist"

ascribes the absence of hornness to something belonging to a rabbit, and is true. This analysis is closer to Russell's theory of description. The Buddhist, on the other hand, is prepared to allow some sort of 'fictional existence' to "the rabbit's horn" which is perhaps not very different from Meinong's 'theory of objects'. In epistemology the Nyāya believed that any object of cognition (which is expressible in words) must be either real or analyzable into constituents which are ultimately identifiable with some real entity or other. Only a complex object can be fictional. The Buddhists, however, hold that the objects of erroneous cognition are fictional."

6. ———. 1974. "A Note on the Nyāya Fallacy Sādhyasama and petitio principii." *Journal of Indian Philosophy* no. 2:211-224.

   "When H. N. Randle (in 1930) interpreted 'sadhyasama' as petitio principii, he made a mistake. Unfortunately, many scholars accepted randle's interpretation. It has been shown that Randle was wrong about this interpretation. 'Sadhyasama' can be correctly translated as a fallacy of being in the same predicament with yet-to-be-proven proposition. Petitio is a different fallacy, as it has been described by Aristotle. Some general comments have been made on the notion of fallacy, and on the distinction between 'formal' and 'non-formal' fallacies."

    Reprinted in J. N. Mohanty, *Phenomenology and Ontology*, Den Haag: Martinus Nijhoff 1970, pp. 183-197.

    Abstract: "It is well known that the Nyāya advocates an extreme form of direct realism and maintains that what we directly perceive are physical objects and not some intermediate entities called variously by philosophers 'ideas', 'contents' or even 'sense-data'. Gotama's sûtras 2.1.31 - 2.1.36 and Vātsāyana's commentaries on them contain arguments which may be regarded as constituting a very effective defence of what has come to be called the physical object language as against the sense-datum language. Gotama's, as well as his commentator's, direct interest however is twofold. In the first place, they are out to refute the suggestion that perception is not an independent source of knowledge but a variety of inference. In the course of this refutation, they are led to their second point: they try to show that the object of perception, that is to say, the physical object, is not a mere assemblage of parts but a true unity of some unanalysable kind. Our task in this paper will be to bring out the relevance of these arguments in the light of contemporary discussions of the problem of perception."

21. ———. 1966. "Nyāya Theory of Doubt." *Visva Bharati Journal of Philosophy* no. 3:15-35.

    Reprinted in J. N. Mohanty, *Phenomenology and Ontology*, Den Haag: Martinus Nijhoff 1970, pp. 198-219 and in J. N.

Mohanty, *Essays on Indian Philosophy*, New Delhi: Oxford: Oxford University Press 1963, pp. 44–61.

Abstract: "The Nyāya logic contains a theory of doubt. A preoccupation with the nature, origin and structure of doubt seems out of place in a logical system inasmuch as logic has been taken to be concerned, speaking rather broadly, with formally valid thought abstracted from its psychological context. Now, Nyāya logic — in fact all Indian logic — does not conform to this conception. It is in a broad sense coextensive with, and indeed indistinguishable from, a theory of knowledge, and concerns itself with all kinds of knowledge, the non-propositional and the invalid ones not excluding. In a narrower sense it is of course a theory of inference. But even as a theory of inference, (i) it does not concern itself with the bare form, though some amount of formalism has been developed, and (ii) it does not separate logic from psychology in a way in which western formal logic has done. Consequently, it is as much interested in the psychological conditions of the origin of a certain type of knowledge, say e.g. of inference, as in the conditions of its logical validity."

22. ———. 1980. "Indian Theories of Truth: Thoughts on their Common Framework." *Philosophy East and West* no. 30:439-451.

    "The peculiar features of Indian theories of truth, according to this paper, are: (I) a theory of cognitive occurrent; (II) absence of a theory of meaning as distinct from reference; (III) a consequent position that avoids the extremes of logicism and psychologism; (IV) a restricted theory of necessary truths, a fallibilism with regard to empirical truths and infallibilism with regard to moral truths; (V) a close connection between cognitive enterprise and practice; and (VI) reliance on reflective analysis of the cognitive situation."

26. ———. 1979. "The Definition of Pervasion ("vyāpti") in Navya-Nyāya II." *Journal of Indian Philosophy* no. 7:107-152.

27. Mullick, Mohini. 1976. "Implication and Entailment in Navya-Nyāya Logic." *Journal of Indian Philosophy* no. 4:127-134.

    "My attempt is to produce some evidence to show that the notions of implication and entailment are clearly distinguished in Navya-Nyāya logic. This is done by examining the nature of the Navya-Nyāya syllogism and showing that the Naiyayikas were aware of various definitions of material implication but rejected them as definitions of vyapti (implication), not because they led to inferential paradoxes but to semantic ones; they in fact never confused implication with entailment. The entailment relation is contained in their notion of "paramarsa" and appears as the last premise in the argument which immediately precedes and thus 'causes' the conclusion."

29. Nemec, John. 2022. "Logical Proofs in the Śivadṛṣṭi of Somānanda." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-23. Dordrecht: Delhi.

    Abstract: "As is well known, Somānanada was a Brahmin of the Kashmir Valley who flourished circa 900–950 CE and who is the founding author of the famed Śaiva philosophical tradition known as the Pratyabhijñā or “Recognition” school. With the present chapter is pursued the somewhat modest concern of exploring various occasions when Somānanda deploys logical argumentation in his magnum opus, the *Śivadṛṣṭi* (ŚD). Three ways in which logic is deployed in the ŚD are examined in what

follows. First is charted a syllogism appearing in the fourth chapter (*āhnika*), which is meant to prove the unity of all in the form of Śiva-as-consciousness. Following this, the present essay examines arguments Somānanda develops to illustrate how his opponents' views can be understood to cohere logically only if they are understood implicitly to assume the existence of the ontological nondualism described by him. Finally, instances are examined in which Somānanda develops arguments with philosophical opponents, where the opponent is forced to accede to the nondualism for which he argues. Altogether, the present chapter illustrates the ways in which, for Somānanda, logical proofs offer more than mere rhetoric but are dispositive of the nature of reality itself."

30. Nicholson, Hugh. 2010. "The Shift from Agonistic to Non-Agonistic Debate in Early Nyāya." *Journal of Indian Philosophy* no. 38:75-95.

    Abstract: "This article examines the emergence of the Nyāya distinction between *vāda* and *jalpa* as didactic-scientific and agonistic-sophistical forms of debate, respectively. Looking at the relevant sutras in Gautama's *Nyāya-sūtra* (NS 1.2.1-3) in light of the earlier discussion of the types of debate in Caraka-Saṃhitā 8, the article argues that certain ambiguities and obscurities in the former text can be explained on the hypothesis that the early Nyāya presupposed an agonistic understanding of vāda similar to what we find in Caraka."

31. Nieuwendijk, Arthur. 1992. "Semantics and Comparative Logic." *Journal of Indian Philosophy* no. 20:377-418.

    "The paper takes up the question as to which logical framework is most suitable for a formal interpretation of Navya-Nyāya logic. It is claimed that, for this purpose, the framework offered by extensional first-order predicate logic is inadequate. This claim is established by discussing three well-known difficulties: the interpretation of the notion of Jnana, the question whether contraposition is a law of NavyaNyaya logic, and the interpretation of the Navya-Nyāya scheme of inference. Next, the interrelatedness of these difficulties is pointed out, and,

carrying through the analysis, it is examined whether situation semantics offers a suitable alternative framework."

32. Nishankar, Vaishnavi. 2022. "Convergence and Divergence of Nyāya and Tattvavāda (Dvaita) Theories of Logic." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-26. Dordrecht: Delhi.

    Abstract: "Indian epistemology has delved deep into the analysis of logic as a component of cognition. It is considered as an essential constituent or, rather, an essential process of inferential cognition. Most Indian schools of thought, except the materialists called Cārvākas, recognize inferential cognition as a kind of cognition. The varied schools developed conclusive theories of inference, each with their own unique contributions, resulting in a vast body of literature, often polemical, in this field of analysis.

    This chapter focuses on providing an Introduction to the various constituents and the logical process of inferential cognition according to the Indian intellectual tradition using illustrations, both classic and contemporary, for elucidation. It particularly focuses on the doctrines of the Nyāya and Dvaita Schools of philosophy in this regard and aims to objectively bring out the points of convergences and divergences in the theories of logic of the two schools and tries to provide the background for the divergences to clarify the reasons for the differences in their view points."

33. Oetke, Claus. 1996. "Ancient Indian Logic as a Theory of Non-Monotonic Reasoning." *Journal of Indian Philosophy* no. 24:447-539.

    "The aim of the paper is to demonstrate that the most ancient varieties of "Indian logic" are significantly related to theories associated with the term "non-monotonc logic" in so far as they try to account for reasoning relying on the ability to use general rules subject to exceptions and indicate a conception of context-dependent validity implying that valid inferences or arguments can lose this status in the context of additional information. On that background it is possible to give a theoretical justification for a number of features of Indian

theories of inference which previously appeared theoretically ill motivated and which were often explained by historical coincidences."

39. Paris, Jeffrey B., and Vencovská, Alena. 2017. "Ancient Indian Logic, Pakṣa and Analogy." In *Philosophical Logic: Current Trends in Asia. Proceedings of AWPL-TPLC 2016*, edited by Yang, Syraya Chin-Mu, Lee, Kok Yong and Ono, Hiroakira, 45-58. Singapore: Springer Nature.

    Abstract: "Abstract The authors B.K. Matilal, and earlier J.F. Staal, have suggested that the Indian Schema (erstwhile Hindu Syllogism) from Gotama's *Nyāya-sūtra* should be understood in terms of an occurrence relation of an event happening at a locus (*paksa*). Building on a reading of the Indian Schema as analogical reasoning, that is, smoke on the hill and the prior example of smoke in the kitchen being associated

    with fire in the kitchen leading to the conclusion that there is fire on the hill, we have previously suggested and investigated a formalisation of the Schema within a binary predicate language. In this paper we consider a version derived therefrom using just unary predicates. We go on to show that within the

context of Pure Inductive Logic this formal version has a rational justification, in the sense that from the Principle

of Atom Exchangeability (akin to Carnap's Attribute Symmetry and a property of Carnap's Continuum of Inductive Methods) it follows that under the assumptions of the Schema fire on the hill must be at least as probable as absence of fire on the hill."

40. Patil, Parimal G. 2010. "History, Philology, and the Philosophical Study of Sanskrit Texts." *Journal of Indian Philosophy* no. 38:163-202.

    Abstract: "This paper is a critical review of Jonardan Ganeri's *Philosophy in Classical India*."

41. Perrett, Roy W. 1984. "Self-Refutation in Indian Philosophy." *Journal of Indian Philosophy* no. 12 (3):237-264.

42. ———. 1985. "A Note on the Navya-Nyāya Account of Number." *Journal of Indian Philosophy* no. 13:227-234.

    "I maintain (contra Ingalls) that the Navya-Nyāya account of number as a property of classes should be understood intensionally, not extensionally. Such a theory is closer to Frege's earlier views than to Russell's and also has certain advantages over Russell's theory. However it seems that Navya-Nyāya cannot provide a criterion of identity for such intrinsically intensional properties; and this difficulty is particularly important for Navya-Nyāya, given its epistemological and metaphysical realism."

43. ———. 1999. "Is Whatever Exists Knowable and Nameable?" *Philosophy East and West* no. 49:401-414.

    "Naiyayikas are fond of a slogan, which often appears as a kind of motto in their texts: "Whatever exists is knowable and nameable". What does this mean? Is it true? The first part of this essay offers a brief explication of this important Nyāya thesis; the second part argues that, given certain plausible assumptions, the thesis is demonstrably false."

44. ———, ed. 2001. *Indian Philosophy. A Collection of Readings. Vol. II. Logic and Philosophy of Language*. New York: Garland.

"Volume 2: *Logic and Philosophy of Language* is concerned with those parts of Indian *pramana* theory that Western philosophers would count as logic and philosophy of language. Indian philosophers and linguists were much concerned with philosophical issues to do with language, especially with theories of meaning, while the Indian logicians developed both a formalised canonical inference schema and a theory of fallacies. The logic of the standard Indian inferential model is deductive, but the premises are arrived at inductively. The later Navya-Nyāya logicians went on to develop too a powerful technical language, an intentional logic of cognitions, which became the language of all serious discourse in India.

The selections in this volume discuss Indian treatments of topics in logic and the philosophy of language like the nature of inference, negation, necessity, counterfactual reasoning, many-valued logics, theory of meaning, reference and existence, compositionality and contextualism, the sense-reference distinction, and the nature of the signification relation."

45. Perszyk, Kenneth J. 1983. "'Virtue is not blue': Navya-Nyāya and some Western Views." *Journal of Indian Philosophy* no. 11:325-338.

46. ———. 1984. "The Nyāya and Russell on Empty Terms." *Philosophy East and West* no. 34:131-146.

    "The purpose of this paper is to demonstrate how the Navya-Nyāya school of Indian philosophy determines the truth or falsity of a sentence which contains an empty term, and to point out some similarities and differences between its method of analysis and truth-value determinations of such sentences and that of Bertrand Russell."

47. ———. 1984. "Negative Entities and Negative Facts in Navya-Nyāya." *Journal of Indian Philosophy* no. 12:265-276.

    "The purpose of this article is to discuss the Navya-Nyaya's thesis that absence is an ontological category, which is to say that there are negative entities, and its corollary that there are negative facts. The Nyāya resists all attempts to eliminate

negative facts in favour of positive facts. In addition, we see that no atomic sentence can have a negative subject-term."

48. Potter, Karl H. 1974. "On the Realistic Proclivities of Navya-Nyāya as Explicated by Bhattacharyya." *Philosophy East and West* no. 24:343-347.

49. ———. 1975. "Some Thoughts on the Nyāya Conception of Meaning." *Journal of Indian Philosophy* no. 3:209-216.

50. ———, ed. 1977. *Encyclopedia of Indian Philosophies. Vol. 2: Indian Metaphysics and Epistemology: The Tradition of Nyāya-Vaiśesika up to Gaṅgeśa*. Delhi: Motilal Banarsidass.

    Contents: Preface XI-XIII; Part One: Introduction to the Philosophy of Nyāya-Vaiśesika 1; Part Two: Summaries of Works 211-715; Notes 687; Index 717-744.

    "The present volume provides a detailed resume of current knowledge about the classical Indian philosophical system of Nyâya-Vaiśesika in its earlier stages. Specifically, it covers the literatures of Nyâya and Vaiśesika from their inception in the respective *sütras* up to the time of Gangesa, that is, about A.D. 1350. This dividing point is regularly accepted in the tradition, since with Gaṅgeśa it is felt that a new start is made within the systems, the result coming to be known as Navyanyäya, "new" Nyäya."

    (...)

    "The form of this book features an extended introductory section followed by summaries of works belonging to the system's literature.

    These summaries are arranged in relative chronological order to assist the reader in tracing the development of the school's thought.

    Summaries have been solicited from scholars around the world —Indian, Japanese, and American scholars have collaborated in the undertaking. This international aspect of the book is one of its pleasantest features, serving to put philosophers and Indologists around the world in closer touch with one another." (Preface. p. XI)

"*Logic*: Nyāya grew in part as a theory of philosophical debate, and among Hindus has been accepted as the system which specially studies the theory of arguments good and had, in keeping with the division of labor principle alluded to in the previous paragraph.

This does not mean that all Hindu philosophers accepted every point in the Nyāya account, but they certainly tended to look to Nyāya for definitive treatment and detailed discussions of intricate points.

Nyāya had its great rival, however, in the logic developed by the Buddhists, and from this controversy developed one of the most comprehensive logical theories the world has known. Indian logic is never conceived as "formal" in the Western sense, but as an account of sane processes of reasoning it has few equals in the West for attention to detail." (p. 2)

51. Potter, Karl H., and Bhattacharya, Sibajiban, eds. 1993. *Encyclopedia of Indian Philosophies. Vol. 6: Indian Philosophical Analysis: Nyāya-Vaiśesika from Gangeśa to Raghunātha Śiromani*. Delhi: Motilal Banarsidass.

Contents: Preface XI; Part One: Karl H. Potter, Sibajiban Bhattacharyya: Introduction to the Philosophy of Nyāya-Vaiśesika 3; Part Two: Summaries of Works 85-590; Notes 591; Index 633-672.

"Volume Six of the *Encyclopedia of Indian Philosophies* picks up the history of the Nyāya-Vaiśesika system where Volume Two left off.

The time covered in this volume is much smaller than in any of the previous volumes of the *Encyclopedia*, a scant two hundred years between approximately 1310 and 1510. There are good reasons for this intensive

attention to such a brief period. For one thing, two of Indian's most remarkable philosophers, Gangeśa and Raghunātha Śiromani, are covered in these pages—in fact, they initiate and terminate the period surveyed.

More generally, we here begin to treat the literature of Navya-nyâya, a movement comparable in its implication to the burgeoning of symbolic logic and its concomitant philosophical speculations found in the writings of Frege, Russell and Wittgenstein in the West at the end of the 19th and beginning of the 20th centuries. The excitement of newly pioneered techniques of philosophical analysis developed by Gangeśa spawned a bevy of philosophical talents. Indeed, this period is even richer than we are able to summarize here, since a good part of it is still unavailable in print.

(...)

The form of this book features an extended introductory section followed by summaries of works belonging to the system's literature.

These summaries are arranged in relative chronological order to assist the reader in tracing the development of the school's thought. Summaries have been provided by scholars from India, England and the United States." (Preface, p. XI)

64. Sahota, Jaspal Peter. 2022. "Early Nyāya Logic: Pragmatic Aspects." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-20. Dordrecht: Delhi.

    Abstract: "This chapter sets out and explains the discussion of inference (*anumāna*) in the Nyāya Sūtra of Akṣapāda Gautama and the Nyāya Bhāṣya of Vātsyāyana Pakṣilasvāmin. Affinities with the pragmatic method of Charles Peirce and modern scientific method are presented. Specifically, the procedural methodology of reasoning to form beliefs and the scope for legitimate doubt are shown to have a pragmatic character.

    An initial definition of inference in NS 1.1.5 is followed by an objection in NS 2.1.37 and a response to the objection in NS

2.1.38. There is scope to read these either as a progressive refinement of a deductive schema or as a sequence of stages in a procedural logic of rational inquiry involving abductive and deductive elements. Accordingly, the definition, objection, and response are presented and analyzed according to a deductive syllogistic schema and according to an open-ended abductive-deductive schema. The extent to which either of these schemas conforms to the intentions of the early Nyāya authors is considered, with reference to Vātsyāyana's remarks in the Nyāya Bhāṣya in particular. Although the deductive schema is found to capture an important aspect of how Vātsyāyana understands correct inference, nevertheless the abductive schema more clearly demonstrates how the inference processes described by the early Nyāya authors are driven by pragmatic considerations, whereby the scope for belief adoption, suspension, and revision are constrained by observable evidence."

65. Salome, D. Judia, and Parthasarathi, Ranjani. 2011. "Mining Ontological Knowledge using Nyaya Framework." *International Journal of Networking and Virtual Organisations* no. 8:123-141.

    Abstract: "Ontology has become the buzzword of the knowledge and semantics community. The process of automatically constructing an ontology with completeness and reduced time has become the need of the hour. This paper presents the method for automatically constructing an ontology for any domain based on the Indian philosophical system, the Nyaya Sastra. Nyaya defines the whole world from atom to universe. This categorisation provided by Nyaya acts as the framework for extracting ontological relations from documents obtained from the web. With Nyaya and Natural Language Processing (NLP) techniques, an improved and enriched knowledge can be obtained from web documents. This paper explains the way of constructing an ontology (i.e., extracting taxonomical and nontaxonomical relations) using Nyaya in detail. The extracted knowledge includes concepts, relations and qualities pertaining to a concept. A Semi-Supervised Learning (SSL) technique for learning Nyaya categories is also explained."

66. Sanyal, Manidipa. 2022. "Imperative Logic: Indian and Western." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-40. Dordrecht: Delhi.

    Abstract: "Statements having imperative intents are found in plenty in the context of formal argumentative discourses. Commands of any form are commonly accepted as expressing a "prescription" as distinct from "proposition," though the possibility of their crossing over is not ruled out. The lingering question remains about the logical status of prescriptions as constituents of imperative arguments. Discussion of Vidhivākya (imperative) is extensively found in the Mīmāṁsā system and it has its pragmatic application in recent days in a very robust form.

    Since twentieth century, imperative arguments are considered as more than a possibility in the West. Its early history starts with Aristotle's practical syllogism, passes through the thoughts of the Stoics, Leibnitz, Hume, and finally has a primary line of development, i.e., becomes a formal logic for normatives in Ernst Mally's Principle of Inheritance of Obligation. Logicians take different stands in explaining the inferential property of an argument involving commands at par with that property of an inference of classical propositional logic. The present chapter undertakes a survey of the logic of imperatives both from the Indian and the Western points of view."

67. Sarkar, Tushar K. 2022. "Jaina Theory of "ANUMĀNA" [Inference]: Some Aspects." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar, 1-51. Dordrecht: Springer.

    Abstract: "The chapter takes a thoroughly analytical, but somewhat nontraditional, look at the Jaina theory of *anumāna* in its various aspects. A critical analysis of the scheme of classification of *anumāna*-s into "svārtha" and "parārtha" is undertaken to show that a *svārthānumāna* is only a proto-anumāna, not a standard *anumāna* at all. So, it is wrong and misleading to consider both of them as "anumāna-s" in the same sense. Next, the features of *bahirvyāpti* and of *antarvyāpti* are compared, the respective roles played by each

of them in universal generalizations and some severe limitations of *bahirvyāpti* in this respect, etc., are critically discussed one by one. After a detailed analysis of the definition of "antarvyāpti," it is claimed that *antarvyāpti* signifies a "semantic-conceptual linkage," and, in this respect, it has a thematic affinity to Kant's notion of "synthetic a priori judgements." "Logical" and "methodological" aspects of *antarvyāpti* are dis-entangled next. It is followed by a thorough discussion of the nature of *Hetvābhāsa*s, the reasons why they are not to be viewed as purely formal fallacies, an enumeration of different types of *hetvābhāsas,* lessons to learn from some queer instances of "fallaciously valid" argument-patterns in Western logic, etc. Topics such as the Minimum Number of *avayava*-s required in an Inferential Unit, notion of "existence" and of *Vikalpa* as "existence proof," notions of Contradiction, Contextualization of LNC in Jaina Logic, etc., are discussed after it. The need of balancing between the ontic and the epistemic conceptions of logic, replacing the tautology-centric notion of "deductive validity" by an information-theoretic-cum-context-sensitive notion of "logical infer-ability" [Sanskrit, "anumeyatva"] are discussed next. In the section "Concluding Remarks," attention is drawn to what the author considers to be an emerging trend of mutual convergence of the respective outlooks [viz., the respective "epistemic" and "ontic" outlooks] of Indian and Western logicians. A final such convergence may even need a radical "paradigm-shift" in the patterns of logical thinking. It is not expected to be an easy task at all. Nevertheless, it feels better to keep dreaming about it as a realizable goal."

83. Schumann, Andrew. 2019. "On the Origin of Indian Logic from the Viewpoint of the Pāli Canon." *Logica Universalis* no. 13:347–393.

    Abstract: "Abstract. In this paper, I show that in the Pāli Canon there was a tradition of Buddhist logic, but this tradition was weak, and the proto-logic we can reconstruct on the basis of the early Pāli texts can be evaluated as a predecessor of the Hindu logic. According to the textual analysis of the Pāli texts, we can claim that at the time of the closing of the Pāli Canon (excluding the later addition of the *Milindapānha* into it by the Burmese tradition) there did not exist the Nyāya philosophy known by the *Nyāya Sūtra*. Meanwhile, we can assume that the Milindapānha, the best logical source of early Pāli literature, was written under influences of the Gandhāran Buddhists and this text preceded the Nyāya philosophy."

84. Schuster, Nancy. 1972. "Inference in the Vaisesikasutras." *Journal of Indian Philosophy* no. 2:341-386.

"Conflicting statements appear in the Vaisesikasutras about how knowledge of imperceptible entities is attained. Passages from the Sutras are compared with the Samkhya Sastitantra, the Nyayasutras, Nyayabhasya, and other early texts. Impact of the Sastitantra on Vaisesikasutras and Nyayabhasya was strong. Contradictions within Vaisesikasutras reveal the compilers' grappling with the Samkhya theory over a period of time. Bias in favor of direct perception dominates the Vaisesika text."

85. Selvamony, Nirmal. 2022. "Logic in nīlakēci and maṇimēkalai." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-20. Dordrecht: Delhi.

    Abstract: "The present chapter attempts to unearth the salient features of logic in the Tamil epics, *nīlakēci* and *maṇimēkalai*. In the former text, we have a few verses which expound the fundamental validative criteria (*aḷavaikaḷ*) of the Jaina faith, and a surfeit of debates the heroine has with exponents of rival faith systems. These debates amply illustrate the techniques of debate called *uttikaḷ* explained in *tolkāppiyam*. Using these techniques, the heroine goes about demolishing rival arguments. The kind of debate she engages in is identified in the essay as “vātam.” Though Jaina philosophy is based on the multivalued logical concept of *nayam*, *nīlakēci*’s debate is based on the bivalent logic of *vākai* (*vātam*). In the case of the Buddhist epic, *maṇimēkalai,* logical matters are dealt with primarily in two cantos (27 and 29). Unlike her Jaina counterpart, *maṇimēkalai*, the heroine, is content to listen to the tenets of rival faith systems and also to those of her own spiritual guru, *aṟavaṇa aṭikaḷ*. The exponents of Tamil logic are *aḷavai vāti*, the logician who explains all the ten *aḷavaikaḷ* of Tamil logic, and *aṟavaṇa aṭikaḷ* who deals with *aḷavaikaḷ* briefly, and inference elaborately. Though the latter speaks of the five-member Tamil syllogism-like text, he elaborates the proper forms and defects of the three-member counterpart adopted by the Buddhists. Similarly, though aṭikaḷ identifies nayam (based on multivalent logic) as a trait of Buddhist

syllogistic text, the theory of inference he expounds is based on bivalent logic."

86. ———. 2022. "Logic in Tamil Tradition." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-22. Dordrecht: Delhi.

    Abstract: "Logic, in Tamil tradition, is inseparably connected with philosophy and rhetoric. It is a reasoning praxis, which includes knowing the truth and communicating it. If the former is the epistemic aspect of logic, the latter is its rhetorical. The rhetorical branch has two main divisions, the monological (*tarukkam*) and the dialogical (*vākai*). Examples are provided from classical literature, folk songs, folk drama, religious polemics, political oration, screen play, research methodology, forum for disputation, and debating forum. The purpose of logic is to affirm the normative mode of truth of each type of society. If the truth of the Tamil primal society is differentiated continuity, that of the Tamil state society is foregone conclusion, and that of the Tamil industrial society is anarchic indeterminacy."

87. ———. 2022. "Logic in tolkāppiyam." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-21. Dordrecht: Delhi.

    Abstract: *"tolkāppiyam* shows us that logic had an important place in the primal society (known as *tiṇai*). Such primal cultural practices as “tarukkam,” “vākai,” analogical reasoning, the use of the criteria of knowledge (“aḷavai”) in premarital life situations and in oral texts (such as *mutumoḻi* and *kāṇṭikai*), and also the primal social institution, namely, the assembly (*avai*) where public debates were held, were all part of the philosophical tradition of this society. Such philosophy embraced logic, which had rhetorical as well as epistemic functions. If rhetorical logic was persuasive (as in tarukkam) and contestatory (as in *vākai* in combat and in the assembly), epistemic logic (*aḷavai*) was validative. In fact, early Tamil logic was a complex discipline not easily distinguishable from philosophy (especially, epistemology and ethics) and rhetoric."

94. ———. 1978. "The Nyāya on Existence, Knowability and Nameability." *Journal of Indian Philosophy* no. 5:255-266.

    "One of the aims of this paper is to discuss the different senses of the term 'existence' as used by the Nyāya philosophers. This discussion leads us to a discussion on absence or negation and its role in logic. A discussion on empty terms has also been introduced in this context. According to the Nyāya, existence, knowability and nameability are considered as universal properties. The distinction between these universal properties has been discussed in this context. I have also discussed the question whether the Nyāya has used redundant terms in designating the same imposed property by using three different terms. A distinction between different senses of the term 'property' has also been discussed in this context."

95. ———. 1980. "The Nyāya on Cognition and Negation." *Journal of Indian Philosophy* no. 8:279-302.

    "The aim of this paper is to discuss the Nyāya concept of negation and the different types of negation. This discussion involves a discussion of the Nyāya concept of cognition, relation and meaning. The Nyāya has drawn a distinction between

qualificative and non-qualificative cognition. A qualificative cognition can be represented by the form "arb". The Nyāya concept of negation cannot be said to be a term-negation, or a sentence-negation, or a propositional function negation. The conclusion is that the Nyāya concept of negation does not correspond to any Western concept of negation."

96. ———. 1981. "Number: From the Nyāya to Frege-Russell." *Studia Logica: An InternationalJournal for Symbolic Logic* no. 41:283-291.

    Abstract: "The aim of this paper is to present the Nyāya concept of number in the light of contemporary philosophy and to show that the Frege-Russell concept of number does not contradict the Nyāya concept of number but rather supplements it."

97. ———. 1991. "Universal Sentences: Russell, Wittgenstein, Prior, and the Nyāya." *Journal of Indian Philosophy* no. 19:103-119.

    "The aim of this paper is to discuss I) whether the following sentences have the same meaning, II) whether they have the same truth-value, III) whether there is some assertion common to all of them, and IV) if there is some such assertion, whether it can be defined. 1) all men are mortal, 2) whoever is a man is mortal, 3) wherever there is humanity, then there is mortality, 4) if anyone is a man, then he is mortal, 5) if humanity is present somewhere, then mortality is also present there."

101. ———. 2014. *Logic and Metaphysics*. Wellington: Society for Philosophy & Culture.

    Edited by D. L. Oxtoby.

102. ———. 2022. "The Nyāya on Logical Thought." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-72. Dordrecht: Delhi.

    Abstract: "In this paper, I shall emphasize the following features of the Nyāya logical thought: (1) some of the uses of Occam's razor or the principle of simplicity; (2) how to avoid the postulation of tertiary entities, such as propositions or images; (3) how the concept of relevance has been used in the context of an inference; (4) the Nyāya view about understanding the meanings of contrary or contradictory expressions; (5) the Nyāya conception of negation, as it cannot be equated with the term negation or the proposition negation in Western philosophy; (6) the definition of the quantifier "all" as well as the pervader-pervaded relation; and (7) the reconstruction of Gadādhara's theory of definite descriptions.

    I would also like to discuss the distinction between the pairs of terms *anuyogī-pratiyogī* (first term-second term), *ādhāra-ādheya* (substratum-superstratum), *viśeṣya-viśeṣaṇa* (qualificand-qualifier), *viśeṣya-prakāra* (qualificand-relational qualifier), *uddeśya-vidheya* (subject-predicate), and *pakṣa-sādhya* (the locus of inference-probandum), which are analogous to the subject-predicate distinction in Western philosophy.

    These terms are used for the explanation of the distinction between perceptual, inferential, and verbal cognitions, as well as for the distinction in meaning between transformationally equivalent sentences and for suggesting a solution to Frege's problem, why predicate alone is to be considered as unsaturated or to use the term of Russell "incomplete"."

Abstract: "In order to protect the Vedas, several linguistic theories covering various aspects of knowledge ranging from phonetics to understanding a sentential meaning were developed in India. A theory dealing with verbal cognition, known as śābdabodha in Sanskrit, is one of them. The discipline of understanding the verbal communication deals with various aspects of linguistic communication such as the nature of the relation between a word and its meaning, the reason behind naming an object, the process of arriving at the meaning of a sentence from its constituents, and various factors that contribute to this process. In this chapter, we present a bird's eye view of the discussions presented by different schools in the Indian philosophical literature."

112. Soni, Jayandra. 2022. "General Introduction to Logic in Jainism with a List of Logicians and Their Texts." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar, 1-21. Dordrecht: Springer.

    Abstract: "In comparison to the work and research done in Brahmanism/Hinduism and Buddhism, studies in Jaina philosophy and particularly Jaina logic are relatively ignored areas. The Jaina contribution to the land of its origin, for example, to literature, art, and architecture, is widely acknowledged, and one is hard pressed to find a reason for the scanty interest in its philosophy and logic. This chapter suggests a possible reason for this in the Indian tradition. At the same time, it is shown that Jaina philosophers and especially logicians have made significant contributions to the development of ideas throughout the history of Indian philosophy. A short list of 13 thinkers and their major works (annotated) is regarded as the minimum one needs for a study of the basic orientation to the development of Jaina logic over a period of 1,500 years. A long list of 43 thinkers with their major works related specifically to logic is also provided additionally. This long list too is a succinct and summary one, especially when it is known that in the Jaina tradition, a list can be drawn entailing, e.g., 352 authors and 951 works."

    Reprinted as Chapter 2 in F. Staal, *Universals: Studies in Indian Logic and Linguistics*, pp. 73-80.

    Abstract: "There is a use of the term ‘model’ in which it can be said that a linguistic expression, in a natural language, is a model for its sense. A translation of a linguistic expression from one language into another may be said to provide another model for the sense of the original. If the sense of a linguistic expression is of a logical nature, the expression can be translated into an expression of formal logic or into a formula. This is not surprising, for logic and mathematics came into being when expressions of natural languages were translated

into formal symbolisms, which were more precise and practical and less cumbersome. Subsequently these artificial languages attained full independence and started a development of their own. Originally, however, these symbolisms could only have been constructed along the lines suggested by the possibilities of expression and the scope of expression of the natural languages themselves. That in mathematics and in modern logic such a linguistic origin of the symbolism has often receded into the background does not imply that the origin of certain symbolisms was independent from the structure of natural languages."

120. ———. 1975. "The concept of Metalanguage and Its Indian Background." *Journal of Indian Philosophy* no. 3:315-354.

    "In Indian culture the concept of metalanguage originated early in the context of linguistics and speculations on language; in the West, late in the context of logic. This is related to the grammatical character of Indian culture and the mathematical character of Western culture. Connections are made between metalinguistic notions and technical, in particular poetic and ritual languages; Mantras; the origin of phonetic writing; communication and metacommunication among animals and men; and the origin of language."

    "The Mimamsa school of Indian philosophy developed two distinct theories of the relation of the meaning of a sentence to the meanings of the words that comprise it, the Anvitabhidhana or "qualified designation" theory and the Abhihitanvaya or "designated relation" theory. Both of these theories, I attempt to show, turn on the observation that the meanings of individual words change in different sentences. I go on to suggest that an appreciation of this fact can lead to a solution of

the problem, first raised by Frege, of the change of meaning of terms in intensional contexts."

125. ———. 2004. "Is Indian Logic Nonmonotonic?" *Philosophy East and West* no. 54:143-170.

"Claus Oetke, in his "Ancient Indian logic as a theory of non-monotonic reasoning," presents a sweeping new interpretation of the early history of Indian logic. His main proposal is that Indian logic up until Dharmakirti was nonmonotonic in character-similar to some of the newer logics that have been explored in the field of Artificial Intelligence, such as default logic, which abandon deductive validity as a requirement for formally acceptable arguments; Dharmakirti, he suggests, was the first to consider that a good argument should be one for which it is not possible for the property

identified as the "reason" (hetu) to occur without the property to be proved (sadhya) -- a requirement akin to deductive validity. Oetke's approach is challenged here, arguing that from the very beginning in India something like monotonic, that is, deductively valid, reasoning was the ideal or norm, but that the conception of that ideal was continually refined, in that the criteria for determining when it is realized were progressively sharpened."

126. Tachikawa, Musashi. 1971. "A Sixth-Century Manual of Indian Logic." *Journal of Indian Philosophy* no. 1:111-145.

"This article consists of four parts: explanations of basic technical terms as an Introduction, a translation of the Nyayapravesa, notes to the translation, and a romanized text based upon Dhruva's edition. This work is Samkarasvamin's Introduction to Dignaga's logic, and deals with means of proof, fallacious means of proof, means of refutation, perception, inference, fallacious perception and fallacious inference."

Translated by Jaysankar Las Shaw.

"The aim of this paper is to discuss the views of Nyāya philosophers on meaning. This paper deals with the meaning and reference of proper names, and general terms. It also deals with the meanings of homonymous expressions, and discusses the question whether demonstrative pronouns are homonymous terms. Different uses of personal pronouns have been mentioned. The section on the quantifier 'all' deals with different uses of it. Similarly, the section on interrogative pronoun deals with as many as seven uses of an interrogative pronoun. This paper ends with the discussion of the meaning of a sentence."

    Abstract: "This chapter explores the ways Abhinavagupta, an eleventh-century Kashmirian polymath, establishes the experience of serenity (śānta) as one of the appraised emotions called rasa. Beyond the issue of whether serenity can be the savoring of rasa, this chapter explores various models from classical Hindu and Buddhist philosophies that establish serenity in order to contextualize the phenomenology of experiencing serenity. For Abhinava, this experience is not a mere negation of emotions but a positive experience. And to establish his argument, Abhinava explores the ways absence is analyzed in Hindu and Buddhist traditions. One of the central problems of aesthetics that overlaps metaphysics is whether the experience of serenity is identical to the experience of liberation. Abhinava paves his path through the middle, without collapsing this experience to the mystical experience of the Brahman or to common everyday experiences. By rejecting the argument that serenity is a product of cessation or that

dispassion evolves into serenity, Abhinava argues that serenity emerges from self-awareness."

131. Tiwari, Heeraman. 1994. "One and Many: The Early Naiyayikas and the Problem of Universals." *Journal of Indian Philosophy* no. 22:137-170.

    "The problem of universals in Indian philosophy is as old as c. 400 b. C. In his great work, Astadhyayi, the grammarian Panini introduced the problem of universals while discussing the meaning of a noun. Later, the Nyāya and Vaisesika systems of Indian philosophy discussed the universals in great detail. The present article deals with the early Nyāya view of universals. The article is divided in two parts: one gives a brief general Introduction to the problem; the other contains a fresh translation of the Nyāya-Sutras 2.2.58-70 and Vatsyayana's commentary on them. The translation is also supplied with discussions and analysis. The article tries to demonstrate that the Nyāya system extends the debate about word and meaning which was inaugurated by early Sanskrit grammarian (viz., Panini, Patanjali etc.)."

135. ———. 1993. "The Referent of Words: Universal or Individual, the Controversies between Mimansakas and Naiyayikas." *Journal of Indian Philosophy*:51-78.

"One of the most important problems discussed in Nyāya philosophy of language is whether words denote an individual or a universal. On this point there are basically two schools of thought which oppose one another, i.e., the Mimansakas and the Naiyayikas. The texts of Muktavali, Dinakari and Ramarudri dealing with this topic give a brilliant summary of the long drawn out conflict between the two Schools. The authors of these texts established the Nyāya position that the denotative function of words is in the individual as qualified by the universal and the present essay examines these arguments and counterarguments."

137. ———. 2003. *A System of Indian Logic: The Nyāya Theory of Inference*. London: Routledge Curzon.

Analysis, text, translation and interpretation of the *Anumana* section of Karikavali, Muktavali and Dinakari.

"Nyāya is the most rational and logical of all the classical Indian philosophical systems. In the study of Nyāya philosophy, Karikavali with its commentary Muktavali, both by Visvanatha Nyayapancanana, with the commentaries Dinakari and Ramarudri, have been of decisive significance for the last few centuries as advanced Introductions to this subject. The present work concentrates on inference (anumana) in Karikavali, Muktavali and Dinakari, carefully divided into significant units according to the subject, and translates and interprets them. Its commentary makes use of the primary interpretation in Sanskrit contained especially in the Ramarudri and Subodhini. The book begins with the Sanskrit texts of Karikavali and Muktavali; followed by English translation of these texts. Next is given the Sanskrit text of

Dinakari which comments on the first two texts, followed by its English translation. Lastly, the book contains a commentary on all the texts included."

138. Venkataramana, B. V. 2022. "Influence of Navya-Nyāya Concepts and Language in Vyākaraṇa." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-23. Dordrecht: Delhi.

    Abstract: "The schools of Nyāya and Vyākaraṇa are mighty Śāstras among the traditional Indian knowledge systems. Both the Śāstras have a long and strong traditional lineage with vast literature, original and commentarial, delineating their unique doctrines, even on common topics between them, that are concluded after much systematic deliberation and in line with the ontology and tenets of the respective Śāstras. Such long traditions of knowledge have much dialectic and polemic engagement, thereby, mutually influencing the pathways the Śāstras traverse as the tradition moves ahead in time.

    Gaṅgeśopādhyāya, a radical thinker of the Nyāya school, not only changed the landscape of the ontology of his own school by bringing in more brevity in categorization and precision in expression, but also influenced the knowledge community then on greatly by giving them the gift of precision in expression through many technical axioms that he adopted for drawing conclusions through the thicket of gruesome complexities that epistemological topics dragged the scholars through.

    Incidentally, the scholars of other schools like Vyākaraṇa, Vedānta, Sāhitya, etc. borrowed the terminology, methodology, and axioms that the Navya-Nyāya school propagated for more incisive logical presentation of their doctrines and used them to refute the viewpoints of other schools, including Nyāya, and establish their own theories. This article throws light on how the Nyāya concepts, axioms, and language influenced the Vyākaraṇa scholars and gave them the tools for analytical and critical thinking, aiding them to establish their doctrines by defending the refutations from other schools and also refuting the viewpoints of other schools while claiming supremacy of their own theories."

142. Vinay, P. 2022. "Dependency of Inference on Perception and Verbal Testimony." In *Handbook of Logical Thought in India*, edited by Sarukkai, Sundar and Chakraborty, Mihir Kumar, 1-16. Dordrecht: Delhi.

    Abstract: "Indian philosophical schools heavily depend upon the means of valid cognition (*Pramāṇas*) to establish the findings of metaphysics and the stand of one's school. Although there is divergence of opinion with the regard to the number of *Pramāṇas*, roughly three distinct means of valid cognition are acknowledged widely: perception, inference, and verbal testimony. Perception refers to sensory means of knowing, while inference is argument to arrive at some conclusion. Verbal testimony is a word of authority which propounds truth of one's experience. In the present chapter, it is examined as to how inference depends upon perception and verbal testimony for its functioning and soundness. Various arguments forwarded by Dvaita thinkers (the school of Indian realism propounded by Śrī Madhvācārya, twelfth-century C.E.) are culled from the classical texts and presented. It is shown as to how any inference is subject to the *Pramanya* of perception and verbal testimony for its intrinsic soundness. The potency of perception, on natural stature as well as being supportive, is being presented here. When the argument at hand is about the sensory objects, the role of perception as supportive to inference is indispensible. In case of an apparent contradiction, the inference which is dependent loses soundness on empirical grounds. Similarly, if the argument is about the supra-sensuals like the virtue and vice, it cannot hope to contradict verbal

testimony, since the latter is the actual means to know the supra-sensuals, and not mere inference. The factor of dependency and the grounds thereof with suitable examples have been presented in the present chapter. The working patterns of the Pramāṇas pertaining to dependency have been portrayed in the chapter. The views of different schools such as that of Vācāspati Miśra and others are presented on the subject and reviewed on the backdrop of great thinkers like Śrī vyāsatīrtha and others of Dvaita school."

Bibliography on Bhartrhari, grammarian-philosopher (First part)

Bibliography (Studies in English) A-Cha

1. Akamatsu, Akihiko. 1993. "*Pratibhā* and the meaning of the sentence in Bhartṛhari's Vākyapadīya." *Asiatische Studien / Études Asiatiques* no. 47:37-43.

   Reprinted in Saroja Bhate, Johannes Bronkhorst (eds.), *Bhartṛhari, Philosopher and Grammarian*, Delhi: Motilal Banarsidass 1994, pp. 37-44.

   "In the second book of the Vākyapadīya (VP), Bhartṛhari sets forth a theory that pratibhä 'intuition' or 'flash of understanding' is the meaning of the sentence (väkyärtha). He discusses the issue of pratibhä in kärikäs 2.143-152. The first kärikä of this section is as follows:

   When we understand the meanings [of the individual words in a sentence] by discriminating them from each other, there arises flash of understanding (pratibhä) which is totally different [from every knowledge of the meanings of the words]. We call that [*pratibhä*], caused by the meanings of the words, the meaning of the sentence.

   As a beginning, by placing this statement in the philosophical and historical context about the linguistic theory in India, I will reconsider the reason Bhartrhari introduced the concept of

pratibhä into his linguistic theory." (p. 37, sanskrit text omitted)

2. ———. 1999. "The Two Kinds of *Anumāna* in Bhartṛhari's *Vākyapadīya*." *Journal of Indian Philosophy* no. 27:17-22.

   "The aim of the present paper is to make clear how Bhartṛhari characterized inference (*anumāna*) when he put forward the two kinds of *anumāna*. The problem of *anumāna* may not be important for Bhartṛhari.

   Although it is evident that he counted *anumāna* among the *pramāṇas*,(9) he considered it as indirect and incomplete cognition in comparison with *agama*. Accordingly it is useless to attempt to estimate his view in the history of Indian logic. Finally, however, we can ask the following question: From where did Bhartṛhari borrow the twofold distinction of *anumāna*?

   As is well known, Bhartṛhari lived and worked before Dignāga and Praśastapāda. Now we must recall a passage of Dignāga translated by Frauwallner (1968). It runs as follows: “Der Vṛttikāra [= Bhavadāsa] vertritt im allgemeinen die Lehre des Vaiśeṣika von der Schlußfolgerung, da er Sehen (*dṛṣṭam*) und Sehen dem Gemeinsamen nach (*sāmānyato dṛṣṭam*) usw. unterscheidet” (p. 87). It is probable that Bhartṛhari also borrowed the view on the two kinds of *anumāna* from the early Vaiśeṣika system. Bronkhorst (1993) has noted some possible links between Bhartṛhari’s Vākyapadīya and the early Vaiśeṣika; we can see the same possibility in Bhartṛhari’s view on *anumāna*." (p.20)

   (9) Cf. Aklujkar (1989).

3. Aklujkar, Ashok. 1969. "Two Textual Studies of Bhartṛhari." *Journal of the American Oriental Society* no. 89:547-563.

   Abstract: "The first half of the article discusses the range of reference and the significance of the title *Vākyapadīya*. It is argued that the title was originally given to the first two books only of Bhartṛhari's monumental work and that the word "Vākyapadīya" has been explained morepreciselyby ancient writers than is generally supposed. In the second half, the article points out how the published parts of Bhoja's *Śṛṅgāra-prakāśa* contain a number of borrowings from Bhartṛhari's partly *vṛtti* of the *Vākyakāṇḍā*, and how the discovery is significant for a textual study of both the works, the manuscript material for which is extremely insufficient."

4. ———. 1970. *The Philosophy of Bhartṛhari's Trikāṇḍi.*

   Unpublished Ph.D. dissertation.

   "My completed dissertation could have been published in Professor Matilal's then newly established *Journal of Indian Philosophy*. However, Professor Matilal did not think he could publish the whole dissertation together in one issue, and, in my view, on the other hand, the chapters of the dissertation were too interdependent to withstand segmented publication. Thus, it remained unpublished. I did not make any effort to have it published elsewhere either, for by that time almost every established scholar who was known to be interested in B [= Bhartṛhari] had either read it or had acquired a photocopy of it and I had moved on to (or returned to) an activity I had deliberately suspended to complete the dissertation, namely the activity of settling the TK [= Trikāṇḍi] text. Recently, I have once again been advised by kind colleagues in the field that I should do the minimally necessary revision and have the dissertation published. But now it seems wasteful to publish it without coordinating the textual references with the better or

more convenient editions I think I will be able to finish in the next few years." (A. Aklujkar, *An Introduction to the Study of Bhartṛhari,* (1993), pp. 12-13)

5. ———. 1971. "Nakamura on Bhartṛhari." *Indo-Iranian Journal*:161-175.

"An article by Professor Hajime Nakamura, "Bhartṛhari The Scholar", was published in the fourth volume of the *Indo-Iranian Journal* (1960: 282-305). That article was a revised translation of a part of Nakamura's *Kotoba no Keijijogaku*, which is regarded by many scholars to be Nakamura's important contribution to the study of Vedānta in general and to Bhartṛhari studies in particular. Naturally I was very surprised to find in it, as I shall presently demonstrate, a large number of inaccurate translations, remarks, conclusions, and comparisons. My purpose in demonstrating what I consider to be Nakamura's mistakes is, of course, purely that of *śāstra-śuddhi* "purification of a branch of learning"; the positive aspects of the present article, namely the correct translations of some of the key verses in Bhartṛhari's *Trikāṇḍi* (1) (*TK* in abbreviation) and a correct understanding of Bhartṛhari's position, are more important in my view than the refutation of the contents of Nakamura's article." (p. 161, anote omitted)

(1) (a) It is generally believed that the title of the work to which I refer as the *Trikāṇḍi* is *Vākyapadīya*. In a recent article (Aklujkar, 1969: 547-555), I have argued that *Vākyapadīya* was originally the title of only the first two books of Bhartṛhari's magnum opus and that *Trikāṇḍi* liis th only ancient name that can refer to the work under study as a whole. (b) Some scholars advocate the view that the composition referred to as *Vṛtti* (as *V* in abbreviation) is not Bhartrhari's work and that it is much later than the verses (*kārikā*) which alone form the genuine *TK*. I see absolutely no reason to subscribe to this view. In my paper, "Authorship of the *Vākyapadīya-vṛtti* ", read at the annual meeting of the American Oriental Society (1969) (to appear in *Wiener Zeitsschrift für die Kunde Süd- und Ostasiens*, vol. xvi, May 1972), I have exposed the weaknesses of the arguments on which this view is based, and I have shown

with unmistakable internal evidence that the traditional ascription of the *V* to Bhartṛhari cannot be doubted by any unprejudiced mind."

6. ———. 1972. "The Authorship of the Vākyapadīya-Vṛtti." *Wiener Zeitschrift für die Kunde Südasiens* no. 15:181-198.

   "1.1 It has been a long tradition in India to ascribe the Vṛtti (*V* in abbreviation) of the first two kāṇḍas of the Trikāṇḍi to Bhartṛhari and to accept it as an integral part of the Vakyapadiya."

   (...)

   "1. 2 Under these circumstances, any doubt about Bhartṛhari's authorship of the *V* may seem highly improbable; but, today, all scholars who are interested in the Trikāṇḍi, as far as I know, entertain such a doubt. Their uncertainty of opinion usually begins when they realize that the *V* occasionally gives two or more interpretations of one verse (kārikā). Then this uncertainty is deepened either by the occurrence in the *V* of the word *tatra-lihavat*, which, in the usage of some ancient authors, serves as Bhartṛhari's epithet, in a manner indicating reference to a person other than the author (S. Iyer 1965: >xxxi-xxxii), or by a feeling that some divergence of views exists between the *V* and thekārikā-text (Bi8ardeau 1964a: 5-21 (summarized by S. Yier 1965: xxxiii-xxxiv), 1964b: 260). But doubtful as they may be, no scholar except Madeleine Biardeau is known to me who has declared the traditional authorship of the *V* to be ill-founded and incorrect. Biardeau has gone beyond the range of uncertainty about the validity of the tradition and reached the conclusion that the *V* cannot be a work of Bhartrhari, that it must have been written by Hari Vṛṣabha sometime after Kumarila, and that the tradition accepted it as Bhartrhari's work through a confusion of names.

   1.3 The purpose of the present article is to refute this conclusion.

   Not only do I uphold the validity of the traditional ascription, but I also maintain that the *V* is an inseparable part of the

Vākyapadīya and that it is wrong to think of the Vākyapadīya as a work consisting of *kārikās* only. Now, there are two ways of establishing this thesis, one negative and another positive. The negative way consists in challenging Biardeau's method of solving the problem of authorship, in pointing out the difficulties to which her conclusion leads, and in demonstrating that the divergences which she notices between the views and use of terms in the *V* on the one hand, and in the *karikas* on the other, are superfluous and that some of her interpretations are inaccurate. I have followed this way in a forthcoming sequel article, and hence it would be proper to devote the present article to a positive demonstration of Bhartṛhari's authorship of the *V*." (pp. 181-185, notes omitted)

7. ———. 1974. "The Authorship of the Vākya-kānda-tīkā." In *Charudeva Shastri Felicitation Volume*, 165-188. Delhi: Charu Deva Shastri Felicitation Committee.

   "1.1 Since the date of its publication (1887) in the Benares Sanskrit Series, the *ṭīkā* on the verses of the second book of Bhartṛhari's *Trikāṇḍi* or *Vākyapadīya* (Aklujkar 1969: 547-555) has been ascribed to Punya-rāja. A few scholars (e.g. Kosambi 1945:65.9-10, ft7.7-9: Bhattacharya 1954:4-5) have given the name of the author of this commentary as Helā-rāja, but that is obviously due to oversight and is not intended to be a deliberately reached conclusion regarding the authorship of the work. Thus, on the whole, the ascription to Punya-rāja has gone unchallenged in the writings of the compilers of manuscript catalogues, of the editors of Bhartṛhari's works, of the scholars working on Bhartṛhari's views and of the historians of Sanskrit grammar. However, it seems likely to me that a serious mistake has been made in deciding the problem of authorship in this case and that the Vakya-kāṇḍa-ṭikā is more likely to be a work of Helā-rāja, the well-known commentator of the third book of the *Trikāṇḍi*, than of Punya-rāja. The evidence favouring this view is manifold and considerably strong when taken cumulatively." (pp. 165-166, notes omitted)

"In this paper I wish to offer some observations on verses 481-490 (1) appearing at the end of the second book of Bhartṛhari's *Trikãndi* or *Vākyapadīya*.

(,,,)

My objective here is neither to review what has been said about them, nor to pronounce judgements on all the controversies they have given rise to. I wish rather to put forward a few considerations that have not so far appeared in print and to refute a few interpretations that have so far gone unrefuted." (p. 9)

(1) (a) In the present and following publications I shall follow Rau's (1977) enumeration of the Trikãndi kãrikãs. It is the only flawless enumeration we have at present that enables us to refer to a tradition of the Trikãndi text (the kãrikã manuscript tradition) in a form determined by objective textual criticism. It will be highly convenient if the Trikãndi text as preserved in the other (Vṛtti and Tīkā) traditions is critically established by following Rau's enumeration. This I advocate simply as a procedure that facilitate future text-critical research concerning Bhartṛhari. I do not hold that the kārikā manuscripts give us the oldest accessible form of the Trikãndi text. See Aklujkar 1971, 1978.

(b) The text of verses 481-490 given below is based on a consideration of all known manuscript traditions. In the case of kãrikã manuscripts I have simply followed Rau's lead. It is only

the collection and evalution of the evidence of the Vṛtti and Tīkā manuscripts that I have freshly attempted.

[Note added by R. Corazzon: in the English translation by K. A. Subramania Iyer, *The Vakyapadiya of Bhartrhari. Chapter II*, Delhi: Motilal Banarsidass 1977, the verses are numbered 476-485, pp. 203-205]

9. ———. 1982. "Interpreting Vakyapadiya 2.486 Historically (Part 1)." In *Dr. K. Kunjunni Raja Felicitation Volume*, 581-601. Madras: Adyar Library and Research Centre.

"The verse I propose to discuss (*parvatād āgamaṃ, labdhvā bhāsya-bijānusāribhiḥ/ sa nīto bahu-śakhatvaṃ candrācāryādibjiḥ punah//*) [*] is a part of the ten epilogue type· verses found at the end of the Vākya-kānda or second book of *Bhartṛhari's Vākyapadīya* or *Trikāṇḍi*.(1)

l have argued elsewhere (Aklujkar 1978:9-26) that the ten verses were not written by Bhartṛhari but by a student of his. However, this does hot diminish the historical importance of the verses, for they remain almost as ancient as they have been thought to be. Secondly, acceptance of my view on the authorship of the verses is not a presupposition underlying the points I wish to make in this article. As far as I can see, the observations I offer below are logically independent of the problem of authorship." (pp. 581-582)

In referring to the *Vākyapadīya/Trikāṇḍi*. verses I have followed the enumeration in Rau 1977.

(1) Eight of these verses are directly or indirectly relevant to the following discussion. They are given below for easy reference: [the author cite the verses in sanskrit, I give the translation by K. A. Subramania Iyer, *The Vakyapadiya of Bhartrhari. Chapter II*, Delhi: Motilal Banarsidass 1977, verse 476-483, pp. 203-204 [Rau numeration is given in parenthesis):]

476. [481] After the *Saṅgraha* declined when it came into the hands of Grammarians who were fond of abridgements and had acquired only little knowledge.

[The *Saṅgraha* is mentioned in the *Mahābhāṣya*, I. p.6.1.12

We are told that there the question whether the word is eternal or only an effect is discussed as one of the main topics.

Commenting on this, Bhartṛhari says in his commentary on the Mahābhāṣya that there were 14 000 topics discussed in the *Saṅgraha*: *Caturdaśa sahasrāṇi vastūni asmin saṃgrahagranthe* (M. Bhā. dīpikā, p. 21, 1. 4-5. B. O. R. I. Post Graduate and Research Department Series no. 8.)]

477. [482] And when the Master Patañjali who knew all the traditions (*tīrtha-darśinā*) had incorporated into his Mahäbhäṣya all the arguments and principles.

478. [483] It was found that those who were not sufficiently equipped (*akṛtabuddhīnām*) could not arrive at proper decisions while studying that work at once bottomless because of its depth and clear because of its lucidity.

479. [484] When that sacred work which was an epitome of the *Saṅgraha* was ruined by Baiji, Saubhava and Haryakṣa who merely followed dry reasoning.

480. [485] The Grammatical Tradition slipped away from the hands of the disciples of Patañjali and in time the mere text of it survived in the South.

481. [486] Then Ācārya Candra and other followers of the principles of the Bhāṣya obtained the true Tradition from the mountain and elaborated it into many branches.

482. [487] After mastering those principles and cultivating his own discipline this collection of traditions was composed by our Teacher.

483. [488] Here only the gist of a few of those traditions is given. In the third *Kāṇḍa*, there wiil be full discussion.

"In the first part of this article, to be published in the Dr K. Kunjunni Raja Felicitation Volume, I have pointed out, among other things, that the explanation of *parvatād āgamaṃ, labdhvā bhāsya-bijānusāribhiḥ// sa nīto bahu-śakhatvaṃ candrācāryādibjiḥ punahIi* II given in Puṇyarāja's or Helārāja's Tīkā is contextually unjustifiable. In the present part I wish to analyse the Tīkā explanation further to establish its mythic character and to account for its acquisition of that character.(...) (1)" (p. 1)

(1) An English summary of the Tīkā explanation is given in section 2.5 of the first part of this article. The aspects in which the Tīkā explanation appears hazy and hesitant are clarified in a footnote to that section.

[From the section 2. 5 of the first part of this article:

"According to it [the Tīkā], what happened in the history of Pāṇinian grammar was essentially this: Because of the peculiar style of the *Mahābhāṣya* and because of the insensitive interpretations· advanced by Vaiji and others, the successors of Pataṇjali lost the knowledge of what Pataṇjali actually wished to say and what Pataṇjali accepted as *siddhānta*. This knowledge was no longer a part of their living tradition of study and was preserved only in manuscripts among the Southerners. Candrācārya and others again gave it currency in a much developed form, once they came in possession of the *mūla-bhūta vyākaraṇāgama*. In other words, although the *Tika* seems hesistant and hazy it probably visualizes the relevant

happenings as follows: Candrācārya and others got hold of the essential, most fundamental, body of Vayākaraṇa doctrines.

They studied the intimations in the *Mahābhāṣya* on the background of these doctrines; they used the principles implicit in Pataṇjali's statements to provide flesh to the skeleton they had received. This activity enabled them to make current once again a multifaceted, robust tradition of Vayākaraṇa views." (pp. 588-569, a note omitted)

11. ———. 1989. "The Number of *Pramāṇas* According to Bhartṛhari." *Wiener Zeitschrift für die Kunde Südasiens* no. 33:151-158.

"In an article entitled "*prāmāṇya* in the philosophy of the Grammarians", expected to be published in the near future,[*] I have tried to explain the distinctive nature of the view of *prāmāṇya* or 'validity of the means of cognition' which the Grammarians or Vaiyākaraṇas held.

I have pointed out in that article that whereas most other traditions of Indian philosophy, knowingly or unknowingly, emphasized the separability of the means of cognition (*pratyakṣa* 'perception', *anumāna* 'inference', etc.), the Grammarian-philosophers like Bhartṛhari ("B" in abbreviation) played down the separability of the means and looked upon them as functioning conjointly(1). In particular, *pratyakṣa* and *anumāna* work on the backdrop of *āgama*, and *āgama* changes, usually gradually, in the light of the knowledge received through *pratyakṣa* and *anumāna*. This is so because the Grammarian's idea of *āgama* was significantly different, which, in turn, was due mostly to his four-fold or multi-level concept of language and his awareness of the centrality of language in our experience of the world." (pp. 151-162)

[*] "Prāmāṇya in the philosophy of the grammarians", in Avinandra Kumar et al. (eds.), Studies in Indology. Prof. Rasik Vihari Joshi Felicitation Volume, Delhi: Shree Publishing House 1989, pp. 15-28.

(1) This is not to say that Indian philosophers of other persuasions are not aware of the mutual dependence or limitations of *prāmāṇas*. They too would readily concede that an *anumāna* is not valid if it is vitiated by a perception, that the perception of a rope as a snake should be rejected if one can infer at a later momerit the real nature of the object, and that one cannot assert that fire does not burn simply because a reliable text or person says so. What I have in mind here is not invalidation or delimitation that obtains after the operation of a *prāmāṇa*. My remark has rather to do with what takes place while a *prāmāṇa* is in operation: The Grammarian school is unlike the other schools of Indian philosophy in accepting at that point the penetration of (what is considered to be) the domain of one *prāmāṇa* by (what is considered to be) the domain of another *prāmāṇa*. While the Buddhist thinkers like Dignāga avoid such overlapping of *prāmāṇas* by restricting the object of *pratyakṣa* (to *svalakṣaṇa*, i.e, by redefining *pratyakṣa*), the Grammarians accept the overlapping as an unavoidable fact of life and view the operations of (so-called separate) *prāmāṇas* as basically complex."

    "As with many great figures of classical times in India, a large number of works have been attributed to Bhartṛhari, and once again current scholarship has hardly settled all questions concerning the authenticity of some of these claims. By definition, the Bhartṛhari we are speaking of is the author of the work that is regularly referred to as the *Vākyapadīya*, a seminal work on Grammar and grammatical philosophy the influence of which, though difficult to calculate precisely, is certainly considerable in subsequent philosophical developments, both within Grammar and outside it. This work has three chapters, and it was more properly termed *Trikāṇḍī*

on that account. Ashok Aklujkar has argued that only the first two chapters constitute the *Vākyapadīya*.

It seems likely that Bhartṛhari also composed th e commentary called *vṛtti* on at least the first two chapters of the *Trikāṇḍi*. Beside this body of literature—verses and prose commentary—Bhartṛhari apparently also wrote a commentary—or part of one — on Patañjali's *Mahābhāṣya*.

Again, the proper title is a matter of discussion: Aklujkar points out that the title *Tripādi* for it has extensive sanction among early commentators in the grammatical tradition , while the title under which it is frequently known nowadays, *Mahābhāṣyadīpikā,* has only one manuscript mention in its favor. No doubt the work is referred to regularly as a ṭikā on the *Mahābhāṣya*. It seems likely that it was a lengthy work, perhaps covering the entire scope of Patañjali's masterpiece, though only a small portion is now available." (pp. 121-122, a note omitted)

Volume, edited by Deshpande, Madhav and Bhate, Saroja, 1-48. Ann Arbor, MI: University of Michigan Press.

"Vākyapadīya (VP in abbreviation) 2.486, the first word of which I intend to discuss here, runs thus:

parvatād āgamaṃ, labdhvā bhāsya-bijānusāribhiḥ/ sa nīto bahu-śakhatvaṃ candrācāryādibjiḥ punah//

The question of the precise import of this verse has given rise to a substantial body of literature extending over 125 years (Aklujkar 1978:9). As I have already examined this literature directly and indirectly in the publications mentioned above, I shall merely state here that I prefer to translate the verse along the following lines: 'Having acquired the traditional knowledge from parvata, Candrācārya and others, who followed the indications in the *Bhāṣia*, again made it (i.e., the traditional knowledge) many-branched'. I should also clarify that in my view, as argued in the 1978 article, the verse was probably authored by a student of Bhartṛhari (B in abbreviation) and not by B as has been commonly supposed.

Although parvata is a common Sanskrit word with 'mountain, mountain range' as its definite meaning and it would not be incompatible in that meaning with the other words of VP 2.486, it has caused much reflection on the part of scholars." (pp. 1-2)

"My lecture has been described as introductory and to some extent it *will* be introductory. However, please note that it will not be introductory in the sense of a presentation proceeding on the assumption that the audience knows nothing or little about Bhartṛhari (hereafter abbreviated to "B") and the works associated with him and hence the principle goal should be to give to the audience some very basic or preliminary information in that regard. Rather, I am principally going to

talk about what research has achieved so far, what parameters are emerging, and what we could expect in the future. From the obseivations made along these lines and the information given in the appendix, it should be possible for you to infer, if you do not already know, what basic factual information and surmises made by scholars there are regarding B, his works, and his commentators." (p. 8)

16. ———. 1993. "Once Again on the Authorship of the Trikāndī-Vṛtti." *Asiatische Studien / Études Asiatiques* no. 47:45-57.

    Reprinted in Saroja Bhate, Johannes Bronkhorst (eds.), *Bhartṛhari, Philosopher and Grammarian*, Delhi: Motilal Banarsidass 1994, pp. 45-58.

    "I keep an open mind on the issue of the authorship of the Vṛtti (hereafter "V" in abbreviation) of the first two kāṇḍas of the Trikāndī (abbreviated to "TK" in the following lines) or Vākyapadīya. My interest is not in arguing for a position by implicitly assuming the adversarial system analogous to that of the British or North American judiciary. That is why when I discussed the problem in 1972 I tried to consider in as much detail as possible all the pieces of evidence that had the potential to disturb the traditional authorship of the V. For example, I collected all cases of double or multiple glossing in the V and attempted to determine if each of them indicated alternative possibilities of meaning entertained by an uncertain commentator or whether the different glosses were in fact intended by the kārikā author - whether what we had in front of us were, in effect, cases of sophisticated *śāstra* punning. In the end, the time-consuming investigation I invited upon myself revealed that the latter indeed was the case. Wherever we had more than one explanation given for a kārikā expression, the content of each explanation was acceptable to the kārikā author on some level or in some specific context. The alternative explanations could not be thought of as signs of uncertainty of understanding and thus be an evidence of the V author's difference from the kārikā author." (p. 45)

17. ———. 2000. "The Epistemological Point of View of Bhartṛhari." In *Concept of Knowledge: East and West*, edited

by Shaw, J. L. , 1-19. Calcutta: Ramakrishna Mission Institute of Culture.

§S.1 In the preceding, I have implicitly made a distinction between B [= Bhartṛhari] as a philosopher (in our most prevalent contemporary Western sense of the term) and as a religious thinker. What that distinction suggests is that B, as a philosopher, need not be seen as needing the concept of *mokṣa* or, to use his expression in Vṛtti 1.5, of *brahmaṇaḥ prāptiḥ* or the other elements of his philosophy to stand.

Another implication of what I have said so far is that there are levels in B's ontology and they are related to his roles as a thinker. As a Grammarian or Vaiyākaraṇa, he accepts as existing everything that words can denote (even 'hare's horn' is deemed to exist from the Grammarian's perspective).(24) As a philosopher, he admits only the physical things and the language principle as truly existing. Everything else is seen as inseparable from either the things or the principle (time and space, as capacities of the latter, are inseparable from it; all other entities such as qualities, universals, etc. have no separate existence from substance).

And as a religious thinker, he entertains the possibility that his philosophical ontic world could be superseded by one in which the language principle alone remains. The assumption then is that a person can reach a certain stage in which his mind (= *buddhi*, *paśyantī*) is divested of diversity and he 'becomes' the language principle.

§S .2 The distinction between B's roles as a Grammarian thinker and as a non-Grammarian thinker is conveyed by the remarks of his ancient commentators, particularly the remarks of Helā-rāja. The differentiation between a *śabda-pramāṇaka* ontology and a *non-śabda-pramāṇaka* (in effect, corresponding to our philosophical) ontology, which Helā-rāja makes, has support in B's remarks. That the *non-śabda-pramāṇaka* ontology is not explicitly characterized as philosophical or is not further divided into philosophical and religious is due to the absence of distinctive terminology for

philosophy and religion in the Indian tradition." (p. 11, three notes omitted)

(24) Compare Quine's procedure of beginning the investigation of what exists with the position 'everything.'

18. ———. 2001. "The Word *is* the World: Nondualism in Indian Philosophy of Language." *Philosophy East and West* no. 51:452-473.

"Bhartṛhari the grammarian-philosopher most eligible for attributing the view "the word is the world," lived sometime around A.D. 425-450, if not earlier. In the current state of our resources, he can be viewed as the originator of the view, although it is clear from his major surviving work, the *Trikāndī* or *Vākyapadīya*, that the view must have preceded him by quite some time, probably many centuries, in several important details if not in its entirety. The argumentation in support of the view, as distinct from the statement of the view, is at present found for the first time only in Bhartṛhari's incompletely preserved *magnum opus*, albeit it is not Bhartṛhari's principal intention, except maybe for a part of the first book, to argue systematically in favor of the view. My aim here is to identify myself with Bhartṛhari, unearth the many facets of his argumentation, and give him the best possible hearing that I can." (p. 456)

19. ———. 2009. "Veda Revelation according to Bhartṛhari." In *Bhartṛhari: Language, Thought and Reality*, edited by Chaturvedi, Mithilesh, 1-98. Delhi: Motilal Banarsidass.

"In his paper “Veda Revelation according to Bhartṛhari”, Ashok Aklulkar discusses the connotations of words like *sākṣākṛta-dharma*n and *pratyakṣadharman* used in Bhartṛhari's Vṛtti and earlier by Yāska and Patañjali. He interprets *dharma* as ‘properties of things’. According to him, Bhartṛhari uses the word *veda* in more than one sense: Veda in a subtle form as appearing in the vision of seers comes before the sequential language form or the textual corpus that is later divided into four Vedas and different śākhās. Aklujkar equates Veda in pre-revelation stage with para-paśyanti-rūpa or the language

principle itself and the first revelaton with paśyanti, i.e., the active or the extrovert stage of it. He also thinks that Bhartṛhari's account of Veda revelation is not an expression of faith only but also has philosophical content and there is empiricist spirit in the account. He further draws the conclusion that although Bhartṛhari has genuine reverence for the Veda, he opts for theoretical fictions when necessary. Aklujkar has added four appendices, mainly discussing the relevant Vṛtti and Nirukta Passages textually, to his paper." (*Editor's Introduction*, p. XXVI)

20. Alackapally, Sebastian. 2002. *Being and Meaning: Reality and Language in Bhartrhari and Heidegger*. Delhi: Motilal Banarsidass.

    Contents: Foreword. General Introduction. Philosophical background of Bhartrhari and Heidegger: Bhartrhari: the grammarian philosopher. Heidegger: the philosopher of being and language. 1. Sabdatattva: the ultimate reality; 2. Sabdatattva: the Sphota of language; 3. Heidegger's concept of reality; 4. Language: the saying of being; General conclusion; Being and language in Bhartrhari and Heidegger: a synthesis; Glossary; Appendix; Bibliography. Index.

    "This is a study of the concepts of Being (Reality) and Language (Meaning) as has been envisioned by Bhartrhari, the Indian linguistic Philosopher and Martin Heidegger, a great independent German thinker. For both, the question of Being is essentially interwoven into the experience of the question of language. For them, there is no philosophy of Being without a philosophy of Language. Hence a thinking of Being is simultaneously a thinking of Language; to experience the truth of the one is necessarily to experience the truth of the other.

    In Bhartrhari's vision the language we speak is the medium of the self-expression of the ultimate Reality communicated through all meaning-bearing words. It leads us across the external appearance to the core of reality which is the source and the underlying unity beneath everything. This approach depends for its validity upon the presupposition that the real is a luminous Truth which needs to be discovered by every

speaker and in every speech. The real breaks-forth (sphut) through the medium of speech *(sabda*). This *sabda* is not merely a means to a truth or reality but it is the Truth and Reality. The awareness of this fact leads one to the realization of the meaningfullnes of Being." (p. 1)

21. Ananthanarayana, H. S. 1992. "Bhartṛhari on Semantics and Pragmatics." *Bulletin of the Deccan College Post-Graduate and Research Institute* no. 51/52:211-219.

    "The present paper makes an attempt to bring to the notice of the students of modern linguistics, as they seem to be unaware of their great heritage, some of the finer points in Bhartṛhari's discussion of semantics which is interpreted syntactically and determined to an extent also pragmatically. We may quote Bhartṛhari himself on this who warns that the Goddess of learning does not smile on those students who would neglect their own ancients (11.485). There is close similarity between Bhartṛhari and modern linguistics in many issues discussed in Vākyapadīya. The paper makes a reference also to these similarities to the extent possible and suggests that a closer study of the Indian tradition is worth its trouble and makes us proud of our heritage. Bhartṛhari starts from the observation that a linguistic unit say, a word, can be considered under two aspects, viz. sound and meaning bearer (1.44). He terms the first as *dhvani* which the speaker utters and which are the *nimitta* 'manifestors' of the real word. The second is called *sphoṭa* which, when manifested by the d*hvanis*, conveys the meaning. It is the meaning bearing aspect of the word, an indivisible entity which is over and above the sounds. The latter are many in number and are uttered by the speaker in a temporal sequence in order to manifest the sphoṭa. *Sphota* is eternal while *dhvani* is transitory. The unit of expression as well as the unit of meaning is, for Bhartṛhari, the sentence since it is only the sentence that is real and meaningful. Individual words for him have no reality and, thus, do not convey meaning. He says 'sounds have no separate existence in words nor do component features within the sounds; nor have the words any separate existence apart from the sentence' (1.73)." (pp. 211-212)

22. Antil, Ritoo Kartari, and Gautam, Vikas Singh. 2022. "Bhartṛhari's Linguistic Philosophy: Śabda Brahman and the Question from Ineffability." *International Journal of Sanskrit Research* no. 8:280-283.

Abstract: "Bhartṛhari mainly focuses on correct interpretation of Vedic literature through grammar and creates the notion of verbal holism, which describes the ultimate reality as a universal language (śabda) without any components. According to his philosophy, śabda is absolute reality, and the universe expresses itself in the shape of language; that is, objective reality is nothing more than the linguistic explanation of any kind of experience. We can only know something if we are able to cognise it verbally, whether in mind or orally. There is, nevertheless, a sense of ineffability, and there are experiences that do not fit within the realm of linguistic cognition and can only be described in terms of raw sensations. As a result, Bhartṛhari's philosophical argument that absolute reality only exists in a word form, i.e. Śabda Brahman, is called into doubt. The paper briefly discusses the scope of ineffability in verbal holism, as well as some alternative remedies from other philosophical traditions, in order to keep the notion of effability alive in Bhartṛhari's Śabda Brahman theory."

24. Behera, Pitambar. 2015. "The Sphoṭa Theory in the Indic Philosophy: The Ancient vs the Modern." In *Proceedings of Twenty Second International Congress on Vedanta*, 223-235. New Delhi: D. K. Print World Publications.

Abstract: "Since the advent of the period of the great grammarians, Patañjali and Pāṇini, in the Indic philosophy, the concept of meaning has been a primordial concern. Different schools of philosophers have attempted to address the said conceptual issue in various ways in consonance with the philosophy of language ranging from the ancient to the modern. Almost all the schools of philosophy (the Vedic,

Vedāntic, Buddhist and Jaina) have participated in the deliberation on the origin of meaning in semantics, which encapsulated the larger chunk of the Indian philosophy on language. The mystic and whimsical doctrine of the articulation of sounds *(sphoṭa*) and the meanings that they respectively convey has been revisited and demystified with a special reference to Bhart¦hari's exponential theory of *sphoṭa*."

    Reprinted in Saroja Bhate, Johannes Bronkhorst (eds.), *Bhartṛhari, Philosopher and Grammarian*, Delhi: Motilal Banarsidass 1994, pp. 67-73.

    "The present paper is an attempt to sum up Bhartrhari's views on the relation of language with reality. It is, in fact, a further extention of the problem posed by Dr. J. Kelley in his paper, namely, whether the Vâkyapadïya (VP) can be looked upon as an argument about the limitations of a formal system of analysis to describe linguistic phenomena.(1) I would like to go a step further and pose the problem whether the VP represents an argument about the limitations of language to describe reality.

    Bhartṛhari accepts perception, inference and word as valid means of knowledge. However, he acknowledges highest authority to word. He declares in the Brahmakända that there is no knowledge which does not assume the form of a word(2). All knowledge must culminate in verbal knowledge. No object which is not expressed in words exists. Language is the only window to the world. Our knowledge of reality is shaped by the language we use. Thus Bhartṛhari has initially accepted an intimate relationship of language with reality.

    However, Bhartṛhari shows the superficial character of this intimacy by pointing out how language falls short of reality. At several places in the VP he describes language not only as an inadequate tool to represent reality but also as a wrong means, which, in fact, never takes us to reality.

It is very intriguing that the VP begins with a declaration that there is no world beyond language, whereas it ends up with a note of disharmony between the two and declares that reality transcends language. What follows is a résumé of the views presented in the VP about the nature of language in relation to reality." (p. 67)

27. Bhattacharya, Bishnupada. 1985. *Bhartṛhari's Vākyapadīya and Linguistic Monism*. Poona: Bhandarkar Oriental Research Institute.

    The *Vakyapadiya*, the magnum opus of the great Bhartṛhari, is not only the most authoritative text on the analytic aspect of Sanskrit language as such, but also one of the most important philosophical works dealing with some of the basic problems of linguistic philosophy, which has also engaged the attention of some of the most eminent linguistic philosophers of our age. The question of the relation of language with the external reality on the one hand and with the internal thought-process on the other is one of the fundamental problems of philosophy. We are aware that there have been various trends of metaphysical quest in India from the very earliest times, and they can be usually classed under two broad heads viz. dualism-pluralism and monism. The Sāmkhya-Yoga, Nyāya-Vaiśeṣika, and Purva-Mīmāṃsā systems are examples of dualistic/pluralistic metaphysics, while the Vedanta of the school of Śaṅkara is the most outstanding example of monism. But besides Śaṅkara's advaita, which is usually known as *brahmādvaita* there have been several other attempts at explaining the phenomenal universe of diversity from one absolute principle without any second. Several variants of monism, however, can be traced in the ancient philosophical literature of India, of which *śabdādvaita-vādā*, *vijñānādvaita-vāda*, and *sattādvaita-vāda* have been noticed in authoritative texts, besides the well-known *brahmādvaita-vāda* or *ātmādvaita-vāda* as taught in the Upaniṣads according to the interpretation of the school with which Śaṅkara is affiliated. Bhartṛhari is the propounder of the theory of *śabdādvaita* or Linguistic Monism, which is a novel doctrine altogether, though the origin of the doctrine is traceable in the Vedic Saṃhitās. Thus Bhartrhari is a great exponent of Monism, though of a different sort, beside Śaṅkara." (pp. 1-2)

28. Bhattacharyya, Gaurinath. 1937. "A Study in the Dialectics of Sphoṭa." *Journal of the Department of Letters. University of Calcutta* no. 29:1-121.

    "We do not know when and by whom the doctrine of *sphoṭa* was first promulgated. There is no reference to it in the *sūtras* of Pāṇini nor in the *vārtikas* of Kātyāyana, But in the Pān. Su. VI. 1. 123, there is the name of a grammarian named Sphoṭāyana. The name may suggest that the grammarian was an exponent of the doctrine of sphoṭa. It is, however, Patañjali who for the first time appears to make a reference to sphoṭa in his epoch-making work on Sanskrit grammar, the *Vyākarana-mahābhāṣya*. Therein he acknowledges in clear terms the distinction between two kinds of word (*śabda*)-permanent (*nītya*) and created (*kārya*); and it is "vith reference to the former that he uses such epithets as "abiding" (*dhruva*), "unchangeable" (*kūṭasta*), etc., epithets that are ascribed to Brahman with which Sphoṭa bas been identified. But Patañjali has not only hinted at *sphoṭa* by noticing the distinction referred to above; he has also actuaJly used the term in his work and has given us a definition of the same. Thus Patañjali observes a distinction between *sphoṭa* and sound by holding that the latter is only a quality of the former and serves to manifest it. And he defines *sphoṭa* as what is perceived by the auditory organs, apprehended by the intellect, manifested by the auditory organs, apprehended by the intellect, manifested by sound and pertaining to ether.

    It is Bhartṛhari, the celebrated author of the Vākyapadīya, who, to our knowledlge, is the first grammarian to have presented to us a systematic treatment of the conception of *sphoṭa*. Bhartṛhari has looked at *sphoṭa* from two standpoints - metaphysical and empirical. From the metaphysical standpoint, Bhartṛhari conceives *Sphoṭa* as identical with the *Brahman* of the Vedāintists, the material cause of the phenomenal world. From the empirical point of view, *sphota* is an indivisible sentence which is expressive of sense.

His attitude towards word, syllable and letter is that they are no better then mere artifices resorted to for the purpose of helping the subject to grasp the indivisble character of *sphoṭa*." (pp. 1-2)

30. Bronkhorst, Johannes. 1989. "Studies on Bhartṛhari, 2: Bhartṛhari and Mīmāṃsā." *Studien zur Indologie und Iranistik* no. 15:101-117.

    [Studies 1 and 4 are in French].

    Reprinted in R. C. Dwivedi (ed.), *Studies in Mīmāṃsā. Dr. Mandan Mishra Felicitation Volume*, Delhi: Motilal Banarsidass, 1994, pp. 371–388.

    "Both Bhartṛhari and Śabara pay a good deal of attention to the subject of *ūha* 'modification, adjustment'. Bhartrhari discusses

it in the first Āhnika of his ·commentary on the Mahābhāṣya (AL 5.18-8.17, Sw 6.17-9.27, Ms 2b9-3c1, while parts of Adhyāya 9 of Sahara's Bhāṣya deal with it. Two cases in particular are treated by both the authors and allow of a detailed comparison." (p. 101)

(...)

"The conclusion must be that Bhartṛhari's description of *uha*, or rather of the absence of, in *aditiḥ pāśān pramoktu* does not represent the position of any group of Mimāṃsakas, but rather the po.sition of the Maitrāyaṇīya branch of the Yajurveda. The Mimāṃsakas on the other hand, or at any rate Śabara , did not confine their attention to one Vedic school." (p. 104)

(...)

"The above observations, if correct, allow us to draw the following conclusions.

Bhartṛhari was acquainted with Mimāṃsa, but did not use it where we would expect him to use it. In the context of ritual details he rather draws upon another tradition, most probably on the traditional manuals current in his Vedic school, that of the Maitrāyaṇīyas. And where he makes references to Mimāṃsa, it is never to Śabara's Bhāṣya, but rather to a Mimāṃsa work in verse, or containing verse, which has not survived, but may have been Bhavadāsa' s Vṛi. He may have known the Pūrva Mimāṃsa Sūtra, or a part of it, but this is not certain." (p. 114)

31. ———. 1991. "Studies on Bhartṛhari, 3: Bhartṛhari on *Sphoṭa* and Universals." *Asiatische Studien / Études Asiatiques* no. 45:5-18.

"Both Brough and Herzberger worked from 'below' 'upward' in their attempt to understand Bhartṛhari's thought. Brough never reaches the metaphysical 'superstructure', whose existence he none-the-less does not deny. For Herzberger the 'superstructure' is the 'top' of a construction built by her 'from below'. For Bhartṛhari, however, we can be sure that the

metaphysical superstructure did not come at the end, but rather at the beginning. It comes at the beginning literally, for the first stanzas of the Vākyapadīya speak of Brahman.

But it must have come at the beginning in another sense as well: Bhartṛhari wrote his work starting from a vision, in which the metaphysical aspects of his thought were already clearly represented. This at any rate seems an extremely reasonable assumption to make." (p. 12)

(...)

"The picture which thus evolves of universals is hardly that of an abstract entity different from the things in which it manifests itself, like the universals of the Vaiśeṣika philosophy. In an important way Bhartṛhari's universal rather is the thing. It is not correct to think that there is a pot, and the universal potness which is different from it. Quite on the contrary, the pot in as far as it really exists is the universal; its not really existing shadow in the phenomenal world is the individual. It is therefore not possible to say that pot and potness are different, even though the former has a spatial and a temporal dimension, which the latter has not. Universals, seen in this way, can most easily be compared with Plato's ideas: they are real and unchanging, while the things that figure in our experience are their unreal reflections.

Returning now to Bhartṛhari's sphoṭa, if the real pot is the universal, the same must be true of words: the real word, i.e. the sphoṭa, is a universal." (p. 14)

"There are reasons to think that Bhartṛhari's writings may shed light on the early history of Vaiśeṣika. One of these is that he obviously knew the Vaiśeṣika system. Almost all of its categories play a role in his work.

Separate sections (*samuddeśa*) of the Vākyapadīya are dedicated to the categories *jāti, dravya, guṇa* and *kriyā*. The relationship called *samavāya* - a special feature of Vaiśeṣika - is mentioned and used repeatedly.

Vaiśeṣika substances appear as 'powers' (*śakti*), most notably *kāla* (time) and *diś* (space).

A second reason is Bhartṛhari's chonological position. I have argued in another publication that Prasaśtapāda's *Padārthadharmaṁsagraha*; as well as Dignāga's *Pramāṇasamuccayavṛtti* before it, were heavily indebted to the Kaṭandī, a work written not long before Dignāga. This Kaṭandī, further argued, exerted a dominating influence on all Vaiśeṣika literature that came after it, including perhaps the versions of the Vaiśeṣika Sūtra

itself, not to speak of the surviving commentaries on this Sūtra work.(2)

Bhartṛhari, on the other hand, lived long enough before Dignāga that someone different from Bhartṛhari could write a commentary on the first two kāṇḍas of his Viikyapadiya still

before Dignaga. Bhartṛhari, therefore, lived and worked most probably before the *Kaṭāndi*! If his work provides information on Vaiśeṣika, it would then be one of the very few sources of information dating form the pre-*Kaṭāndi* period of this system.

In what follows we shall consider some possible links between Bhartṛhari's Vākyapadīya and the Vaiśeṣika of his days." (p. 75)

"There seems to be a tendency among recent scholars to consider as possible, or even probable, the identity of Bhartṛhari, supposedly the author of the Three Centuries (śatakatraya, subhāṣitatriśat), with the grammarian-philosopher of the same name.

This article is meant to draw attention to the fact that the arguments adduced to support this position are far weaker than is generally realized." (p. 32)

34. ———. 1995. "Studies on Bhartṛhari, 7: Grammar as the Door to Liberation." *Annals of the Bhandarkar Oriental Research Institute* no. 76:97-106.

"In the beginning of his *Vākyapadīya*, Bhartṛhari describes grammar as *dvāram apavargasya* 'the door to liberation'. This remark has drawn the attention of several scholars, none of whom have been able to explain how the study of grammar could possibly lead to the highest aim of Indian religions, liberation from this world. Some complain about the lack of information about this in the *Vākyapadīya*. (p. 97)

(...)

"There are many aspects of Bhartṛhari's thought where the influence of Buddhism is clearly noticeable. His conception of the highest reality is an example, as I have tried to show

elsewhere.(21) His view as to to what extent the world of our daily experience is determined by language, is another example(.22) The present paper has tried to show that even his ideas about the ultimate religious aim, and how to reach it, may have been borrowed from the Buddhists. To all this we must however add that Bhartṛhari never borrows ideas without thoroughly adjusting them to their new surroundings. Many of his ideas may be Buddhist in origin, together they constitute Bhartṛhari's philosophy which, as such, is not Buddhist at all. His is the philosophy of a traditional Brahmin, who manages to adjust the Buddhist and other ideas in such a way, that they come to contribute to a Veda-centered view of the world." (pp. 104-105)

"With this in mind we turn to another Brahmanical thinker who, as it seems to me, has been profoundly influenced by Buddhist ideas.(53) This is Bhartṛhari, the linguistic thinker par excellence of classical India.

Bhartṛhari stood, in fact, under the influence of both Vaiśeṣika and Buddhism, not to speak of several other currents of thought. The extent to which he is indebted to Vaiśeṣika is

evident on almost every page of his Vâkyapadïya. The Buddhist influence is less immediately obvious, but not any the less important, as it appears to me. I have drawn attention to Bhartṛhari's indebtedness to Buddhist thought in an earlier publication.(54)

In the present lecture I will try to show how Bhartrhari, at least where ideas concerning the relationship between language and phenomenal reality are concerned, remains closer to the Buddhists than to the Vaiśeṣikas. I will also point out how he adapts these essentially Buddhist ideas to his own vision of the world. We will see that Bhartrhari accepts the close correspondence between language and phenomenal reality, that, like the Buddhists, he looks upon phenomenal reality as ultimately unreal, and that, like Nägärjuna, he includes sentences in the parts of language that correspond to the phenomenal world." (p. 125)

(53) For the argument here presented it is not important to know whether Bhartṛhari was directly acquainted with Nägärjuna's works. Nägärjuna's style of reasoning left a profound impression on Buddhist thought after him, so that Bhartrhari may have undergone his influence indirectly. Some features of Bhartrhari's thought suggest that he may have been acquainted with one or more Yogäcära thinkers; see note 81 below.

Publications de l'Institut Orientaliste de Louvain, 8 Louvain-la-Neuve: Institut Orientaliste] 1973: 88-89, 108 (= Mahäyänasamgraha II, 2; II, 16).

36. ———. 1999. "Studies on Bhartṛhari, 8: *prākṛta dhvani* and the Sāṃkhya *tanmātras*." *Journal of Indian Philosophy* no. 27:23-33.

"Bhartṛhari distinguishes between the word itself (sometimes called *sphoṭa*) and the sounds that manifest it. These sounds themselves are subdivided in one passage of the Vākyapadīya into *prākṛta dhvani* and *vaikṛta dhvani*. These two expressions have puzzled modern scholarship." (p. 23)

(...)

"To conclude. For a correct understanding of Bhartṛhari's *prākṛta* and *vaikṛta dhvani*, his intellectual context must first be taken into consideration. Comparison with theories of modern linguistics is delicate, and should not be made until Bhartṛhari's own intellectual background has been properly explored.

It seems likely that the notions of *prākṛta* and *vaikṛta* forms of sound come from Sāṃkhya, where these notions appear to have been current until the revision of that philosophy during which the qualities as final evolutes were replaced by the five elements.

This hypothesis explains both Bhartṛharis terminology and the ideas it covers: both Sāṃkhya and Bhartṛhari distinguish between two perceptible forms of sound, the one "pure", the other one "impure". Questions remain as to their temporal relationship: does the *vaikṛta dhvani*, come into being after the *prākṛta dhvani*? Neither Bhartṛhari's text nor our limited knowledge about the Sāṃkhya known to him allow us to reach a clear and certain answer to this question.

The revision of Sāṃkhya referred to above did away with both *prākṛta* and *vaikṛta dhvani*. Not surprisingly, the commentator Vṛṣabhadeva no longer understood Bhartṛhari's short and enigmatic passage, and gave it a different interpretation." (pp. 32-33)

37. ———. 2001. "The Peacock's Egg: Bhartrhari on Language and Reality." *Philosophy East and West* no. 51:474-491.

    "Bhartrhari was not only a clever and well-informed philosopher but also a conservative Brahmin who maintained his own tradition's superiority against the philosophies developed in his time. He exploited a problem that occupied all his philosophical contemporaries to promote his own ideas, in which the Veda played a central role. Bhartrhari and his thought are situated in their philosophical context. As it turns out, he dealt with issues that others had dealt with before him in India and suggested solutions to existing problems. Indeed it becomes clear that he was both a philosopher who dealt with current problems and challenges and a traditionalist who used the philosophical debate of his time to gain respectability for his own Vedic tradition."

38. ———. 2009. "Bhartṛhari and His Vedic Tradition." In *Bhartṛhari: Language, Thought and Reality*, edited by Chaturvedi, Mithilesh, 99-118. Delhi: Motilal Banarsidass.

    "In this paper I wish to concentrate on one thinker and explore to what extent his thought may have been influenced, or even determined, by the Vedic school to which he belonged. This thinker is Bhartṛhari — a Brahmanical philosopher belonging to the fifth century of the common era, author of the Vākyapadīya and of a commentary, Tikā, on the Mahābhāṣya, nowadays often referred to as Mahābhāṣya-dīpikā. The Vedic school to which he belonged is that of the Mānava-Maitrāyaṇīyas. Is it possible that this famous thinker may have borrowed, or rather inherited, some of his key ideas from this, his own, Vedic tradition? (p. 102)

    (...)

    "What can we conclude from the preceding? Not very much, ! fear. It seems possible, even likely, that Bhartṛhari looked upon his Vedic school, that of the Mānava-Maitrāyaṇīyas, as one of his sources of inspiration which he refers to as authoritative

tradition, *āgama*. The specific texts belonging to that tradition which he used probably include the Maitrāyaṇīya Upaniṣad.

He also used other treatises of the Mānava school, among them probably a Mānava Dharmaśāstra. Whether he derived philosophical ideas from these treatises is not clear. The Manusmṝti — assuming that it is based on the Mānava Dharmaśāstra known to Bhartṛhari — does not provide much information that might support this." (p. 112)

39. ———. 2011. *Language and Reality: On an Episode in Indian Tought*. Leiden: Brill.

Revised and updated English edition of: *Langage et réalité : sur un épisode de la pensée indienne*, Turnhout: Brepols 1999.

Chapter Two, § 15: *Bhartṛhari*, pp. 108-117.

"Bhartṛhari, according to a few verses added at the end of the second book of his principal work, the Vākyapadīya (“Treatise on Sentences and Words”), played an important role in the resurgence of the Mahābhāṣya in the fifth century of the common era. The Vākyapadīya was aware of the problems relating to the correspondence principle, particularly the problem of the impossibility of the arising of things.

Bhartṛhari proposes several solutions. We should not be surprised to find him making greater use, in comparison with other thinkers we have discussed, of the ideas found in the Mahābhāṣya.

A verse from the third book of the Vākyapadīya articulates the central problem as follows: “What we call origination is the fact of attaining one’s own nature, and only something existent attains what is to be attained. If [this thing] exists [already], why does it arise? But if it does not exist, how does it arise?”(271) The problem is easily recognizable: for something to arise, it has to exist; but if it already exists, why would it arise? To quote once again the words of Nāgārjuna: “If there existed anywhere something unarisen, it could arise. Since no such thing exists, what is it that arises?”(272)" (P. 108, Sanskrit omitted)

(272) [Nāgārjuna, Mūlamadhyamakakārikā, ed. J. W. de Jong, The Adyar Library and Research Centre, Madras 1977 7.17:

40. ———. 2012. "Studies on Bhartṛhari, 9: Vākyapadīya 2.119 and the Early History of Mīmāṃsā." *Journal of Indian Philosophy* no. 40:411-425.

Abstract: "This article argues that in early Mīmāṃsā the view was current that there are objects in the world corresponding to all words of the Sanskrit language. Evidence to that effect is primarily found in passages from Bhartṛhari's works, and in some classical Nyāya texts. Interestingly, Śabara's classical work on Mīmāṃsā has abandoned this position, apparently for an entirely non-philosophical reason: the distaste felt for the newly arising group of Brahmanical temple-priests."

VI.2. Bhartṛhari 295; VI.2.1, The Vākya-padīya: editions and translations. 295; VI.2.2. The authorship of the Vṛtti 297; VI.2,3, The dates of Bhartṛhari and his

commentators 298; VI.2 4 Studies on the doctrines set forth in the Vākya-padīya 299; VI.2.5. Evaluations of Bhartṛhari and his commentators 304-305.

"The major text on semantics and philosophy of grammar in the Paninian school is Bhartṛhari's Vākya-padīya. This, together with the Mahā-bhāsya, is the basic work for later treatments of topics in the treatises of Kauṇḍabhaṭṭa and Nāgeśa. Not only this, the Vākya-padīya is also referred to extensively in later treatises of many schools.

The text is composed in verses (*kärika*) and divided into three parts (*kānda*)'. the Āgama-samuccya ('compendium of traditional teaching') also called the Brahma-kaṇḍa, the Väkya-kaṇḍa, and the Pada-kaṇḍa or Prakirnakaṇḍa ('miscellaneous part'). The third part is further subdivided into fourteen

sections called *samudeśa* in which are treated; generic properties (*jāti*), substance (*dravya*), relation (*sambandha*) between items and their meanings, substance again (*bhūyo-dravya-samuddeśa*), properties (*guṇa*), spatial concepts (*dik*), kārakas (*sādhana*), action (*kriyā*), time (*kāla*), the concept of person (*puruṣa*), number (*saṃkhyā*), the semantics associated with active and middle endings (*upagraha*), gender (*liñga*), derivatives such as compounds (*vṛtti*, see note 263). The last kāṇḍa is considered by both commentators and most modern scholars to be lacking sections originally included therein. Ther term *vākya-padīya* was used to refer to the first two kaṇḍas and the term *trikāṇḍi* to refer to the whole work.

The following commentaries on the Vākya-padīya are extant: the Vṛtti on the first and second parts, the latter fragmentary; the Ṭīkā on the second part, usually attributed to Punyaräja. Helärāja's Prakäśa on the third kāṇḍa. In addition, the Vṛtti on the first section itself has a commentary, the Paddhati of Vṝṣabhadeva." (pp. 295-296, notes omitted)

"It is generally agreed that Bhartṛhari deserves his reputation for his insights into language. There has, nevertheless, been some disagreement on how one should evaluate him. In particular, should one approach him as a linguist or as a philosopher, through his commentaries in addition to the Vākya-padīya and the Tripädi or through these alone?" (p. 304)

42. ———. 1999. "Approaching the Vākyapadīya." *The Journal of the American Oriental Society* no. 119:88-125.

This is a review-article of: *The Sambandha-Samuddesa (Chapter on Relation) and Bhartrhari's Philosophy of Language: A Study of Bhartrhari's Sambandha-samuddesa in the Context of the Vakyapadiya with a Translation of Heldrdja's Commentary, Prakirna-prakasa*. B y Jan E. M. Houbeng. Gonda Indological Studies, vol. II. Groningen: Egbert Forsten, ,995. Pp. 460 + xv.

Abstract: "In connection with a recent work on the *Sambandhasamuddeśa* of the *Vākyapadīya*, I consider some major issues concerning Bhartṛhari, the tradition he represents,

and how a modern scholar might approach the *Vākyapadīya*. I discuss theoretical principles which have been set forth as a basis for dealing with Bhartṛhari and evidence from the *Vākyapadīya* in connection with these principles, chiefly what is referred to as Bhartṛhari's perspectivism. I take up in some detail one large issue: the status of the received high language, associated with a group of model speakers called *sista*, who use speech forms characterized as "correct" (*sādhu*) linguistic units (*śabda*) opposed to incorrect linguistic units (*asadhusabda, apaśabda*), that are viewed as corruptions *(apabhramsa*) with respect to how meanings are understood by users. The principal issue here is: do *apaśabdas* directly signify meanings for *sista*s when they communicate with someone using a vernacular, or do these speakers resort to a translation technique such that the *apaśabda* used calls to mind a *sadhusabda*, which then directly signifies a meaning? This topic also involves another important question: how one should consider the *Vrtti* and other commentaries in relation to what is said in the kārikā text."

    "While remaining faithful to the tradition of his predecessors in grammar, Bhartṛhari ranges widely in his treatment of pertinent topics, to the extent that he has been characterized as embracing an attitude of accomodation towards the views of others and of being not only encyclopedic but also perspectivistic.

    Scholars who have, with some justification, emphasized this aspect of Bhartṛhari’s approach, though they acknowledge Bhartṛhari’s close affiliation with the Mahābhāṣya, to the point where in many places—especially in the third kaṇḍa—the

Vākyapadīya takes on aspects of a learned commentary on this work, have not, in my opinion, sufficiently emphasized the degree to which Patanjali anticipates Bhartṛhari in devoting attention to various points of view. In addition, insufficient attention has been paid to the manner in which both authors can make known their sharp disagreements with views they find unacceptable. In the present contribution, | consider examples from the Mahābhāṣya and the Vākyapadīya to illustrate the similarity in approach, then discuss some general issues concerning Bhartṛhari's attitude." (pp. 120-121, note omitted)

Bibliography on Bhartrhari, grammarian-philosopher (Second part)

Bibliography (Studies in English) Cow-Hon

1. Coward, Harold G. 1976. *Bhartṛhari*. Boston: Twayne Publishers.

   Contents: About the Author; Preface; Chronology; 1. Bhartrhari in His Own Day 13; 2. The Vakyapadlya's Theory of Language 31; 3. The Yoga Psychology Underlying Bhartrhari's Vakyapadlya 53; 4. Bhartrhari's Dhvani as Central to Indian Aesthetics 80; 5. Yoga in the Vairagya-Sataka of Bhartrhari 95; 6. The Contribution of Bhartrhari 105; Notes and Beferences 125; Selected Bibliography 139; Glossary of Sanskrit Terms 141; Index 147-150.

   "The Vākyapadīya, Bhartṛhari's great work on language and metaphysics, is technical Indian Sanskrit philosophy at its best. I have done my best to make it understandable to the beginning English reader, but have also included in the text the key Sanskrit terms (with translations) since some of these concepts are not always clearly expressible in English. A glossary of Sanskrit terms is provided. All quotations from and references to the Vākyapadīya are based upon K. A. Subramania Iyer's excellent English translation. It should be noted, however, that his numbering of verses is sometimes different from the usual numbering. Bhartrhari's philosophy of language, and the Yoga psychology assumed, is complex and may prove to be heavy going for those not philosophically inclined.

Readers more interested in Bhartrhari's poetry or contribution to Indian aesthetics can safely omit the more difficult parts of Chapters 2 and 3 and go on to Chapter 4. In Chapters 4 and 5, brief summaries or reviews of Bhartṛhari's philosophy and psychology have been included." (from the *Preface*)

3. ———. 1980. *The Sphota Theory of Language: A Philosophical Analysis*. Delhi: Motilal Banarsidass.

   "Sanskrit grammar was an attempt to discipline and explain the behaviour of a spoken language, so that the inner meaning could shine forth unobstructed.

   It was this latter aspect, the perceiving of the intended meaning, that commanded the attention of the Indian philosophers of language. Among the many excellent Indian philosophers of language (e.g. Maṇḍana Miśra, Kumārila, Kauṇḍa Bhaṭṭha, Abhinavagupta, etc.) Bhartṛhari(5) (580 a.d.) consistently ranks as the most important. In Bhartrhari's major work, the Vākyapadīya, the ways in which Indian philosophy conceives the

   outer word form to be united with its inner meaning are discussed.

   Bhartrhari's own position has come to be known as the *Sphoṭa* Theory after the Sanskrit term sphuṭ, which means " to burst forth" or when applied to language "a bursting forth of illumination or insight." V. S. Apte in his Sanskrit-English Dictionary defines sphoṭa as the idea that bursts out or flashes on the mind when a sound is uttered.(*)" (pp. 10-11)

   (5) For a beginner's Introduction see Harold G. Coward, *Bhartṛhari.*

4. ———. 1982. "Time (Kala) in Bhartrhari's "Vakyapadiya"." *Journal of Indian Philosophy* no. 10:277-287.

"Summary and Conclusion.

Behind the discussion of the levels of language in the *Vākyapadīya* is Bhartṛhari's notion of the dynamic limiting function of time (*kālaśakti*). After setting forth the absolute nature of Brahman as being the one eternal essence of word and consciousness Bhartṛhari then introduces the notion of time as the power or means by which this one unchanging absolute (sabdatattva-Brahman) manifests itself as the dynamic diversity mankind experiences as

creation. Time is the creative power of Brahman, and thus is responsible for the birth, death and continuity of everything in the cosmos. Time is one, but when broken or limited into sequences appears as moments or actions. These segments of time are mentally categorized as seconds or minutes. Such limited segments of time are then mentally unified into day, week, month and year. In the same fashion notions of past, present, and future are developed. When time is thought of as an action not yet completed, the notion of the present is established. An action that has been completed is time as past; and an action yet to be completed is time as future. All of ordinary life is sequenced by these three powers of time. Yet all the while, declares Bhartṛhari, there is really no sequence at all. From the ultimate viewpoint all three powers of time are constantly present. Time is One. Although the effects of the three powers of time (i.e., past, present, and future) are mutually contradictory, they function without causing any disorder in the cosmos. They are like three paths on which objects move about without any confusion. Similarities and differences with the Advaita Vedānta, Nyāya-Vaiśeṣika, Sāṅkhya-Yoga and Buddhist views of *Kāla* were briefly explored.

Bhartṛhari enters into this deep discussion of time in relation to the absolute, not as a fascinating metaphysical aside, but to explain how the unitary Word (*Sabda-brahman*) manifests

itself in experience as the diversity of words called language. As a grammarian, he is also providing a metaphysical basis for the experience of the tenses past, present and future in language.

And, it is past and future that have the veiling function of keeping one apart from the absolute eternal present. In religious terms union with the eternal present is union with the Divine, and, for Bhartṛhari, this is the inherent goal toward which all language, all grammar, is reaching." (pp. 285-286)

5. ———. 1982. "The Meaning and Power of *Mantras* in Bhartṛhari's *Vākyapadīya*." *Studies in Religion* no. 11:365-375.

   "Bhartṛhari, the fifth century systematizer of the Grammarian School, presents a philosophy of language which proves helpful in understanding both the factual and the intuitive levels of language. Bhartṛhari's *Vākyapadīya* offers a metaphysical, philosophical, and psychological analysis of language which spans the Vedic through to the Tantric experience of *mantra*. All the views of *mantra* summarized above (including *mantra* as 'meaningful' and *mantra* as 'meaningless') are encompassed by Bhartṛhari within one understanding in which language is seen to function at various levels." (p. 367)

6. ———. 1990. "Derrida and Bhartṛhari's Vākyapadīya on the Origin of Language." *Philosophy East and West* no. 40:3-16.

   Reprinted in H. G. Coward, *Derrida and Indian Philosophy*, Albany: State University of New York Press 1990, pp. 27-48.

   "Professor T. R. V. Murti, in his 1963 presidential address(1) to the Indian Philosophical Congress, presented a challenge to Indian philosophy - a challenge that seems to have fallen on deaf ears. Murti challenged the traditional schools of Indian philosophy to rethink themselves and their relationships with one another from the perspective of language.

   Not only would this breathe fresh air into the stale situation obtaining in Indian philosophy-because the Kantian and Hegelian reinterpretations of basic Indian metaphysics had about run their course - it would also allow a significant engagement between Indian philosophy and the contemporary

Western concern with the philosophy of language. This chapter takes up that challenge by entering a dialogue between traditional Indian philosophy as formulated by Bhartṛhari and the modern Western deconstructionist thought of Jacques Derrida. In approaching this dialogue I will follow the insightful suggestions of Professor Murti as to one point on which this dialogue should be focused, namely, the issue of the origin of language." (pp. 27-28 of the reprint)

" Presidential Address to the 37th Session of the Indian Philosophical Congress held in Chandigarh in 1963, and reprinted in *Studies in Indian Thought: The Collected Papers of Professor T. R. V. Murti*, ed. Harold Coward. Delhi: Motilal Banarsidass, 1983, pp. 355-376 .

7. ———. 1991. ""Speech versus Writing" in Derrida and Bhartrhari." *Philosophy East and West* no. 41 (2):141-162.

   Reprinted in H. G. Coward, *Derrida and Indian Philosophy*, Albany: State University of New York Press 1990, pp. 49-79.

   "Both Derrida and Bhartṛhari agree that, since philosophy must be done in language, literary analysis is as important and perhaps more important than logical analysis. As Derrida puts it, philosophers have been able to impose their various conceptual systems only by ignoring or suppressing the disruptive effects of language.(20)

   Bhartṛhari in Vākyapadīya 1 : 14 describes Grammar as the "purifier of all the sciences." It is through the use of correct forms of language-as identified by the Grammarians-that philosophic or any other kind of knowledge can be obtained. Both Bhartṛhari and Derrida break down the barrier between literary criticism and philosophy." (p. 56 of the reprint)

8. ———. 1994. "Kumārila's theory of word meaning in relation to the sphoṭa theory of Bhartṛhari." In *Studies in Mīmāṃsā, Dr.*

Mandan Mishra Felicitation Volume, edited by Dwivedi, R. C., 215-219. Delhi: Motilal Banarsidass.

"Kumārila of the Mīmāṃsā school and Bhartṛhari of the Grammarian school share many points of agreement with reg:ird to word meaning. Over against schools such as the *Cārvāka, Jaina, Nyāya and Buddhists*, that see the relationship between word and meaning as human-made or conventional, Kumārila and Bhartṛhari agree that the relationship between the word (*śabda*) and its meaning (*artha*) is inborn, eternal and therefore not subject to creation by any person including even God.(1)" (p. 215)

(...)

"Kumārila, arguing against Bhartṛhari, maintains that the word or *śabda*, whether it be the sentence or the individual word, is nothing more than a collection of word-sounds or spoken letters, and it is with this collection alone that the word-meaning is associated. When such a coIIection is brought to the mind of the hearer by the sounds uttered by the speaker, the hearer understands the meaning from the sounds alone. No mystical entity, such as *sphoṭa*, need be postulated at all.(6) According to Bhartṛhari, however, "the essence of the *Sphoṭa* doctrine is the idea that the word, mainly in the form of the sentence and secondarily in the form of the individual word and the phoneme (the articulated letter sound), is an entity over and above the sounds and not a mere collection of them and that it is this entity which is the bearer of the meaning.(7)"

(...)

"The debate between Kumārila and Bhartṛhari as to how words reveal their meaning is clearly summarized in the *Sphoṭasiddhi* of Maṇḍana Misra.(4)" (p. 216)

(...)

"Although Maṇḍana in presenting this debate clearly favours the Grammarian position, a dispassionate reading of the analysis suggests a draw rather than a victory for one side or
